LOBAU, GEORGE MOUTON, count, lieutenant-general, and, in 1830, commander of the national guards of Paris, one of the pupils of the French revolution of 1789, and a distinguished actor in that of July, 1830, was born in 1770, and designed for commercial pursuits. On the invasion of France, in 1792, he entered the military service, and obtained his first promotion on the Rhine. Having served with distinction in Italy, where he was dangerously wounded, he was created, by the first consul, Bonaparte, general of brigade, and afterwards accompanied the emperor in all his campaigns, in the capacity of aid. In 1807, he was wounded at Friedland, and promoted to the rank of general of division. His brilliant services in Spain, in 1808, and in Germany, obtained him his title of count. (See *Aspern*.) After having served in the Russian campaign, he was made prisoner in Dresden in 1813, but set at liberty after the abdication of Napoleon. He rejoined the emperor during the hundred days, was named peer of France, received the command of a division, and distinguished himself at Waterloo. On

the second restoration of the Bourbons, count Lobau was banished from the kingdom (see *Louis XVIII*), and he resided in Belgium till 1818, when he was allowed to return to France. During the revolution of 1830, he took an active part on the popular side, and, when Lafayette resigned the command of the national guards, was appointed (December 21) commander of those of Paris.

LOBEIRA, VASCO, author of the celebrated romance of *Amadis de Gaul*, was born at Porto, in Portugal, in the fourteenth century. In 1384, he was knighted on the field of battle, at Aljubarrota, by king Joam I. He died at Elvas, where he possessed an estate, in 1403. The original of his celebrated romance was preserved in the library of the duke of Aveiro, who suffered for the conspiracy against Joseph I.; but whether still in existence or not, is doubtful. This romance has been claimed for France, it having been asserted that Lobau was only a translator; but Dr Southey has succeeded in refuting that pretension. See *Amadis*.

LOBEL, MARTIN DE, (Latinised, *Lobelius*), was born at Lille, in 1538, studied medicine at Montpellier, travelled through Italy, Switzerland, Germany, became physician to the prince of Orange, and was at a later period, invited to England, as a lecturer, by king James. He died in 1616, at Highgate, near London. His chief works are *Storpium advenna nova*, with engravings (London, 1570, 4to, several times reprinted; the last time, Frankfurt, 1610, folio); *Plantarum seu Storpium Histories cum Anasariorum Volumine*, with engravings (Amstervp, 1610, folio; in Dutch, *ibid*, 1581); *Icones Storpium*, Amstervp, 1681, 4to; also London, 1806, 4to. After him, a genus of plants has been called *Lobelia*. All the species are poisonous; some very much so.

LOBELIA; a genus of plants distinguished by the labiate corolla, and by having the five segments united in the form of a cylinder, as in the *corollæ*. About 160 species are known, which are herbaceous or frutescent, having alternate leaves, and flowers disposed in terminal racemes. The juice is at a milky, and more or less acrid and caustic.

LOBSTER (*astacus*). This well known crustaceous animal has already been cursorily mentioned under the head of *Crayfish*, and it was there inadvertently stated, that the lobster, found on the American coast, was the *A. gemmarus*, or, in other words, identical with the European species. It was so considered by most naturalists, until Mr Say pointed out the differences between them. (See *Journ. Acad. Nat. Sci. Philad.* i. 165.) He was it *A. marinus*. Mr Say observes that *Saba*, however, was aware that this species was distinct from the European, and figured it in his great work. They are exceedingly alike, though there are certain marks of difference, sufficient to authorize a separation. The habits of the American species are, so far as they have been observed, analogous to those of the *gemmarus*. They are taken by means of pots or traps made of strips or osiers, formed somewhat like a mouse-trap, baited with garbage, attached to a line and buoy, and sunk by means of a weight. The European lobster having been more studied by naturalists, the following particulars respecting it have been obtained. Like the crabs, they change their crust annually. Previous to this process, they appear sick, languid, and restless. They acquire the new shell in about three or four days, during which time being perfectly defenceless, they become the prey not only of fish, but also of such of their kindred as are not in the same condition. It is difficult to conceive how they are able to draw the membrane of the claws out of their hard covering. The fishermen say, that during the pining state of the animal

before casting its shell, the limb becomes contracted to such a degree as to be capable of being withdrawn through the joints and narrow passage near the body. Like all other crustaceous animals, they only increase in size whilst in a soft state. The circumstance of lobsters losing their claws on occasion of thunder-claps, or the sound of cannon, is well authenticated. The restoration of claws lost thus, or from their frequent combats with each other, in which the vanquished party generally leaves one of his limbs in his adversary's grasp, may be readily observed, as the new limb seldom, if ever, attains the size of the former. These animals are very sensible to the shock communicated to the fluid in which they live, by the firing of cannon. In the water, they are very rapid in their motions, and, when suddenly alarmed, can spring to a great distance. They attain their retreat in a rock with surprising dexterity, throwing themselves into a passage barely sufficient to permit their bodies to pass. They are extremely prolific: Dr Baster says that he counted 12,444 eggs under the tail of a female lobster, besides those that remained in the body unprotruded. The female deposits these eggs in the sand, where they are soon hatched.

LOCH; the Scottish for *lake*.

LOCH KATRINE, or CATHARINE; a small lake of Scotland, in the county of Perth, in the Grampian hills, celebrated for the picturesque beauties of its shores. It has become famous as the scene of the Lady of the Lake. Bordering on it are the mountains called the Trosachs, full of wildness and rude grandeur. The access to the lake is through a narrow pass, about half a mile in length, "the Trosachs' rugged jaws."

LOCH LEVEN. See *Leven*.

LOCH LOMOND; a lake of Scotland, lying betwixt Dumbartonshire and Stirlingshire, and nearly equally belonging to both. It is about twenty-three miles in length from north to south, and its greatest breadth is five miles. It contains nearly thirty islands of different sizes. It communicates with the Clyde by a river, which joins the Clyde at Dumbarton. (See *Leven*.) This beautiful lake is surrounded by hills and mountains, and is celebrated for the grand and picturesque scenery of its shores. Its depth is various, in some parts 100 fathoms. It abounds in trout.

LOCK; a well known instrument, used for fastening doors, chests, &c., generally opened by a key. The lock is reckoned the masterpiece in smithery, a great deal of art and delicacy being required in contriving and varying the wards, springs, bolts, &c., and adjusting them to the places where they are to be used, and to the several occasions of using them. The principle on which all locks depend, is the application of a lever to an interior bolt, by means of a communication from without; so that, by means of the latter, the lever acts upon the bolt, and moves it in such a manner as to secure the lid or door from being opened by any pull or push from without. The security of locks, in general, therefore, depends on the number of impediments we can interpose betwixt the lever (the key) and the bolt which secures the door; and these impediments are well known by the name of *wards*, the number and intricacy of which are supposed to distinguish a good lock from a bad one. If these wards, however, do not, in an effectual manner, preclude the access of all other instruments besides the proper key, it is still possible for a mechanic, of equal skill with the lockmaker, to open it without the key, and thus to elude the labour of the other. Various complicated and difficult locks have been constructed by Messrs Bramah, Taylor, Spears, and others. In a very ingenious lock, in-

vented by Mr Perkins, twenty-four small blocks of metal, of different sizes, are introduced, corresponding, to the letters of the alphabet. Out of these, an indefinite number of combinations may be made. The person locking the door selects and places the blocks necessary to spell a particular word, known only to himself, and no other person, even if in possession of the key, can open the door, without a knowledge of the same word.

LOCKS. When a canal varies from one level to another of different elevation, the place where the change of level takes place, is commanded by a lock. Locks are tight, oblong enclosures, in the bed of the canal, furnished with gates at each end, which separate the higher from the lower parts of the canal. When a boat passes up the canal, the lower gates are opened, and the boat glides into the lock, after which the lower gates are shut. A sluice, communicating with the upper part of the canal, is then opened, and the lock rapidly fills with water, elevating the boat on its surface. When the lock is filled to the highest water level, the upper gates are opened, and the boat, being now on the level of the upper part of the canal, passes on its way. The reverse of this process is performed when the boat is descending the canal. Locks are made of stone or brick, sometimes of wood. The gates are commonly double, resembling folding doors. They meet each other, in most instances, at an obtuse angle, and the pressure of the water serves to keep them firmly in contact. Cast iron gates are sometimes used in England, curved in the form of a horizontal arch, with their convex side opposed to the water. In China, inclined planes are said to be used instead of locks, along which the boats are drawn up or let down. They have also been used in Europe, and on the Morris canal, in New Jersey, America.

LOCKE, JOHN, one of the most eminent philosophers and valuable writers of his age and country, was born at Wrington, in Somersetshire, Aug. 29, 1632. His father, who had been bred to the law, acted in the capacity of steward, or court-keeper, to colonel Alexander Popham, by whose interest, on the breaking out of the civil war, he became a captain in the service of parliament. The subject of this article was sent, at a proper age, to Westminster school, whence he was elected, in 1651, to Christ church college, Oxford. Here he distinguished himself much by his application and proficiency; and, having taken the degree of B. A. in 1655, and of M. A. in 1658, he applied himself to the study of physic. In the year 1664, he accepted an offer to go abroad, in the capacity of secretary to Sir William Swan, envoy from Charles II. to the elector of Brandenburg, and other German princes; but he returned, in the course of a year, and resumed his studies with renewed ardour. In 1666, he was introduced to lord Ashley, afterwards the celebrated earl of Shaftesbury, to whom he became essentially serviceable in his medical capacity, and who formed so high an opinion of his general powers, that he prevailed upon him to take up his residence in his house, and urged him to apply his studies to politics and philosophy. By his acquaintance with this nobleman, Mr Locke was introduced to the duke of Buckingham, the earl of Halifax, and others of the most eminent persons of their day. In 1668, at the request of the earl and countess of Northumberland, he accompanied them in a tour to France, and, on his return, was employed by lord Ashley, then chancellor of the exchequer, in drawing up the Fundamental Constitutions of Carolina. He also superintended the education of that nobleman's son. In 1670, he began to form the plan of his *Essay on the Human Understanding*, and, about the same time, was made a fellow of the royal society. In 1672, lord Ashley, having been created earl of

Shaftesbury, and chancellor, appointed Mr Locke secretary of presentations, which office, however, he lost the following year, when the earl was obliged to resign the seals. Being still president of the board of trade, that nobleman then made Mr Locke secretary to the same; but, the commission being dissolved in 1674, he lost that appointment also. In the following year, he graduated as a bachelor of physic, and, being apprehensive of a consumption, travelled into France, and resided some time at Montpellier. In 1679, he returned to England, at the request of the earl of Shaftesbury, then again restored to power; and, in 1682, when that nobleman was obliged to retire to Holland, he accompanied him in his exile. On the death of his patron, in that country, aware how much he was disliked by the predominant arbitrary faction at home, he chose to remain abroad; and was, in consequence, accused of being the author of certain tracts against the British government; and, although these were afterwards discovered to be the work of another person, he was arbitrarily ejected from his studentship of Christ church, by the king's command. Thus assailed, he continued abroad, nobly refusing to accept a pardon, which the celebrated William Penn undertook to procure for him, expressing himself, like the chancellor L'Hopital, in similar circumstances, ignorant of the crimes of which he had been declared guilty. In 1685, when Monmouth undertook his ill-concerted enterprise, the English envoy at the Hague demanded the person of Mr Locke, and several others, which demand obliged him to conceal himself for nearly a year; but, in 1686, he again appeared in public, and formed a literary society at Amsterdam, in conjunction with Limborch, Leclerc, and others. During the time of his concealment, he also wrote his first Letter concerning Toleration, which was printed at Gouda, in 1689, under the title of *Epistola de Tolerantia*, and was rapidly translated into Dutch, French, and English. At the revolution, he returned to England, in the fleet which conveyed the princess of Orange, and, being deemed a sufferer for the principles on which it was established, he was made a commissioner of appeals, and was soon after gratified by the establishment of toleration by law. In 1690, he published his celebrated Essay concerning Human Understanding, which he had written in Holland. It was instantly attacked by various writers. It was even proposed, at a meeting of the heads of houses of the university of Oxford, to formally censure and discourage it; but nothing was finally resolved upon, but that each master should endeavour to prevent its being read in his college. Neither this, however, nor any other opposition, availed; the reputation, both of the work and of the author, increased throughout Europe; and, besides being translated into French and Latin, it had reached a fourth English edition, in 1700. In 1690, Locke published his second Letter on Toleration; and, in the same year, appeared his two Treatises on Government, in opposition to the principles of Sir Robert Filmer, and of the whole passive-obedience school. He next wrote a pamphlet entitled *Some Considerations of the Consequences of lowering the Interest and Value of Money* (1691, 8vo), which was followed by other smaller pieces on the same subject. In 1692, he published a third Letter on Toleration, and, the following year, his Thoughts concerning Education. In 1695, he was made a commissioner of trade and plantations, and, in the same year, published his Reasonableness of Christianity, as delivered in the Scriptures, which being warmly attacked by doctor Edwards, in his Socinianism Unmasked, Locke followed with a first and second Vindication, in which he defended himself in a masterly manner. The use made by Toland,

and other latitudinarian writers, of the premises laid down in the Essay on the Human Understanding, at length produced an opponent in the celebrated bishop Stillingfleet, who, in his Defence of the Doctrine of the Trinity, censured some passages in Locke's Essay; and a controversy arose, in which the great reading and proficiency in ecclesiastical antiquities of the prelate yielded, in an argumentative contest, to the reasoning powers of the philosopher. With his publications in this controversy, which were distinguished by mildness and urbanity, Locke retired from the press, and his asthmatic complaints increasing, he resigned his post of commissioner of trade and plantations, observing that he could not, in conscience, hold a situation, to which a considerable salary was attached, without performing the duties of it. From this time, he lived wholly in retirement, where he applied himself to the study of Scripture; while the sufferings incidental to his disorders were materially alleviated by the kind attentions and agreeable conversation of lady Masham, who was the daughter of the learned doctor Cudworth, and, for many years, his intimate friend. Locke continued nearly two years in a declining state, and at length expired in a manner correspondent with his piety, equanimity, and rectitude, October 28, 1704. He was buried at Oates, where there is a neat monument erected to his memory, with a modest Latin inscription indited by himself.

The moral, social, and political character of the eminent man, is sufficiently illustrated by the foregoing brief account of his life and labours; and the effect of his writings upon the opinions and even fortunes of mankind, is the best eulogium on his mental superiority. In the opinion of doctor Reid, he gave the first example in the English language, of writing on abstract subjects with simplicity and perspicuity. No author has more successfully pointed out the danger of ambiguous words, and of having indistinct notions on subjects of judgment and reasoning; while his observations on the various powers of the human understanding, on the use and abuse of words, and on the extent and limits of human knowledge, are drawn from an attentive reflection on the operations of his own mind. In order to study the human soul, he went neither to ancient nor to modern philosophers for advice, but, like Maimoniche, he turned within himself, and, after having long contemplated his own mind, he gave his reflections to the world. Locke was a very acute thinker, and his labours will always be acknowledged with gratitude, in the history of philosophy; but, at the same time, it must be remembered, that, in attempting to analyse the human soul, as an anatomist proceeds in investigating a body, piece by piece, and to derive ideas from experience, he has unintentionally supported materialism. His declaration, that God, by his omnipotence, can make matter capable of thinking, has been considered dangerous as a religious point of view. Locke's great work, his Essay on the Human Understanding, which he was nineteen years in preparing, owes its existence to a dispute, at which he was present, and which he perceived to rest on a verbal misunderstanding, and considering this to be a common source of error, he was led to study the origin of ideas, &c. The influence of this work has rendered the empirical philosophy prevalent in Britain and France, though in both countries, philosophers of a different school have appeared (See Cousin.) Henry Lee and Norris (in Holland) were among his earliest opponents. In France, Jean Leclerc (Clericus) distinguished himself particularly as a partisan of Locke; and Wierwille spread his philosophy, by compendiums, in Holland. Amidst the improvements in metaphysical studies

to which the Essay itself has mainly conduced, it will ever prove a valuable guide in the acquirement of the science of the human mind. His next great work, his two Treatises on Government, was opposed by the theorists of divine right and passive obedience (see *Legitimacy*), and by writers of Jacobitical tendencies; but it upholds the great principles, which may be deemed the constitutional doctrine of his country. It was a favourite work with the statesmen of the American revolution, by whom it is constantly appealed to in their constitutional arguments. His Reasonableness of Christianity maintains, that there is nothing contained in revealed religion inconsistent with reason, and that it is only necessary to believe that Jesus is the Messiah. His posthumous works, also, have caused him to be considered, by some, as a Socinian. Besides the works already mentioned, Locke left several MSS. behind him, from which his executors, Sir Peter King and Mr Anthony Collins, published, in 1706, his Paraphrase and Notes upon St Paul's Epistles to the Galatians, Corinthians, Romans, and Ephesians, with an Essay prefixed for the Understanding of St Paul's Epistles, by a reference to St Paul himself. In 1706, the same parties published Posthumous Works of Mr Locke (8vo), comprising a Treatise on the Conduct of the Understanding, an Examination of Malebranche's Opinion of seeing all Things in God. His works have been collected together, and frequently printed in 3 vols. folio, 4 vols. quarto, and, more lately, in ten vols. 8vo, with a life prefixed, by Law, bishop of Carlisle. Some unpublished MSS. yet remain in possession of lord King, who has given to the public some valuable materials in his Life and Correspondence of John Locke (London, 1829).—See, also, Stewart's Philosophical Essays.

**LOCKER**; a kind of box, or chest, made along the side of a ship, to put or stow anything in.

**Shot-lockers**; strong frames of plank near the pump-well in the hold, in which the shot is put.

**LOCKMAN**. See *Lokman*, and *Fable*.

**LOCOMOTION**. The arts of locomotion are very well described in Bigelow's Technology (Boston, 1829), and the few remarks that follow are abridged from the first part of the article. The chief obstacles which oppose locomotion, or change of place, are gravity and friction, the last of which is, in most cases, a consequence of the first. Gravity confines all terrestrial bodies against the surface of the earth, with a force proportionate to the quantity of matter which composes them. Most kinds of mechanism, both natural and artificial, which assist locomotion, are arrangements for obviating the effects of gravity and friction. Animals that walk, obviate friction by substituting points of their bodies instead of large surfaces, and upon these points they turn, as upon centres, for the length of each step, using themselves wholly or partly from the ground in successive arcs, instead of drawing themselves along the surface. As the feet move in separate lines, the body has also a lateral, vibratory motion. *man*, in walking, puts down one foot before the other is raised, but not in running. Quadrupeds, in walking, have three feet upon the ground for most of the time; in trotting, only two. Animals which walk against gravity, as the common fly, the treadmill, &c., support themselves by suction, using *suckers* on the under side of their feet, which they enlarge, at pleasure, till the pressure of the atmosphere causes them to adhere. In other respects *their locomotion* is effected like that of other walking animals. Birds perform the motion of flying by striking the air with the broad surface of their wings downward and backward direction, thus propelling the body upward and forward. After each

stroke, the wings are contracted, or slightly turned, to lessen their resistance to the atmosphere, then raised, and spread anew. The downward stroke also, being more sudden than the upward, is more resisted by the atmosphere. The tail of birds serves as a rudder to direct the course upward or downward. When a bird sails in the air without moving the wings, it is done in some cases by the velocity previously acquired, and an oblique direction of the wings upward; in others, by a gradual descent, with the wings slightly turned, in an oblique direction, downward. Fishes, in swimming forward, are propelled chiefly by strokes of the tail, the extremity of which being bent in an oblique position, propels the body forward and laterally at the same time. The lateral motion is corrected by the next stroke, in the opposite direction, while the forward course continues. The fins serve partly to assist in swimming, but chiefly to balance the body, or keep it upright; for, the centre of gravity being nearest the back, a fish turns over, when it is dead or disabled.\* Some other aquatic animals, as leeches, swim with a sinuous or undulating motion of the body, in which several parts at once are made to act obliquely against the water. Serpents, in like manner, advance by means of the winding or serpentine direction which they give to their bodies, and by which a succession of oblique forces are brought to act against the ground. Sir Everard Home is of opinion that serpents use their ribs in the manner of legs, and propel the body forwards by bringing the plates on the under surface of the body to act, successively, like feet against the ground. This he deduces from the anatomy of the animal, and from the movements which he perceived in suffering a large coluber to crawl over his hand. Some worms and larvæ of slow motion, extend a part of their body forwards, and draw up the rest to overtake it, some performing this motion in a direct line, others in curves. When land animals swim in water, they are supported, because their whole weight, with the lungs expanded with air, is less than that of an equal bulk of water. The head, however, or a part of it, must be kept above water, to enable the animal to breathe; and to effect this, and also to make progress in the water, the limbs are exerted, in successive impulses, against the fluid. Quadrupeds and birds swim with less effort than man, because the weight of the head, which is carried above the water, is, in them, a smaller proportional part of the whole than it is in man. All animals are provided, by nature, with organs of locomotion best adapted to their structure and situation; and it is probable that no animal, man not being excepted, can exert his strength more advantageously by any other than the natural mode, in moving himself over the common surface of the ground.† Thus walking cars, velocipedes, &c., although they may enable a man to increase his velocity, in favourable situations, for a short time, yet they actually require an increased expenditure of power, for the purpose of transporting the machine made use of, in addition to the weight of the body. When, however, a great additional load is to be transported with the body, a man, or animal, may derive much assistance from mechanical arrangements. For moving weights over the common ground, with its ordinary asperities and in-

\* The swimming-bladder, which exists in most fishes, though not in all, is supposed to have an agency in adapting the specific gravity of the fish to the particular depth in which it resides. The power of the animal to rise or sink, by altering the dimensions of this organ, has been, with some reason, disputed.

† This remark, of course, does not apply to situations in which friction is obviated, as upon water, ice, rail-roads, &c.

qualities of substance and structure, no piece of inert mechanism is so favourably adapted as the wheel-carriage. It was introduced into use in very early ages. Wheels diminish friction, and also surmount obstacles or inequalities of the road, with more advantage than bodies of any other form, in their place, could do. The friction is diminished by transferring it from the surface of the ground to the centre of the wheel, or, rather, to the place of contact between the axletree and the box of the wheel; so that it is lessened by the mechanical advantage of the lever, in the proportion which the diameter of the axletree bears to the diameter of the wheel. The rubbing surfaces, also, being kept polished, and smeared with some unctuous substance, are in the best possible condition to resist friction. In like manner, the common obstacles that present themselves in the public roads, are surmounted by a wheel with peculiar facility. As soon as the wheel strikes against a stone or similar hard body, it is converted into a lever for lifting the load over the resisting object. If an obstacle eight or ten inches in height were presented to the body of a carriage unprovided with wheels, it would stop its progress, or subject it to such violence as would endanger its safety. But by the action of a wheel, the load is lifted, and its centre of gravity passes over in the direction of an easy arc, the obstacle furnishing the fulcrum on which the lever acts. Rollers placed under a heavy body diminish the friction in a greater degree than wheels, provided they are true spheres or cylinders, without any axis on which they are constrained to move; but a cylindrical roller occasions friction, whenever its path deviates in the least from a straight line. The mechanical advantages of a wheel are proportionate to its size, and the larger it is, the more effectually does it diminish the ordinary resistances. A large wheel will surmount stones and similar obstacles better than a small one, since the arm of the lever on which the force acts is longer, and the curve described by the centre of the load is the arc of a larger circle, and, of course, the ascent is more gradual and easy. In passing over holes, ruts, or excavations, also, a large wheel sinks less than a small one, and consequently occasions less jolting and expenditure of power. The wear also of large wheels is less than that of small ones, for if we suppose a wheel to be three feet in diameter, it will turn round twice, while one of six feet in diameter turns round once; so that its tire will come twice as often in contact with the ground, and its spokes will twice as often have to support the weight of the load. In practice, however, it is found necessary to confine the size of wheels within certain limits, partly because the materials used would make wheels of great size heavy and cumbersome, since the separate parts would necessarily be of large proportions to have the requisite strength, and partly because they would be disproportioned to the size of the animals employed in draught, and compel them to pull obliquely downwards, and therefore to expend a part of their force in acting against the ground.

LOCOMOTIVE ENGINE is that which is calculated to produce locomotion, or motion from place to place.

In this article, it is our intention to give an historical and descriptive account of locomotive engines, and to reserve the consideration of their effects upon railways, until we come to treat of *railways*, (q. v.) Dr Robinson, while a student at Glasgow college in 1759, seems to have been the first who suggested the application of steam power to the propelling of carriages. Oliver Evans, an ingenious American, thought of the same thing twenty-three years after-

wards, but it does not appear that any thing more than a good high pressure fixed engine was the result of his labours. In 1784, James Watt took out a patent for the application of his steam engine to move carriages, and three years afterwards, Mr William Symington exhibited a model of a steam carriage of his own invention at Edinburgh, the engine being of the low pressure kind. In 1802, a carriage on four wheels, was erected by Mr Richard Trevithick, having a high pressure engine and boiler contained in the carriage. The great defect of Trevithick's carriage, consisted in the slipping of the wheels, which Mr Blinckesop endeavoured to obviate in 1811, by employing a rack rail, in which a large toothed wheel was to work. In the year following, Messrs Chapman brought forward a steam carriage, in which the weight was distributed over a larger surface, and consequently less injury done to the rail. About the same time, Mr Brunton of Bathurst contrived a carriage to be propelled by levers, acting like horse's feet. A railway carriage invented by M George Stevenson in July, 1814, was reckoned the most perfect for many years. That gentleman employed two cylinders, and increased the efficiency of the machine, by distributing the pressure over four wheels, instead of over two as in Trevithick's machine. In 1830, steam carriages of a still better construction, were started upon the Liverpool and Manchester railway. The carriages tried on the Sanspareil by Mr Hawkworth, the *Novelty* by Messrs Braithwaite and Ericson, and the *Rocket* by Mr Stevenson: after a fair trial, the *Rocket* obtained the reward. Mr Stevenson has, however, made further improvements upon his steam carriage, which we shall now proceed to describe. Various views of this railway steam carriage are given in plates 51. No. 1, and 51. No. 2. A side elevation is shown in fig. 1, plate 51. No. 1; figs. 2 and 3 are end elevations, the former showing the back, and the latter the front elevation, fig. 4, is an end view of the boiler. Fig. 1, plate 51. No. 2 is a ground plan, and fig. 2 a section and 3 a side view with some parts taken away, in order to show the more concealed portions of the machinery. The same letters of reference are used in all the figures.

Our attention must in the first place, be directed to the boiler, an end view of which is represented in fig. 4, plate 51. No. 1. It consists of a massive cylinder, having two flat ends, the cylinder being commonly about six feet in length. The under part of this cylinder is occupied by eighty or 100 copper tubes traversing the whole length, and each of about 1½ inches diameter. These tubes are so many that being open at both ends, the one end communicating with the fire box, or furnace, and the other opening into the chimney, thus affording a passage for the smoke and hot air. These pipes being heated, they communicate their caloric to the water which surrounds them, the boiler or cylinder being filled with water to such a height as to cover the tubes. The boiler lies lengthwise in the carriage, as may be seen at A A' in the longitudinal section, fig. 2, plate 51. No. 2, one end of the boiler as was before observed opens into a fire-box or furnace, seen at b b c c in the same section. The furnace bars are laid horizontally at a as may be seen, also in the ground plan, fig. 1, plate 51. No. 2. The fire box or furnace, is a square box formed of two casings, the one contained within the other. The outside casing communicates with the lower, and also at the upper, parts of the boiler, by means of two pipes, therefore when water is poured into the boiler, it flows into the space between the outside casing and the fire-box, and the boiler being constantly kept about half full of water the casing is consequently well supplied. The steam

that is generated in the casing, passes into the boiler by the upper pipe. Above the fire-box, and communicating with the upper part of the boiler, there is a sort of bell-shaped receiver covered at the top, and opening into the boiler, as seen at E." From this receiver a pipe is led, one end of which opens into the receiver: at a little distance below, this pipe is bent, having a knee joint, and then traverses horizontally along the whole length of the boiler. At its further extremity, it opens into two pipes of smaller bore, one of which is seen at g, the other being hid in the section. These pipes are bended downwards, in order to supply the cylinders, one of which is seen at R.

The hot air and smoke, as before stated, pass along the horizontal tubes in the boiler, rise up through the chimney A, and escape into the air. F is the safety-valve, being of the steel yard kind, but instead of the pressure being regulated by a moveable weight, it is regulated by a spiral steel spring, whose elastic force is measured by a graduated scale. F' is another safety-valve, wrought in a similar way, but confined within a pipe, so that the workmen cannot get at it, in order that should the other valve be too much loaded, the valve F' will still act, and prevent accident when the force of the steam is greater than it should be. E is the main hole, which is uncovered when the boiler requires to be cleaned. The engine, which is of the high pressure kind, is seen at R R'; the cylinders two in number, lie nearly in a horizontal position, being a little inclined upwards towards the fire-box, or back of the carriage.

The alternate motion of the piston rod, gives motion to a crank on the axle of the back wheels, and thus the carriage is propelled. The valves in the nozzles are wrought by an eccentric, V r. The rods for putting off or on the steam, as also for working the eccentric that causes the carriage to move either backwards or forwards, are seen at h and Z at the end of the fire-box.

D is the hot water pump, which may be connected with the gearing at pleasure, by a handle at the command of the engine-man, who stands within the rail at the back of the carriage. The whole is suspended on springs, which may be seen at N, in plate 51. No. 1.

The above is only intended to be a general description; more particular details will be given in our articles *Railways and Steam Engine*.

With regard to locomotive engines for moving on common roads, it is unnecessary to say much. Various attempts have from time to time been made by Mr Gurney, Messrs Heaton, Mr Russell, and other ingenious engineers; but although very great mechanical skill has been displayed in these inventions, none of them have succeeded to satisfaction. From the rapid improvements in the various departments of machinery, it is highly probable that ere long, steam carriages will be made to ply on our turnpike roads with safety and expedition.

LOCRI was a country of Middle Greece, whose inhabitants, the Locrians, were among the oldest Grecian people. There were four branches of them—the Epicnemidian, the Opuntian, Ozolian, and Pizephyrian Locrians. The last were a colony from the Ozolian stock, and lived in Lower Italy. Their capital, Locri, was one of the most powerful, splendid, and wealthy cities of Magna Græcia.

LOCUST. The misapplication of popular appellations, and the mutations of entomology, have introduced some confusion in regard to the scientific names of many insects. The American *cicada* are particularly known in the United States both by the names of *harvest-fly* and *locust*; the latter term, however, is incorrectly applied. Under the generic name

*locusta* is included, by several modern entomologists, the devouring locusts and the common grasshoppers. These entomologists use the term in nearly the same sense as Linnaeus, who affixed it to a group of his great genus *gryllus*, which constitutes the genus *gryllus proper* of Fabricius. The grasshopper may be thus characterized. The wings and wing-cases are applied obliquely to the sides of the body in repose; the antennæ are short, and do not taper towards the ends; the feet have only three joints; and the tail is not furnished with a projecting oviduct, or piercer, for the deposition of the eggs. These insects have the hind legs formed for leaping, and the males produce a stridulous sound, by scraping these legs against their wing-cases. The female deposits her eggs in the earth, and the young survive the winter in the larvæ state, concealed among the decayed vegetation of the surface. They pass through an imperfect metamorphosis, for both larvæ and pupæ resemble, somewhat, the perfect insects in form, are active, and take food in the same way, but are destitute of wings. In all stages, they are herbivorous, and sometimes do immense injury to vegetation. The salt marshes of North America harbour an innumerable host, which not unfrequently strips them of every blade of grass; or, when a scanty crop is gathered into the barn, the hay is so filled with the putrescent carcasses of these grasshoppers, or locusts, as to be highly offensive, and totally unfit for forage. In some sections of that country, they occasionally appear in such numbers as to fill the air in clouds, and wherever they alight they devour every green thing in their path. It is stated, on good authority, that, more than once, when they visited some parts of New England, they not only ate up all the grass in the fields, but actually attacked clothing and fences to appease their insatiable hunger. Some workmen, employed in raising the steeple of a church, in Williamstown, Massachusetts, were, while standing near the vane, covered by them, and saw, at the same time, vast swarms flying at a great height far above their heads. These swarms are said to return after a short migration, and perish on the very grounds they have ravaged. (See Dwight's *Travels*.) Many of these insects are ornamented with various beautiful colours, particularly on the wings, which, however, in repose, are not visible, being folded like a fan, and covered by the long, narrow wing-cases. One of the largest and most common American species is the *locusta Carolina* of Linnaeus. It is about one inch and three quarters in length, and the wings are of a deep black colour, surrounded with a broad yellow border. The most celebrated species of grasshopper is the *gryllus migratorius* (migratory locust). Of all animals capable of adding to the calamities of mankind, by destroying the vegetable products of the earth, the migratory locusts would seem to possess the most formidable powers of destruction. In Syria, Egypt, and almost all the south of Asia, these insects make their appearance in legions, and carry desolation with them, in a few hours changing the most fertile provinces into barren deserts, and darkening the air by their numbers. Happily for mankind, this calamity is not frequently repeated, for it is the inevitable precursor of famine, and its horrible consequences. The annals of most of the southern Asiatic climates are filled with the accounts of the devastations produced by locusts. They seldom visit Europe in such swarms, though they are occasionally formidable to the agriculturist. Even when dead, they are still productive of evil consequences, since the putrefaction which arises from their inconceivable number, is so great, that it is justly regarded as the cause of some of those desolating pestilences

which almost depopulate whole districts of country. When locusts thus make their appearance, they are said to have a leader, whose flight they observe, and to whose motions they pay a strict regard. We are told that nearly as much damage is occasioned by what they touch, as by what they devour. Their bite is thought to contaminate the plants, and either to destroy or greatly weaken their vegetation. Of the innumerable multitudes in which they occur, scarcely an adequate conception can be formed. Barrow (*Travels*, &c.) states that, in Southern Africa, the whole surface of the ground might literally be said to be covered with them for an area of 2000 square miles. The water of a very wide river was scarcely visible on account of the dead carcasses that floated on the surface. When the larvæ (for these are much more voracious than the perfect insects) are on a march during the day, it is utterly impossible to turn the direction of the troop, which is generally with the wind. In some parts of the world, these insects are used for food. For this purpose, they are caught in nets, and, when a sufficient number is procured, they are roasted over a slow fire, in an earthen vessel, till the wings and legs drop off; when thus prepared, they are said to taste like crawfish. Mr Adanson (*Voyage to Senegal*) says, however, that he would willingly resign whole armies of locusts for the meanest fish. The locusts constituted a common food among the Jews, and Moses has specified the different kinds which they were permitted to eat. "Even these thou mayest eat; the locust after his kind; the bald locust after his kind; the beetle after his kind; and the grasshopper after his kind." *Levit.* xi. 22.

The popular term *grasshopper* is also applied, and with more propriety, to insects in another group of the *gryllæ*—the *tettigonia* of Linneus (*locusta* of Fabricius). They are distinguished from the locusts of the preceding section, by their very long, bristle-shaped, or tapering antennæ, and by having four joints to their feet, and an exerted oviduct. The latter instrument often has the form of a curved sword or sickle, and is used in preparing a hole, and in conveying the eggs to their appropriate *nidus* beneath the soil. These insects have long, slender hind legs, formed for leaping; but the males do not play with them against their wing-cases, for the production of sounds. Their musical organs consist of a pair of frames, within each of which is stretched a transparent membrane. These tabourets are affixed to that part of the base of each wing-case which laps on the top of the back, and one lies directly over and in contact with the other; so that, whenever the wing-cases are opened and shut, the frames grate together, and, as often as the shuffling motion is repeated, a grating sound is produced. These musical grasshoppers are usually of a green colour, and are nocturnal in their habits. During the daytime, they conceal themselves in the grass or the foliage of trees; but at night, they quit their lurking places, and the joyous male commences the song of love with which he recreates his silent partner. It would be well to restrict the popular appellation *grasshoppers* to these insects, which have been distributed into several modern genera. Two only need here be mentioned, viz., *conocephalus* (Thunberg), (*acrida*, Kirby), including the species whose head terminates in front in a conical projection, and *pteroptylla* (Kirby), whose head is obtuse, and not produced in front. The latter genus contains the well-known insect, called, from its note, *katy-did*, *pteroptylla concava* (*locusta concava*, Say.) Its large, oblong-oval, concave wing-cases, unwrap the abdomen, and meet at their edges above and below, somewhat like the two sides or valves of a pea-pod. Perched on

the topmost twig of a tree, the insect begins his nocturnal call by separating, closing, and re-opening its wing-cases. The friction of the tabouret-frames upon each other, thrice, produces three distinct notes, which is the usual number; occasionally, only two are given, when the wing-cases are merely opened and shut once. The mechanism of these organs reverberates, and increases the sound to such a degree, that it may be heard, in the stillness of the night, at the distance of nearly a quarter of a mile. At intervals of three or four minutes, he repeats his clamorous babble, while rival songsters echo the note, and the woods resound with the call of *katy-did*, *as did*, the live-long night. The *tettigonia* of Linneus, or grasshoppers above-mentioned, are not to be confounded with the insects referred to the modern genus *tettigonia* of Olivier, Lamarck, and Latreille. The former, with all the *gryllæ* of Linneus, have jaws for masticating their food, and belong to the order *orthoptera*; while the latter, with the *acridæ*, or *grasshopper* (misnamed *locust*), have suctionary tubes, for sucking plants and imbibing their juices, and belong to the order *homoptera*. In the genus *acridæ*, the antennæ are six-jointed: there are three *acridæ*, and the legs are not adapted for leaping. In *tettigonia*, the antennæ are three-jointed; there are only two *acridæ*, the thorax is transverse; not produced behind, and the legs are formed for leaping. To the genus *tettigonia* (Olivier) may be referred the *manis*, insect which attacks the grape vine, and injures it to a great extent by noxious punctures, and the exhalation of its sap. When the leaves of this valuable plant are agitated, the little *tettigonia* leap or fly from them in swarms. The infested leaves soon become yellow, sickly, and, losing their vitality, give to the plant, in midsummer, the aspect it assumes naturally at the approach of winter. On turning up the narrow cuttings, the insects will be seen busily engaged upon the under side, with their proboscis thrust into the tender epidermis. These insects pass through all their metamorphoses, which are imperfect, upon the plant; the wingless larvæ and pupæ, having a general resemblance to the perfect insect, feed together in the same manner, and their innumerable whitish skins will be found adhering to every part of the leaves. This species survives the winter in the perfect state, hibernating beneath sticks, stones, and among the roots of grass. It may be called *acridæ vitis* (Harris). It is, in its perfect state, nearly an inch long; of a straw colour, with two broad, scarlet bands across the wing-cases, one at the base and the other on the middle, and the tips of the wing-cases are blackish.—The *acridæ* *tettigonia* (Fab.), popularly misnamed *locust*, and found in various parts of the world, subsists on the leaves of trees and other vegetable substances. These insects are furnished with a hard proboscis, capable of boring wood. They are well known from the peculiar note made by the males. The instrument for the use situated on each side of the base of the abdomen, and each is covered by a kind of cartilaginous lamina. The cavity which contains these is divided by a triangular partition. Examined from its interior, each cell presents, anteriorly, a white and pliant membrane, and below this, a tense, thin, transparent lamina, termed, by Réaumur, the *membrane*. From the external side, there was a second plaited membrane on each side, which is acted on by a powerful muscle, composed of a great number of straight and parallel fibres; this membrane is the *drum*. The muscles, in rapidly contracting and relaxing, act on this drum, and thus produce the noise. It is said, that in some species, in temperate climates, this is very powerful. Mr. *Swainson* speaks of some of these insects, whose notes can be

heard at the distance of half a mile. The most remarkable species is the seventeen years' locust (*C. septendecim*), so common, in particular seasons, in some parts of the United States. These insects emerge from the ground towards the end of April, and always during the night. On their first coming out, they are in the pupa state; but the back soon bursts, and the perfect fly appears. They begin to lay eggs about the end of May; these are deposited in close lines of two inches long, in the tender twigs of trees. As soon as the young attain their growth, in the grub state, they fall to the ground, and make their way two or three feet underneath the surface, in order to undergo their change into the pupa form. Soon after attaining their last transformation, they are found in great numbers over large districts of country. They appear about every seventeen years, though it is highly probable, that the periods of their return vary, according to the heat of the climate, and other circumstances. These insects have been known to make their appearance in the city of Philadelphia in great numbers, penetrating from their subterranean residence, between the bricks of a pavement. Notwithstanding the usual idea, they are in no way injurious to vegetation, except from the damage done by the female in depositing her eggs. This insect is the favourite food of various species of animals. Immense numbers are destroyed by the hog, before they emerge from the ground; they are, also, when in their perfect state, eagerly devoured by squirrels. Some of the larger birds are also fond of them. The Indians likewise consider them as a delicate food when fried. In New Jersey, they have been converted into soap. It is stated, on good authority, that they never light on the pine, nor does the female deposit her eggs in this tribe of trees.

**LOCUST** (*robinia pseudacacia*.) This valuable and ornamental tree, which is so frequently cultivated in the Atlantic States of America, and highly prized in Europe, grows wild in great profusion among the Alleghany mountains, and throughout the Western States, even to the borders of the sandy plains which skirt the base of the Rocky mountains. When in bloom, the large, pendulous racemes of fragrant, white flowers, contrasting with the light-green foliage, produce a fine effect, and give this tree a rank among the most ornamental. The leaves are pinnate, and the leaflets very thin and smooth. The flowers, resembling in form those of the pea, diffuse a delicious perfume, and are succeeded by a flat pod. The ranches and young stems are usually armed with thorns. The wood is compact, hard, capable of receiving a fine polish, and has the valuable property of resisting decay longer than almost any other. The colour is greenish-yellow, with brown streaks. Locust-posts are consumed in enormous quantities, and are every where preferred, when they can be obtained. This wood is also very much employed in ship-building, in the upper and lower parts of the same, together with the white and live oaks and red cedar; but it is difficult, in the Atlantic ports, to procure stocks of sufficient dimensions. For tree-nails, it is preferred to all other kinds of wood, as it acquires extreme hardness with age, and considerable quantities of these are annually exported to Great Britain. It is also employed by turners, and, from its fine grain and lustre, forms a very good substitute for mahogany. The locust grows very rapidly, but, when cultivated in the Atlantic states, it is found to be exceedingly liable to the attacks of an insect, which, boring into the wood in various directions, weakens the tree so much, that it is easily broken by wind. In various parts of Europe, great attention has been paid to the propagation of this tree, for

ornament as well as for its useful properties, and its cultivation is further encouraged by the absence of the destroying insect above-mentioned. The usual stature of the locust is forty or forty-five feet, but, in the fertile regions of the south-west, it attains much greater dimensions, sometimes reaching to the height of eighty feet, with a trunk four feet in diameter.

The *R. viscosa*, a smaller tree than the locust, from which it is distinguished by its rose-coloured flowers, and by having the young branches covered with a viscous substance, is, in its natural state, confined to the south-western parts of the Alleghany mountains. It usually does not exceed forty feet in height, with a trunk twelve inches in diameter, and is a more ornamental tree than even the preceding. The properties of the wood are very similar to those of the common species, and it will bear cultivation in the same climates.

The *R. hispida* is also a native of the south-west ranges of the Alleghanies. It is a shrub with very hispid branches, often cultivated in gardens on account of its very large and beautiful rose-coloured flowers, which, however, like those of the *R. viscosa*, are inodorous.

A fourth species of *robinia* is said to exist within or near the basin of the Red river, but, with respect to its character, botanists are, at present, entirely uninformed. This genus is thus peculiar to North America.

**LODGE.** This word, with several symbols and ceremonies, was taken from the corporations of stone-cutters and masons, by the freemasons. The former called the place where they assembled a *lodge*; and, in freemasonry, *lodge* signifies the place of meeting; and hence that body of masons, with necessary officers, &c., who meet at such place. Each lodge is distinguished by its particular name, with the addition of the name of the place where it holds its meetings. For further information, see *Masonry*.

**LODI**, a well-built town, since 1814 the chief town of the province of Lodi in the government of Lombardy, in the Lombardo-Venetian kingdom, lies on the Adda, in a fertile territory; lon. 9° 31' E.; lat. 45° 19' N.; population, 17,800. The bishopric is subject to the archbishop of Milan. The town contains a strong citadel. The celebrated Parmesan cheese is made, not at Parma, but at and about the town of Lodi alone, and is considered the best in Italy. The manufactures of earthen ware are also celebrated. It was at this place that general Bonaparte gained the famous victory, May 10, 1796, over the Austrians, under Beaulieu. They had passed the Adda, evacuated Lodi, and taken a very strong position, defended by thirty pieces of cannon, which could be approached only by a narrow bridge over the Adda. Bonaparte formed a part of his forces into a close column, brought his whole artillery into play, and charged at a quick step. The slaughter was dreadful, as the Austrian artillery swept down whole ranks at once on the bridge. The French wavered; but, at this critical moment, the French generals Bérthier, Masséna, Cervoni, Lannes, &c., placed themselves at the head of the column, forced their way over the bridge, and took the Austrian batteries. The Austrians fought bravely; both armies struggled with the greatest obstinacy, and victory long remained in suspense, till the division of Augereau came up, and decided the fate of the battle. The Austrians, driven from their post, lost a part of their artillery and over 3000 men; but Beaulieu saved the honour of the Austrian arms by a retreat conducted with coolness. The French loss was not less. If they did not lose 4000 men, as the Austrians stated, they certainly lost more than 2000, which was their own account. Men of science have

censured both generals.—Bonaparte, for taking a post with an immense sacrifice, of which, say they, he might have been master, in twenty-four hours more, with comparative ease; and Beaulieu, for having evacuated the town of Lodi in such haste, as to neglect breaking down the bridge, by which alone the enemy could approach his position; but it is idle to dispute with Raphael about perspective. Lodi remains one of the most striking military achievements of Napoleon; not merely from the personal courage which he displayed, but from the boldness with which the action was planned, and the energy with which it was executed. At Lodi, Bonaparte received the title of *petit caporal* (little corporal). See Thiers's *Histoire de la Révolution Française* (vol. 8th); Volta's *Histoire de l'Italie de 1789 à 1814*.

LOG; a machine used to measure the rate of a ship's velocity through the water. For this purpose, there are several inventions, but the one most generally used is the following, called the *common log*. It is a piece of thin board, forming the quadrant of a circle of about six inches radius, and balanced by a small plate of lead, nailed on the circular part, so as to swim perpendicularly in the water; with the greater part immersed. The log-line is fastened to the log by means of two legs, one of which is knotted, through a hole at one corner, while the other is attached to a pin, fixed in a hole at the other corner, so as to draw out occasionally. The log-line, being divided into certain spaces, which are in proportion to an equal number of geographical miles, as a half or quarter minute is to an hour of time, is wound about a reel. The whole is employed to measure the ship's head-way in the following manner: The reel being held by one man, and the half-minute glass by another, the mate of the watch fixes the pin, and throws the log over the stern, which, swimming perpendicularly, feels an immediate resistance, and is considered as fixed, the line being slackened over the stern, to prevent the pin coming out. The knots are measured from a mark on the line, at the distance of twelve or fifteen fathoms from the log. The glass is therefore turned at the instant that the mark passes over the stern; and, as soon as the sand in the glass has run out, the line is stopped. The water, then being on the log, dislodges the pin, so that the board, now presenting only its edge to the water, is easily drawn aboard. The number of knots and fathoms which had run off at the expiration of the glass, determines the ship's velocity. The half-minute glass, and divisions on the line, should be frequently measured, to determine any variation in either of them, and to make allowance accordingly. If the glass runs thirty seconds, the distance between the knots should be fifty feet. When it runs more or less, it should therefore be corrected by the following analogy: As thirty is to fifty, so is the number of seconds of the glass to the distance between the knots upon the line. As the heat or moisture of the weather has often a considerable effect on the glass, so as to make it run slower or faster, it should be frequently tried by the vibration of a pendulum. As many accidents attend a ship during a day's sailing, such as the variability of winds, the different quantity of sail carried, &c., it will be necessary to heave the log at every alteration, and even if no alteration be perceptible, yet it ought to be constantly heaved. The inventor of this simple but valuable device is not known, and no mention of it occurs till the year 1607, in an East India voyage, published by Purchas.

LOG-BOARD; two boards shutting together like a book, and divided into several columns, containing the hours of the day and night, the direction of the winds, and the course of the ship, with all the material occurrences that happen during the twenty-

four hours, or from noon to noon, together with the latitude by observation. From this table, the officers work the ship's way, and compile their journals. The whole, being written with chalk, is rubbed out every day at noon.

LOG-BOOK; a book into which the contents of the log-board is daily transcribed at noon, together with every circumstance, deserving notice, that can happen to the ship, or within her cognizance, either at sea, or in a harbour, &c. The intermediate divisions or watches of a log-book, containing four hours each, are usually signed by the commanding officer thereof, in ships of war or East Indiamen.

LOG-LINE; the line which is fastened to the log (q. v.).

LOGAN, JAMES; born at Lurgan, in Ireland, Oct. 20, 1674, of Scottish parents. At the age of thirteen years, having learned Latin, Greek, and some Hebrew, he was put apprentice to a linen draper in Dublin; but, the country being smitten with much confusion by the war of the revolution, 1793, he returned to his parents, at Bristol, in England, where he devoted all the time which he could command to the improvement of his mind. In his sixteenth year, having happily met with a small treatise on mathematics, he made himself master of it with any manner of instruction. Having, also, further improved himself in the Greek and Hebrew, he acquired the French, Italian, and Spanish languages. He was engaged in a trade between Dublin and Bristol, when William Penn made proposals to him to accompany him to Pennsylvania, as his secretary, which he accepted, and landed, with the proposals in Philadelphia, in the beginning of December, 1794. In less than two years, William Penn returned to England, and left his secretary invested with several important offices, which he discharged with honor and judgment. He filled the offices of private secretary, commissioner of property, chief justice, and, upon the demise of governor Gordon, governed the province for two years as president of the council. He had, for a long time, earnestly solicited him to relinquish his family a release from the fatigue of their business; but, even after this return, he was constantly consulted and appealed to in relation to the quiet and good government of the province for a number of years, was due to his practical experience. He lived about twenty years at home, enjoying literary leisure, corresponding with many men in various countries, and engaged in collecting that library which he bequeathed to the public. He was also the author of several learned works. His *Experimenta Metemata de Plantarum Generatione* entitles its author to be ranked among the great improvers of botany. It was written in 1738, and corresponded with the great Swedish botanist. Logan died at Stenton, near Philadelphia, Oct. 31st, 1761, having just completed his seventy-seventh year.

LOGAN, REV. JOHN, an ingenious poet and a common writer, was born in the parish of Fife, in Lothian, in 1748, and educated for the church at Edinburgh. Having been ordained, he became minister of South Leith in 1773, previously to which he had published a collection of poems, some in own composition, and some the composition of his friends, Michael Bruce. He afterwards produced a tragedy, entitled "Ruismodeir," which was acted at Edinburgh, but with no great success. In 1781 he removed to London, and became a writer in the English Review. He died in 1788. His poems, which were published after his death, are much admired.

LOGARITHM (from the Greek *λογος*, proportion, and *αριθμος*, number). "The logarithms of numbers

are the exponents of the different powers to which a constant number must be raised, in order to be equal to those numbers; the principles, therefore, which apply to exponents in general, apply to logarithms." To constitute a logarithm, it is necessary that the exponent should refer to a system or series. These exponents, therefore, constitute a series of numbers in arithmetical proportion, corresponding to as many others in geometrical proportion. Take, for instance, the series,  $10^1=10$ ;  $10^2=100$ ;  $10^3=1000$ ;  $10^4=10,000$ : then we have the logarithm of  $10=1$ ; logarithm,  $100=2$ ; logarithm,  $1000=3$ ; logarithm,  $10,000=4$ , &c. Perhaps the definition of a logarithm may be more scientifically expressed thus: *Logarithm*, is a mathematical term for a number by which the magnitude of a certain numerical ratio is expressed in reference to a fundamental ratio. The value of a ratio becomes known to us by the comparison of two numbers, and is expressed by a number called the *quotient* of the ratio; for instance,  $12:4$  is expressed by 3, or  $18:9$  by 2; 3 and 2 being called the *quotients* of the two proportions,  $12:4$  and  $18:9$ . If we now imagine a series of proportions, which have all the same value or quotient, as, for instance,  $1$  to  $3$ ,  $3$  to  $9$ ,  $9$  to  $27$ ,  $27$  to  $81$ , &c. (in which 9 and 3, 27 and 9, 81 and 27, are in the same ratio as 3 and 1), and if we at the same time adopt the ratio 3 to 1, as the fundamental ratio (or the unit of these ratios), then 9 to 1 is the double of this ratio, 27 to 1 the triple, 81 to 1 the quadruple, and so on. The numbers 1, 2, 3, 4, which indicate the value of such ratios, in respect to the fundamental ratio, are called *logarithms*. If, therefore, in this case, 1 is the logarithm of 3, 2 must be the logarithm of 9, 3 of 27, 4 of 81, &c. If we adopt, however, the ratio of 4:1 as the fundamental one, and hence 1 as the logarithm of 4, then 2 would be the logarithm of 16, 3 of 64, &c. The logarithms of the numbers which lie between, must be fractions, and are to be calculated and put in a table. A table of logarithms, made according to an assumed basis or fundamental ratio, of all numbers, to a certain limit, is called a *logarithmic system*. The most common, at present, is that of Briggs, in which the fundamental basis is 10 to 1; hence 1 is the logarithm of 10, 2 of 100, 3 of 1000, 4 of 10,000, &c. It is evident that all logarithms of numbers between 1 and 10, must be more than 0, yet less than 1, i. e. a fraction; thus the logarithm of 6 is 0.7781513. In the same way, the logarithms of numbers between 10 and 100 must be more than 1, but less than 2, &c.; thus the logarithm of 95 is 1.977236. All logarithms of the numbers between 0, 10, 100, 1000, &c., are arranged in tables, the use of which, particularly in calculations with large numbers, is very great. The process is simple and easy. If there are numbers to be multiplied, we only have to add the logarithms; if the numbers are to be divided, the logarithms are merely to be subtracted; if numbers are to be raised to powers, the logarithms are multiplied; if roots are to be extracted, the logarithms are merely to be divided the exponent of the root. In a table of logarithms, an integer figure is called the *index* or *characteristic*. The decimals are called, by the Germans and Italians, the *mantissa*. In general, the logarithms of a system in which 1 indicates 10, are called *common* or *Briggs's logarithms*. The use of logarithms in trigonometry was discovered by John Napier, (c.) a Scottish baron, and made known by him in a book published at Edinburgh, in 1614. Logarithmic tables are of great value, not only to mathematicians, but to all who have to make calculations with large numbers. The best logarithmical tables are those of Vega and of Callet. The former are calculated with ten decimals. Logarithms are of incal-

culable importance in trigonometry and in astronomy. Vega's edition of Vlacq's tables contains a trigonometrical table of the common logarithms of the radius or *log. sin. tot.*  $\equiv 10.0000000$ , which gives the logarithms of sines, arcs, co-sines, tangents, and co-tangents for each second of the two first and two last degrees, and for each ten seconds of the rest of the quadrant. Under Napier's direction, B. Ursinius first gave the logarithm of the sines of the angles from 10 to 10 seconds, the logarithm of the tangents, which are the differences of the logarithms of each sine and co-sine, together with the natural sine for a radius of 100,000,000 parts. Kepler turned his attention particularly upon the invention of Napier, and gave a new theory and new tables. Briggs was also conspicuous in the construction of tables. Mercator shows a new way for calculating the logarithms easily and accurately. Newton, Leibnitz, Halley, Euler, L'Huilier, and others, perfected the system much, by applying to it the binomial theorem and differential calculus. The names of Vlacq, Sherwin, Gardiner, Hutton, Taylor, Callet, and others, deserve to be honourably mentioned. The edition of Vlacq, within a few years, by Vega, is particularly valuable. During the French revolution, when all measures were founded on the decimal division, new tables of the trigonometrical lines and their logarithms became necessary. The director of the *bureau du cadastre*, M. Prony, was ordered, by government, to have tables calculated, which were to be not only extremely accurate, but to exceed all other tables in magnitude. This colossal work, for which the first mathematicians supplied the formulas and the methods for using the differences in the calculations, was executed, but the depreciation of the paper money prevented its publication. The tables would have occupied 1200 folio pages. (*Notices sur les grandes Tables Logarithmiques et Trigonométriques, calculées au Bureau du Cadastre à Paris, an IX.*)

LOGAU, FREDERIC, baron of; an epigrammatist, born in Silesia, 1604, and died in 1655. He early showed poetical talents, but, at a later period, his avocations appear to have prevented him from attempting any large poems, and his poetical productions were confined to short pieces and epigrams. He published a selection of 200 epigrams, which were so well received, as to induce him (probably in 1654) to publish a new collection of 3000. A contemporary of Opitz, he followed in the steps of his great predecessor, and often expresses himself with as much vigour. Many of his epigrams are original and happy, and are the more striking as this department has been little cultivated by German writers. Logau is particularly original in the gnome, and truly poetical in a form which is now become foreign to poetry. Ramler and Lessing, who edited a collection of his epigrams in 1759, revived his reputation. After Lessing's death, Ramler republished the collection, in 1791. Select poems of Logau are contained in W. Müller's *Bibliothek Deutscher Dichter des 17. Jahrhunderts*, (Library of the German Poets of the seventeenth Century, volume vi., Leipsic, 1824).

LOGGE DI RAFFAELLO; part of the Vatican, and one of those beautiful scenes to be found nowhere but in Rome. Leo X. had these logge or arcades built under the direction of the immortal Raphael. There are three stories which enclose a court called *il Cortile di S. Damaso*. The middle story is the most celebrated. It is formed by thirteen arches, and the vault of each contains four paintings in fresco, representing scenes from the Old Testament, and executed by Giulio Romano, Pierin dal Vaga, Pellegrino da Modena, Polidoro, and Maturino da Caravaggio, and others, after cartoons prepared by the great Raphael himself. The number of these

exquisite pictures is fifty-two; the arches and pilasters are adorned with grotesque paintings, executed by Giovanni da Udine, so famous in this branch, also under the direction of Raphael.

LOGIC (*λογική*, i. e. *ιστιότης*); the science of the laws of thought, and the correct connexion of ideas. It is not certain, however, whether the name was derived originally from *thought* or from *language*, because both may be designated by *λογος*, i. e. reason and word. In German, this science has also been called *Denk-Lehre*, or *Verstandes-Lehre* (rule of thinking, or rule of understanding), because logic strives to represent, in a scientific way, those laws which the understanding is bound to follow in thinking, and without the observance of which, no correct conclusions are possible. Logic is valuable, not only as affording rules for the practical use of the understanding, but also as a science preparatory to all other sciences, particularly mental philosophy, as it affords the rules for giving scientific connexion to all knowledge, the laws of thinking determining the character of scientific arrangement. But, inasmuch as the laws of logic can only determine the form of our knowledge, but can by no means teach us how to obtain the materials of knowledge, and gain a clear insight into things (which is the business of *mental philosophy*, properly so called), in so far logic has been, of late, separated from intellectual philosophy. But if, as is not unfrequently done, all sciences are divided into the historical (those which proceed from experience, as history, natural philosophy, medicine, &c.) and the philosophical (the subjects of which do not fall within the domain of experience), logic is a philosophical science, because the laws of the connexion of thoughts and ideas are founded in reason itself, and not in experience, and the subjects of logic are, therefore, capable of a demonstrative certainty beyond those of any other philosophical science. Logic has not unfrequently been overvalued, particularly by the ancient philosophers. It should always be kept in mind, that the most systematic order, alone, does not render assertions truth. The province of logic has been enlarged or restricted by different philosophers. Among the ancients, logic was made to include the deeper philosophical investigation of the general characteristics of truth, or the essential conditions of the truth of our knowledge, which some modern philosophers have referred to metaphysics. Logic may be divided into the pure and the applied; the former treats of the general laws and operations of thought (conceiving, judging, concluding), and their products (notion, judgment, conclusion). Applied logic treats of thought under particular and special relations, which are to be taken into consideration in applying the general laws of thought, viz. the connexions of thought with other operations of the mind, and the impediments and limitations which it thereby experiences, as, also, the means of counteracting them. For the first scientific treatment of logic, we are to look to the Greeks. Zeno of Elea is called the father of logic and dialectics; but it was then treated with particular reference to the art of disputation, and soon degenerated into the minister of sophistry. The sophists and the Megarean school (founded by Euclid of Megara) greatly developed this art. The latter, therefore, became known under the name of the *heuristic* or *dialectic school*, and is famous for the invention of several sophisms. The first attempt to represent the forms of thinking, in *abstracto*, on a wide scale, and in a purely scientific manner, was made by Aristotle. His logical writings were called by later ages, *organon*, and for almost two thousand years after him maintained authority in the schools of the philosophers. His investigations were directed,

at the same time, to the criterion of truth, in which path Epicurus, Zeno, the founder of the stoic school, Chrysippus, and others followed him. Logic, and dialectics, enjoyed great esteem in later times particularly in the middle ages, so that it was considered almost as the spring of all science, and was taught as a liberal art from the eighth century. The crown of logic was the scholastic philosophy (which is but a new form of the ancient sophistry); and theology, particularly, became filled with verbal subtleties. Raymundus Lullius strove to give logic another form. The scholastics were attacked by Campanus, Cassiodorus, Peter Ramus (*Pierre de la Ramée*), Bacon and others, with well-founded objections. Descartes and Malebranche again confounded logic and metaphysics. Locke, Leibnitz, and Wolf, Tschirnhaus, Thomasius, Crusius, Ploucquet, Lambert (in his *Organon*), Reimarus, and others, have rendered great service to modern logic. Kant, Fichte, Schelling, Hegel, have maintained very various opinions on the subject. Whateley's *Treatise on Logic*, published in the *Encyclopædia Metropolitana*, and since in a separate volume, is one of the best treatises in English, on the subject.

LOGOS (Greek, *λογος*, from *λεγειν*, to speak, has a great variety of meanings: 1. language, speech in general; hence, 2. every manifestation of the mind and understanding by language, so that it has the meaning of oration, eloquence, conversation, address also of the right and opportunity of speaking, &c. Language being peculiar to man, as a reasonable being, and speech presupposing thought, logos signifies, 3. reason, the faculty of thinking in general, of every thing which is a production of the mind, notions, conceptions, demonstration, calculation, explanation, condition, and relation, nay, even reason and logic. Thus *logos* has the meaning both of *reason* and *oratio*.<sup>\*</sup> In Christian theology, the word *λογος*, as used in certain passages of the Scriptures, has been the source of continual disputes ever since the third century of our era. The passage in the Bible which gives rise to this discussion, is the opening of the gospel of St John:—"In the beginning was the Word, and the Word was with God, and the Word was God. The same was in the beginning with God. All things were made by him, and without him was not any thing made that was made," &c. In the Greek text, the expression here translated *Word* (*le verbe*, *das wort*, &c.) is *λογος*. What is here to be understood by *λογος*, what is its essential character, whether it is a person of the Deity or not, the creative intellect of God, or the Son, through whom he created, or the divine truth which was to be revealed, &c.—this work is not the proper place to examine, nor will our limits permit us even to enumerate the different opinions which have been entertained on this interesting point of Christian metaphysics. We can refer the reader to no better source of information than the *General History of Christianity and the Church* (in German, by Augustus Neander, Hamburg, 1827, et seq.—a work of distinguished research and impartiality). The Roman Catholic doctrine of the *λογος* (*verbum*) makes it a person, and not a mere name, and maintains that the Word is called *God*, not by catachresis, but in the strict and rigorous meaning of the term, that the most ancient fathers of the church always taught the divinity of the Word, and that they derived the same from the Holy Scriptures alone, and not from the

\* A slight study of cultivated languages will show us generally the word signifying *speech*, or *reason*, being derived from the original verb *to speak*, has acquired a very extended meaning; as the Latin *res*, from the Greek *λογος*, *λογος* from *λεγειν*, *Emere* and *Debere*, signifying *to take* or *to owe* from the same Greek terms in the Oriental languages.

Platonic philosophy, as many have asserted. For a view of the Catholic doctrine, we must refer our readers to the Catholic *Dictionnaire de Théologie* (Toulouse, 1817), article *Verbe*, and to the works particularly devoted to this subject. Some of the opinions of modern theologians on the meaning of the *logos* are as follows:—It is necessary, some say, in order to understand the true meaning of *logos*, to begin with the examination of *σοφία*, which was previously used. (See the book of *Proverbs*, viii. 1, et seq., and the book of *Wisdom*, vii. 22, et seq.) The poetical author of the *Proverbs* does not imagine a person separate from God, but only an interior power of God, because, in his time, there could be no idea of a being proceeding from God, the Jews having borrowed this notion at a later period from the Oriental doctrine of emanations. The author of the book of *Sirach* (xxiv. 3) first uses *λογος του Θεου*, as equivalent to *σοφία*, to signify the almighty power of God. The Word being an act of wisdom, gave rise to the symbol. John speaks of the *logos* in the beginning of his gospel only, and afterwards uses the expression *πρωμα του Θεου*. From his representation, the following positions have been deduced:—the *logos* was (a.) from the beginning of all things (comp. *Proverbs*, viii. 22; *Sirach*, xxiv. 9); (b.) from the beginning with God (comp. *Sir.* i. 1; *Wisd.* ix. 4, 9); (c.) through it the world was created (*Prov. Sol.* viii. 31; *Sir.* xxiv. 9); (d.) in the person of Christ, the *logos* was manifested as a man to the world (*Wisd. Sol.* x. 16; ii. 14; *Sir.* xxiv. 12). St John, therefore, say those who thus interpret him, had the same idea of the *logos* as the apocryphal writers; for the circumstance that the latter ascribe to the *logos* the creation of all things, while St John leaves this point undecided in his *λογος ην*, does not amount to a contradiction. Others, particularly the earlier commentators, understand by *logos*, the Deity himself, that is, the second person of the deity (according to St John viii. 58). But those who adhere to the former opinion maintain that this is in contradiction to John xiv. 28; xii. 49—50; v. 19—20; and that he understood by *logos*, only a power of God, which was communicated to Jesus, on account of which he could claim divine attributes, and yet call the Father, as the source of this power, greater than himself. Others, as Herder, Paulus, Eckerman, understand by *logos*, the Word of God (*דבר יהוה*), which, in the Old Testament, as the expression of the will of God, is the symbol of his creative power (*Gen.* i, et seq.). The later Jews represented the divine omnipotence by the word of God. But it is maintained, on the other hand, from the manner in which John speaks of the *logos*, that he did not understand by it merely the divine omnipotence. A similar account is given of the creation by the Word, in the religion of Zoroaster. According to Richter (*Das Christenthum und die ältesten Religionen des Orients*), the *logos* corresponds with the Indian Om, the Persian Hanover, the Egyptian Kneph. Others, following the fathers of the church, particularly Eusebius, understand by *logos* an independent substance, external from God, like the *νοος* of Plato. But this, again, it is said, involves an error, because Plato means by *νοος*, only a power of God. Still others, as Mosheim, Schlegel, Jerusalem, declare with Irenæus, the *logos* of St John to be identical with the *logos* of the Gnostics; it is objected, that John did not conceive of a unity, like that in the doctrine of æons. Lange considered *logos* equivalent to the *sophia* of the Old Testament, and that to the *logos* of Philo, and as a distinct person from God; but, say the others, *σοφία* not something distinct from God. Paulus, in his commentary, also identifies the *logos* of Philo, with

that of St John. But it is said, on the other hand, that John cannot be supposed to have been acquainted with Philo's notion, as it was not an opinion commonly known at the time, and that the view of the apocryphal writers is more similar to his; moreover, that if St John meant anything more than an original, eternal power in God, his *εως ην* would imply dualism. Others have attempted grammatical explanations. Doderlein and Storr translated the word *λογος* by *doctrina*, the abstract being put for the concrete, *doctrine for teacher*, as in *Gen.* xlii. 38; 2 *Sam.* xxii. 23; *Luke* iv. 36. According to others, *λογος* means *επαγγελια* (the promised); but history makes no mention of Christians who still expected a Messiah. The ancient philosophers often distinguish two *logoses*, an interior in God or man, which merely thinks (*λογος ιδιαιτης*), and an exterior or uttered (*λογος προφορικος*).\*

LOGTHING; the legislative portion of the Norwegian *storting*, or diet. As soon as the king or his representative has opened the session, the *storting* choose one quarter of their members to compose the logthing. The remaining three-fourths constitute the *odelstthing*, or representatives of the landed property. These bodies conduct their deliberations separately, and each chooses its own president, and secretary. Every law is first proposed in the *odelstthing*, either by its own members or by the government, through a counsellor of state. If the proposition is then accepted, it is then sent to the logthing, who either accept or reject it, at pleasure, in the latter case giving their reasons. These are considered by the *odelstthing*, who either abandon the proposed measure, or send it again, either with or without alteration, to the logthing. If the proposition is twice sent down by the *odelstthing* to the other house, and is, by them, twice rejected, the whole *storting* then assemble together, and the question is decided by a vote of two-thirds of all the members. At least three days must elapse between each of the considerations. When a measure proposed by the *odelstthing*, has received the assent of the other division of the assembly, or of the whole *storting*, a deputation from both branches of the *storting* is sent to the king, or, in his absence, to the viceroy or regency, to obtain the royal sanction for the measure. The sessions of both houses are public, and their deliberations are daily made known to the public, by means of the press. The members of the logthing form, together with the highest judicial authorities, the supreme court of the kingdom, which decides on charges, preferred by the *odelstthing*, against the members of the council of state, or of the members of the superior courts, for violations of their official duties, or members of the *storting*, for any offences which they may have committed in that capacity. In this tribunal the logthing presides. Against a sentence pronounced by this supreme tribunal, no pardon avails, except in cases where the punishment is death. See *Storting*.

LOGWOOD. This important article of commerce is the wood of the *hamatoxyylon Campechianum*, a small straggling tree, belonging to the family *leguminosæ*, which grows wild, in moist places, along the western shores of the gulf of Mexico.

\* Goethe, in his celebrated *Faustus*, makes use of this passage of St John to plunge *Faustus* deeper into his despondency. He endeavours to translate *λογος* by *word, mind, power*; nothing will do: at last he chooses *deed*, and is satisfied. Though this agrees well enough with the character of the hero, the poet ought to have considered that if *Faustus* understood Greek, he must have known that *λογος* never means *deed* or any manifestation of reason by action.

From its abundance in some parts of the bay of Campeachy, it is sometimes called *Campeachy-wood*. The leaves are pinnate; the flowers small, yellowish, and disposed in axillary racemes at the extremity of the usually spinous branches. The wood is red, tinged with orange and black, so heavy as to sink in water, and susceptible of receiving a good polish; but it is chiefly employed in dyeing. The black and purple colours are very much used, but they are not so permanent as some obtained from other substances. Though cultivated to some extent in Jamaica, the logwood of commerce is chiefly obtained from Honduras, where the cutting of it forms an extensive, but unhealthy, branch of business.

LOHENSTEIN, DANIEL CASPAR VON, a German poet of the Silesian school, was born 1635, in Silesia, and died 1683, at Breslau. He wrote a great deal, particularly tragedies and comedies; and we mention him merely as a model of bad taste. His bombast is pushed to the furthest extravagance, and as an instance of aberration from taste, is not uninteresting in the history of the human mind. His dramatic *extravaganzas* are collected in his *Trauer- und Lust-gedichte* (Breslau, 1680, 1689; Leipsic, 1733).

LOIR-AND-CHER; a department of France, so called from the two rivers which cross it; the former in the south part, and the other in the north. See *Department*.

LOIRE (*Liger*), the largest river of France, rises in the Cevennes, in the department of the Ardèche, and empties into the Atlantic ocean below Nantes in Bretagne. Its length is about 520 miles. It is shallow in many places, but is navigable for large merchant ships to Nantes, for smaller ones to Briare, and for boats to Boanne. The levee upon the Loire is one of the most stupendous works in France. It extends from Angers to Orleans, and was constructed to confine the river within its banks, and to exclude the waters from a tract of country which is said formerly to have been a morass one hundred miles in length, and thirty or forty in breadth. Its base is about forty feet wide, and its elevation nearly twenty-five from the adjoining level; and its upper surface, which is paved with large stones, is just capacious enough to admit three carriages abreast. By the new division of France, since the revolution, three departments have received their name from the river—the Loire, and the Upper, and Lower Loire. In 1815, the river became of historical importance. The French army, which, after the battle of Waterloo, had fallen back to the walls of Paris, having, by the terms of capitulation made by the provisional government, retired without further hostilities, under the command of Davoust, beyond the Loire, it was called the *army of the Loire*.

LOIRE, LOIRE UPPER, and LOIRE LOWER; three French departments. See *Department*.

LOIRET; a French department. See *Department*.

LOIZEROLLES, M. DE, was a barrister at the time of the French revolution, and was arrested, with his father, in 1793, on suspicion, and conveyed with him to the prison of St Lazare. On the 7th of Thermidor, two days before the fall of Robespierre, the messengers of the revolutionary tribunal arrived at the prison with a list of the prisoners who were to be tried, and called for Loizerolles, the son. The young man was asleep, but the father, with a heroic wish to sacrifice his life for the preservation of his son, allowed himself to be taken to the Conciergerie, and appeared before the judges. The clerk, perceiving the error in point of age, substituted the name of Francis for John, the word father for son, and the age of sixty-one for twenty-two, and thus the father was led to the scaffold, though no charge or crime was

alleged against him! M. Loizerolles, junior, has since celebrated this act of paternal affection in a poem, in three cantos, with historical notes (18mo, 1817).

LOK. See *Northern Mythology*.

LOKMAN is a name that figures in the *proverbs* and traditions of the Arabians. The period in which he lived is very differently stated, so that it is even doubtful if there were not two of the same name at different periods. According to tradition Lokman was a scion from the stock of Ad, and was once sent, with a caravan, from Ethiopia to Mecca, to pray for rain in a time of great drought. But God's anger destroyed the whole family of Ad, except Lokman, the only righteous one; whereupon the Creator of the world gave him his choice, to live as long as the dung of seven gaseles, which lay in an inaccessible hole in a mountain, should live, or for a period equal to the lives of seven successive rulers. Lokman chose the last, and lived for an almost incalculable length of time. There is also in the Koran an account of a Lokman, surnamed *the wise*; sometimes, also, called *Abu-Anan*, or *the father of Anan*. This one, whether identical with the former or not, is not for us to determine, lived in the same time, and is represented as similar in many respects to the Phrygian Esop; and the Arabians have a great variety of fables by him, which, however, are formed upon the model of those of Esop, and of which the whole style and appearance are such that they cannot be referred to so early a date as the first century of the Hegira. This person had also a life of remarkable duration (according to some 300, according to others 1000 years), which circumstance in the accounts of them affords good grounds for the conjecture, that the Lokman of the Koran, and the one whom tradition ascribes to the race of Ad, are one and the same person, whose history, in the course of ages, has been thus fancifully adorned. The fables of Lokman were, for the first time, made known to Europe through the press, by Erpenius, in 1625. They were first published in Arabic, with a Latin translation, were afterwards appended to an Arabic grammar, published by Erpenius, at Leyden, and have since gone through many editions, some of which, however, are free from errors. Among the Oriental nations, these fables, owing to their brevity and tasteless dress, are held in little regard, and, on the whole, are not worthy of the reverence which they have, for a long time, sustained with us. In 1799, during the occupation of Egypt by the French, Marcel superintended an edition of *Fables de Lokman*, at Cairo, which was republished in Paris in 1803; but the best is that prepared by Meunier in 1818, for the use of the pupils at the *École Orientale*. The editor of Galland's translation of the *Arabian Nights*, or *Fables of Bidpai*, is mistaken in ascribing these Indian fables to Lokman as well as Bidpai. The most complete manuscript of the fables of Lokman is in the library of the Vatican, in Persian.

LOLLARDS. See *Requiers*, *Protestants* and *Oldcastle*.

LOLLI, ANTONIO; a celebrated *comedian* born 1729, or according to some, 1730, at Bergamo in the Venetian territory. In 1762—73, he was in the service of the duke of Wurtemberg. He afterwards went to Russia, and his performance pleased the empress Catharine II. so much, that she presented him with a bow, on which she had herself written the words, "This bow, made by Catharine, with her own hands, is intended for the unequalled Loli." In 1775, he travelled in England, France and Spain. In Madrid, besides other perquisites, he received 5000 reals from the director of the theatre for each season. In 1789, he returned to Italy, and died at Naples in 1794. Loli endeavoured to unite the excellencies of

the schools of Nardini and Ferrari. He had acquired an astonishing facility on his instrument. He was called the *musical rope-dancer*. None of his predecessors had attained such perfection on the finger-board; but, at the same time, he lost himself in wild and irregular phantasies, in which he often neglected all time, so that the most practised player could not accompany him.

LOLME, *Dr.* See *De Lolme*.

LOMBARD HOUSE, *LOMBARD* (*mons pietatis*, *mont de piété*); a public institution, at which every person, but especially the poor, may obtain money for a short time, at a moderate rate of interest, on depositing sufficient pledges (pawns), and are thus saved from the necessity of having recourse to usurers. The chief difference between Lombards and pawnshops is, that the former are established by public authority, for the relief of the poor, while the latter are established by private individuals, for their own profit. After a given time, the pawns, if not redeemed, are sold by public auction, and the surplus, after deducting interest and costs, is given to the former owner; or, if he cannot be found, retained for him one year. If he does not then appear, the sum is given to charitable institutions. The Lombard gives a certificate, stating the time of deposit, the sum received, the name of the pawner, the article pawned, the page of the book in which it is entered. The bearer of this certificate may redeem the articles within the time fixed, unless the owner has apprised the Lombard that it was lost, &c.

The origin of these establishments has been, with much probability, referred, by Dorotheus Asconius (i. e. Matthew Zimmermann, who died in 1639, and who was superintendent in Meissen\*), to the time of pope Pius II. or Paul II. (1464—1471). Barnabas Interamnensis, however, a Minorite friar, established the first Lombard house in Perugia, in the States of the Church, before 1464, or in that year, though it did not receive pope Paul II.'s confirmation before 1467. A lawyer in Perugia, Fortunatus de Copolis, rendered much assistance in the execution of the plan. Another Lombard was soon after erected in Orvieto. In 1472, Sixtus IV. confirmed one, established at Verbo, in 1469, by a Minorite, Franciscus de Verbo, and, in 1479, another at Savona, his native place. Lombards were thus gradually established in almost all Italian cities during the fifteenth and sixteenth centuries. (See Beckmann's *History of Inventions*, vol. iii., 3d part.) The first Lombard in Germany was established in Nuremberg, in 1498, on an imperial privilege. In the Netherlands, France, and England, whither the rich Lombard merchants emigrated, on account of the struggles of the Guelphs and Ghibelines, they lent their money for interest; whence such establishments were, and still are, called *Lombards*. In some large cities of France, the Lombards are very extensive, but do not always attain the object for which they were originally intended, as the following statement will prove.

The following statistical facts, relative to the *mont de piété* in Paris, framed by the prefect of the police, are interesting, as they show that there is a serious class of persons who can with difficulty find the means of existence; and that half of the inhabitants of the capital are obliged to have recourse to the pawn-broker, at some time of the year, when they are forced to pay usurious interest. In the year 1826, there were 1,200,104 pledges of different articles, upon which the sum of 24,521,157 francs lent. The number of pledges redeemed in the year amounted to only 1,124,221, and the sum

to 21,569,437 francs; so that 75,883 remained at the *mont de piété*; and there was in its hands the sum of 2,951,720 francs. As it is the principle of the *mont de piété* not to lend more than about a quarter of the value upon articles pledged,—though the law for its formation, dated in 1777, directs that the borrower shall receive two-thirds of the value of his pledge,—we may estimate the value of the 75,883 unredeemed pledges, upon which nearly 3,000,000 of francs were lent, at 12,000,000. Supposing the sale of these articles to be effected, and all the reductions of excise, registry, &c., made, there would be returned to the proprietors of them the half of these 12,000,000. It would result, that 6,000,000, at least, are thus annually levied upon the least affluent class of society—that which approaches the nearest to the description of persons for whom the *dépôts* for mendicity were created. Independently of these 6,000,000, inevitably lost to the unfortunate borrowers, we must add the interest of twelve per cent. per annum, taken upon the 24,521,137 francs lent by the *mont de piété*; that is to say, 2,942,536 francs, adding nearly 3,000,000, which, with the 6,000,000 already spoken of, constitute a total of 9,000,000. 9,000,000, divided among 437,500 inhabitants, half of the 875,000 composing the entire population of the capital, give twenty francs, twenty centimes, or, omitting the fraction, twenty francs for each inhabitant. In a family composed of four persons, the average will be nearly eighty francs—an immense sum for a family which can with difficulty procure daily necessities!

LOMBARD SCHOOL. See *Italian Art*, in the article *Italy*, and *Painting*, *History of*.

LOMBARD STREET, a well-known spot in the gigantic metropolis of the British empire, is situated in the city, and received its name from having been the residence of the Lombards, the money-lenders of former times, whose usurious transactions caused their expulsion from the kingdom in the reign of Elizabeth. It is now chiefly occupied by bankers, and is a place of much importance in the London commercial world.

LOMBARDS, LONGOBARDI, or LANGOBARDI. Some derive the name from the long *bards* or spears, by which this nation is said to have been distinguished from the other northern tribes; others from the long strips of land (*bærde*) which they inhabited, on both sides of the Elbe, from Luneburg to Magdeburg. They are generally considered a German tribe (but Paulus Diaconus calls them Scandinavians), of the tribe of the Hermiones or Suevi, which dwelt below the Istævones. Their most ancient seats were on the east side of the Elbe, in the eastern parts of the principality of Luneburg, and in the Almark, or the *Bardengau*, so called, which, most probably, takes its name from them. Here Tiberius found them, on his expedition to the Elbe, and fought a battle with them. Strabo narrates that Tiberius drove them beyond the Elbe; but Velleius Paterculus, who himself accompanied the expedition, makes no mention of it. The Lombards afterwards appear in the Marcomanic league, under Maroboduus, with whose despotism being dissatisfied, they concluded a league with the Cherusci. They appear, at this time, to have left their settlements on the Elbe, and to have approached nearer the Cherusci. The latter tribe, having been weakened by a series of misfortunes, the Lombards improved the opportunity to spread themselves farther, and humiliate the Cherusci, took possession of all their settlements north of the Harz mountains, and became the most powerful of the nations there. According to the accounts of Ptolemy, they now spread between the Weser and the Rhine, in the territories of the

\*superintendent, in the north of Germany, is a superintendent minister.

former Angrivarii, Tubantes, Marsi, and Cherusci. They maintained themselves in these territories till the new Frankish confederacy, formed of the ancient Cheruscan league, enforced against them the ancient rights of the Cherusci, and, in all probability, drove the Lombards back to their ancient seats on the Elbe. For 200 years, we hear nothing more of them, till, at the close of the fifth century, they appeared again on the north side of the Danube, and, after having obtained a part of Pannonia from the Greek emperor Justinian II., aided by the Avari, put an end, under their king Alboin, in 566, to the empire of the Gepidae, in Transylvania. Meeting with little resistance, they conquered, two years after, under the same king, in connexion with 20,000 emigrant Saxons, all Upper Italy (which was now called the kingdom of the Lombards, subsequently Lombardy (see Lombardy), together with a great part of Middle Italy. Their king, Liutprand, an able sovereign, from 713 to 726, extended the Lombard dominion in Middle Italy. But, having become too formidable to the popes, the latter solicited the aid of the Frankish kings, and Charlemagne took the Lombard king Desiderius prisoner, in 774, after a six months' siege, in Pavia, and destroyed the Lombard kingdom. (See Henry Leo's *History of Italy*, vol. i. (from A. D. 568 to 1125), in the *Geschichte der Europäischen Staaten*, by Heeren and Uckert (Hamburg, 1829). A political history of Italy, and of the social condition of the people under the dominion of the Lombards, by C. Troya, of Naples, has been announced.

LOMBARDY, in the sixth century, when the Lombards had conquered a great part of Italy, comprehended the whole of Upper Italy. At a later period, the Austrian provinces in Italy (the duchies of Milan and Mantua) have been called *Austrian Lombardy*. These, with other countries, were formed by Bonaparte into the Cisalpine, then into the Italian republic, and, lastly, in 1805, into the kingdom of Italy, and the name of *Lombardy* ceased to be used. By the peace of Paris, in 1814, Austria came into possession of much of that part of Upper Italy which had constituted the kingdom of Italy, and in 1815, it formed of its Italian provinces a Lombardo-Venetian kingdom. In this are comprehended the territories of the former republic of Venice (with the exception of Istria, and the canton of Civida, which are united to the new kingdom of Illyria), the Austrian portion of the duchy of Milan, Mantua, a small part of Parma, Placentia, and the papal territories, and those formerly belonging to Switzerland, viz. the Valteline, Bormio, and Chiavenna. It is bounded by Switzerland, Germany, the Adriatic sea, the Papal States, Modena, Parma, and Sardinia. It contains 17,600 square miles, and 4,176,000 inhabitants, among whom are 66,500 Germans, 5600 Jews, and some Greeks. It is watered by the Tagliamento, the Piave, the Brenta, the Adige, the Po, Ticino, Mincio, and Adda. The principal lakes are those of Como, the Lago Maggiore, and the lakes of Iseo and Garda. Its canals are also numerous. The country is, for the most part, level, but towards the north, it is broken by spurs of the Alps, and to the west of Padua, lie the Euganean mountains, mostly of volcanic origin, and from 1700 to 1800 feet in height. This province is, in most parts, well cultivated, and resembles a garden. The climate is cool in the northern districts, near the Alps; but is, in the remaining parts, warm, mild, and healthy, although not free from frosts in winter; and, on this account, it sometimes happens that the olive, orange, citron, and other tender plants, as well as the vineyards, are injured by the cold, and the rivers frozen. Even the lagoons at Venice are sometimes frozen so hard, that

you may walk a considerable distance, or even drive carriages upon them. The animals of the country are neat cattle, tolerable horses, sheep with coarse wool, numerous birds, and fish. The soil was also raised. Agriculture is the chief dependence of the inhabitants. The soil is fertile, and very productive in maize, and other species of grass, leguminous plants, garden fruits, flax, &c. Low lands that are swampy are devoted to the cultivation of rice, of which part is consumed in the country, a part exported to Germany. The production of silk and wine is also much attended to. Breeds of fruits above-named, chestnuts, almonds, figs, &c. as many other fruits grow here. A considerable quantity is carried on in figs, oranges, and chestnuts. The mineral kingdom produces iron, copper, marble, &c. There are some mineral waters. Manufactures longer sustain the rank which they once held. The principal are those of glass, silk, and iron. The production and manufacture of silk are attended to throughout the country. All kinds of silk and ribbons, hose, and sewing-silk are exported. The manufacture of glass at Venice and Murano was once important, and their mirrors much celebrated; now even now, artificial pearls, and glass works of all kinds, are executed in great perfection. The manufactures of steel and iron are chiefly to be found at Brescia, where many fire-arms, muskets, &c. are made. The manufacture of woollens has much declined. The gold and silver works at Venice and Milan are celebrated; porcelain, pottery, copper paper, many articles of luxury, as masks, garden flowers, pomatum, confectionery, perfumes, orange candied fruits, vermicelli, and preserved chestnuts are also produced. Cremona is noted for violins, flutes, &c. The exports exceed the imports. This country is dependent upon the Austrian government, but, in April, 1815, the emperor gave it a constitution. (See article *Constitution*.) It is governed by a viceroy, who resides at Milan, and is divided into the governments of Lombardy and Venice. The administration of each is intrusted to a governor, a council, dependent upon the highest authorities at Vienna. The government of Lombardy contains nearly 2,200,000 inhabitants, on 8270 square miles territory, and its capital is Milan. Venice is the capital of the government of the same name, and contains 2,000,000 inhabitants, upon 5320 square miles. The sub-divisions are called *deputations*. With the authorities are connected permanent colleges, composed of individuals from various classes.

LOMENIE DE BRIENNE, STEPHEN CARDINAL, archbishop, and minister of state in France, born at Paris, in 1727, embraced the career of religion, in which his active spirit, and the powerful influence of his connexions, enabled him to rise rapidly, although his connexion with the revolution of the age (D'Alembert, Morellet, &c.) rendered it have been very agreeable to the court and the clergy. In 1754, he published, with Turgot, *Le Constitution ou Lettres d'un Ecclesiastique à un Magistrat*, which was intended to quiet the difficulties then existing between the parliament and clergy, and which afterwards several times republished by Condorcet, Dupont de Nemours, and others. In 1773, he was at Rome, in the capacity of confessor of Cardinal Luyne, in the conclave which raised Clement XIV. to the papal throne. In 1780, he was appointed bishop of Condom, and, three years after, to the archbishopric of Toulouse, in which situation he obtained the praise of those who were opposed to the old hierarchical and monastic establishments. When he attempted to reduce the power and wealth of the monasteries, he was liberal in assisting all who were in need; he caused the Garçons to be maintained

the canal of Caraman, by a lateral canal, which still bears his name; he established institutions for education, also hospitals, and several scholarships at the military school at Toulouse. In 1770, he was made a member of the academy, and, when Beaumont, the archbishop of Paris, died, he would have obtained that elevated situation, but for his attempts at a general reform of the monasteries, which the bigots at court could not forgive. At the first breaking out of the discontents in France, Brienne was among the most active. He was the first to raise his voice against the administration of Calonne; and, after the dismissal of that minister, the partisans of Brienne induced Louis XVI. to place him, as his successor, at the head of the finances. His brother, the count de Brienne, was, at the same time, (1787), appointed minister of war. The new financier shortly fell short of the most moderate expectations; and, if some excuse is found for him in the almost inextricable confusion which reigned in the affairs of France at this period, still his warmest defenders must allow that, for once, at least, they were deceived in him. The confusion increased daily, and the minister, whose ambition had raised him to the rank of prime minister, at this stormy period, showed himself destitute of ability and resources. Complaints were soon raised against him on all sides, and, in August, 1788, the king found himself compelled to dismiss him, and to appoint Necker in his place; who, however, as is well known, was himself unable to quell the storm. Brienne had previously been nominated archbishop of Sens, in place of the cardinal De Luynes, and, to console him for the loss of his place as minister, Louis gave him some abbey, and obtained for him, from Pius VI., a cardinal's hat. Brienne also took a journey to Italy, but without visiting Rome, and returned, in 1790, to France, to make arrangements for the settlement of his debts, which, notwithstanding his immense income, were so considerable as to compel him to dispose of a portion of his valuable library. The cardinal de Lomenie, as he was now called, took the oath prescribed to the clergy by the constitution, and, in March, 1691, he asked his dismissal from the college of cardinals—a favour which Pius willingly granted. Brienne had hoped, by this step, to save himself from the persecutions of the revolutionary party; but he was arrested at Sens, in November, 1793, was released, and, subsequently, again arrested, and, upon the morning of Feb. 16, 1794, was found dead in his prison. The ill treatment and abuse which he had suffered from his brutal guards, together with an indigestion, had brought on an apoplexy, of which he died, in the sixty-seventh year of his age.—His brother, the minister of war, Athanasius Louis Marie de Lomenie, count de Brienne,—whose successor in the ministry was De la Tour du Pin,—fell, the same year, beneath the axe of the executioner. There is an *Oraison funèbre du Dauphin* (Paris, 1766), by the cardinal de Brienne.

LOMONOSOFF, MICHAEL WASILOWITZ; the creator of the modern poetical language of his country, and the father of Russian literature; born in 1711, near Cholmogory, in the government of Archangel, in the village of Denisowskaina, where a monument was erected to his memory, in 1825, though the influence of Neophytus, bishop of Archangel. His father was a fisherman, whom he assisted in his labours for the support of the family. In later a clergyman taught him to read. A poetical spirit and a love of knowledge were awakened in the boy by the singing of the psalms at church, and the reading of the Bible. Without having received any instruction, he conceived the plan of celebrating the wonders of creation and the great deeds of Peter I., in songs similar to those of David. But, hearing that

there was a school at Moscow, in which scholars were instructed in Greek, Latin, German, and French, he secretly left his father's house, and went to the capital to seek that instruction which his inquisitive spirit demanded. He was then sent to Kiev, and, in 1734, to the newly established academy of literature at St Petersburg, where he studied natural science and mathematics. Two years later, he went to Germany, studied mathematics under Christian Wolf, in Marburg, read the German poets, and studied the art of mining, at Freyberg. On his journey to Brunswick, he was seized by Prussian recruiting officers, and obliged to enter the service; but, having made his escape, he returned, by the way of Holland, to St Petersburg (1741), where he received a situation in the academy, and was made director of the mineralogical cabinet. Soon after, he published his first celebrated ode (on the Turkish war and the victory of Pultawa). The empress Elizabeth made him professor of chemistry (1745), and, in 1752, he received the privilege of establishing a manufactory for coloured glass beads, &c. As he had been the first to encourage an attempt at mosaic work in Russia, the government confided to him the direction of two large pictures in mosaic, intended to commemorate the deeds of Peter I. In 1760, the gymnasiums and the university were put under his inspection; and, in 1764, he was made counsellor of state. He died April 4, 1765. Catharine II. caused his remains to be deposited with great pomp in the monastic church of saint Alexander Newski. Besides odes and other lyric pieces, he wrote *Petride*, a heroic poem on Peter I., in two cantos, which is the best work of the kind that Russia has yet produced. Lomonosoff also wrote a Russian grammar, and several works on mineralogy, metallurgy, and chemistry. His Grammar, and his Sketch of Russian History, have been translated into German and French. The Russian academy published his works in 6 vols., 4to. (2d edit., 1804, 3 vols.). Admiral Tschitschagoff has written a Life of Lomonosoff. See Bowring's *Russian Anthology*.

LOMUS, in Indian mythology; the first being created by Brama, which, to give itself up entirely to the contemplation of divine things, buried itself in the earth, and whose life will last longer even than that of Brama. In order to indicate the enormous duration of the life of Lomus, the Indians say, that Lomus has a body more than ninety miles long, covered with hair. Each time that a Brama dies, who lives 360 days, each day being equal to 4320 human years, Lomus pulls out a single hair from his body; and when, at last, all the hairs are gone, and even Vishnu and Mahadeva have ceased to live, then the whole universe is dissolved, and all returns to chaos, so that nothing remains but the eternal, original being; because with the last hair Lomus also dies.

LÖN, or LUN; a Gothic word, signifying *wood*. *London* has been derived from it.

LONDON, the metropolis of the British empire, stands in lat. 51° 31' N., and lon. 5° 37' W. from the observatory at Greenwich. It is situated in the counties of Middlesex and Surrey, about sixty miles west from the sea, on the banks of the Thames, the mean width of which, at London, is about a quarter of a mile, and its average depth about twelve feet. The northern bank slopes gently upward, and its soil is chiefly gravel and clay, with a mixture of loam and sand. On the southern or Surrey side, the surface is almost uniformly flat. The buildings on the northern, or Middlesex shore, follow the natural bend of the river, and rise somewhat amphitheatrically, from east to west, stretching northward, on an average length, to three miles from the river; and those on the southern or Surrey side, forming the

chord of the semicircle, penetrate southward to an extent varying from one to three miles. The extent of this vast aggregate, from east to west, i. e. from Hyde Park Corner to Mile End or Poplar, may be taken at seven miles and a half, and from south to north, or from Newington-Butts to Islington, nearly five miles. Its circumference may be estimated at thirty miles; and its area, extending over 11,520 square acres, of which the river occupies 1120, is about twenty miles. Fashion and convenience have united to furnish various modes of designating the several parts of the colossal mass. Thus the ideal line, which is progressively moving more and more westerly, separates the world of fashion, or the West End, from the world of business. The city, so called, includes the most ancient and central division of the metropolis. It is rapidly being depopulated; as the chief traders and merchants occupy merely counting-houses and warehouses in the city, and, in proportion as wealth accumulates, flow towards the western regions of fashion. In the East end are found the docks and warehouses connected with ship-building and commerce, and every collateral branch of naval traffic. Southwark, or the Borough, on the southern bank of the Thames, the *trans Tiberim* of London, abounds with huge manufactories, breweries, iron-foundries, glass-houses, &c. It is the abode chiefly of workmen, labourers, and the lower classes of society, but interspersed with some considerable buildings, hospitals, prisons, and charitable foundations. The city of Westminster, including the houses of lords and commons, the law courts, royal palaces, and many government offices, may be designated as the Court End of London. The remaining portion can hardly be classified, or specifically denominated. It is a nondescript accumulation of streets, crescents, polygons, terraces and squares, occupying the northern portions of the metropolis, along the line of the new road.

*Historical Sketch.* Many of the important events that have occurred in London belong rather to the history of the country than the capital, and will accordingly be found narrated in the historical portions of the articles *England* and *Britain*. In this place, it is only necessary to take a brief view of its rise and progress, and of such incidents as have more particularly marked its history as a city.

The origin of London is involved in deep obscurity; but it certainly was a strong-hold of the Britons before the Roman invasion. The etymology of its name is variously traced; the most probable supposition deriving it from two British words, *llyn* and *din*, signifying the town on the lake. Its Roman designation, *Augusta*, marks it as the capital of a province; and Tacitus speaks of *Londinium* or *Colonia Augusta*, as a commercial mart of considerable celebrity in the year 61. It was subsequently noted as a large and wealthy city, in the time of the emperor Severus, and regarded as the metropolis of Great Britain. A few vestiges of the original walls are still discoverable in London wall, in the courts between Ludgate hill and the Broadway, Blackfriars, and in Cripplegate churchyard. It had four principal gates, opening to the four great military roads, and others were subsequently formed, but their names alone commemorate their existence. After the Roman forces had been withdrawn from Britain, in the fifth century, London fell successively under the dominion of the Britons, Saxons, and Danes. It was nominated a bishop's see, on the conversion of the Saxons to Christianity, in 604, and a cathedral church was erected in 610, where St Paul's now stands. Its importance in the year 833, appears from a *Wittenagemot* having been held here; and under the reign of Alfred, who gained possession of it in 884, its municipal govern-

ment was planned, which has since been preserved moulded into the form described in a preceding part of this notice. Its wealth seems to have been increased during the reign of Edward the Confessor, and, on the conquest by William I., a new charter assumed that station which it has ever since maintained as the metropolis of the kingdom, having received from that monarch a charter, still preserved in the city archives, and beautifully written in four characters. The privileges of the city were later extended by a charter of Henry I. in 1120, and early in the reign of Richard I. the title of mayor was substituted for that of *bailliff*, which had previously designated the chief magistrate of London. In the reign of Edward III. (1348), it was smitten by a pestilence, during which 50,000 inhabitants perished in the ground now forming the present Charter house. The year 1380 was marked by an insurrection headed by Wat Tyler, and quelled by the courage of Sir William Walworth, mayor of London. A similar, but equally unsuccessful insurrection, threatened the safety of the metropolis in the year 1450, when it was assailed by Jack Cade, a powerful body of malecontents. During the reign of Edward IV. we have the earliest record of a mayor being employed in the building of houses and Lanes, Cisterns and conduits for water were reserved, and the city was generally lighted at night by lamps. A dreadful visitation, called the *peste*, or *sickness*, desolated the city in 1485, and after the accession of Henry VII., during whose reign the river Fleet was made navigable to Holborn, and the splendid chapel, called after that monarch, was appended to Westminster abbey. Many valuable improvements in the municipal regulations of the city, its police, streets, markets, &c. were effected during the reign of his successor, Henry VIII. His reign of Edward VI. witnessed the establishment of Christ's hospital, Bridewell, and St Thomas's hospital, and, under the sway of Elizabeth, the metropolis increased with surprising rapidity, a commercial enterprise and general prosperity. The plague renewed its ravages soon after the accession of James I. in 1603, when upwards of 30,000 persons fell victims to it. Sir Hugh Middleton, about the same time also, commenced his great work of supplying the inhabitants with water from the New river, and the pavements were improved for the comfort of pedestrians. The reign of Charles I. was marked by a recurrence of the plague, which cost the lives of 35,000 of the inhabitants. It returned in the year 1665, with unparalleled fury. This awful visitation swept away 100,000 of the inhabitants within thirteen months. It was shortly after followed by a great fire, which broke out on the 2d September 1666, and raged with irresistible fury, and consumed eighty-nine churches, 13,000 dwelling houses, and 400 streets, the city gates, Guildhall, many public structures, hospitals, schools, libraries, and stately edifices, leaving a ruined space of 60 acres from the Tower to the Temple church, and from the north-east gate, along the city wall, to Roper bridge, and destroying property to the enormous amount of £10,000,000. Within less than 70 years after this terrible calamity, the city was wholly rebuilt, in a style of far greater security, commodiousness, and salubrity. After the revolution of 1688, the metropolis rapidly expanded, and, in 1711, the population was found to have greatly increased, that an act of parliament passed for the building of fifty new churches. The winter of 1739, 40 is memorable for the occurrence of the most intense frost recorded in the annals of England; it continued for eight weeks, and the Thames above London bridge, became a solid mass, on which

thousands of the citizens assembled daily as to a fair. The reign of George III. witnessed a great extension of the splendour, comforts and elegances of social life in London. The north of the metropolis became covered with spacious streets, squares, churches and public edifices. The thoroughfares were rendered safe and clean; the enormous signs and protruding incumbrances of the shops were removed. Blackfriars, Southwark and Waterloo bridges, Somerset house, Manchester, and other squares, at the West End, were erected, and the vast parish of Marylebone almost covered with buildings. In 1780, an insurrection, headed by Lord George Gordon, but composed of the lowest rabble, threatened very alarming consequences to the peace of the city. The insurrection arose from a petition of the Protestant Association against the Roman Catholics. The prisons of Newgate, the King's bench, and the Fleet, besides some Catholic chapels, were burned, and military interference was necessary to quell the disturbances. In 1794, a dreadful fire broke out in Ratcliffe highway, and consumed 700 houses. The jubilee of George II.'s accession was commemorated on the 25th Oct. 1809, and the grand civic festival to the emperor of Russia, king of Prussia, and other distinguished foreigners, was given, by the corporation of London, at Guildhall, at an expense of £20,000. In the year 1814, the winter of which was memorable for a frost of six week's continuance and extreme intensity. During the regency and reign of George IV., the grand avenue of Regent Street, the unfinished palace of Buckingham house, the splendid terraces on the site of Carlton gardens, the widenings of Charing Cross, Pall Mall, and the Strand, wrought a great change in the West End of the metropolis. Much curious information regarding London will be found in the works of Stowe and Maitland, in Pennant's *Some Account of London*, and in the work of Rayley, Brewster, and Nightingale, entitled "*London, Westminster and Middlesex described*." See also the *Supplement to Leigh Hunt's "London Journal"* for very interesting literary details regarding the streets of the metropolis.

*General Description*—London is intersected by two grand lines which cross each other near the spot which seems to have been regarded as the centre, and from this point, the standard in Cornhill, the distances of various places were calculated. One of these lines of streets extends from Stoke Newington and Kingsland, on the north, through Shoreditch, Finsbury, Finsbury Square, Bishopsgate Street, Gracechurch Street, Fish Street Hill, High Street, Southwark, and Newington Street, to Newington Butts, Walworth, and Camberwell on the south; and the other from the West End on the east, through Whitechapel, Aldgate, Fenchurch Street, Cornhill, the Poultry, to the west end of Cheapside, where the line diverges into two branches, one proceeding on the north, through Newgate Street, Skinner Street, Holborn, High Street, St. Paul's Churchyard, and Oxford Street, to its termination in the bridge road; and that on the south passing by St. Dunstons Churchyard, Ludgate Street, Fleet Street, the Strand, Pall Mall East, the Haymarket, and Piccadilly, towards Knightsbridge, and Kensington, on the western road. The streets eastward of the bridge require no particular notice; but the Commercial Street, from Whitechapel to Blackwall, may, probably at no distant period become a very handsome and extensive street. The principal or more remarkable streets in the city, besides those mentioned above, are Thames Street, Fenchurch Street, Eastcheap, and Old London Street, the two last chiefly on account of the collections of times of yore, connected with them, and Broad Street, formerly the principal residence of the nobility and now of bankers, Broad Street, Al-

dersgate Street, Bridge Street, Blackfriars, and Farringdon Street. Northward of the city are several good streets, together with Finsbury Circus, and Finsbury Square. In that district which has been termed the northern suburb, between Gray's Inn Lane and Tottenham Court Road, are various handsome modern streets and squares; among the latter are Bloomsbury Square, and Russell Square. At the west end of the town is Regent Street, consisting of splendid ranges of buildings, reaching from Waterloo Place, Pall Mall, to Langham Place, north of Oxford Street, whence it is continued by Portland Place to Park Crescent, on the south side of the Regent's Park. In this part of the metropolis also are Pall Mall, St James's Street, Arlington Street, Albemarle Street, Bond Street, Harley Street, Wimpole Street, Stratford Place, Baker Street, Gloucester Place, and Connaught Place, with several noble squares, among which are Hanover Square, Grosvenor Square, Cavendish Square, and Portman Square. There are also some handsome ranges of buildings on both sides of the New Road from Islington to Paddington; and on the north of that road is the Regent's Park, so named in honour of the Prince Regent, afterwards George IV. It is tastefully laid out, with a canal, plantations, and roads, and comprises, besides detached villas and other edifices, various magnificent ranges of buildings, denominated from the titles of members of the royal family, as the terraces of Ulster, York, Cornwall, Clarence, Hanover, Chester, Cumberland, and Cambridge, and Sussex Place. Hyde Park, extending from the western border of the metropolis to Kensington Gardens, is a noble enclosure, which became the property of the crown in the reign of Henry VIII.: it has a canal, called the Serpentine River, formed by order of Queen Caroline, in 1730; and great improvements have recently been made in it, by the erection of a bridge over this piece of water, by the substitution of iron rails for the dead wall by which the park was partly encompassed, and by building handsome lodges at the entrances. The Green Park, on the south side of Piccadilly, is bordered on the east by several noble mansions. St James's Park, communicating with the preceding, was enclosed and planted by Henry VIII., but greatly improved in the reign of Charles II., when the trees were planted, which form the grand avenues on each side of the canal; and under George IV. beautiful plantations were formed by Mr Nash. London contains about 9000 streets, lanes, terraces, &c.; eighty squares, twenty-four market-places, and more than 180,000 houses. The buildings were formerly composed chiefly of wood-work and plaster, a mode of construction still observable in a few ancient houses remaining in some of the suburbs, and which must, when generally practised, have contributed in no small degree to occasion those destructive fires which are recorded in the annals of the metropolis. Such disasters have given rise to legislative enactments for the prevention of their recurrence. But notwithstanding all precautions, fires are of by no means unfrequent occurrence, and sometimes cause extensive damage. The buildings of London are now principally of brick, often, however, ornamented with stuccoed fronts, in imitation of stone. Hence there is much more apparent solidity than real strength in these structures; and those who have watched the progressive elevation of ranges of handsome shops and dwellings, must have frequently remarked the insecure appearance of the naked walls and pillars, which when finished, present a widely different aspect. This mode of building must be attributed chiefly to the nature of this kind of property, houses being generally erected on ground taken on building leases, for terms varying from sixty to ninety-nine years, and

the edifices are therefore constructed in such a manner as to become ruinous about the period of the expiration of the lease. Such motives do not exist in the case of public buildings, which, whether of brick or stone, are seldom deficient in strength and durability.

All the streets of London are paved with great regularity. The carriage-road is either laid with cubes of granite, accurately jointed and embedded in clay, or else *Macadamized*. Macadamizing is greatly in vogue in the squares and wider outlets of the West End, but it seems to have failed in the narrower and more cart-trodden streets of the city. The number, variety and magnificence of the squares in London deserve a cursory notice. The largest square in London is Lincoln's Inn Fields, its area being computed equal to 770 square feet; but, the tide of fashion having long set westward, this square is chiefly occupied by members of the legal profession. The college of surgeons forms a prominent object on the southern side, and the eastern is adorned (with the intervention of a garden) by the range called *stone buildings*, part of Lincoln's Inn. Russell square is nearly equilateral, each side being about 670 feet long. The houses are spacious. It communicates with Bloomsbury square by a street, at the northern extremity of which is a colossal bronze statue of the late duke of Bedford, by Westmacott, opposite to which, at the southern end, is a similar statue of Charles James Fox, by the same artist. Belgrave square, begun on the estate of earl Grosvenor, at Piccadilly, in 1825, is one of the most splendid in architectural decoration. The squares chiefly distinguished by residences of the nobility are Berkley, Cavendish, Grosvenor, Hanover, St James, Manchester, and Portman squares.

Within the last twenty years, the use of coal gas, instead of oil, in lighting the streets and public edifices of London, has become almost universal. The consumption of coals, by three of the gas companies, amounts to 32,700 chaldrons per annum, and their length of main pipe extends nearly 200 miles, communicating with more than 40,000 lamps. There is not a street, lane or alley, in this vast metropolis, which is not perforated, so to speak, with arched excavations. Every house communicates, by one or more drains, with the main sewers, which again empty themselves into larger tunnels, and ultimately into the Thames. London is plentifully, though not very purely, supplied with water. The New River company was incorporated under James I., in 1619. Mr Hugh Middleton, a goldsmith and citizen of London, after many obstructions, succeeded in conveying a stream from a spring at Chadwell, near Ware, twenty miles from London, by a devious course of forty miles in length, terminating in two capacious basins, which cover five acres, and average ten feet in depth. These reservoirs are eighty-five feet above low-water mark; but, by means of siphons and steam-engines, water can be raised sixty feet above that level. It is chiefly conveyed by main and branch pipes of cast metal, which communicate with the houses by leaden pipes of an inch diameter. The total supply to 177,100 houses, is 28,774,000 gallons per day. M. Dupin observes, that the water distributed by one of these companies (the New River company) costs the consumer about 2d for every 6300 pints; and that the system of pipes, for water and gas lighting jointly, stretches out in a line exceeding 400 leagues in extent, beneath the pavement of London. Fuel is sufficiently abundant, but extravagantly dear, in London. Since the great fire of 1667, a duty was imposed on coal, in order to assist the rebuilding of public edifices, and has ever since continued, to enable the corporation to execute improvements in the

city. The government duty, however, upon a sea-borne coal was repealed in 1830. The average price of coals in London, winter and summer, is, to the consumer, about 30s per chaldron. 28½ cwt. About 2,000,000 chaldrons per annum are consumed in Middlesex and Surrey, and, considering the vast supplies required for the steam-engines in manufactures of London, perhaps nearly two thirds of that quantity are devoted to the metropolis and The coals brought to the London market are chieft from Newcastle, in Northumberland, in coastal vessels, to the number of 4500. The average consumption of the principal articles of food in London has been calculated as below:

Oxen, . . . . .	100,000	Annually sold
Sheep, . . . . .	1,500,000	in the metropolis
Calves, . . . . .	21,000	market etc.
Hogs, . . . . .	7,000	
Milk, . . . . .	6,000,000 gallons.	
Butter, . . . . .	11,000 tons.	
Cheese, . . . . .	13,000 do.	
Wheat, . . . . .	1,000,000 quarters, of which	

4-5ths, made into bread, form 15,000,000 quarters of bread.

By a return from the corn exchange, it appears that the quantity of British and foreign corn and flour bond, on the first June, 1830, was as follows:

Wheat, . . . . .	280,000 quarters.
Oats, . . . . .	43,218 do.
Flour, . . . . .	173,000 cwt.
Foreign ditto: . . . . .	
Wheat, . . . . .	71,710 quarters.
Oats, . . . . .	12,000 do.

The value of poultry, annually consumed, amounts to nearly £80,000, exclusive of game, the supply which is variable. The principal market for cattle is at Smithfield, held every Monday and Tuesday. The markets for country-killed cattle, pigs and poultry, are Leadenhall (where skins and snuff also, are exclusively sold); Newgate, on Monday Wednesdays, and Fridays; and Fleet (now Fenchon) market rebuilt on a large scale, and opened in 1829. The supply of fruit and vegetables is equal abundant. The chief mart is Covent garden, where ranges of handsome shops have lately been erected on the estate of the duke of Bedford. There are at least 2000 acres, in the immediate vicinity of London continually under spade cultivation as kitchen gardens; which by judicious management, yield on a terminable succession of valuable produce. It has been calculated, that the cost of fruit and vegetables consumed annually in London, exceeds £1,500,000 sterling. The fruit-gardens, exclusive of those belonging to private residences, are computed to occupy about 3000 acres, chiefly on the banks of the Thames in Surrey and Middlesex. Few cities are more abundantly supplied with fish of every description and quality. Turbot and brill of the finest quality are procured from the coast of Holland, salmon in profusion from the great rivers of Scotland and Ireland, and, occasionally, from the Thames mackerel, codfish, lobsters, and oysters, from time to time. A calculation makes the supply of fish at Billingsgate, in the year 1828, as follows:

Fresh salmon, . . . . .	65,000
Plaice, skate, &c., . . . . .	30,734 hundred
Turbot, . . . . .	87,000
Cod (fresh), . . . . .	66,130
Herrings, . . . . .	3,200,000
Haddocks, . . . . .	60,000
Mackerel, . . . . .	1,000,000
Lobsters, . . . . .	1,000,000

And the number of fishing-vessels engaged in obtaining this supply, was registered, in the same year at 3827. The consumption of ale and porter can be estimated from the following facts. It appears by the annual statement of the London brewers, in the year ending July 5, 1830, that the quantity of porter brewed by the ten principal houses amounted

to 1,077,285 barrels. The ale annually brewed, by the six principal ale-brewers, amounts to about 80,000 barrels. In 1827, the quantity returned, by the ten principal brewers, was 1,129,772 barrels. The decrease within these years is owing, perhaps, partly to the deteriorated quality; for it appears, that, while the quantity actually brewed throughout England amounted, during the last ten years, to 6,170,000 barrels, the actual quantity of malt used decreased annually in a remarkable degree. But, besides this, the comparative cheapness, and more rapid excitation produced by ardent spirits, especially that deleterious compound called *English gin*, have induced the most destructive habits of intemperance among the lower classes. It is stated that there are about 11,000 public houses, i. e. houses for the sale of beer and spirituous liquors, in London alone. The total consumption of gin, in London, is about 24,000,000 gallons!

**Public Buildings.** The public buildings of London are numerous, but many of them being encircled by houses, or not advantageously exposed, they do not form a prominent feature of the metropolis. St James's palace, at the west end of Pall Mall, the principal town residence of royalty, is an irregular brick building, with nothing attractive in its exterior, but very magnificently decorated within. It was originally erected by Henry VIII. The Banqueting Hall of Whitehall Palace (being all that remains of that palace, which was destroyed by fire in 1697), is an elegant structure, designed by Inigo Jones. It consists chiefly of one room, of an oblong form, forty feet high, which has been converted into a chapel, where divine service is regularly performed by the royal chaplains. The ceiling is decorated with paintings by Rubens. Buckingham-house, in St James's Park, was erected in 1703, but, between 1825 and 1830, the whole of the building was remodelled at an enormous expense, and is now called the King's Palace in St James's Park. Besides these, there are Kensington Palace, the residence of the duchess of Kent, and Lambeth Palace, the residence of the archbishop of Canterbury. Among the town mansions of the nobility are Northumberland House, in the Strand, erected chiefly in the reign of James I.; Burlington House, Piccadilly; Uxbridge House, Burlington Gardens; Cleveland House, St James's Place; Devonshire House, Piccadilly; Apsley House, Hyde Park Corner, the town residence of the duke of Wellington; Grosvenor House, Park Lane. Public structures, rarely ornamental, are extremely rare in this metropolis. The Monument, on Fish Street Hill, is the only work of architecture deserving notice, strictly pertaining to this class. It was erected by Sir Christopher Wren, between the years 1671 and 1677, in commemoration of the great fire of London, on the site of the ancient church of St Margaret, destroyed in that conflagration. It consists of a noble Ionic column, 202 feet in height, surmounted by a canopy, in the centre of which rises a flaming vase of gilt bronze; and the sides of the pedestal of the monument display emblematic sculpture and various inscriptions. The other principal detached public monuments are the fine equestrian statue of Charles I. at Charing Cross, cast in bronze by Hubert Le Sueur, in 1633, and placed in its present situation in 1693; and the colossal statue of Achilles, in Hyde Park, cast by R. Westmacott, R.A., erected in 1822, in honour of the duke of Wellington and his companions in arms, by their country-women. The ancient gates were entirely removed in 1760. Temple Church was erected by Sir Christopher Wren, in 1671, to mark the boundary between London and Westminster. On the east side are niches, containing the

statues of queen Elizabeth and James I.; and on the west, others with the statues of Charles I. and Charles II. The only ancient gate remaining is St John's Gate, west Smithfield, a relic of the priory of the Knights Hospitallers of St John of Jerusalem. Buckingham Stairs water-gate is a deservedly-admired production of Inigo Jones. The beautiful gate at Hyde Park Corner, ornamented with Ionic columns and sculpture on the entablature, and connected with the richly decorated iron railing in front of Apsley House, was recently erected from the designs of Decimus Burton, Esq. On the opposite side of the road is a noble gateway, or triumphal arch, leading into the grounds belonging to the new palace at Piccadilly, (Buckingham-house) with appropriate architectural decorations, and richly ornamented bronzed gates. For the bridges, see *Bridge*.

The Tower of London is situated at the south-eastern angle of the city, and the oldest part, called the White Tower, is supposed to have been built in the reign of William I., by Gundulph, bishop of Rochester, a distinguished Norman architect, but it was renovated or rebuilt in 1638, and various additional structures and fortifications have been erected at different periods. The present extent of ground within the walls is more than twelve acres, and the circumference outside the ditch 1052 feet. This fortress was anciently the principal palace of the kings of England; but it has long been used as a state prison; and it also includes a menagerie of wild beasts and an armoury. Within its walls likewise is the church of St Peter in Vinculis, a Gothic structure, founded by Edward I. The Mint, Tower Hill, for the coinage of the United Kingdom, is a large and handsome building, erected partly from the designs of R. Smirke, R.A. The Trinity House, Tower Hill, originally founded at Deptford, as the office of a corporation for the management of certain naval affairs, was built under the direction of Samuel Wyatt, Esq., and opened in 1795. The Guildhall, or City Hall of the Corporation, King Street, Cheap-side, was founded in the reign of Henry IV.; the interior was destroyed by the fire in 1666; and the ancient front was rebuilt in 1789, by George Dance, Esq. In the Great Hall are sculptural monuments in honour of William Pitt, earl of Chatham; William Pitt, the son of that great statesman; admiral Lord Nelson; and William Beckford, lord mayor in 1762 and 1769. In the Council Chamber and other apartments, there are a considerable number of historical paintings and portraits. Near Guildhall, on the site of Blackwell Hall is the office of the commissioners of Bankrupts, erected in 1820; to the south of which stands a range of building comprising the London Land-tax Office, the Irish Chamber, and the City Court of Requests. The mansion house of the lord mayor, near the west end of Lombard street, is a spacious structure, with a Corinthian portico in front, built between 1739 and 1753, from the designs of George Dance, sen. Somerset House, so called from a palace erected by the Protector Somerset, the uncle of Edward VI., was rebuilt in 1775, under the authority of an act of parliament, from the designs of Sir William Chambers, the front facing the Strand being ornamented with Corinthian columns and various sculptures. The interior includes several government offices, and apartments appropriated to the use of the Royal Academy of Arts and the Royal Antiquarian Societies. Part of the new university called King's College forms the eastern wing of Somerset House. The Duchy of Lancaster Office, on the western side of Wellington street, in the Strand, is a handsome and extensive modern edifice, for the transaction of the affairs of that duchy. The Admiralty Office, Whitehall, has in front a handsome

screen of Portland stone, designed by Robert Adam. The War Office, usually called the Horse Guards, is a substantial structure, built by W. Kent, about 1730. The Treasury, with various government offices, forms a range of buildings with an ornamented front opposite Privy Gardens, designed by John Soane, R.A. Westminster Hall, between the Abbey and the Thames, was built by William Rufus, and was altered and enlarged, if not rebuilt, in the reign of Richard II.: it was also completely repaired, and the front was renovated in 1822. Parliaments were formerly held in this hall, and it is still appropriated for coronation feasts. On the western side of the hall, and communicating with it, are the new Courts of Chancery, King's Bench, Common Pleas, and Exchequer, erected by Mr Soane. The House of Lords, Old Palace Yard, and House of Commons, adjoining, were burned in 1834. In the Old Bailey is the sessions' house for the city of London; on the south side of Clerkenwell Green stands the County Hall, or sessions' house for Middlesex, a spacious detached edifice; and in Portugal Street, Lincoln's Inn Fields, is the Insolvent Debtors' Court, a commodiously arranged modern structure. In connexion with the buildings for the use of the legislature and the administration of the laws, may be mentioned the Inns of Court, designed for the education of lawyers. The Temple, consisting of a number of quadrangles, passages, and buildings, on the south side of Fleet Street and the Strand, is divided into two establishments, the Inner Temple, and the Middle Temple, under the government of their respective societies, the principal officer, being a clergyman, called the master of the Temple. These buildings, comprising the Temple Church, were anciently the residence of the Knights Templars, from whom they were transferred in 1524, to the students of the common law. Lincoln's Inn, on the west side of Chancery Lane, stands on the site of a mansion anciently belonging to the Laceys, Earls of Lincoln; its buildings include a spacious hall, and a chapel, designed by Inigo Jones; it is governed by a society established in 1310. Gray's Inn, on the north side of Holborn, is so called, because it anciently belonged to the noble family of Grey or Gray de Wilton; and in 1541 Henry VIII. granted it to the students of law. There are other Inns of Court in the vicinity of the preceding, as Sergeant's Inn, Clement's Inn, Staple's Inn, &c. The Royal Exchange, Cornhill, was originally founded for the congress of merchants, by Sir Thomas Gresham in 1567, and having been burned down in 1666, it was rebuilt probably from the designs of Sir Christopher Wren, at the expense of nearly £100,000, and opened in 1669. The present tower is of recent erection, and consists of a spacious quadrangle, encompassed by a colonnade, above which, arranged in niches, are statues of the kings of England from Edward I. to George III.; on a pedestal in the central area is a statue of Charles II., and under the piazza or colonnade are those of Sir T. Gresham, and Sir John Barnard. The Bank of England, Threadneedle Street, belonged to a chartered company, established in 1693, under the management of a governor, a deputy-governor, and twenty directors, was built in 1732, its concerns having been previously transacted at Grocers' Hall, in the Poultry. The East India House, Leadenhall Street, was built in 1726, and enlarged in 1799, by the addition of the portico and east wing. The Auction Mart, Bartholomew Lane, is a spacious and commodious building, erected in 1810. The Commercial hall, Mincing Lane, for the sale of colonial produce, was built in 1811. The Corn Exchange, Mark Lane, is a handsome edifice, erected in 1827. The Custom House Lower Thames

Street, was originally founded in the reign of queen Elizabeth, and having been repeatedly destroyed by fire, was rebuilt on a most extensive scale, in 1814, but the foundation having given way in 1823, the front next the Thames has been since rebuilt. The Excise Office, Broad Street, is a spacious structure, erected in 1768, on the site of Graham College. The General Post Office, the business of which was formerly carried on in Lombard Street, is a noble structure, the principal front of which is towards St Martin's-le-Grand. It is a building of great extent, consisting of a central portico of *double columns* of the Ionic order. It was erected in 1838.

*Civil government.*—The chief civil officer of London is the lord mayor, annually elected from among the aldermen on the 29th September. The powers and privileges of this officer are very extensive. The court of aldermen consists of twenty-six members. They are chosen for life by the householders of the twenty-six wards into which the city is divided, each being the representative of a several ward. They are properly the subordinate governors of their respective wards, under the jurisdiction of the lord mayor and preside in the courts of Wardmote for the redress of minor grievances, removing nuisances, &c. assisted by one or more deputies, nominated by them from the common council of the respective wards. Such as have filled the office of lord mayor, become justices of the quorum, and all others are justices of the peace within the city. The sheriffs, two in number, are annually chosen by the livery, or general assembly of the freemen of London. When once elected they are compelled to serve, under a penalty of £100. The common council is a court consisting of 300 representatives, returned by (twenty-five of the wards in proportion to their relative extent: the *twenty-sixth*, or *Bridge Ward Without*, being represented by an alderman. The general business of the council is to legislate for the internal government of the city, its police, revenues, &c. It is convened only on summons from the lord mayor, who is an *ex officio* member of the court, as are the aldermen also. The decisions are, as in other assemblies, dependent on a majority of voices. The recorder is generally a barrister of eminence, appointed, for life, by the lord mayor and aldermen, as principal assistant and adviser to the civic magistracy, and one of the justices of Oyer and Terminer, for which services he is remunerated with a salary of £2000 per annum from the city revenues. The subordinate officers are the chamberlain, town clerk, common serjeant, city mace-bearer, sword-bearer, &c. The livery of London is the aggregate of the members of the several *craft* companies, of which there are ninety-one, embracing the various trades of the metropolis. They constitute the elective body, in whom resided the *ancient* and only of all the civil officers, but also of the *free* members who represented the city in parliament. The local jurisdiction of Westminster is partly vested in civil, partly in ecclesiastical officers. The high steward has an under-steward, who officiates for him. Next in dignity and office are the high bailiff and the deputy bailiff, whose authority resembles that of a sheriff, in summoning juries and acting as *electing* officers at the election of members of parliament, of whom the city of Westminster returns two. These officers are chosen by the dean and chapter of Westminster, and appointed for life. The *ward* of Southwark is one of the city wards, and

\* The Municipal Reform Bill, recently passed, has effected an entire revolution in the constitution of the city and boroughs. In that bill, however, London is treated as it is intended to be the subject of a special consideration. Meanwhile, therefore, we can only give the present state of the metropolis as it has existed and still exists.

*Bridge Ward Without.* It is subject to the jurisdiction of the lord mayor. It returns two members to parliament. The military force supplied by London comprises two regiments of militia, amounting to 2200 men, whom the city is authorised to raise by ballot; the officers being appointed by the commissioners of the king's lieutenancy for the city of London, according to a parliamentary act in 1794. The year 1829 witnessed the almost entire remodelling of the ancient system of police and nightly watch. These latter guardians of the public were heretofore appointed by the several wards in the city district, and by the parochial authorities in other parts of the metropolis. But a recent act of parliament established a body of metropolitan police, divisioned and disciplined somewhat like the *gens d'armes* of France, and subjected to the control of a board, consisting of three commissioners, who superintend and are responsible for all acts of their inferiors. The metropolis being subdivided into sections, each has a station or watch-house, and a company of police, consisting of one superintendent, four inspectors, sixteen sergeants, and 144 police constables. They are dressed in a blue semi-military uniform, and are on duty at all hours, night and day. This new police commenced its duties, in several of the parishes of Westminster, on September 29, 1829. But the city retains its special establishments, under the control of its own magistracy. It comprises marshmen, day and night patrols, constables, watchmen, and streetkeepers, altogether amounting to 800 or 900 men, appointed by the several wards. The principal city police offices are at the Mansion-house and Guildhall, where aldermen preside in rotation. In the districts not within the city jurisdiction, there are eight different offices, presided over by twenty-seven magistrates, usually selected from among the barristers. There are also one hundred foot-patrols, and, in winter, fifty-four horse-patrols, the former continually, the latter only by night, protecting the streets and environs of the metropolis. Independent of these is the Thames police, established in 1798, for the protection of persons and property connected with the shipping, from Vauxhall bridge to Woolwich. The chief office is at Wapping, and the importance of such an establishment may be estimated, by considering that there are upwards of 13,000 vessels of various sizes engaged on this river, annually discharging and receiving more than 3,000,000 packages of goods of very description. The chief prison for criminals is Newgate in the Old Bailey. It is the common goal for London and Middlesex. The number of its inmates varies from 900 to 350. The Compter is situated in Giltspur street, close to Newgate, and destined for the reception of vagrants and persons committed previous to examination, or as a house of correction for the confinement of persons sentenced to hard labour or imprisonment. Clerkenwell prison in Spafelds, receives prisoners of every description, for the county of Middlesex. Its average number of inmates is about 200. The Fleet prison, in what was lately Fleet market, is a receptacle for debtors and persons guilty of what is technically called *contempt* of the court of chancery. It is intended to remove this nuisance, and to build a substitute in St George's fields, in the Borough. The prison usually contains 250 indwellers, and keeps on foot of about sixty out-patients, i. e. prisoners privileged to live within the rules. The King's Bench prison is a spacious goal for debtors and minor criminals. It has about 200 separate apartments. The other prisons of note are in Southwark, viz. Newmonger lane or the Surrey county goal, appropriated to felons and debtors; the Borough Com-

pter, for various classes of offenders; the New Bridewell, erected in 1829, near Bethlehem hospital, as a house of correction, in which the prisoners are chiefly employed at the tread-mill; and the Marshalsea prison in Blackman street, for persons committed by the Marshalsea court. The principal houses of correction are the Bridewell hospital, Cold Bath fields, and the penitentiary at Millbank.

*Churches, Charities, Societies, &c.* The ecclesiastical division of London comprises ninety-seven parishes within the walls, seventeen without, ten in Westminster, besides twenty-nine out-parishes in Middlesex and Surrey. It contains one cathedral (St Paul's), one collegiate church (Westminster abbey), 130 parish churches, and seventy Episcopal chapels; nearly 200 places of worship belonging to Protestant Dissenters; eighteen churches or chapels of foreign Protestants, viz. one Armenian, one Danish, two Dutch, five French, seven German, one Swiss, and one Swedish; six meeting-houses of the Friends (or Quakers); ten British Roman Catholic chapels; five ditto for foreigners of that persuasion, viz. one Bavarian, one French, one German, one Sardinian, one Spanish; and six Jewish synagogues, one of which is for Portuguese, and another for German Jews. (Westminster abbey and St Paul's cathedral are described in separate articles.) London owes not merely its magnificent cathedral, but fifty-three other churches, to Sir Christopher Wren. The multiplication of churches has nearly kept pace with the rapid extension of the metropolis. The commissioners, appointed for the purpose, are gradually removing the stigma upon an opulent church establishment, that religious accommodation was unprovided for the poor. Many of the churches possess much architectural beauty. There are, in London, forty-five free schools, endowed in perpetuity, for educating and maintaining nearly 4000 children, seventeen for pauper or deserted children, and about 240 parish schools, in which clothing and education are supplied to about 12,000 children. The chief public endowments, of the first description, are, St Paul's school, Christ's hospital, Westminster school, Merchant Tailors' school, and the Charter house. St Paul's school, founded in 1509, bestows a classical education upon 153 pupils. Christ's hospital, founded by Edward VI., in 1547, can accommodate about 1100 children of both sexes, who are clothed, boarded, and educated for seven years. Some of the boys are prepared for the university, most of them for commerce. Westminster school, founded in 1560 by queen Elizabeth, receives a large number of pupils of high rank and respectability. Merchant Tailors' school, founded by the company of merchant tailors in 1561, educates about 300 pupils at a very low rate of payment. The company nominate to forty-six fellowships in St John's college, Oxford. The Charter house endowed in 1611, supports and educates scholars for the university (where they receive a liberal annuity), or for commerce, besides instructing about 160 other pupils. Many other charitable institutions for education are supported by voluntary contribution, as are, also, the parochial schools, which usually provide clothing and elementary instruction for the poor children of the respective parishes. The children of these schools are annually assembled in the vast area of St Paul's on the first Thursday in June. The central national school, with its forty subsidiary schools in London, educates there about 20,000 children. The British and foreign school society, at its central and subsidiary schools, of which there are, in London, forty-three, educates about 12,000 children. The Sunday schools, taught by about 5000 gratuitous teachers, instruct between 60,000 and 70,000 children. The founding hospital is capable of

receiving about 200 children. There are also orphan asylums, an asylum for the deaf and dumb, one for the indigent blind, and many others. Alms-houses are numerous. There is a small debt relief society, a mendicity society, a philanthropic society for giving employment to the industrious poor, a prison discipline society, &c. There are also various hospitals; St Thomas's, with 490 beds; St Bartholomew's, capable of accommodating between 400 and 500 patients; Guy's hospital, with 400 beds; St George's, with 350; Middlesex hospital, able to contain 300 patients; the London hospital; small-pox hospital; various lying-in hospitals, &c. The Bethlehem hospital, and St Luke's hospital receive insane patients. The humane society has eighteen receiving-houses in different parts of London, with apparatus for restoring suspended animation. Dispensaries relieve more than 50,000 patients annually. There are at least thirty of them, besides twelve for the sole purpose of vaccination. The college of physicians and the college of surgeons examine candidates for the professions of physic and surgery, in the metropolis and the suburbs. The museum of the latter body contains the collections of the celebrated John Hunter, amounting to 20,000 specimens and anatomical preparations. The British museum is a spacious brick structure, in the French style of architecture. It was originally, the palace of the first duke of Montague, built in 1677; its dimensions, 216 feet in length, by 70 feet in depth, and 57 feet in height. The ground floor is appropriated solely to the reception of the library of printed books. The principal or upper floor contains the miscellaneous articles of curiosity for public inspection; such as collections of minerals, lavas, volcanic productions, shells, fossils, and zoological specimens, British and foreign, and also various articles from the South sea islands, and North and Western America, &c. The ground floor is connected with a more modern building, called the *gallery of antiquities*, divided into fifteen apartments, in which are distributed nearly 1000 pieces of sculpture, Greek and Roman, a fine collection of *terra cottas*, Roman sepulchral urns, *cippi*, *sarcophagi*, &c. In a temporary room are deposited the Elgin marbles, purchased by government for £35,000. The upper floor of this gallery contains the collections of Herculanean and Pompeian antiquities made by Sir William Hamilton, cabinets of coins and medals, and also a rare collection of prints and engravings by the most eminent artists. The present building is destined to be razed to the ground as soon as a splendid edifice, now constructing, is completed. There are various other public libraries. King's college (q. v.) was founded in 1282. The London university, founded in 1825, is not a chartered institution. Its course of instruction comprehends languages, mathematics, physics, ethics, law, history, political economy, and medical science, communicated in public lectures, examinations by the professors, &c. The front, to Gower-street, is a handsome facade, adorned with the noblest portico in London, of twelve Corinthian columns, ascended by a flight of steps, surmounted by a dome and lantern. On the principal floor is a spacious examination hall, a museum of natural history, a museum of anatomy, professors' apartments, a grand library, 120 feet by 50, and a smaller library, 41 feet by 22; and at each end is a semicircular theatre for lectures, 65 feet by 50. The ground floor is portioned into lecture-rooms, cloisters, two theatres, chemical laboratory, museum, offices, and council-room. The number of students, in this university, in the year 1829, was 680. The royal society of literature was instituted in 1823; the royal society for improving natural knowledge, in 1663; the society of anti-

quaries, in 1572; the royal institution, in 1780 is diffusing mechanical knowledge, and the acquisition of science to the various purposes of life; the society of arts, in 1574, to award premiums and bounties to useful inventions and discoveries; the royal academy, in 1768, for the promotion of the fine arts. It provides students with busts, statues, pictures, and painting models, and has professors of painting, architecture, anatomy, perspective, and sculpture. The annual exhibition of new paintings, drawings, sketches, sculptures, &c., the admission to which is one shilling per head, averages £4000 per annum, and supports all the expenses of the establishment. There are several other societies for the promotion of the fine arts, and the private collections of works of art are numerous and splendid. The number of theatres and amphitheatres is twelve, of which the principal are, the King's theatre or Italian opera-house, Drury lane and Covent garden theatres. Vauxhall gardens are a favourite place of summer resort for the lovers of music, singing, and fireworks. The principal promenades are St James's park, Green park, Hyde park (q. v.), (which comprises nearly 400 acres), Kensington gardens, and the Regent's park, which is laid out in shrubberies and rich plantations, adorned by a fine park of water, studded with villas, and intersected by roads and promenades. The Zoological garden, in the garden, contain many different sorts of animals, a paddocks, dens, or aviaries.

*Manufactures.* London may be considered a more a commercial than manufacturing city. Its manufactures are of a very miscellaneous description. The chief is the Spitalfields silk manufacture, which is not, however, in a flourishing condition. In household furniture, especially cabinet work, the artists of London greatly excel. Among other business prosecuted to a great extent may be mentioned clock and watch making, with their subsidiary trades and operations; engraving in all its branches, printing, bookbinding, type founding, and other are connected with literature; carving and gilding, and the manufacture of picture-frames and window-glasses; embossing, chasing, making gold and silver plate, and the works of the lapidary and jeweller, coach and carriage building, &c.; the manufacture of all kinds of musical instruments; and ship-building and equipping and storing vessels for the service. There are other arts and manufactures prosecuted on an extensive scale, or distinguished by their importance or ingenuity. The number of the public breweries in London, in 1825, was eighty-four; of the retail breweries, eighty-four. Of the intermediate breweries, eight; and there were still licensed victuallers, of whom seventeen only brewed their own beer. There are likewise various iron and brass foundries and bell foundries, distilleries, drug-mills, oil-mills, sugar-refineries, glass-works, saw-mills, shot-manufactures, establishments for refining saltpetre, and for making vinegar and nitric acid, aquafortis, and oil of vitriol. In London are made agricultural machines and implements, opticians' instruments, artificial hands, legs, and steam-engines, copying-machines and printing-needles, for the manufacture of which Birmingham was formerly noted, fishing-tackle, gun and powder works in ivory, tortoiseshell, and mother of pearl, scagliola and ornamental stone-work, artificial flowers and feathers, optical and mathematical instruments, &c.

*Commerce.* The commerce of London can be traced back to a very early period. It is the noble emporium of the island, the great resort of merchants, and, although not a city in that period, yet as a city celebrated for its commerce.

mercial intercourse. After this, little is known of its trade, until the close of the second century, when it is again mentioned as having become "a great and wealthy city." In 359, it is said of England, that its commerce was so extended, that 800 vessels were employed in the port of London for exportation of corn only. Three centuries after, Bede styles it "an emporium for many nations repairing to it by land and sea." Fitz-Stephen, who lived in the reign of Henry II., says, "that no city in the world exports its merchandise to such a distance as London." He does not, however, inform us what goods were exported, or to what countries they were carried. But among the imports, he mentions gold, spices, and frankincense, from Arabia; precious stones from India, and palm-oil from Bagdad. In 1296, the company of Merchant adventurers was first incorporated by Edward I. The Hanse merchants also received considerable privileges about the same time.

It was not, however, till the reign of Elizabeth that England began to feel her true weight in the scale of commerce. She then planned some settlements in America, particularly in Virginia. About this period the civil dissensions in Flanders caused multitudes of families to flock to London, and to bring with them their trades and their riches. This great addition to the population of the city, and the consequent increase of its commerce, led to the erection of the Royal Exchange, by Sir Thomas Gresham. In 1579, the Levant or Turkey company, and also the Eastland company, were established. On the 31st December, the queen granted the first patent to the East India company. The first adventure proving successful, the company continued its exertions, and hence has arisen the most splendid and powerful mercantile association that probably ever existed in the world. Assurance and insurance companies were now established in London; and the company of Spanish merchants was likewise incorporated. In the reign of James I., the foreign trade rapidly increased. Many of the patents granted by Elizabeth were annulled, and the trade thrown open. Among the circumstances which occasioned the vast increase of trade during this reign, may be reckoned the colonization of America and the West India islands. The new discoveries, likewise, which were every day made in different quarters of the world, had a powerful effect in stimulating numbers of peccant persons to commercial exertion and adventure.

During the peaceful part of Charles I.'s reign, the commerce of the metropolis still continued to make rapid progress. The augmented commerce of its port may in some measure be estimated by the quantity of *ship-money*, which this monarch imposed on the city in 1634. About this time *Prices current* were first printed; and in 1635, an order was issued by the king in council to "the post-master of England and foreign parts," requiring him to open a regular communication, by running posts, between the metropolis and Edinburgh, Ireland, and a variety of other places. Previous to 1640, it was usual for the merchants to deposit their money in the Tower mint. At this deposit lost all its credit by the ill-advised measure of a forced loan, which the king thought proper to make. The merchants, in consequence, were obliged to trust their money to their apprentices and clerks. The circumstances of the times and opportunity holding forth great inducements to many masters lost at once both their servants and their money. Some remedy became necessary. Merchants now began to lodge cash in the hands of goldsmiths, whom they commissioned also to receive and pay for them. Thus originated the

practice of *Banking*; for the goldsmiths soon perceived the advantage that might be derived from possessing disposable capital, and began to allow a regular interest for all sums committed to their care; and at the same time they commenced the discounting of merchants' bills, at an interest superior to that which they paid. In 1651, the celebrated *navigation act* was passed, the provisions of which greatly contributed to promote the naval and commercial greatness of Britain. This year coffee was introduced into London by a Turkey merchant named Edwards. The sugar trade was now likewise established, and upwards of 20,000 cloths were sent annually to Turkey, in return for the commodities of that country. The plague, in 1665, almost wholly suspended the commerce of London, so that scarcely a single foreign vessel entered the port for the space of three years. The great fire also occasioned incalculable loss to many of the most opulent merchants. Notwithstanding these disastrous events, the spirit of the survivors was roused to uncommon exertions, and in the course of a few years the city rose from its ashes with greater magnificence and splendour. Indian muslins were first worn in 1670, and soon became prevalent. In this year also, the Hudson's-bay company was established, with very extensive powers. The Greenland fishing company was incorporated in 1693, and the institution of the Bank of England rendered the following year justly memorable in the commercial annals of the metropolis. The great progress that commerce made in a few years may be inferred from the following statement:—the number of vessels belonging to the port of London in 1701, amounted to 560, carrying 84,882 tons, and 10,065 men. In 1710, the customs of this city are stated at £1,268,095, and those of all the out-ports only at £346,081.

During the reign of George I., the trade of London made little, if any, progress, owing to the South-Sea scheme, the rebellion of 1715, and the Spanish war. But in 1732, commerce began to revive: its advances, however, were comparatively slow, till the peace of Aix-la-Chapelle in 1748, after which it extended with uncommon rapidity. The next check it sustained was occasioned by the American war. But no sooner was peace signed, than it proceeded with renewed vigour; for so early as 1784, the value of exports to America only had increased to £3,397,500, considerably above the greatest amount in any year before the war. The net sum of duties levied in the port of London, and paid into the exchequer this year, rose to the vast sum of £4,472,091. From this period to 1790, the commerce of London continued uniformly increasing. In that year, however, in consequence of the commencement of the war, the value of exports was upwards of £2,000,000 less than the preceding year, though the imports scarcely suffered any diminution. Numerous bankruptcies consequently took place, but the timely interference of the legislature, and the voting of exchequer bills to the amount of £5,000,000, for the use of such persons as could give sufficient security, soon checked the growing distress. In the course of three succeeding years, the appearance of things was entirely changed. In 1796, the exports of London amounted in value to £18,410,499, and the imports to £14,719,466. The number of British ships that entered the port amounted to 2007, carrying 436,843 tons; and 2169 foreign vessels carrying 287,142 tons. The total, entering coastwise, was 11,176, including repeated voyages, which made a tonnage of 1,069,915. The following year, some alarm was spread among the merchants, by the stoppage of bank-payments in specie; but, through the intervention of parliament, confidence was soon restored. The net amount of the customs was

£3,950,608. In 1798, the importations of sugar and rum far exceeded those of any preceding year, as did likewise the revenue of the customs, which amounted to the sum of £5,321,187; in 1799, it had increased to £7,226,353, West India  $\frac{4}{5}$  per cent. duty included; but next year it fell to £6,408,655. The official value of the imports in 1800, was £18,843,172, and of the exports £25,428,922, of which £13,272,494 was in British merchandise. Their real value exceeded £68,000,000, nearly two-thirds of the value of the trade of the whole kingdom. The number of vessels belonging to the port in that year was 2666, carrying 568,268 tons, and 41,402 men. Comparing this number with the number returned in the beginning of the last century, the increase is truly astonishing.

On the quantity of tonnage it is nearly a proportion of six to one; and on the number of ships, upwards of four to one. The East India Company's ships alone carry more burden by tons, than all the vessels of London and a century ago. In 1806 the value of the imports and exports of London was £36,527,000; in 1819 £46,220,000; in 1825 it had increased to 96,256,000; and in the year ending January, 1829, to £107,722,000. The number of coasters which entered the port in 1810 was 15,139, in 1821, 18,915, and in 1829, 20,712. Of vessels employed in the foreign trade were 4012 British, and 1534 foreign. The following Table exhibits

A RETURN of the NUMBER and TONNAGE of SHIPS that have Entered the Port of London with Cargoes from Foreign Ports, distinguishing the Countries whence they have arrived, during the Years 1830, 1831, and 1832.

The port of London extends from London Bridge to Deptford, a distance of four miles. The West India Docks, stretching across the isthmus forming the Isle of Dogs to the Middlesex side of the river, were opened in 1802. They consisted originally of an import and an export dock, the former containing about thirty and the other about twenty-five acres of water, exclusive of basins. To these have recently been added the South Dock, formerly the City Canal. The warehouses at the West India Docks are of vast extent. The London Docks, also of very great extent, are situated at Wapping. The tobacco warehouse belonging to them, covers a space of nearly five acres. There are also the St Katharine's Docks, adjoining the tower; the East India Docks, at Blackwall; and the Commercial Docks, on the Surrey side of the river. Owing to the competition of the different companies, all sorts of dock charges are now reduced to the lowest level, and hardly one of the concerns can be said to be profitable. The dividend on London Dock stock in 1833 was only  $2\frac{1}{2}$  per cent.

**Population.**—The population of London, in general, has for a long period been rapidly augmenting, but that of the city, separately taken, and especially in the parishes within the walls, has greatly decreased since the beginning of the last century, owing to the widening of the streets and the erection of public

buildings and warehouses, instead of dwellings. In 1700, the city of London, within the walls, contained 139,300 inhabitants; in 1801, it contained less than 78,000, and the number has since diminished.

The health of the metropolis is said to have been in a gradual state of improvement since the middle of the seventeenth century. It was more healthy in the century and a half since the plague has raged in London; and three diseases which were so epidemic there—the bloody flux, the sweating sickness, and the small pox—have ceased for above a century. The cholera was less fatal in its ravages in London than in many places of the British empire. In 1817 the average rate of mortality in London was 1 in 21; in 1821, according to Dr Barlow, it was more than 1 in 40. The christenings and burials in London during the year 1834, are reported to have been as follows:—

Christened	{ Males, 12,791	Buried	{ Males, 12,791
	{ Females, 12,613		{ Females, 12,613
Total,	25,404	Total,	25,404

The following table exhibits a view of the population of the metropolis in 1700, 1811, 1821, and 1831, with the increase or decrease of the different divisions.

**LONDONDERRY**; one of the nine counties of Ulster, Ireland, is bounded on the north by the Atlantic Ocean, on the west by Lough Foyle and the county Donegal, on the south by Tyrone county, and on the east by Lough Neagh, the river Bann, and part of the county of Antrim. It forms an irregular triangle, including an area of 798 square miles, about a fourth part of which is occupied with bleak ghlands, from 1200 to 1600 feet in elevation, running southward from the coast through the whole country. Some fertile places are interspersed between the hills. The principal rivers are the Foyle or Green River, and the Bann, or White River. The city of Londonderry or Derry, and Coleraine are the only places of consideration in the county. See *Ulster and Ireland*.

**LONDONDERRY**, or **DERRY**, a city and county of itself in Ulster, situated 150 miles S. W. from Dublin, and about four miles south of Culmore Fort, which latter is at the entrance of the river into the great estuary called Lough Foyle. It stands upon a high conical hill, crowned by the cathedral. It is a place of ancient foundation, an abbey having been erected here in 546, by St Columba. It was plundered by the Danes, and reduced to ashes by those barbarians about the

year 783; and it was erected into an episcopal see in 1158. Upon the plantation of Ulster, in the reign of James I., this city and liberties, with other estates, were granted to the twelve corporations of London, who may be said to have built the greatest part, and given to the whole the prenominal of London. The old city is enclosed by fortifications, consisting of a thick earthen rampart, faced with limestone, and flanked with bastions, placed at short intervals. They afford, at the present day, an agreeable promenade to the inhabitants, and command extensive and beautiful views. The most conspicuous event in the history of this place, is that commonly called "the siege of Derry;" a memorable occasion, when the citizens sustained a close siege from the month of December, 1688, to August, 1689, from the whole force of the Irish army, in the interest of king James II. The besieged had to contend, not merely with fatigue and famine, but with discord and treachery within their walls. This duplicity manifested itself in the person of their governor, Lumley, whom they forthwith superseded, and substituted for him the famous George Walker, a dissenting minister, and Major Baker. Under the heroic guidance of these two persons, they held out until the breaking of the boom across the Foyle, and arrival of a British vessel with provisions and relief.

Londonderry is an episcopal see, and one of the cleanest, best built, and most beautifully situated towns in Ireland. It carries on a considerable trade with Scotland, the West Indies, and America. Population about 20,000.

LONDONDERRY, ROBERT STEWART, marquis of, the second son of the first marquis, was born in the north of Ireland, June 18, 1769, and was educated at Armagh, after which he became a commoner of St John's college, Cambridge. On leaving the university, he made the tour of Europe, and, on his return, was chosen a member of the Irish parliament. He joined the opposition, in the first place, and declared himself an advocate for parliamentary reform; but, on obtaining a seat in the British parliament, he took his station on the ministerial benches. In 1797, having then become lord Castlereagh, he returned to the Irish parliament, and, the same year, became keeper of the privy seal for that kingdom, and was soon after appointed one of the lords of the treasury. The next year, he was nominated secretary to the lord-lieutenant, and, by his strenuous exertions, and abilities in the art of removing opposition, the union with Ireland was greatly facilitated. In the united parliament, he sat as member for the county of Down, and, in 1802, was made president of the board of control. In 1805, he was appointed secretary of war and the colonies; but, on the death of Mr Pitt, he retired, until the dissolution of the brief administration of 1806 restored him to the same situation in 1807; and he held his office until the ill-fated expedition to Walcheren, and his duel with his colleague, Mr Canning, produced his resignation. In 1812, he succeeded the marquis of Wellesley as foreign secretary, and the following year proceeded to the continent, to assist the coalesced powers in negotiating a general peace. His services after the capture of Napoleon, and in the general pacification and arrangements which have been usually designated by the phrase the *settlement of Europe*, form a part of history. It is sufficient to notice here, that he received the public thanks of parliament, and was honoured with the order of the garter. On the death of his father, in April, 1821, he succeeded him in the Irish marquise of Londonderry, but still retained his seat in the British house of commons, where he acted as leader. After the arduous session of 1822, in which his labour was unremitting, his mind was observed to be much shattered; but, unhappily, although his physician was apprized of it, he was suffered to leave London for his seat at North Cray, in Kent, where, in August, 1822, he terminated his life by inflicting a wound in his neck, with a pen-knife, of which he died almost instantly. This statesman has been censured for a severe, rigid, and persecuting domestic government, and for an undue countenance of despotic encroachment and arrangement as regards the social progress of Europe. His party and supporters, in answer to these strictures, for the most part, plead political necessity and expediency, while no small portion of them defend his views on the ground of principle. He was an active man of business, and a ready, although not an elegant orator. His remains were interred, in Westminster abbey, with great ceremony, but not without an exhibition of popular ill-will. (See *Mem. of the late Marquis of Londonderry*, London, 1829.) He was succeeded in his title by his half-brother, lieutenant-colonel lord Stewart, who was for some time ambassador to Prussia, and afterwards to Vienna. His lordship is author of a *Narrative of the Peninsular War* (second edition, London, 1828), and a *Narrative of the War in Germany and France*, in 1813 and 1814, and is a member of the British house of peers.

LONGCHAMP; a promenade of the Parisian fashionables, on the right bank of the Seine, about four miles below the capital. It was once a convent, founded by Isabella, sister of St Louis, where she spent her last years, and terminated her life, Feb.

22, 1269. The convent was then called the *Abbaye de l'humilité de Notre Dame*, and the credulity of times ascribed to the bones of Isabella, who was buried there, such miraculous powers, that she canonized her in 1521. 116 years after the death of Isabella, with the permission of Urban VIII were collected in the presence of the archbishop of Paris, and, like other relics, set in gold and silver. Two other princesses of France also died there. Blanche, daughter of Philip the Long, who lived ended his life at this place, Jan. 3, 1321, and Jean of Navarre. Previous to the revolution, Longchamp was a place of resort to the Parisian *beau monde* to the English. It is still related, that on the 3d when it was a part of *bon ton* to repair there (Wednesday, Thursday and Friday of *Pâques* week) some of the English carried their luxury so far as to make the shoes of their horses and the turn of the coach wheels of silver, on these promenades. At the beginning of the revolution, when the abbey Longchamp, like the monasteries of France, general, was abolished, and the buildings were demolished, the splendour of this place was destroyed; but under the consulate, when wealth dared to display itself openly, Longchamp recovered its ancient brilliancy, and again offered the French ladies an opportunity of exhibiting their dress. Tallien and Recamier were then the stars in the firmament of fashion and beauty. Under the empire government, the splendour of Longchamp was somewhat diminished, owing partly to Napoleon's contempt for frivolous exhibitions, partly to the wars, which withdrew great numbers of rich men from the capital. After the restoration, the promenade of Longchamp was almost wholly neglected. But more recently, it has again recovered some of its former splendour.

LONGEVITY. The extreme limit of human life and the means of attaining it, have been a subject of general interest, both in ancient and modern times, and the physiologist and political economist are equally attracted by the inquiry. It is for the exact biblical antiquities to decide in what sense we are to understand the word *year* in the scriptural sense of the antediluvians; whether it signifies a revolution of the sun or of the moon, or whether the extreme longevity is only the creation of tradition, in the sense which we now give to the word *year*. Accounts would make the constitution of man in the period referred to, very different from what it is at present, or has been, at any period from which observations on the duration of human life have been transmitted to us. The results of all these observations, in regard to the length of life in given circumstances, do not essentially differ. Pliny affords us valuable statistical information, if accurate, regarding the period at which he lived, obtained from an official, and, apparently, authentic *censoire* census, directed by the emperor Vespasian in the year 76 of the Christian era. From this we learn that, at the time of the computation, there were the part of Italy comprised between the *Apennines* and the Po, 124 individuals aged 100 years and upwards, viz. 54 of 100 years, 57 of 110, 2 of 122, 1 of 130, 4 of 135 to 137, and 3 of 140. At Parma there was living aged 120, and 2 aged 130; at *Verona*, female aged 132; and at a small town near *Patavia*, called *Velleiacium*, lived 6 persons aged 100 years each, and 4 of 120. These estimates, however, do not accord with those of *Ulpian*, who seems to have taken especial care to become acquainted with the facts of the case. His researches prove that the expectation of life in Rome, at that time, was not less than it now is in London, or in any of our cities. Hufeland, indeed, in his *Medicobiblical*, asserts that the

tables of Ulpian agree perfectly with those afforded by the great cities of Europe, and that they exhibit the probabilities of life in ancient Rome to have been the same as those of modern London. But as Mr F. Bisset Hawkins, in his *Elements of Medical Statistics* (London, 1829), says that the tables, kept by the censurs for 1000 years, and constituting registers of population, sex, age, disease, &c., according to Ulpian (who was a lawyer, and a minister of Alexander Severus), refer only to free citizens, and that, to draw a just comparison between Rome and London, it would be necessary to take, among the inhabitants of the latter city, only those who were similarly circumstanced, viz. those whose condition was easy, in which case, the balance would be greatly in favour of modern times. Mr Finlayson has ascertained, from very extensive observation on the decrement of life prevailing among the nominees of the exchequer, and other life annuities, granted by the authority of parliament, during the last 40 years, that the expectation of life is above 50 years for persons so situated which affords the easy classes of Britain a superiority of 20 years above even the easy classes among the Romans. The mean term of life among the easy classes of Paris is, at present, 42 years, which gives them an advantage of 12 years above the Romans. In the third century of the Christian era, the expectation of life in Rome was as follows:—From birth to 20, there was a probability of 30 years; from 20 to 25, of 28 years; from 25 to 30, 25 years; from 30 to 35, 22 years; from 35 to 40, 20 years; from 40 to 45, 18 years; from 45 to 50, 15 years; from 50 to 55, 9 years; from 55 to 60, 7 years; from 60 to 65, 5 years. Farther than this the computation did not extend. The census taken from time to time in Britain affords us information of an unquestionable character. The first actual enumeration of the inhabitants was made in 1801, and gave an annual mortality of 1 in 44.8. In France, the annual deaths were, in 1781, 1 in 29; in 1802, 1 in 30; in 1823, 1 in 40. In the Pays de Vaud, the mortality is 1 to 49; in Sweden and Holland, 1 to 48; in Russia, 1 to 41; in Austria, 1 to 38. Wherever records have been kept, we find that mortality has decreased with civilization. Perhaps a few more persons reach extreme old age among nations in a state of little cultivation; but it is certain that more die in infancy, and the chance of life, in general, is much less. In Geneva, records of mortality have been kept since 1540, which show that a child born there has, at present, five times greater expectation of life than one born three centuries ago. A like improvement has taken place in the salubrity of large towns. The annual mortality of London, in 1500, was 1 in 25; in 1751, 1 in 21; in 1801, and the four years preceding, 1 in 35; in 1811, 1 in 38, and in 1821, 1 in 40, the value of life having thus doubled, in London, within the last 80 years. In Paris, about the middle of the last century, the mortality was 1 in 20; at present, it is about 1 in 32; and it has been ascertained that, in the fourteenth century, it was one 16 or 17. The annual mortality in Berlin has decreased during the last 50 or 60 years, from 1 in 28 to 1 in 44. The mortality in Manchester was, about the middle of the last century, 1 in 20; in 1750, 1 in 25; 50 years afterwards, in 1811, the annual deaths were diminished to 1 in 44; and, in 1821, they seem to have been still fewer. In the middle of the last century, the mortality of Vienna was 1 in 20; it has since, however, improved in the same proportion as some of the other European cities. According to recent calculation it is, even now, 1 in 22, or about twice the proportion of that of Manchester, or Geneva. Many years ago, Mr Finlayson drew up the following table, to exhibit the difference in the

value of life, at two periods of the seventeenth and eighteenth centuries. Had it been calculated for 1830, the results would have been still more remarkable.

Age.	Mean Duration of Life, reckoning from		Notwithstanding the Increase of Mortality in the former Ratio of 100 to
	1600.	1700.	
Years.	Years.	Years.	
10	41.7	42.7	125
20	34.4	40.4	114
30	31.1	41.1	123
40	27.7	36.7	131
50	24.4	33.4	131
60	21.1	30.1	133
70	17.7	26.7	138
80	14.4	23.4	140

The following is the annual mortality of some of the chief cities of Europe and North America:—

Philadelphia,	1 in 45.08
Glasgow,	1 in 44
Manchester,	1 in 44
Geneva,	1 in 43
Boston,	1 in 41.20
London,	1 in 40
New York,	1 in 37.83
St Petersburg,	1 in 37
Charleston,	1 in 36.50
Baltimore,	1 in 35.44
Lisbon,	1 in 35
Berlin,	1 in 34
Paris, Lyons, Barcelona, and Strasbourg,	1 in 33
Nice and Palermo,	1 in 31
Madrid,	1 in 30
Naples,	1 in 29
Brussels,	1 in 26
Rome,	1 in 25
Amsterdam,	1 in 24
Vienna,	1 in 22

From Dec. 12, 1828, to Dec. 15, 1829, in London, the whole number of deaths was 23,520. The proportion of deaths, in different ages, was as follows:—

Under two years of age,	6710
Between two and five,	2347
Five and ten,	1019
Ten and twenty,	949
Twenty and thirty,	1563
Thirty and forty,	1972
Forty and fifty,	2094
Fifty and sixty,	2004
Sixty and seventy,	2153
Seventy and eighty,	1811
Eighty and ninety,	749
Ninety and one hundred,	95
One hundred and one	1
One hundred and eight,	2

On the average of eight years, from 1807 to 1814 inclusive, there died annually within the city of Philadelphia and the liberties, the following proportion of persons, of different ages, compared with the total number of deaths:—

	Per Cent
Under one year,	29.07
From one to two years,	10.71
Two to ten,	17
Ten to twenty,	10.90
Twenty to thirty,	8.61
Thirty to forty,	10.90
Forty to fifty,	5.75
Fifty to sixty,	5.75
Sixty to seventy,	1.99
Seventy to eighty,	1.7
Eighty to ninety,	1.99
Ninety to one hundred,	0.99
One hundred to one hundred and ten,	0.009

Another question of interest is the inquiry in what degree the various trades and professions are favourable to human life, or the contrary. Several statements have lately been published respecting this subject, but further and more copious observations are required, to afford satisfactory results. Literary

\* The *Literary Gazette* gives in a tabular form, the results of a work on this subject, from the pen of Mr. Theobald,

occupations do not appear to be more injurious to long life than many others. Many of the first literati, most distinguished for application throughout life, have attained old age, both in modern and ancient times. In the ancient authors, numerous instances of this kind are recorded, many of which may be found collected in the work of Hufeland, alluded to.

There are several essential circumstances which must combine, to give any individual a chance of exceeding the usual period assigned to human existence. These may be comprehended under the following heads: a proper configuration of body; being born of healthy parents; living in a healthy climate and good atmosphere; having the command of a sufficient supply of food; constant exercise; a due regulation of sleep; a state of marriage; and due command of the passions and temper.

Most of these particulars seem to be so well established, and are, in themselves, so apparent, that it seems hardly requisite to do more than mention them, to obtain the assent of the mind to their immediate reception. Thus, a deformed person can hardly expect a very long life, nor one born of unhealthy parents; neither can a person inhabiting an unhealthy city or district, expect to escape the dangers with which he is perpetually surrounded. There are some districts, both in Europe and America, where the inhabitants scarcely ever survive

thirty-five or forty years. And it is well known that some counties in England, particularly Shropshire, Devonshire, Warwickshire, and Yorkshire, are much more healthy than the rest; whilst Essex, Lancashire, and some parts of Kent, are, from the swamps rendered particularly noxious to human life. Tracts liable to be visited by severe epidemics, have seldom produced instances of long life.

It has been remarked, also, that certain families are gifted by Heaven with better stamina and strength, and, therefore, live longer. Quakers and persons of moderate passions, may be expected to be longer lived than others; but these, in the decline of life, are subject to accessions of low spirits and melancholy, so that they become inactive, and do not resist the attacks of disease. One very singular fact, and well established, is this, that no unmarried person has ever been known, at least in Great Britain, to exceed the age of 100 years. Keepers of the passions under due control, and bearing, with serenity and resignation, the evils of life, is a great means of attaining long life. Longevity is not confined to any nation or country, for instances of it are to be found all over the world; but they are more abundant in cold and temperate climates. Heat seems to relax and enfeeble the body as much; the heart, it may be conceived, is made to beat too rapidly, and the vital power is too soon expended. The vegetable diet, too, of hot countries

an eminent surgeon, of Leeds.—*Out-of-door occupations.* Butchers are subject to few ailments, and these the result of plethora. Though more free from diseases than other traders; they, however, do not enjoy greater longevity: on the contrary, Mr. Thackeray thinks their lives shorter than those of other men who spend much time in the open air. Cattle and horse-dealers are healthy, except when their habits are intemperate. Fish-mongers, though much exposed to the weather, are hardy, temperate, healthy and long-lived; cart-drivers, if sufficiently fed, and temperate, the same. Labourers in husbandry, &c., suffer from a deficiency of nourishment. Brickmakers, with full muscular exercise in the open air, though exposed to vicissitudes of cold and wet, avoid rheumatism and inflammatory diseases, and attain good old age. Pavlois are subject to complaints in the loins, increasing with age, but they live long. Chaise-drivers, postillions, coachmen, guards, &c., from the position of the two former on the saddle, irregular living, &c., and from want of muscular exercise, in the two latter, are subject to gastric disorders, and, finally, to apoplexy and palsy, which shorten their lives. Carpenters, coopers, wheelwrights, &c., are healthy and long-lived. Smiths are often intemperate, and die comparatively young. Rope-makers and gardeners suffer from their stooping postures.—*In-door occupations.* Tailors, notwithstanding their confined atmosphere and bad posture, are not liable to acute diseases, but give way to stomach complaints and consumption. The prejudicial influence of their employment is more insidious than urgent: it undermines rather than destroys life. Stay-makers have their health impaired, but live to a good age. Milliners, and dress-makers and straw-bonnet-makers are unhealthy and short-lived. Spinners, cloth-dressers, weavers, &c., are more or less healthy, according as they have more or less exercise and air. Those exposed to inhale imperceptible particles of dressings, &c., such as friziers, suffer from disease, and are soonest cut off. Shoemakers are placed in a bad posture. Digestion and circulation are so much impaired, that the countenance marks a shoemaker almost as well as a tailor. We suppose that, from the reduction of perspiration, and other evacuations, in this and similar employments, the blood is impure, and, consequently, the complexion darkened. The secretion of bile is generally unwholesome, and bowel complaints are frequent. In the few shoemakers who live to old age, there is often a remarkable hollow at the base of the breast-bone, occasioned by the pressure of the last. Curriers and leather-dressers are very healthy, and live to old age. Saddlers lean much forward, and suffer, accordingly, from headache and indigestion. Printers (our worthy co-operators) are kept in a confined atmosphere, and generally want exercise. Pressmen, however, have good and varied labour. The constant application of the eyes to minute objects gradually enfeebles these organs. The standing posture, long maintained here, as well as in other occupations, tends to injure the digestive organs. Some printers complain of disorder of the stomach and head, and few appear to enjoy full health. Consumption is frequent. We can scarcely feel or hear of any compositor above the age of fifty. The exhalation of the types is injurious. Book-binders, a healthy employment. Carvers and gilders look pale and weakly, but their lives are not abridged in a marked degree. Clock-makers are generally healthy, and long-lived; watch-makers, the reverse. House servants, in large smoky towns are unhealthy. Colliers and well-sinkers,—a class

by themselves,—seldom reach the age of fifty.—*Impurities producing dust, odour, or gas are extremely noxious.* These are all injurious, if they arise from animal substances, or from the fumes of wine or spirits. Tobacco manufacturers do not appear to suffer from the floating poison in their own sphere, but making is more pernicious. Men in all-mills are generally healthy. Brush-makers live to a great age, because in hostlers inspire ammoniacal gas, and are robust, healthy, and long-lived. Glue and size boilers, exposed to the most noxious stench, are fresh-looking and robust. Tallow-renderers also exposed to offensive animal odour, attain considerable age. Tanners are remarkably strong, and exempt from consumption. Corn-millers, breathing an atmosphere loaded with dust, are pale and sickly, and very rarely attain old age. Millmen can live long and must leave the trade in middle life. Tanners suffer from the dust, especially of green trees; but the injury is not permanent. Coffee-rovers become indolent and subject to headache and indigestion. Paper-makers often cannot endure the effect of the dust from cotton, to stop the paper. The author suggests the use of machinery in this process: the wet and wear and tear of the mills, they are not so much affected, but live long. Manners are short-lived, dying generally before forty. They inhale particles of sand and dust, of heavy weights, and are too often intemperate. Whisk distillers are short-lived. Machine-makers seem to suffer very little from dust they inhale, and the consequent bronchial irritation. Foundrymen are almost all unhealthy, and, therefore, short-lived. Founders (in brass) suffer from the inhalation of the volatilized metal. In the fumes of yellow brass, in particular, the evolution of oxide of zinc is very great. They seldom reach fifty years. Copper-smiths are also much affected by the fine scales which rise from the volatilized metal, and by the fumes of the sulphur, or other brassy. The men are generally unhealthy, suffering from disorders similar to those of the brass-founders. Foundryworkers are subjected to fumes from materials of iron, and sulphureous exhalations from the coke which they use. The exhalations, however, appear to be unwholesome, rather than injurious, as the men are tolerably healthy, and live to a considerable age. Tinsmiths, also, are subject only to transient inconvenience from the fumes of the soldering. Pewter-smiths are exposed to the volatile and noxious fumes of lead, a hurt from the process of casting. They are weakly and short-lived. House-painters are unhealthy, and do not generally attain full age. Chemists and druggists, in laboratories are sickly and consumptive. Pottery, suffered through the pores of the skin, become paralytic, and are remarkable subject to consumption. Hatters, grocers, butchers, and dress-makers (a dull association) also suffer through the skin, although the irritation occasions & wounds, they are not short-lived in the last class, fatal. Dyers are healthy and long-lived. Brewers are, as a body, far from healthy. Under a similar often florid appearance, they conceal chronic disease of the abdomen, particularly a congested state of the vesicular system. When these men are accidentally hurt or wounded, they are more liable than other individuals to severe and dangerous effects. Cooks and confectioners are subjected to venereal heat. Their common cooks are more unwholesome than butchers. Their great vices are generally unwholesome, and they are subject to indigestion, and their tempers rendered unwholesome. Glass-workers are healthy. Glass-blowers often are subject

does not seem so well calculated for giving the necessary degree of strength and elasticity to the fibre; for although in warm countries more children are to be men and women, yet, as the age of puberty comes on very early, they seldom exceed sixty years. This fact was ascertained, in China, in 1784, when Kien Long ordered all the oldest men in the empire to be brought before him, when, out of a population of two hundred millions, only four persons could be found, whose ages exceeded a hundred; whereas, in Russia, Norway, and other cold countries, instances of longevity are frequent. Thus, in Norway, in 1781, of 699, who died, 63 were 100 years old; and, in Russia, in 1811, of 726,278 persons, who died, 216 were 100 years old, and 220 had exceeded that age; and one, indeed, was more than 150. The districts of Arcadia, Etolia, and other parts of Greece, were formerly celebrated for instances of long life; and many of the most distinguished Greeks, such as Pythagoras, Plato, Sophocles, Pindar, &c., attained to a very advanced period of life.

In Italy, when a general census of the inhabitants was made in the year 79, by order of the emperor Vespasian, lord Bacon says there were then living, between the river Po and the Apennines,

54 — 130		8 — 130
57 — 110		1 — 125
9 — 110	Parosetta	1 — 111
6 — 110	Parosetta	6 — 111
4 — 105		6 — 120
7 — 105		1 — 117
3 — 100	Rimini	1 — 130

The bills of mortality, in Pinnak, in Russia, showed, as follows:—

5	perkins	110
6	-	111
7	-	112
8	-	113
9	-	114
10	-	115
11	-	116

The climate of the British islands is very friendly, in general, to the human body; and, in proportion to their size and population, show almost more instances of long life than any other country. Carew, the historian of Cornwall, says, that in that country its inhabitants frequently reach 90 with unimpaired strength of body and mind: but these are the farmers; for the miners seldom live more than 40 years, the fumes of the sulphur, copper, and arsenic, and the damp, killing them all of consumption. But Brown, the Cornish beggar, lived to be 120; and a man, called Polemo, to 130. In Scotland, old age is common; 12 persons, in the lower parts of Galloway, were living, a few years ago, of from 100 to 115 years of age. Old William Marshall, a tinker, walked through that county, at 118, with all his faculties perfect. In Montrose, too, in 1812, there were five persons alive from 100 to 110. Small islands and peninsulas, if quite free from marshes, are generally very favourable to long life, and in all latitudes. In the Bermuda islands, many natives reach 100 and more; and in the hurricane at Barbadoes, in 1789, four people were killed who were above 100, and one of 115. Madeira has always been noted for its healthy climate; and a new born infant's chance of life, is there about thirty-nine years, or about a third more than that of one in London. Martin, in his description of the Western islands, speaks of a person in the island of South Uist, aged 130, retaining his appetite and understanding; and also of one Gilbert McCraw, in the island of Jura, who spent 180 Christmases in his own house.

Here follows a list of the names of some of the best known instances, with the domiciles, and authorities annexed.

[illegible]

NAME.	AGE.	PLACE.	DATE.	AUTHORITY.
John Jacob . . . . .	121	Mount Jura . . . . .	1790	All the public prints

**LONGIMETRY**; the measuring of lengths or distances, both accessible and inaccessible. Accessible distances are measured by the application of some measure a certain number of times, as a foot, chain, &c. And inaccessible distances are measured by taking angles, &c., by means of proper instruments, as the *circumferentor*, *quadrant*, *theodolite*, &c. This embraces a great number of cases, according to the situation of the object and observer.

**LONGINUS**, Cassius; a Platonic philosopher and

celebrated rhetorician of the middle of the 3d century, A. D. According to some accounts he was born at Emesa, in Syria; according to Rambert Athens was his birth-place. Greek literature was the principal subject of his studies. At Athens, Athens, etc., he attended the lectures of the most distinguished scholars. He studied the Stoic and Peripatetic systems of philosophy, but subsequently became an ardent adherent of the Platonists, and annually celebrated the birthday of its founder, by a

baquet. His principal attention was directed, however, to the study of grammar, criticism, eloquence, and antiquities. At the invitation of queen Zenobia, he went to Palmyra to instruct her in Greek learning and to educate her children. He was likewise employed by her in the administration of the state, by which means he was involved in the fate of this queen. For when Zenobia was taken prisoner by the emperor Aurelian, and could save her life only by betraying her counsellors, Longinus, as the chief of them, was seized and beheaded, A. D. 273. He suffered death with all the firmness of a philosopher. Of his works, among which were some philosophical ones, none is extant, except the treatise *On the Sublime*, which goes under his name, and was in a state of mutilation. It illustrates, with great acuteness and taste, the nature of the sublime in thought and style, by rules and examples. The first editions are those of Pearce (1724), of Toup and Lushington (Oxford, 1778). Benj. Weiske's edition appeared at Leipzig, 1800. There is an English translation of it by Wm. Smith. Longinus is usually called *Dionysius*, but this has arisen from the negligence of editors. The manuscript copy of the treatise *On the Sublime*, in Paris, and one in the Vatican, bear the inscription in Greek, *By Dionysius or Longinus*, which appeared in the first printed copies as *Dionysius Longinus*. The Florence manuscript bears the inscription *Anonymous*. Some critics have ascribed the work to Dionysius of Halicarnassus, others to another Longinus, while others confess that the author is uncertain.

**LONG ISLAND**, or **NASSAU ISLAND**; an island belonging to the state of New York, extending 30 miles in length, and varying from ten to twenty miles in breadth. On the west, it is divided from Staten Island by the Narrows, and from Manhattan Island by the East river. On the north, East river and Long Island sound separate it from the mainland. Its eastern extremity is Montauk point. On the south, it is washed by the ocean. Lon 71° 47' 33" 57' W.; lat. 40° 34' to 41° 10' N. Like other insular positions, its climate is more mild than that of the adjacent continent. The island is divided into three counties—King's, Queen's and Suffolk. Long Beach is the principal port. The south side of the island is flat land, of a light, sandy soil, bordered, on the sea coast with large tracts of salt meadows. The soil, however, is well calculated for raising grain, especially Indian corn. The north side of the island is hilly, and of a strong soil, adapted to the culture of grain, hay, and fruits; and the western part is remarkably adapted to the growth of wood, and supplies, in great part, the city of New York with this article. This ridge forms Brooklyn and other heights, known in the revolutionary war, as principal towns and villages on the island are Brooklyn, Jamaica, Sag Harbor, Flatbush, Flushing, Jamaica and Huntington.

**LONG ISLAND SOUND**; a bay, from three to thirty-five miles broad, and about 120 long, extending the whole length of Long Island, and dividing it from Connecticut. It communicates with the ocean on both ends, and may be considered as extending from New York on the west to Fisher's Island on the east. On its northern shore are the towns of Greenwich, Stamford, Fairfield, Bridgeport, Milford, New Haven, Saybrook, New London, Stonington, &c. on the Connecticut, Housatonic, Thames, and other rivers.

**LONGITUDE**, **geographical**; the distance measured, according to degrees, minutes, seconds, upon the equator, or a parallel circle, from one place to another, which is called the first, or the meridian. Longitude is divided into eastern

and western. It is altogether indifferent through what point we draw the first meridian, but it must be settled what point we adopt. In Germany, the Island of Ferro (q. v.) is generally adopted; in France, the observatory at Paris; in Britain, that of Greenwich; in Berlin, that of Berlin; in the United States, the meridian of Washington is sometimes taken as a first meridian. Some geographers reckon from the first meridian 180 degrees west, and the same number east; others, on the contrary, reckon the longitude from the west to the east, the whole length of the equator, to 360 degrees. The longitude of any place, together with the latitude, is requisite for the determination of the true situation of the place upon the earth. From the form of our earth, it follows that the degrees of longitude must always decrease towards the poles. The degrees of latitude, on the contrary, are all taken as equal to each other, and each amounts to sixty geographical miles. The measure of a degree of longitude upon any parallel of latitude is found by multiplying the length of a degree on the equator by the co-sine (taking radius equal to 1) of the latitude of the parallel. The longitude shows the difference of time between any place and the first meridian. The sun performing his apparent revolution in twenty-four hours, a place which lies fifteen degrees farther to the west than another, will have noon one hour later. Places whose difference of longitude amounts to 180° have opposite seasons of the day, since in the one place it is mid-day, and in the other, at the distance of 180°, it is midnight at the same moment. The difference in longitude of any two places may be also determined by observations of the time of certain celestial phenomena, taken at both places, such as eclipses of the moon, occultations of fixed stars, and, in particular, the eclipses of Jupiter's satellites; and, *vice versa*, we can, from the difference of longitude of two places, accurately ascertain the difference of their time. 15° upon the parallel circle corresponding to one hour, 1° gives 4' of time, 15 give 1° of time, 15 give 1° of time, &c. The difference of longitude between Boston and London may serve as an example. This difference is 71°, 4', 0"; consequently, noon at London is four hours, forty-four minutes, and six seconds earlier than at Boston. The determination of longitude at sea, at any moment, is highly difficult and important. The British parliament, in 1714, offered a reward of £20,000 for an accurate method of finding the longitude at sea, within one half of a degree; but this act was repealed July 15, 1828. A watch which should preserve a uniform motion, was the most suitable means that could be afforded to the navigator, who might, from the difference of the time of noon on board the ship, and the time by the watch immediately determine the difference between the longitude of the place for which the watch was regulated, and that wherein the ship then was. Harrison was the first who invented a chronometer of the requisite accuracy. Upon the first voyage, it deviated only two minutes in four months. Other artists followed, namely, Kendall, Mudge, Berthoud, Le Roy, &c.; and Arnold and Emery have lately prepared such accurate chronometers, that they have been used for the determination of longitude upon land, as well as at sea, with great success. Nevertheless, astronomical observations furnish the most exact methods of determining longitude. As eclipses and occultations are comparatively rare, and are somewhat difficult of calculation, the distances of the moon from the sun or some of the fixed stars have been adopted for the calculation of longitude, because these can be measured almost every night, and an accurate knowledge of the moon's orbit is the only thing requisite thereto.

*Longitude* in the heavens, as that of a star, &c., is an arc of the ecliptic comprehended between the first of Aries, and a circle perpendicular to the ecliptic, passing through the place of the star. The computation is made according to the signs of the ecliptic. The longitude of a star is found by means of its right ascension and declination. It changes on account of the precession of the equinoxes. See *Equinox*, and *Precession*.

LONGUS, author of a Greek pastoral romance, the subject of which is the loves of Daphnis and Chloe probably lived in the time of Theodosius the Great. Nothing is known of the circumstances of his life, nor is he mentioned by any of the ancients. His work is interesting by its poetical spirit, graphic description, and style. The earlier editions, of which Villosion's is the best, do not contain the work in so complete a state as that of Courier (Paris, 1810). He supplied, from a Florentine manuscript, an important cuasm, but, having taken a copy of it, was careless or mean enough to render the page of the manuscript which contained that narration, illegible by an enormous ink-spot. This spot, the librarian, Del Furia, justly indignant, has laid before the eyes of the public in an engraving, with an account of the whole affair.

LONGWOOD. See *St Helena*.

LOO-CHOO, or LIEOU-KIEOU, or LEW-CHEW; a group of islands in the Pacific ocean to the south of Japan and east of China, to which they are tributary. Lat.  $20^{\circ}$  to  $27^{\circ}$   $40'$  N.; lon.  $127^{\circ}$   $10'$  to  $129^{\circ}$  E. But little was known to us of these islands until they were visited by Maxwell and Hall, on their return from the embassy to China. (See Hall's *Voyage to Corea and Loo-Choo*.) They are represented as having a mild climate and an excellent soil, abounding in fruits and vegetables. The voyagers who have touched have been allowed to land only under the most jealous precautions, and have never been permitted to enter the country. In other respects, they have been kindly treated and supplied with provisions, for which the islanders have uniformly refused to receive pay. Captain Hall paints the islands as a new Arcadia, in which the use of arms, money, and punishments is unknown. It is manifest that little reliance is to be placed on the accounts of travellers, who were ignorant of the language of the Loo Chocans, and whose intercourse with them was evidently subject to all the restraints of a most vigilant and despotic police. In fact, the statements of Captain Hall on several points have been contradicted by the last voyager who has visited these islands (Beechey, *Voyage in the Pacific*, London, 1831), who asserts that the Loo-Chocans have arms and money, and inflict the most severe and cruel punishments. As for the supplies, they appear to have been furnished by authority, and not by individuals, and the refusal to receive compensation is easily accounted for, on the ground that the government which shows such an aversion to strangers is unwilling to suffer any traffic between them and its subjects. They were for some time subject to Japan, but, in 1372, were conquered by China.

LOOK-OUT; a cape on the coast of North Carolina, in lat.  $34^{\circ}$   $34'$  N.; N. E. of cape Fear, and S. W. of cape Hatteras.

LOON (*Columbus*; large aquatic birds, common to both Europe and America. They seldom visit Britain, but are met with in the north of Europe and Asia. In America, they are most numerous about Hudson's bay, but are also found farther south. In Pennsylvania, they are migratory, making their appearance in the autumn. They are commonly seen in pairs, and procure their food, which is fish, by diving and swimming under water for a length of

time. They are very wary, and are seldom killed, eluding their pursuers by their great activity in plunging beneath the water. They are very restless before a storm, always uttering loud cries on its approach of a tempest. They are not eaten, as flesh being rank and fishy. Some of the tribes of the Russian empire tan the skin which covers the base of this fowl, and form dresses, &c. of it, which are very warm, and imbibe no moisture. The sea-landers also make the same use of them. The male measures two feet ten inches from the tip of the bill to the end of the tail, and four feet six inches in breadth: the bill is strong, of a ebony black, an four inches and three quarters long, to the corner of the mouth. The head and base of the nape of the neck are of a deep black, with a greenish purple reflections; this is succeeded by a line consisting of interrupted white and black bars, which encompasses the neck, and tapers to a point at its fore part, without joining; below this is a band of dark glossy green and black, which is blended behind with the plumage of the neck. The whole of the upper parts are of a deep black, slightly glossed with green, and thickly spotted with white in regular transverse or semicircular rows, the end on the end of each feather; the lower parts are all white, with a slight dusky line across the vent. The outside of the legs and feet is black, the inside is colour. The leg is four inches in length; both the feet are marked with five-sided pyramidal spots, each about eight to ten pounds. The female is somewhat smaller than the male, and differs in her colour. The young do not attain their perfect plumage until a second or third year. It should be remarked, however, that Temminck and the prince of Saxe-Gotha state that the two sexes are alike in plumage, with men who reside on the coast where there is plenty, insist, on the contrary, that the males of the sexes may always be distinguished by their plumage. The female lays two large brownish eggs, and generally builds at the edge of small islands or the margins of lakes and ponds. In swimming and diving the legs only are used, and not the wings, as in a guillemot and auk tribes; and, from their being situated far behind, and their slight descent on the line of the body, the bird is enabled to pass itself through the water with great velocity.

LOOS, DANIEL FREDERICK, a celebrated draftsman, was born at Altonburg, in Saxony, in 1734. Stüeler, the royal die-cutter, took him as an apprentice, but kept him back from January 1750, and never, finally went to Dresden, where he worked in the mint, but his merits were here soon known by his employer. After many vicissitudes, he was employed in the Prussian service at Magdeburg, where he was unable to maintain his family, and spent some time in poverty, in Berlin. His poverty was last acknowledged. In 1787, he became member of the academy of fine arts, and produced a great number of medals. Proficiency of style and drawing were not so much required in Prussia as in France or Germany, but his successors have highly valued him in technical skill. Loos died in 1818. He is one of the chief officers of the Berlin mint.

LOPE DE VEGA (*Don Lope Felix de Vega Carpio*; Frey, as he is often called, sometimes celebrated dramatic poet, was born at Madrid, September 25, 1562. When a child, he displayed a lively taste for poetry, made verses before he knew how to write, and, as he himself avers, had composed several theatrical pieces, when scarcely seven years of age. About this time, he ran away from home with a comrade, for the purpose of serving the king, but was stopped at Astorga, and sent back by the authorities of the place, to Madrid. Lope early in

his parents, but was enabled, by the assistance of Avila, bishop of Alcalá, to complete his studies. He afterwards found a patron in the duke of Alva, at Madrid. Encouraged by this Mecenas, whose secretary he became, he composed his *Arcadia*, a heroic pastoral in prose and verse, of which Montemayor had given an example in his *Diana*. The *Arcadia* is an idyl, in five acts, in which the shepherds, with their *Dulcineas*, speak the language of Amadis, and discuss questions of theology, grammar, rhetoric, arithmetic, geometry, music, and poetry. Inscriptions are also introduced upon the pedestals of the statues of distinguished men in a saloon, in which a part of the action takes place. This work proved the various acquisitions of the author. Conceits and quibbles are frequent in this, as in Lope's other writings. In general, he is one of those writers who set a dangerous example of that false wit, a taste for which extended almost all over Europe. Marino particularly introduced it into Italy, and acknowledged, with lively expressions of admiration, that Lope had been his pattern. After the publication of his *Arcadia*, Lope married. He appears, however, to have cultivated the poetic art with increasing zeal. A nobleman of rank having made himself merry at Lope's expense, the poet revenged himself upon this critic, and exposed him to the laughter of the whole city. His opponent challenged him, and was dangerously wounded in the encounter, and Lope was obliged to flee to Valencia. After his return to Madrid, the loss of his wife rendered a residence in that place insupportable to him. In 1584, therefore, he served in the invincible armada, the fate of which is well known. During this expedition he wrote *La Hermana de Angelica* (the Beauty of Angelica), a poem in twenty cantos, which continues the history of this princess from the time in which Ariosto left it. By this work he hoped to do honour to his country, in which, as he learned in Turpin, the succeeding adventures of the heroine occurred. In addition to the peril of rivalry with Ariosto, the difficulty of success was increased by the appearance of a poem upon the same subject, by Luis Borbono de Soto, under the title *Las Lagrimas de Angelica*, which passed for one of the best poems in the Spanish language, and was honourably mentioned in Don Quixote. In 1590, Lope returned to Madrid, and again entered the married state. In 1598, he obtained one of the poetical prizes, offered on the occasion of the canonization of St. Isidore. This prize poem he published with many other poems, under the name of *Tomo de Burguillos*. About this time, he also composed a great number of pieces for the theatre. His literary fame increased, and his domestic situation made this the happiest period of his life. But he lost his son, and soon after his wife, and had only a daughter left. He now sought consolation from religion, and became a priest and secretary of the inquisition. His devotion, however, did not interfere with his poetical studies, and he still endeavoured to maintain the distinguished rank which he had taken upon the Spanish Parnassus, and to repel the attacks of his foes and his rivals, among whom Luis de Gongora y Argote was the most distinguished. Lope, who had been attacked in his satires, and who was indignant at the corruption of taste produced by him, allowed himself to ridicule his obscure and affected style, and that of his pupils, although, in his poem *Laurel de Apolo*, he acknowledges the talents of Gongora. But Gongora's corrupt taste infected even his opponents, and it must be confessed that Lope's last works are not entirely exempt from it. Another yet more distinguished assailant was Cervantes, who publicly advised him, in a sonnet, to

leave the epic poem, upon which he was then engaged—*Jerusalem conquistada*—unfinished. Lope parodied this sonnet, and published his poem, the weakest of his performances. He accompanied it with many remarks, which are all found in the last edition of 1777. Cervantes acknowledged his merits, however, in the following verses:

"Poeta insigni, a cuyo verso o prosa  
Ninguno le aventaja ni aun le llega."

(A distinguished poet, whom no one, in verse or prose, surpasses, or equals.) Cervantes died soon after (1616), in poverty, in the very city in which his rival lived in splendour and luxury, and in the possession of the public admiration. How differently has posterity judged of these two poets! For 200 years, the fame of Cervantes has been increasing, while Lope is neglected in his own country. About the time of Cervantes' death, the enthusiasm of the Spaniards for Lope approached to idolatry, and he himself was not wise enough to reject it. The number of his poetical productions is extraordinary. Scarcely a year passed in which he did not print a poem, and, in general, scarcely a month, nay, scarcely a week, in which he did not produce a piece for the theatre. A pastoral, in prose and verse, in which he celebrates the birth of Christ, established his supremacy in this branch; and many verses and hymns on sacred subjects bore testimony to his zeal for the new calling to which he had devoted himself. Philip IV., who greatly favoured the Spanish theatre, when he ascended the throne, in 1621, found Lope in possession of the stage, and of an unlimited authority over poets, actors, and the public. He immediately loaded him with new marks of honour and favour. At this time Lope published *Los Triunfos de la Fe*; *Las Fortunas de Diana*, novels in prose, imitations of those of Cervantes; *Circe*, an epic poem, and *Phylamela*, an allegory, in which, under the character of the nightingale, he seeks to revenge himself upon certain critics, whom he represents under that of the thrush. His celebrity increased so much that, suspicious with respect to the enthusiasm which had been shown for him, he printed the work *Soliloquios a Dios*, under the assumed name, N. P. Gabriel de Valdepeño (an anagram of Lope de Vega de Carpio), which likewise obtained great applause. He afterwards published a poem on the subject of Mary Stuart, viz. *Corona tragica* (the Tragic Crown), and dedicated it to pope Urban VIII., who had also commemorated the death of this queen. The pope wrote an answer to the poet with his own hand, and conferred on him the title of doctor of theology; he also sent him the cross of the order of Malta—marks of honour which, at the same time, rewarded his zeal for strict Catholicism, on which account he was also made a familiar of the inquisition. All this contributed to support the enthusiasm of the Spaniards for this "wonder of literature." The people for whom he wrote, without regard to criticism (for he says in his strange poem, *Arte de hacer Comedias*, that the people pay for the comedies and, consequently, he who serves them should consult their pleasure), ran after him whenever he made his appearance in the street, to gaze upon this prodigy of nature (*monstruo de naturaleza*), as Cervantes called him. The directors of the theatre paid him so liberally, that at one time he is said to have possessed property to the amount of more than 100,000 ducats; but he was himself so generous and charitable, that he left but little. The spiritual college in Madrid, into which he had been admitted, chose him president (*capellan mayor*). In common conversation, any thing perfect in its kind, was called *Lopon*. Until 1633, he continued without interruption to produce poems and

plays. At this period, however, he occupied himself with religious thoughts, and devoted himself strictly to monastic practices, and died August 26 of the same year. The princely splendour of his funeral, of which the duke of Susa, the most distinguished of his patrons, and the executor of his will, had the direction, the great number as well as the tone of the panegyrics, which were composed for this occasion, the emulation of foreign and native poets to bewail his death, and to celebrate his fame, presented an example altogether unique in the history of literature. The splendid exequies continued for three days, and ceremonies in honour of the Spanish Phoenix were performed upon the Spanish stages with great solemnity.

The number of Lope's compositions is astonishing. It is said that he printed more than 21,300,000 lines, and that 800 of his pieces have appeared upon the stage. In one of his last works, he affirmed that the printed portion of them was less than those which were ready for the press. The Castilian language is, indeed, very rich, the Spanish verses are often very short, and the laws of metre and rhythm are not rigid. We may, however, doubt the pretended number of Lope's works, or we must admit, that, if he began to compose when thirteen years of age, he must have written about 900 verses daily, which, if we consider his employments, and the interruptions to which, as a soldier, a secretary, the father of a family, and a priest, he must have been subject, appears inconceivable. What we possess of his works amounts to only about a fourth of this quantity. This, however, is sufficient to excite astonishment at his fertility. He himself informs us that he had more than a hundred times composed a piece and brought it on the stage within twenty-four hours. Perez de Montalvan asserts that Lope composed as rapidly in poetry as in prose, and that he made verses faster than his amanuensis could write them. He estimates Lope's plays at 1800, and his sacramental pieces (*Autos sacramentales*) at 400.

Of his writings, his dramatic works are the most celebrated. The plots of those that approach nearest to the character of tragedy, are usually so extensive, that other poets would have made, at least, four pieces of them. Such, for instance, is the exuberance found in *La Fuerza lastimosa*, which obtained the distinction of being represented in the seraglio at Constantinople. In fertility of dramatic invention, and facility of language, both in prose and verse, Lope stands alone. The execution and the connexion of his pieces are often slight and loose. He is also accused of making too frequent and uniform a use of duels and disguises (which fault, however, his successors committed still more frequently), and of freedom in his delineations of manners. Some (lord Holland, for instance) have attributed to him also the introduction of the character termed *gracioso*, upon the Spanish stage. In those irregular pieces which Lope composed for the popular taste, we find such bombast of language and thought, that we are often tempted to conclude that he intended to make sport of his subject and his hearers. The merit of the elaborate parts of his tragedies consists particularly in the rich exuberance of his figures, and, according to the Spanish critics, the purity of his language. In judging of his boldness in treating religious affairs, we must take into consideration the character of the nation, and the nature of the Spanish stage. Many foreign dramatic writers, we may add, have imitated Lope, and are indebted to him for their best pieces and touches. Schlegel, in his lectures on the drama (*Vorlesungen über dramatische Kunst*), says of Lope—"Without doubt, this writer, sometimes too much extolled, sometimes too much undervalued, appears

in the most favourable light in his plays; the defect was the best school for the correction of his two capital faults, viz. defective construction, and a useless display of learning." In some of his pieces, especially the historical, which were founded upon old romances and traditions, a certain rudeness of manner predominates, which is by no means correct of character, and seems manifestly to have been chosen for the subjects. Others, which display the manners of the time, display a cultivated taste. They all contain much humour and interesting action, and probably there are few which, with our exceptions, would not be well received, even at the present day. Their general faults are the want of closeness of plot and negligent execution. They are deficient in depth, and in those fine qualities which constitute the mysteries of the art. A *Tratado de las Obras sueltas asi en Prosa como en Verso de Lope*, &c., appeared at Madrid, 1776, 4to. (see 4to.) This does not contain his plays, however, which were published at an earlier date, viz. 1740. Concerning his life, of which his poetical works give, perhaps, the most valuable information of writings, consult the work of lord Holland, *Account of the Life and Writings of Lope de Vega Carpio* (London, 1817, 2 vols., 8vo.).

LORD; of uncertain etymology; a title of honour or dignity, used in different senses. In the best times, lord (*seigneur*) was the granter or proprietor of the land, who retained the dominion or sole property of the feud or fee, the use only being granted to the tenant. A person who has the fee of a manor and consequently the homage of his tenants is called the lord of the manor. In these cases, the lord or barony was connected with the superior right of jurisdiction. The superior lord is styled *lord paramount*, and if his tenants again grant a piece of land to other persons, they being tenants in fee to the lord paramount, and lords in reference to their own tenants, are called *mesne or intermediate lords*. Lord is also a mere title of dignity annexed to certain official stations, which are hereditary, but sometimes only official or honorary, who are noble by birth or creation, that is, the peers of Britain, are called lords; the five nobles constitute the lords temporal, a distinction from the prelates of the church, who are spiritual, both of whom sit together upon the lords. (See *Peers*.) It is sometimes applied to a title, as *lord advocate*, *lord mayor*, &c. It is also applied, but only by courtesy, to the heads of families and marquises, and to the eldest sons of peers.

In Scripture, the word LORD, when printed in capitals, in the Old Testament, is a translation of the Hebrew *Adonai*, which the Jews were accustomed to substitute in reading, and even in writing, for the ineffable name *Jehovah* (q. v.). In the New Testament it is applied to Jesus (Christ, the term, as the Greek, being *κύριος* (owner, master).

LORDS, HOUSE OF. See *Parliament* in article *Britain*.

LORD'S SUPPER; a ceremony among Christians by which they commemorate the death of the founder of their religion, and make, at the same time, a profession of their faith. Jesus Christ instituted the rite when he took his last meal with his disciples. The bread, which he broke after the manner of a supper, was a fitting symbol of his body, which was to be broken; and the red wine (the price of his blood) used this kind of wine, which is the most common in Palestine) was a significant symbol of his blood. In all the churches founded by the apostles, the usage was introduced. In the first and second centuries, this rite was celebrated in connection with the *agape* (q. v.) or *love-feast*. After the third century

when the congregations became more numerous, the *agapes* ceased, and the Lord's supper was from thence celebrated on the occasion of every divine service in the churches, in such a way that all present could partake, with the exception of catechumens (i. e. Christians not yet baptized), and of unbelievers. These were obliged to withdraw when the celebration of the Lord's supper commenced, because communion was considered as a mysterious act, which was to be withheld from profane eyes. Christians soon began to ascribe supernatural power to the rite, and to take the consecrated bread and wine for more than bread and wine, and to maintain that the body and blood of our Saviour were united with them. From this originated the doctrine of transubstantiation, which was started by Parrhasius Radbertus, in the ninth century. Though this doctrine was at first opposed (see *Berengarius*), yet it was soon generally received, and, in 1215, solemnly confirmed by pope Innocent III., in the fourth Lateran council. From the new doctrine sprang the adoration of the host (in which God was present, according to the new belief), as well as the custom of refusing the cup in the communion to the laity, because it was supposed, that, where the body of Christ was, his blood must be too (*concomitance*), whence the use of the wine was not necessary for the reception of the communion. This refusal was, also, partly owing to a desire of avoiding every occasion whereby the blood of Christ might be incautiously spilled, and become profaned; and partly to the efforts of the clergy to establish a distinction in their own favour. Even before the origin of the doctrine of transubstantiation, the Lord's supper had begun to be represented as a sacrifice. From this sprang the private mass. (See *Mass*.) After the notion of purgatory had become prevalent, this doctrine was connected with the above-mentioned conception of the communion as a sacrifice, and now masses were said chiefly for the purpose of delivering the souls of the deceased from purgatory. As early as the seventh century, private masses were celebrated in various places; after the ninth century, they were in use every where. Thus the Lord's supper had become, in the course of time, something quite different from the design of its founder. This had been contended previous to the reformation, by some parties dissatisfied with the ruling church, especially by the Hussites (see *Hussites*, in article *Huss*), in the fifteenth century, to whom indeed the council of Bale was obliged to allow the use of the cup in the communion. The reformers renewed the complaint, that the church had deviated, in the celebration of the Lord's supper, from the purpose of Christ, and the example of the apostolic age, and both the German and Swiss reformers agreed in rejecting the doctrine of transubstantiation and the mass, and maintaining, that the Lord's supper ought to be celebrated before the whole congregation, and with the administration of both bread and wine. In explaining the words by which the supper was instituted, Luther and Zuinglius differed, and their different opinions on this subject formed the principal subject of the unhappy dissension between the Lutheran and Calvinistic churches. Luther took the words, "This is my body," &c., in their literal sense, and thought that the body and blood of Jesus Christ were united, in a mysterious way, with the bread and the wine, so that the communicant receives, with and under (*cum et sub*) the bread and wine, the real body and real blood of the Redeemer. Zuinglius, on the other side, understood the words in a figurative sense, and supposed that Jesus Christ meant to say, "The bread and the wine represent my body and my blood," and maintained, therefore, that the bread and wine were mere signs of the body and the blood of Christ.

From this difference of opinion arose a violent dispute between Luther and Zuinglius, which, in later times, has been continued between the Lutheran and Calvinistic divines. The opinion advanced by Calvin, by which a spiritual presence of the body and blood of Christ is supposed in the communion, though it came nearer to the Lutheran doctrine than that of Zuinglius did, yet was essentially different, and, therefore, also met with a strong opposition from the strict adherents of Luther. Melancthon inclined to the Calvinistic notion, and so did many other Lutheran divines, who were called by the opposite party *Philippists* and *Crypto-Calvinists*. The *formula concordia*, or articles of religious peace, suppressed the *Crypto-Calvinists* in the greater part of the Lutheran church, and established the idea of Luther. In recent times, many Lutheran divines have inclined to the Calvinistic doctrine. The Greek church has not adopted the doctrine of transubstantiation in its whole extent; yet her doctrine comes nearer to this dogma than to that of the reformed church. The Oriental Christians differ also from the Western, in using leavened bread in the Lord's supper, and in administering it to children. See *Greek Church*.

[The doctrine of the Lord's supper has given rise to such long and bitter contention between Catholics and Protestants, that the following remarks, written by a Catholic, and giving the Catholic views on this subject, may not be uninteresting to our readers.] The Catholic doctrine of communion (says the writer) cannot be understood without a clear insight into the fundamental views of the Catholic church on all sacred things. He, to whom Christianity is not an external revelation of the Deity, to whom Jesus is not the incarnate God, and his doctrine not divine truth higher than all human conceptions, who regards not the church as a divine institution, and her traditions as indisputably true, cannot enter into the Catholic views on the communion. It must be particularly considered, that Catholic Christianity is of a truly mystic nature. By *mysticism* we mean not the capricious imaginations of each individual, but the universal mystical belief of the church. Of these mysteries the sacrament of communion is the highest, and is the central point of all the institutions of the Catholic church. In all religions, we find the idea of a sacrifice, which man offers to the Deity, by which he acknowledges a relation between himself and the Deity, and endeavours to represent the devout spirit of religion by an act of external worship. The purer this idea of a sacrifice is, the purer is the religion. It was reserved for Christianity to give it its highest reality and greatest purity. In the prophecies relating to the Messiah, it is said, that he shall be a priest after the order of Melchisedek (*Psalms* cx. 4); but this Melchisedek was a priest of the Most High, who offered bread and wine. (*Gen.* xiv.) How then was this prophecy fulfilled? Malachi predicted that the sacrifices of the ancient law would be abolished, and supplied by a pure meat-offering. (*Malachi* i. 11.) The incarnate God walked in the flesh among mortals, teaching and working miracles. After having performed the miracle of multiplying the loaves, he delivered a part of his mysteries (*John* vi. 48—56; *1 Corinthians* xix. 16; *Luke* xxii. 19, 20; *Mark* xiv. 22—29; *Math.* xxvi. 26—28.) It is easily perceived that this rite must have been coeval with the foundation of his religion, and that the apostles every where introduced it and made known its signification. But what the apostles have introduced and preached we learn only by tradition. This tradition, however, tells us that the ordinance of Christ was meant literally. The Lord (proceeds the writer) remained in his church: in the congregations of the Christians, the

body and the blood of the Saviour were offered and tasted in the shape of bread and wine. This was the belief of the church from the beginning; and it cannot be shown that it commenced at any particular time, or supplanted another doctrine. The clearest proof of this, that a similar doctrine, even if it be not the same doctrine of transubstantiation is to be found in all the churches, which long since separated from the Catholic. This rite is in remembrance of the death and the resurrection of Jesus. But how (says the writer) can we sin against the body and the blood of Jesus? How can we take it at all unworthily, if the whole ceremony is a mere act of commemoration? To what purpose would be the admonition, "This is in remembrance of me," if there was no meaning attached to it but that of a participation in the fruits of Jesus' death by an act of commemoration? The memory of Jesus is essentially connected with all the benefits of his religion. Further, as soon as we admit of a real presence of Jesus in the eucharist, we must be ready to concede, also that the bread and wine cease to exist in reality, though they remain still in appearance. That which really exists, is the sacramentally (not visibly) present body and blood of Christ. By a miracle of the Omnipotent, a change is effected, and this we call *transubstantiation*. It has been proved already by Leibnitz, that there is no philosophical contradiction in this, and we find it the principle of a whole philosophical school, the sceptics, to dispute the real existence of appearances. Even the oldest Christian fathers, not only in sermons, but in passages explanatory of their doctrines, and destined for the instruction of the catechumens, expressed themselves in such a way as to show us that the first Christians were not only convinced of Christ's being present through our belief, but also that the bread or wine no longer existed. Justin Martyr, endeavouring to give the emperor a notion of the religion of the Christians, after describing the ceremony of consecration, says, "We eat this not as common bread, and drink this not as common wine; but as Jesus Christ, after having been made man by the word of God, had flesh and blood, so we believe also, that the food consecrated by his words, has become the flesh and blood of the man Jesus." (*Acts 1*.) We know also, the Christians were accused, by the pagans, of eating, in their secret assemblies, the flesh of an infant—a notion which certainly took its rise from their doctrine of the Lord's supper, of which the former might have heard some obscure account. The Christians, in general (continues the writer), kept this doctrine very secret (*disciplina arcani*). If they believed that they received Christ only through faith, it is not easy to see why they made such a mystery of it. But this they did, and instructed their catechumens in this doctrine but a short time before their baptism. The dogma of transubstantiation is as old as the communion itself, and was by no means first set up by Parrisius Radbertus in the ninth century, as is commonly asserted by the Protestants. There is no reason why that real presence should be limited to the time when the Christian receives the eucharist; for Christ distinctly says, "This is my body," and tenders it, on that account to his disciples. And how could it be decided at what moment his presence commences, and when it ceases? The first Christians knew nothing about this limitation. They regarded the consecrated host with feelings of adoration; they partook of it with the utmost awe, and carried it with them in times of persecution, to encourage themselves with the enjoyment of it. Origen, a writer of the third century, says, "You, who are allowed to partake in the holy mysteries, you know how to keep the body of the

Lord you receive, with all caution and reverence (the Christians received it formerly with their hands, lest any part of the hallowed gift fall to the ground; you believe justly that you bring guilt upon yourselves when, by negligence, you drop any part of it." Equally strong terms are to be found in Cyril's instructions to the new converts, as well as in the liturgy of all the Oriental and Western churches, the testimony of which is of the greater importance, as it is not the testimony of a few single scholars, but the public profession of entire churches. As soon the first times, the presbyter of the congregation performed the consecration, the peculiar view of the Catholic church, which considers the spiritual guide of a congregation as a sacrificing priest, is expressed. The mass is nothing but this sacrifice, and is so, as old in its essential character as the Lord's supper, though it first received its external addition and form under Gregory the Great. The Lord's supper is a sacrament, which by an external symbol, satisfies the internal man. The Catholic view of communion pervades the whole Catholic religious and ecclesiastical system. This creed of the whole Christian church, the Greek not excepted, as it is represented here, remained uncontested until the eleventh century, when the controversy between the Greek and the Latin churches broke out, respecting the bread to be used in the communion—whether it ought to be leavened or unleavened. Respecting the doctrine of the supper, there arose no dispute till the beginning of the thirteenth century, when the priest Berengarius of Tours denied the doctrine of transubstantiation, but not that of the substantial presence of Christ. The whole church was surprised at this innovation. This gave occasion, in the tenth Lateran council, to a solemn proclamation of the old creed of the church on transubstantiation. The creed continued in full authority, and even Huss did not impeach it; nay, Huss and his adherents were filled with reverence towards the sacrament, and claimed even the cup. It had become customary in latter times, from fear of spilling some part of the blood, to give only the body to the laity, since in the body the blood was contained (doctrine of *communion*). The Hussites, however, believed that the cup was a constituent part of the sacrament, without which the sacrament would not be complete. The church condemned this opinion as a heresy, at the council of Constance, in 1415. By the reformers of the sixteenth century, the whole Catholic system was attacked, as the reformers, rejecting the traditions of the church, took the Bible alone for their guide in matters of belief, and departed, at the same time, from the Catholic theory of communion. If they had left the Catholic doctrine on communion, the priesthood and mass would necessarily have remained too. By what means could the people of the new sect obtain their consecration? It was therefore necessary to establish a new theory of communion; or, rather, it was the natural consequence, since the new church, founded on reason, by which the scripture was to be searched, must needs lose a sense of the Catholic mysteries. In the council of Trent, session 13, are pronounced the following canons, which represent the creed of the church—1. If any one denies that there is contained in the most holy sacrament of the altar, truly, really and substantially, the body and the blood, together with the soul and divinity of our Lord Jesus Christ, and consequently the entire Christ,—if such a one say, that he is contained therein only as in a symbol, *vel figura, vel virtute, anathema sit* (let him be cursed). 2. If any one says, that there remains in the most holy sacrament of the altar, the substance of the bread and wine, together with the life and the blood of

our Lord Jesus Christ, and if he denies that wonderful and miraculous transformation of the whole substance of the bread into the body, and the whole substance of the wine into the blood, whilst there remains only the shape (*species*) of the bread and the wine, which transformation is termed, by the Catholic church, *transubstantiation—anathema sit*. 3. If there be any one who denies that there is contained in the venerable sacrament of the altar, under both sorts, and after division has been performed under the single parts of both sorts, the whole Christ—*anathema sit*. 4. If any one says, that, after consecration has been performed, the body and the blood of Christ is not in the miraculous sacrament of the altar, but that this is only during the tasting, neither before nor afterwards, and that there is not in the consecrated host or the particles, preserved or remaining after the celebration of the Lord's supper, the true body of the Lord—*anathema sit*. 5. If any one says, either that remission of sins is the principal effect of the sacrament of the altar, or that no other results spring from it—*anathema sit*. 6. If any one says, that the only-begotten Son of God is not to be adored by external worship, in the holy sacrament of the altar, and to be revered with particular solemnity, nor to be solemnly carried about in processions, after the praiseworthy and universal usage of the church, nor to be presented publicly to the people, and that those who adore him are idolaters—*anathema sit*. 7. If any one says, it is not permitted to keep the holy eucharist in the pix, but that it must be distributed immediately after the consecration to the bystanders, or that it is not permitted to bear it reverentially to the sick—*anathema sit*. 8. If any one says, that the Christ offered in the eucharist is tasted only spiritually, and not sacramentally and really—*anathema sit*. 9. If any one denies that all Christian believers of either sex, as soon as they are arrived at years of discretion, are bound, after the command of the holy Catholic church, to communicate, at least, at Easter every year—*anathema sit*. 10. If any one says, that it is not permitted to the officiating priest to administer the sacrament to himself—*anathema sit*. 11. If any one says, that faith alone is a sufficient preparation for the enjoyment of the holy sacrament—*anathema sit*. The Catholics have still the *præsumen numen*, as a pledge that the Lord remains with their church. See *Corpus Christi*.

LORENZO DE MEDICI. See *Medici*.

LORETTO; a small town in the States of the Church, about three miles from the sea, in the Marc f Ancona, with a bishop, who is also bishop of Recanati, and 5000 inhabitants, who are principally supported by the resort of pilgrims. Pilgrimages are made to the *casa santa*—the holy house in the cathedral of Loretto, which is supposed to have been the house of the virgin Mary, and which was carried by the angels (1291) from Galilee to Dalmatia, and thence, in 1294, to Italy, near Recanati, and, finally (1295), to the spot where it now remains. his holy house, which is in the centre of the church, covered, externally, with marble, and is built of *ony and brick*. It is thirty feet long, fifteen wide, and eighteen feet high, and richly ornamented. It is also been imitated at other places (for instance, Prague). Loretto formerly contained great treasures, collected from the pilgrims. The income of this house once amounted to 30,000 *scudi*, besides presents received annually. The pilgrims were estimated at 100,000 yearly. Amongst other curiosities, a window is shown in the holy house, through which the angel Gabriel appeared to Mary, when he announced the birth of the Saviour. Raphael's painting of the virgin throwing a veil over the infant beautiful. The treasures were in part, expended

in paying the contributions imposed by the French (1798); the rest was taken possession of by them. They carried the image of the virgin to Paris, but it was restored with great pomp, December 9, 1802.

L'ORIENT; a fortified and regularly built seaport of France, department of the Morbihan, on the bay of Port Louis, at the influx of the small river Scorff. The harbour is large and secure, and of easy access. It has still some trade, particularly with the French colonies, and is a place of importance, on account of its magazines for the use of the royal navy. The principal manufacture is of salt. Population, 17,115; 340 miles W. by S. of Paris; lat. 47° 45' N.; lon. 6° 2' W.

LORME, MARION DE. See *Delorme*.

LORRAINE, CLAUDE. See *Claude Lorraine*.

LORRAINE (*Lotharingia*; in German, *Lothringen*), so called from Lothaire II., to whom this part of the country fell in the division of the empire between him and his brothers, Louis II. and Charles (854), had previously belonged to the kingdom of Austrasia. It was divided into Lower and Upper Lorraine; the former including all the country between the Rhine, the Meuse, and the Scheldt, to the sea; the latter, the countries between the Rhine and the Moselle, to the Meuse. Lorraine, at a later period, was bounded by Alsace, Franche-Comté, Champagne, Luxemburg, the present Prussian province of the Lower Rhine, and the Bavarian circle of the Rhine, containing 10,150 square miles, and at present forming the French departments of the Meuse, the Vosges, the Moselle, and the Meurthe, with a population of 1,500,000 inhabitants. Its forests and mountains, among which the principal is the Vosges, are adapted for the raising of cattle, and contain much game; they also yield copper, salt, iron, tin, and some silver. Salt springs and lakes, abounding with fish, are also to be found. The soil is, for the most part, poor, and not adapted for tillage. The vine is cultivated to a considerable extent. The French and German languages are spoken. The people are of German origin. Lorraine was for centuries a subject of dispute between France and Germany. It was, for a long time, a fief of the German empire. On the death of Charles the Bold, duke of Lorraine, in 1431, without male heirs, the country was inherited by his daughter Isabella. The two grandsons of her son-in-law Frederic—Antony and Claude—founded, in 1508, the principal and collateral Lorraine lines, the latter of which spread in France (the dukes De Guise, D'Aumale, D'Elbeuf, D'Harcourt, belonging to it). From that time forward (1540), France took a decided part in all disputes relating to Lorraine. Charles of Lorraine was driven out, during the thirty years' war, on account of his connexion with Austria. He was restored in 1659, under severe conditions, and, in 1662, he consented that Lorraine should go to France on his death, the house of Lorraine being recognised as princes of the blood. He was, however, again deposed, and died in the Austrian service. His brother's grandson Leopold was recognised as duke of Lorraine by the peace of Ryswick (1697). France finally succeeded in her intentions, when Stanislaus, father-in-law of Louis XV., and the dethroned king of Poland, by the peace of Vienna (November 8, 1738), received the duchies of Lorraine and Bar (with the exception of the county of Falkenstein), which, after his death (1766), were united with France. By the second peace of Paris (1815), a small part, with the fortress Saarlouis, was ceded to Germany, and now belongs to the Prussian province of the Lower Rhine. Besides the principal town, Nancy, Lunéville has been distinguished by the peace of 1801. Charles Eugene, duke of Lor-

1620; and, because the name *Gentile*, by chance, had never been drawn, the popular belief prevailed, that the devil had carried him off, together with his name, to punish him for this unlucky invention. Numbers were afterwards substituted instead of the names of eligible noblemen, and hence the lotto assumed its present form. The numbers from one to ninety are used; from these, on the day of drawing, five numbers are always drawn. Out of the ninety numbers, each adventurer chooses for himself such and as many numbers as he likes, and specifies with what sum and upon what kind of chance he will back each selected number; whereupon he receives a printed ticket. In this lottery, there are four kinds of chances: 1. An *estrado*, so called, which requires only one number among the five that are drawn, and in which the successful adventurers receive fourteen times the stake. By this the lotto gains sixteen per cent., because there are seventeen blanks to one prize.—2. The wager, in which a man lays a wager, as it were, with the lotto, that one of the selected numbers will have the first, second, third, fourth or fifth place in the order of drawing. Should this event happen in the drawing, the bettor obtains sixty-seven times the sum deposited. By this the lotto gains about twenty-five per cent.—3. The third is an *ambo*, in which, of the numbers drawn, there are two which the adventurer has pitched upon. He receives from the lotto 240 times the stake. In this case, the lotto gains thirty-seven per cent., there being 399 blanks to one prize.—4. The last is a *terno*, by which the lotto gains fifty-four per cent., there being 11,347 blanks to one prize. It requires the adventurer to pitch upon three of the five numbers drawn, in which case he wins 4800 times the amount of the stake. The *quaternes* and *quinternes* are a later invention, and seldom applied to practice, because the lotto thereby gains eighty-eight per cent. and more.

The lotto was every where patronized by the multitude, with an interest increasing almost to madness. Wise governments soon saw into the destructive tendency of the lotto, and put an end to it, or prohibited adventuring in it under a severe penalty. Though the profit of the lotto banks was evident, yet fortune, by means of *ternes* and *quinternes*, brought many of them to ruin, or, at least, to its very verge, and hence, if numbers were backed too frequently, the conductors took the precaution to secure themselves, by declaring before the drawing, that such numbers were full, and they could receive no further stake upon them. Frauds, also, were practised, by means of violent riding and carrier-pigeons, on those lottoes, he under offices of which, being placed at a distance, were accustomed to sell tickets, after the drawing in the principal offices had commenced.

II. The proper lottery, called also *class lottery*, then divided into classes. Its origin is more ancient than that of the lotto. It has been referred to the *oman Congiaria*. It is more probable that it originated from the transfer of merchandise by lot, of which method the Italian merchants made use even in the middle ages, and of which we also find traces in Germany; for as early as 1521, the council at Nuremberg is said to have established lotteries for merchandise. So also in France, under Francis I., similar lotteries for merchandise were permitted to the merchants, under the inspection of government, in consideration of certain duties. A money lottery is established at Florence, in 1530. In 1571, there appears to have been a public officer in Venice for the inspection of the lottery. From Italy, lotteries passed into France, under the name of *blanque* (from the Italian *bianca*, because most of the tickets were white, mere white paper, *carta bianca*). In 1582 and 1588, Louis de Gonzaga established such a

*blanque* in Paris, for providing poor girls of his estates with dowries; and, in 1656, Lawrence Tonti (from whom the Tontines derive their name) sought to establish a large *blanque royale*, which was first accomplished in 1660. Since this time there have been in France only *lotteries royales*, the income of which is commonly applied to public buildings. This iniquitous traffic has been revived of late, in France, on a much larger and more destructive scale than it has attained in any other country. In 1810—and we have no reason to believe any decrease has since taken place—lotteries were drawn twice a week at Paris, and so often at Bourdeaux, Brussels, Lyons and Strasbourg, as to afford one every other day. 12,000,000 francs were yearly produced to government by this public gambling; and it has been estimated, that at Paris, the result has been more than 100 suicides annually. In England, the first lottery occurs in 1567—1568, a printed plan of which, as distributed, belongs to the antiquarian society in London. In 1612, a lottery was granted in behalf of the Virginia company, and, in 1680, one also in behalf of the undertaker of an aqueduct to furnish London with water. In 1709, the rage for private, and, in many instances, most fraudulent lotteries, was at its height in England, and shop-keepers, of all descriptions, disposed of their goods in this way, the price of tickets being as low as half-a-crown, a shilling, or even sixpence. Towards the close of the year, an existing act of parliament was put in force for their suppression, and another to the same purpose was passed in the tenth of queen Anne. The first parliamentary lottery was instituted in 1709, and, from that time till 1824, no session passed without a lottery bill. In October, 1826, the last British lottery was drawn. They are now abolished in Britain. As early as 1549, a lottery was drawn in Amsterdam, to procure money for the erection of the tower of a church, and, in 1595, one at Delft. In 1633, one was established at Hamburg, according to the Dutch method, and, in 1699, the first class lottery, at Nuremberg, and, in 1740, the first one was drawn in Berlin. Most of the late German lotteries are drawn in classes, in order to facilitate the sale of tickets. The great lottery of Hamburg goes upon the plan of one drawing. Latterly, lotteries for merchandise of all kinds, under the inspection of government, have been frequent in Germany. The managers of the principal lotteries sell only whole tickets. Brokers, however, divide them into halves, quarters, eighths, and even sixteenths, in order to facilitate their sale. In some places, they even let out tickets and parts of tickets, upon a particular number of drawings; in which case they are not obliged to pay the prize which may fall to the ticket, unless it be drawn within the stipulated number of drawings. If the principal prizes remain for a long time in the lottery, so that the probability of being able to obtain them increases at each successive drawing, then a great profit is made in buying and selling tickets, and there are cases in which, in the last drawings, ten, and even twenty times the original price of the ticket has been demanded. Very lately, in the Austrian monarchy, in the kingdom of Bavaria, and in the duchy of Mecklenburg, estate lotteries have been got up, and manufactories, the estates of noblemen, and even whole lordships, have been disposed of by lottery, under public sanction, and, ordinarily, under the security of important mercantile houses, which undertook the disposal of the property, in order to settle the debts of the owners. A money lottery has ordinarily been combined with them.

Latterly, lotteries have been combined with state loans. When the credit of the state is low, or when the rate of interest is high, efforts have been made to

induce capitalists to put their money into the hands of the state, by means of a lottery, which gives them the expectation of a premium above the customary interest of the country. For example: If a government is uncertain of obtaining, or cannot obtain, money at seven per cent., it may, perhaps, effect its object by offering four per cent. for a loan, and dividing the remaining three per cent. among the lenders by means of a lottery; for the hope of winning the great prizes in the lottery, in addition to the certainty of disposing of their capital at four per cent., has a stronger influence on many men than the offer of seven per cent. interest. In this way, loans have been raised in Austria, Denmark, Baden and other states, and also in Prussia, in 1821. By this means, in Prussia, stocks to the amount of 30,000,000 were sold at their full nominal value, which, in the market, were current only at seventy per cent.

In most, if not all of the United States of America, lotteries, not specially authorized by the legislatures of the states, are prohibited, and the persons concerned in establishing them are subjected to a heavy penalty. In some of the states, lotteries have been very numerous. This is the case with several of the Southern States—Virginia, Maryland, and particularly Tennessee. They have also been numerous in New York. The object for which they have been granted has been generally the assistance of literary or benevolent institutions—colleges, academies, hospitals, asylums, or of public works—as roads, bridges, the improvement of the navigation of rivers, &c. Their pernicious effects have induced the legislatures of some of the United States to decline granting them in any case.

**LOTUS.** This name has been applied very vaguely to various species of plants which have been celebrated in mythology and fabulous tradition. In the ancient Hindoo and Egyptian mythological representations of nature, the lotus (*Nelumbium speciosum*, Lin.), an aquatic plant, was the emblem of the great generative and conceptive powers of the world. Several varieties are found in India under the names of *padma*, *tamara*, and *camala*. When Vishnu, says the Hindoo fable, was about to create the world, the god, swimming in the ocean of milk, produced the lotus from his navel. It unfolded its flower, and displayed Brahma, the first result of the creative energy. As an aquatic plant, the lotus was the attribute of Ganga, the goddess of the Ganges. In Egypt it was consecrated to Isis and Osiris, and was an emblem of the creation of the world from water. It was also the symbol of the rise of the Nile and the return of the sun. It is found in bas-reliefs and paintings on the Egyptian temples, in all representations of sacrifices, religious ceremonies, &c., and in tombs, and whatever is connected with death or another life. With both of these nations, it was regarded with religious veneration, and the precept of Pythagoras to abstain from beans, has been supposed to refer to the fruit of the lotus-plant. The *rhynchos lotus* is a shrub, the fruit of which is a small firruncous berry, of a delicious taste, which is used by the natives of Africa to make a sweet cake. This shrub is found on the northern coast of Africa, and is probably the food of the *lotophagi* of antiquity. The fables of the ancients concerning them are well known. They were represented as a mild, hospitable race of men, in northern Africa, who lived on the lotus berry (hence their name *λωτοφάγοι* and *φάγος*, to eat), which had the power of making strangers who ate it, forget their native country.

**LOUDON, or LAUDON, GIDEON ERNEST**, baron of one of the most distinguished generals of Austria in the eighteenth century, was born at Tootzen, in Bohemia, in 1716, and was a descendant of an old

Scottish family, a branch of which had emigrated thither in the fourteenth century. In 1731, he entered the Russian service, and rose to the rank of lieutenant, under Munich, in the campaign against the Turks. In 1739, he was discharged in consequence of the peace, and, intending to enter the Austrian service, went by the way of Berlin, where by the advice of some of his former comrades he attempted to obtain admission into the Prussian service. After being kept in suspense for a long time, he became so poor, that he was obliged to support himself by copying. When the king was allowed him to be presented, he uttered the following words: *La physiognomie de cet homme ne m'annonce rien de bon*. Loudon then proceeded to Vienna, in 1742, was made captain in the corps of hussars, under the partisan chief Trenk. In the battle of Saverne, he was wounded and taken prisoner; he was exchanged, and served against France in Great Britain, in the second Silesian war. Trenk again sent Loudon the outrages and cruelties which he himself committed, but the latter defended himself from the charge, and Trenk was sentenced to a prisonment in the fortress of Spillberg. After the peace, Loudon again lost his employment, and was in great poverty. He was at length appointed major in a regiment stationed on the Turkish frontier, where he married, and embraced the Catholic religion. Five years afterwards, the war was again broken out, and Loudon's name was struck from the list of officers destined to serve in Croatia, a man who hated talent; upon which he went to Vienna to complain, but found the authorities prejudiced against him, and was sent back to the frontiers, when a great success in getting him appointed lieutenant colonel of a corps of light-infantry. Loudon soon distinguished himself, and was appointed, under the name of Hildburghausen, commander of the imperial army which were united with the French under Soubis. Thus Loudon was obliged to witness the capture of Gotha by the Prussian general Seidlitz, and the defeat at Rossbach. At this time, Frederick the Great sent him a flattering letter, with the commission of general, which his honors had taken from an Austrian courier. In 1754, Loudon was made lieutenant field-marshal. He decided the victory of Cunersdorf (q. v.) in 1759, which decided the destruction of the Prussian monarchy, and was appointed general of artillery, with the command of 30,000 men. In 1760, he gained the battle of Landshut, and covered the retreat of the army of Russia after the battle of Liegnitz, in so masterly a manner, that Frederick exclaimed—"We must leave him to retreat from Loudon: he leaves the field to a conqueror." In 1761, without any previous appointment, he took Schweidnitz, which was well provisioned and strongly fortified, by a sudden achievement for which he was on the point of being called to account before the council of war at Vienna. At the breaking out of the French war of succession, he was appointed lieutenant-in-chief and field-marshal. After the conclusion of peace, he studied diligently during his leisure. When the war with Turkey broke out, Joseph II. thought, at first, that he could conduct the campaign without the assistance of Loudon, but was himself obliged to resort to the aged general, and victory returned to the Austrian banners by the conquest of Belgrade. Loudon received the title of the order of Maria Theresa, which was considered as brilliant, and kept in the treasury of the imperial family, and which properly distinguished only the emperor as grand-master. After Loudon's death

the emperor Leopold gave his widow 50,000 florins for it. Loudon also received the unlimited command, and the title of *generalissimo*, which had not been conferred on any one since Eugene. He died July 14, 1790, at his head quarters at New Titschein, Moravia. Loudon continued to study, even in advanced age, and his military boldness seemed rather to increase with his years. In his private life, he was moderate, and extremely modest. The duke of Aremberg, in reply to the question of the empress, at a court party, Where is Loudon? answered—*Le voilà comme toujours derrière la porte, tout honteux d'avoir tant de mérite.*

LOUIS IX. (St.), king of France, eldest son of Louis VIII. and Blanche of Castile, born 1215, and baptized at Poissy (for which reason he sometimes wrote himself *Louis of Poissy*), came into possession of the government in 1226, and remained under the guardianship of his mother, who was at the same time regent of France. This is the first instance of the guardianship and regency being united in one person. The queen had, with the assistance of the pope, sought into subjection the independent barons, who, always at war with each other, disturbed the tranquillity of the kingdom. Louis successfully pursued the enterprise of his mother, summoned to his council the most able and virtuous men, put an end to the abuse of the ecclesiastical jurisdiction, composed the disturbances in Brittany, preserved a wise neutrality in the quarrels of Gregory IX. and Frederic II., and as always intent upon promoting the happiness of his subjects. The wise management of his states enabled him to levy a powerful army against Henry I. of England, with whom the great men of the kingdom had united themselves. Louis had the good fortune, in 1241, to defeat his adversary twice in the course of six days, and to force him to a disadvantageous peace. In the year 1244, when sick of a dangerous disorder, he made a vow to undertake a crusade to Palestine; and neither his mother nor wife was able, four years after, to prevent him from fulfilling this vow. He embarked with his wife, his children, and the French chivalry, landed at Damietta, and in 1249, conquered this city. He afterwards twice defeated the sultan of Egypt, to whom Palestine was subject. He himself performed prodigies of valour, particularly in the battle of Massura (1250). But disease and contagious disorders soon compelled him to retreat; his army was almost entirely destroyed, the Saracens, and himself and his followers carried into captivity. The sultan demanded for the ransom of the king and his lords the restoration of Damietta, 11,000,000 gold Byzantines. But Louis answered, "A king of France cannot allow himself to be ransomed for gold." He offered, however, to restore Damietta, as the ransom of his own person, and to pay the sum demanded for his followers. The sultan was so well pleased with this answer, that he remitted himself with 800,000 Byzantines (about 1,000 marks of silver, and concluded a truce of five years. (In Napoleon's *Mémoires, Notes, et Mémoires* (vol. i.) is found a comparison between the reign of Bonaparte in Egypt and that of St Louis.) It was not till the year 1254, that Louis returned to France, and, in the interval, queen Blanche, who had ruled the kingdom in an extraordinary manner, had died. Louis again turned his attention to the administration of the laws, which, at this time, had been left entirely to the caprice of the barons. The subjects could now appeal from the decision of their lords to four royal tribunals, and new men were introduced into the parliaments, so members had till now been composed of barons so ignorant as to be unable to write. Louis wisely diminished the taxes, which had exhausted

the wealth of the subjects. In 1269, he drew up a pragmatic sanction, which secured their rights to the chief or cathedral churches. He, nevertheless, repressed, when occasion required, the arrogant pretensions of the clergy. The high character which Louis IX. bore among his contemporaries may be seen from this circumstance, that Henry III. and his nobles, in 1268, selected him for the arbiter of their disputes. After he had united to his dominions several French provinces which had hitherto been under the dominion of England, he determined, in 1270, to undertake another crusade. He sailed to Africa, besieged Tunis, and took its citadel. But a contagious disorder broke out, to which he himself (Aug. 24, 1270), together with a great part of his army fell a sacrifice. The instructions which he left in writing for his son, show the noble spirit which inspired this king; a spirit, which, if it had not been infected with the religious bigotry of the times, would have rendered his administration the greatest of blessings. In 1297, he was canonized by Boniface VIII. Louis XIII. afterwards obtained from the pope that the festival of Saint Louis should be celebrated in all the churches.—See Arthur Reugnot's *Essay upon the Institutions of Saint Louis* (Paris, 1821), and count Segur's *Life of Louis IX.* (Paris, 1824.)

LOUIS XI., king of France; one of those personages who live at a period when old principles are giving way to new, and whose life, therefore, becomes an epoch. But Louis XI. is a subject of great interest, not only as a representative of his age, but in his individual character. A person more ready for crime, if conducive to his ends, or a greater devotee, not for the purpose of deceiving others, but to quiet himself, is not to be found among monarchs. The life of such a sovereign can hardly be treated satisfactorily, within the limits to which we are confined, because it is not particular events, but the policy of his government, and the character of his measures, which render him remarkable. A full view of his life would be a history of France during the fifteenth century; we can give only the outlines. Louis XI. was the son of Charles VII., and was born at Bourges, July 3, 1423. He was educated in a simple manner, under the eyes of his mother, Mary of Anjou, one of the most virtuous women of her time. At the age of five years, he married Margaret of Scotland, who died seven years afterwards. Active, bold, and cunning, he was the reverse of his well-disposed but imbecile father, of whose ministers and mistress, Agnes Sorel, he soon showed himself a decided enemy. In 1440, he left the court, and put himself at the head of an insurrection at Niort, known under the name of *la Praguerie*. Charles defeated the rebels, executed some, but pardoned his son, whom he even trusted, in 1442 and 1443, with the command against the English and Swiss. Louis conducted himself with valour and prudence, and his father became entirely reconciled to him; but, having soon entered into new conspiracies, Louis was obliged to flee to Dauphiné, which Charles left at his disposal. Contrary to the will of his father, he married the daughter of the duke of Savoy, and entertained a treasonable correspondence with the king's court; he is even said to have been accessory to the death of Agnes Sorel. His father, however, obliged him to flee to Burgundy, and he lived five years at Gennepe, in Hainault, in a dependent condition. He repeatedly appeared disposed to return, when the king's death seemed to be at hand, but, with the restoration of his father's health, always declined so doing. Charles VII. died in 1461, having, from fear of being poisoned by his son, hardly ventured to eat any thing, and thus lost his life by excessive care of it. Louis now hastened to Rheims to be crowned. He promised pardon

to all who had used force against him in the service of his father, excepting seven, whom he did not name. He swore not to increase the taxes, and immediately broke his oath. The ministers of his father were dismissed, and men of the lower orders—barbers, tailors, &c.—assumed their places. Insurrections broke out at Rheims, Alençon, &c., in consequence of his imposition of new taxes, in violation of his oath; but they were soon quelled, and followed by many executions. Louis now made a tour through the south of his dominions, supported the king of Arragon in his usurpation of Navarre, and obtained the cession of Roussillon and Cerdagne. His policy became more and more evident. Whilst he pretended to reconcile contending parties, he secretly instigated them against each other; and, whenever he had a meeting with a foreign prince, he corrupted his courtiers by bribes, and established secret correspondences with them: instances of this are to be found in his conduct as arbitrator between Castile and Arragon (1463) at his meeting with Henry IV. of Castile, on the Bidassoa, and, at an earlier period, at the court of the duke of Burgundy; he even formed the design of seizing the duke of Burgundy and the count of Charolais. His vassals rebelled against him on account of his treatment of Francis II., duke of Brittany, whom he attempted to deprive of his rights. The duke, being taken by surprise, had promised everything required of him, but encouraged the dukes of Lorraine, Bourbon, Alençon, Nemours, Burgundy, and the king's brother, the duke of Berri, to conclude the *ligue du bien public*, which, in 1465, began open hostilities. The Burgundians besieged Paris, and the king could force his way to his capital only by means of the battle of Monthermé. But Louis extricated himself, on this as on other occasions, by artful treaties, which he never observed longer than he was compelled to. He consented to yield Normandy to his brother, part of Picardy to Burgundy, &c.; but, no sooner was the league dissolved, than he declared that Normandy could not be severed from France, and forced his brother to seek refuge in Brittany. The duke, however, was too weak singly to maintain the struggle against the king, and signed a sort of capitulation just as Charles the Bold, the young duke of Burgundy, approached with an army to his relief. Louis, who might have risked a battle with Charles, preferred negotiation, which, however, proceeding slowly, he requested a passport from the duke of Burgundy, and actually went to visit him at Peronne. He had, just before, secretly instigated the people of Liege to rise, and promised them aid. Charles, having discovered this act of treachery, was furious with rage, and hesitated three days (during which he kept the king in prison) as to what course he should adopt. Nothing but the aversion of Charles to take the life of a king, and the greatest presence of mind on the part of the latter, who asserted his innocence under the most solemn oaths, saved him.\* He was obliged to accompany Charles to Liege, and to witness the pillage and slaughter of which he had been the cause. A peace was concluded on favourable terms for Charles and his allies; but, when Louis returned to Paris, he used every artifice to evade its fulfilment. He had promised to cede Champagne to his brother, but persuaded him to take Guienne instead. The duke of Burgundy, irritated at this conduct, secretly concluded an alliance with England and Brittany. Meanwhile, Louis XI. had become the father of a prince (afterwards Charles VIII.), and the duke of Guienne had lost all hope of ascending the throne of France. He, therefore, re-

newed his connexions with Burgundy. Louis obtained information of these proceedings, and, after, the duke of Berri died of poison administered in an apricot. It never has been decided whether the king was the perpetrator of the crime, though he ordered masses to be said for the deceased. The duke of Burgundy openly accused him of the murder of his brother, and also of an attempt to assassinate him. The war broke out between them with renewed fury, but an armistice was soon concluded, in which the duke of Burgundy was obliged. The king of Arragon, who had no war against Louis, was not a party to the treaty, and the French king now turned his arms against the prince, from whom he wrested a large tract of territory. He sent the cardinal Justice, and the count of Armagnac, who aimed at constant rebellions by a terrible death. During a mistice, Charles had attacked Nevers, and Louis united with the emperor Frederic III. the Swiss, and attacked Burgundy, in 1476, he concluded a truce of seven years with Henry IV. of England, who had hastened to the aid of Charles, by the promise of a sum of money, pension, and of marrying the daughter of his princess. Burgundy and Brittany were afterwards concluded another armistice with him, by which Quentin was ceded to Louis, and the count of St Pol was given up to him. After the death of Charles the Bold (q. v.), before Louis took possession by force, of a considerable part of his dominions, as vacant fiefs of France, he rejected the proposed marriage of the daughter Charles, then twenty years old, with the daughter who was but ten years of age. Maximilian, the emperor Frederic III., obtained the hand of the princess, with a part of her dominions, and drove the forces of Louis at Guinegate in 1479. The protracted negotiations, peace was finally concluded, Dec. 23, 1482, Mary being then dead and so of Ghent remaining faithful to her brother, Philip and Philip. It was agreed that the daughter should marry Margaret, and receive the counties of Flanders and Burgundy, &c., and that Philip should receive the remaining territories. In 1481, Louis, who had been twice affected by apoplexy, hurried by the fear of death, shut himself up in his castle of Plessis-les-Tours, endeavoured to conceal the state of his health, loaded himself more than ever with saints and relics, continued to command criminal pardon for them from so divine source, as *jeu de tresse* (the virgin) and died at last, Aug. 30, 1483.

The great object of Louis was the consolidation of France, the establishment of the royal power, and the overthrow of that of the great vassals. He has been blamed for neglecting to marry the daughter of Mary of Burgundy, and allowing her to be united to an Austrian prince; also for not taking the opportunity to marry the daughter to Jeanne, daughter of Ferdinand and Isabella, which would have united Charles VIII. heir of Spain and America to the throne of France. He neglected the investiture of Naples, and when the king offered to take him for their sovereign, he refused. "The Genoese give themselves to us, and I give them to the devil." His great object was to overthrow the feudal aristocracy, and make himself absolute; and he neglected no opportunity and no crime to effect his purpose. The number of the time enumerate four thousand persons perished on the scaffold, or by the gibbet, during his reign. Tristan, his chief favourite, was so brutal. His ministers and companions were of the same

\* Our readers are acquainted with the fine representation of this scene by Sir Walter Scott, in his *Quentin Durward*.

classes. His cruelties were often studied. The children of the duke of Nemours were placed under the scaffold, in such a manner that their father's blood flowed upon them; they were then thrown into dungeons, where they were exposed to great suffering, and their teeth were pulled out at intervals. There was no great man in his reign, and no virtue. Fear supplanted every other feeling. The people were as submissive as galley slaves. On the other hand, he encouraged commerce as much as the ignorance of his times allowed, was extremely active, and attended to everything. The contradictory traits of his character occasioned a singular opposition in his tastes and feelings. He was, at the same time, confiding and suspicious, avaricious and lavish, audacious and timid, mild and cruel. "Towards the end of his life," says Chateaubriand, "Louis XI. shut himself up in *Plessis-les-Tours*, devoured by fear and ennui. He dragged himself from one end of a long gallery to the other, surrounded by grates, chains, and avenues of gibbets leading to the castle. The only man who was seen in these avenues was Tristan, chief hangman, and the companion of Louis. Fights between rats and rats, and dances of young peasant boys and girls, served to amuse the tyrant. It is said that he drank the blood of young children to restore his strength. *De terribles et de merveilleuses médecines*, say the chronicles, were compounded for him. Yet his efforts could not avert death. Louis XI. was the first French monarch who had the title of *most Christian king*." The principal counsellors of this prince were Philip de Comines, and John du Lude, called, by his master, *Jean des Habiletés*.

LOUIS XII., king of France from 1498 to 1515, called by his subjects *le père du peuple*, was born in 1462. Before his accession to the throne, which took place after the death of Charles VIII., he was duke of Orleans, and first prince of the blood. The lessons of his German mother, Mary of Cleves, and the misfortunes which he underwent at a later period, corrected the faults of his education, which had been purposely neglected, in compliance with the will of Louis XI., (q. v.) On ascending the throne, he pardoned the wrongs which he had suffered before his accession. "The king of France," said he, "must not revenge the injuries done to the duke of Orleans." He showed himself grateful towards his friends. The ambitious Georges d'Amboise, his minister, archbishop of Rouen, and cardinal Legate, enjoyed his full confidence. After the death of this minister, in 1510, Louis took the reins himself. He re-established discipline in the army, and brought his turbulent students of Paris to order—a task which was not without difficulty, on account of their great number, and the privileges which they enjoyed. He much improved the administration of justice, lessened the taxes, and would never consent to increase them, though he was engaged in many wars. The expense of these he supplied by making a number of offices venal, and selling some crown estates. He united the duchy of Brittany never with the crown, by marrying, in 1499, the widow of Charles VIII., the beautiful Anne, duchess of Brittany, the object of his love even before his separation from the excellent, but extremely plain Anne, daughter of Louis XI., whom he had been forced to marry, and who had born him no children. In order to enforce the rights which he inherited from his grandmother, Valentina Visconti, to the duchy of Milan, against Louis Sforza, called *Moro e Sforza*, he sent, in 1499, an army over the Alps, which conquered the duchy of Milan within eleven days; after which Genoa also surrendered to him. In vain did Louis Moro attempt to maintain himself by the assistance of the Swiss; he was taken

prisoner, in 1500, at Novara, and died, in 1510, in confinement at Loches in France. In 1500, Louis XII. concluded a treaty with Ferdinand the Catholic, by which the kingdom of Naples was divided between them. King Frederic of Naples proceeded to France, where Louis gave him a considerable annuity. But Ferdinand possessed himself of the whole kingdom of Naples, and retained it by the treaty of 1505. Louis had promised to marry his daughter Claude to the grandson of the German emperor, Charles of Luxemburg, afterwards Charles V., and to give her Brittany, Burgundy, and Milan as a dowry. But the estates assembled in 1506, at Tours, begged on their knees the *father of his people*, as they called him, to marry his daughter to Francis, count of Angoulême, of the family of Valois. Louis consented; the estates declared the first contract of marriage void, and contrary to the fundamental laws of the realm, and Francis married Claude. Louis now devoted himself particularly to the education of this prince, who was to succeed him (see *Francis I.*), but at first with so little success, that on one occasion he sorrowfully exclaimed, "*Nous travaillons en vain; ce gros garçon gâtera tout*." The league of Cambray (see *League*), established by pope Julius II. against Venice, in 1508, involved France in a new war. Louis now commanded the army in person, and was victorious over the Venetians, at Agnadello, in 1509, where he fought with great bravery. Julius II., however, fearing the power of France in Italy, concluded the holy league (see *League*) with Venice, Switzerland, Spain, and England, against Louis XII., in 1510. In vain did the king, in conjunction with the emperor Maximilian, assemble, in 1511, a council at Pisa, in order to reform the church, in its head and members, and to depose Julius II.; the pope laid an interdict on France, in 1512, and declared Louis XII. to have forfeited his crown. The French armies could not maintain themselves after the death of their general, Gaston de Foix; they were beaten by the Swiss at Novara, in 1513, and retreated over the Alps; after which Maximilian, son of Louis Moro, took possession of Milan, and Genoa made herself independent of France. The Swiss, at the same time, penetrated into France as far as Dijon, and Henry VIII. of England defeated the French, in 1513, at Guinegate (*Journée des Espérons*, because the French made more use of their spurs in flight, than of their swords in fight). Ferdinand the Catholic, also, in 1512, had taken Upper Navarre, which, until then, belonged, together with Lower Navarre, in France, to the house of Albert. Louis XII. now renounced the provinces on the other side of the Alps and the Pyrenees, became reconciled with Leo X., the successor of Julius II., and concluded, in 1514, a general peace with Henry VIII., whose sister Mary he married, after the death of Anne, after which he united his second daughter, Renée, to the archduke Charles (Charles V.) From love to his beautiful wife (only sixteen years old), Louis (then fifty-three years of age), changed his whole mode of life, to the injury of his health, and thus accelerated his death. He died January 1, 1515.—Louis XII. possessed many of the qualities of a good ruler. He was open, honest, economical, just, kind-hearted, and magnanimous; he was a friend of science, and attracted learned men to his country, particularly from Italy; and France owes to him its first scientific collections. He loved to read Cicero's *De Officiis*, *De Senectute*, and *De Amicitia*. Trajan was his model. France enjoyed, under him, a degree of prosperity and security which it had never possessed before. In regard to the foreign relations of the country, Louis had not sufficient talent to oppose the crafty Julius II., Ferdinand the Catholic,

and cardinal Wolsey. His generals, Trivulce, De la Tremouille, Gaston de Foix (nephew of Louis XII.), Bayard, and others, maintained, even in misfortune, the glory of the French arms.—See P. L. Roederer's *Louis XII. et François I., ou Mémoires pour servir à une nouvelle Histoire du Règne de Louis XII. et de François I.* (Paris, 1825, 2 vols.)

LOUIS XIII., surnamed the *Just*, in the early part of his reign, from what cause is not known, was born in 1601, the son of Henry IV. and Maria de' Medici. He ascended the throne May 14, 1610, after the murder of his father. Maria de' Medici, who was made guardian of her son, and regent of the kingdom, squandered the treasures of the crown in forming a party for herself, and departed from the principles of her husband, especially by forming a close alliance with Spain. The troops were dismissed, and Sully was obliged to retire from the court. The princes of the blood and the nobles took advantage of the weakness of the kingdom occasioned by these measures; they rose in rebellion, with the marshal Bouillon at their head. The government was compelled to yield to their demands, and these concessions led to still greater encroachments upon the rights of the crown and people. France became the prey of internal parties and civil dissensions, which the Florentine Concini, marshal D'Ancre, prime minister at that time, was utterly unable to suppress. The disturbances rose to the highest, when the king, in 1615, married a Spanish princess. Henry II., prince of Condé, abandoned the royal party, and took up arms in conjunction with the Huguenots. The king, too weak to oppose this attack, made peace with the prince, but sent him to the Bastille some time after, whereby another civil war was kindled, in which, however, the insurgents had no success, and the marshal D'Ancre, whom the young king hated, being murdered with his connivance, (1617), tranquillity appeared to be again restored. (See *Luynes*.) But when the king, soon after, banished his mother to Blois, new disturbances arose; for the people, who had hated Maria for her tyranny, now took compassion upon her, in her misfortune. The king was obliged to be reconciled with her, and a formal peace was concluded at Angoulême (1619), between the contending parties. But it was hardly signed, when it was again broken. Maria, at the instigation of the bishop of Luçon, again took up arms against her son. A new reconciliation took place, only to be followed by new dissensions. During these disturbances, the Huguenots rose in arms, with Rohan and Soubise at their head; and a great part of the kingdom rebelled against the king, who now delivered himself up to the guidance of the cardinal Richelieu. After victory had inclined, sometimes to one side, sometimes to the other, and both parties felt deeply the necessity of repose, peace was again concluded between the king and the Huguenots (1623). This also continued no longer than the preceding. Rochelle, the head-quarters of the Huguenots, revolted, and was supported by England. The king drove the English to the sea, conquered the island of Ré, and at last (Oct. 28, 1628), Rochelle likewise, which, under the spirited command of the mother of the duke of Rohan, had defended itself for more than a year, and contended with all the horrors of a siege. This siege cost the crown 40 million livres. Afterwards a war arose with the emperor, who had refused to the duke of Nevers the investiture of Mantua. The united forces of the emperor, Spain and Savoy, were again defeated by the French, at Vegliano (1630), and the duke of Mantua confirmed in his possessions by the peace of Chierasco (1630). The only brother of the king, Gaston of Orleans, now revolted against him, in conjunction

with the queen mother. The insurgents were nevertheless, defeated; the duke of Mantua, in alliance with Gaston, was a prisoner at the battle of Castelnaudary, Sept. 1, 1632, taken prisoner, and executed at Toulouse, October 3, of the same year. Gaston received a pardon. In the surviving war with Spain, which continued twenty-five years, being thirteen of which it was waged in Germany, was inclined sometimes to one side, sometimes to the other; yet the king was at last enabled to expel from the French dominions the Spanish army, which had landed in Provence, and the Spanish army which had penetrated as far as Bayona. The events of the following year were yet more favorable to France; but the exhausted state of the country opposed an insuperable obstacle to the progress of the French arms. In this state of weakness, Louis XIII. died, May 4, 1643. During his reign, he had (Aug. 15, 1638) put his personal arms in the kingdom, under the protection of the king, a day which was long regarded as a festival. His equestrian statue, in bronze, erected in 1792, destroyed by the people in 1792.

LOUIS XIV., king of France and Navarre, was born Sept. 5, 1638, after a barrenness of seven years on the part of his mother. Being then considered a particular gift of Heaven, he was called *Dieu donné*. He came into the world with teeth, on which subject Grotius has some fine letters. He died Sept. 1, 1715. His mother, Maria Theresa, daughter of King Philip IV. who died July 30, 1683. In the same year he early married Frangoise d'Aubigné, widow of the (madame de Maintenon, who died April 1, 1719). His principal mistresses were Frangoise de la Vallière (see *Falliere*), the marchioness de Vespignan, mother of the duke of Maine and of the duke of Toulouse (see *Rochechouart*), and Marie de d'Escorailles, duchess of Fontanges, who died 1681.

Louis XIV. was five years of age when his father, Louis XIII., died. His mother caused herself to be declared regent and guardian. To Mazarin he entrusted the superintendence of the education of the king, which was much neglected. But although Louis learned nothing from his teacher, the cardinal Péréfixe, he observed much. A deep impression was made on him, during his minority, by the operations of the Fronde (see *Fronde* and *Rois*), and so many different characters in action. Sept. 1651, Louis proclaimed his majority; he continued at the head of the government till his death, March 9, 1661. From this time, Louis reigned fifty-four years, without any gross abuse of complete accordance with his own words—*Je dis c'est moi!* From Mazarin he had learned a cautious policy, and a contempt of the parliament. On one occasion, when Mazarin could not obtain his purpose, the young king, seventeen years of age, entered the hall of the parliament of Paris, armed and spurred, with his whip in his hand, and commanded an edict to be registered. From doing united to surround him with splendor. However, he has not confirmed his title of great king, possessed some royal qualities, perhaps as still the requisite for show. Thus he was enabled to gratify the inclination of the French for theatrical display; he even gave this inclination a permanent sanction. His reign was adorned by great statesmen, generals, ecclesiastics, and men of letters and arms. The civil wars had produced the same effect, still the revolution afterwards produced, of raising both men of talent and energy, who made the military glory and the splendour of the king the object of their exertions. Louis himself had a taste for a kind

of greatness. "This was," as John Muller says of him, "the source of the benefits which he rendered to the arts and sciences, of the disturbances of Europe, of the violation of all treaties, in short, of the remarkable character of his reign." The king was unfortunately ignorant, and destitute of settled principles. *Il aimait la gloire et la religion*, says Montesquien, *et on l'empêcha toute sa vie de connaître ni l'une ni l'autre*. His person was vigorous and noble. With handsome features and a tall form he united a peculiar dignity of language and manner. The noble and charming tone of his voice won the heart; but the loftiness of his whole demeanour inspired respect. His kindness never passed into familiarity. One look of his kept the wittling in check. The Spanish gravity, which he inherited from his mother, was tempered by the graces of French politeness. Naturally so grave, that even the oldest courtiers never recollected to have heard more than one jest from his mouth, he loved, nevertheless, gaiety in others, applauded Molière's comedies, and laughed at the witty sallies of madame de Montespan. At his court, which became a model for all the others of Europe, every thing had reference to the king, and tended to augment his dignity. The nearer you approached his person, the higher rose your awe. It was a reverence resembling worship, which was paid to the throne, the person of the king, and the pride of the nation. On the whole, to use an expression of Bolingbroke's, hardly ever as a king played his part better. But a theatrical representation he always would maintain, even in rifles; for example, in his latter years, he never appeared in the presence of any one without his great peruke. But he possessed, nevertheless, qualities which are requisite for playing well the part of a monarch. "The qualities of his mind," says Bouville, "were justness, solidity, constancy, and application. He united therewith habitual discretion and the seriousness which conceals deficiencies. He was naturally silent, and inclined to observation." Louis had nothing of the hero, but he possessed the art of ruling those who surrounded him. He was no general, but was able to appropriate to himself the reputation of his generals. Resoluteness and energy elevated him, at times, above the restrictions of courtly etiquette. Early in life, he danced the ballets. But hearing at the theatre, when *Britannicus* was performed, the verse in which it is said of Nero, as a reproach, *Il excelle à se donner en même spectacle aux Romains*, he never again danced in public. The manners of his time favoured a natural disposition to gallantry. He loved with enthusiasm, and expressed his feelings with dignity and tenderness. With an excellent memory, his judgment was sound; he knew how to say what was suitable at the right time, and with dignity and delicacy; he understood how to punish and reward with equity. Thus after the widow of Scarron, supported by many friends, had solicited in vain, for several years, her husband's pension of 1500 livres, he gave her a pension of 2000 livres, with the words, *Madame, vous m'avez fait attendre long temps, mais vous avez eu d'amis, que j'ai voulu avoir seul ce mérite auprès de vous*. The following trait shows, that, even in generosity, he had a dash of ostentation. The marquis of Uzelles, having been compelled to surrender a garrison, thirty-two days after the opening of the trenches, threw himself at the feet of the king, whose pleasure he feared, while he related the reasons for the surrender. "Rise, marquis," said the king; "you have defended the fortress like a man of spirit,

and capitulated like a man of sense." He intimated to the aged Boileau, who had retired to Auteuil, and appeared but seldom at court, that when his health permitted him to come to Versailles, he would always have a half an hour for him. Louis was above the praise of trifles. When De Grammont found fault with a madrigal of the king's, Louis was pleased, that the courtier, being ignorant of the author, had spoken so freely. Boileau, also, ventured to blame some verses which met the king's approbation, and Louis was by no means displeased. "He understands such things; it is his business," was his remark. Low flattery he repelled: thus he rejected the prize-question of the French academy—"Which of the virtues of the king deserves the preference?" By the esteem which he manifested for Boileau, Molière, Bossuet, Massillon, &c., he contributed to inspire the higher classes with a respect for the arts and sciences, and a taste for the society of men of learning and genius. But this was only meant to give splendour to his reign. Corneille and Lafontaine, and the meritorious scholars of the Port Royal, remained unnoticed by him. The great Arnaud, doctor of the Sorbonne, was compelled to live almost entirely concealed, from 1641, and died in exile. Louis was twenty years of age, and devoted to the pleasures of the court and chase, when Mazarin died. "To whom shall we now apply?" asked his secretaries of state: "To me," he replied with dignity; and the handsomest man of the kingdom, who had grown up in perfect ignorance, with his heart full of romantic gallantry, devoted himself sedulously to business and the acquisition of information. In the first half of his reign, he laboured daily eight hours. But his natural pride often degenerated into haughtiness, his love of splendour into useless extravagance, his firmness into despotism. Determined no longer to tolerate Calvinism in France, he said—"My grandfather loved the Huguenots without fearing them; my father feared, without loving them; I neither fear nor love them." He evinced his severity, also, in the case of Fouquet, superintendent of finance, from whom he accepted a *fête*, when he was on the point of condemning him to perpetual imprisonment, in 1661; with equal cruelty he took revenge for his offended pride, on the pope, in 1662. He was, as may be seen from his *Instructions pour le Dauphin*, a despot from religious conviction. As an absolute sovereign, he regarded himself as the proprietor of all the possessions of his subjects, but deemed himself bound to make a wise use of his power. He rarely, however, mistook the extraordinary men who signalized his age and France. He manifested an interest in the advancement of his nation; but, deceived by self-love, he submitted to the influence of others. While he believed himself free and independent, madame de Maintenon exercised the strongest power over him by her talents, piety, and virtue. His credulity went so far, that he assured the nuncio, in 1685, that whole cities, such as Uzès, Nîmes, Montpellier, &c., had been converted! While the Protestants were robbed of their property and freedom, he was engaged in splendid hunting expeditions. Two meritorious naval officers, who had taken the liberty to offer some modest suggestions respecting a naval school, were imprisoned for a year, and cashiered.

The reputation of Louis is the work of his ministers and generals. (See *Turenne*, *Condé*, *Luxembourg*, *Catinat*, and *Villars*.) Feuquières raised the art of war into a science. Louvois introduced discipline into the army. Vauban greatly improved the art of fortification. Men like Estrades and D'Avaux, made diplomacy at home in France. Louis himself was capable of negotiating immediately with ambas-

\* John Kettler, of Zurich, cast an equestrian statue of Louis XIV., at Paris, in 1690.

sadors on matters of state. The splendour of the French court, the boldness displayed in the cabinet and the field, the fame of the nation in arms and arts, introduced the French language into the courts of Europe, and from the peace of Nimeguen, in 1678, it gradually supplanted Latin, as the official language of states. But Colbert was the chief source of the greatness of Louis and France. That ordering, creating, and sagacious spirit originated the great standing armies of Louis, and imposed this burden on all the governments of Europe; at the same time, he maintained 100 ships of the line, and encouraged manufactures, navigation, and commerce; and the first French settlement in the East Indies was founded at Pondicherry. Colbert developed the astonishing resources of France, in population, natural riches, and national spirit. But, after his death, in 1683, Louvois and Louis plucked the fruit, while they felled the tree. The pride of the king, and the vanity of the nation, seconded the ambition of the despotic minister of war. Notwithstanding all this oppression, disaffection never found a rallying point of resistance. Such gratification did the nation experience in the splendour of a cruel and prodigal reign! Five wars, the revocation of the edict of Nantes (which Benjamin Constant has well termed *l'erreur de Louis XIV.*, et *le crime de son conseil*), the building of Versailles, the hatred of the nations, the battle of La Hogue, and the deep policy of William III. of England, overthrew the power of Louis in the Spanish war of succession. Favourable circumstances, the opinion of the age, and the consciousness of strength on the part of a people not yet corrupted, were all that preserved from downfall the tottering throne of the failing king. Death rapidly snatched away those who stood nearest him; first his only son, then his grandson, with his grandson's wife and eldest son, the hopes of France. The court intrigues, satiety, devotion, and the religious predominance of Maintenon, together with the influence of his confessor, La Chaise, and his far worse successor, Tellier, from 1703, made the heart of the aged king indifferent to the state of his dominions. The proud Louis, who imagined himself competent to every thing, who, after the death of his great minister, selected young men, whom he could guide at pleasure, was, at last, so led astray by his confessor, Tellier, that he caused the constitution *Unigenitus*, drawn up according to Tellier's plan, by three Jesuits, to be issued as a bull, in 1713, by pope Clement XI., who was equally deceived, thus giving the Jesuit party the triumph over their opponents, and, at the same time, producing commotions, which continued for forty years to agitate the church and state. Louis manifested, however, a strength of mind and firmness in death, as well as in the misfortunes which, in his last years, shook his throne and house; for Heinsius, Eugene and Marlborough humbled the pride of France before the Spanish throne was secured to the second grandson of Louis, by the death of Joseph I. and the victory of Villars at Demain. He submitted to all conditions, unless they were dishonourable, but such he rejected with scorn. When Philip was finally established on the throne at Madrid, the partition wall of the Pyrenees was not destroyed, as Louis had hoped, when he said to his grandson, on his departure, *Il n'y a plus de Pyrénées*; and France was burdened with a debt of 2,500,000,000 livres. The plan of attaching Spain to France, in order to counteract the connexion of Britain and Holland (which threatened the French commerce, navigation, and colonies), exhausted France, and laid the foundation of that revolution which was not to terminate till a century after the death of Louis XIV. Grouvelle says, therefore, of him, with justice—"We may

allow him good qualities, but not virtue. The misfortunes of succeeding reigns were, in part, laid on him and he has hardly influenced posterity, except for ruin." The same judgment is passed by M. de Stael, in her *Reflections on the French Revolution*. What is called the age of Louis XIV., is connected with Pericles, Augustus, and the Medici, as the source of the impulse which circumstances communicate to the national genius. Louis, who was at least possessed of a great comprehensive mind, and who was much and laboriously occupied on ungratified genius only as a necessary instrument for his purposes. At Colbert's suggestion, he founded the academy of sciences and that of inscriptions, he improved the French academy, encouraged the writers to raise his reputation and the French language above the hatred of nations, and the scope of its influence was wider than that of his reign. His nation gave laws to Europe, in matters of taste. The tone of French society was a model for the man courts, and corrupted the spirit of the nations, while it destroyed morals. It is not, however, to be forgotten, that the expulsion of the Huguenots from France also promoted the diffusion of the French language and manners. The great art of power was the soul of all the other arts in France, it opened to science itself the avenue to the courts of the polished classes. Pascal, who wrote with reason and delicacy, the sublime Bossuet, and Fenelon, splendid in his humility, the great Corneille, who boldly took his flight above the surrounding barbarism, the unique Molière, the inimitable *faisant*, and the calm thinker and spirited satirist, Boileau, the friend of the classical Racine, kindled the taste for light and philosophy in France. "Three centuries shook roused," as John von Muller, expresses himself, "the north from the monotonous studies of the universities." The fine arts were not neglected. Of Lebrun's epoch of art under Louis XIV., we are reminded by thirty-four paintings by this master in the museum of the Louvre. The French school, particularly Teniers, did not please the king; Le Sueur, Poussin and Mignard were the ornaments of the French school. Girardon was distinguished among the sculptors. Lenotre laid out the splendid gardens of Versailles; Perrault built the colonnade of the Louvre, Hardouin Mansard the dome of the church. Lulli was the creator of French music. A large portion of the great monuments of France, which excite the astonishment of the traveller, had their origin in the reign of Louis. He constructed the wonderful harbours, shipyards and fortifications at Breck, Brest, L'Orient, Havre, Dunkirk, Cherbourg, and Toulon. At his bidding, the canal of Languedoc united the Mediterranean with the ocean.

See Voltaire's *Siecle de Louis XIV.*, the *Œuvres de Simon*, *Œuvres complètes pour servir à l'histoire du Cours de Louis XIV.*, de la *Régence et de Louis XV.*; and the *Mémoires de Desmaisons*, as well as those published by madame de Genlis, as they are published by Lemonney (Paris, 1818), in *Les Émancipations de l'Établissement monarchique de Louis XIV.*, de *Œuvres de Louis XIV.* (vol. I.—VI., Paris, 1807), published by the diplomatist Grouvelle, and the count Grimoard, and the *Considérations sur Louis XIV.*, by Grouvelle, contained in the volume, which, although too favourable, are an excellent introduction to the history of this monarch. The *Instructions pour le Dauphin*, of 1661—1662, comprised in that work, are supposed to have been taken down by Pelisson, from the mouth of the king. —The Louis himself did not practise his precepts. He warns the dauphin to beware of the influence of favourites, and still more of the love of the women, which tends to divert the mind from business.

These writings, besides other historical matter, contain information respecting the system of corruption practised by Louis XIV., even at German courts, e. g. at Berlin. The *Mémoires* and *Pièces militaires*, which constitute the third and fourth volumes of the work, relate to the campaigns of 1672—1678, and that of 1692. In Grimoard's preface, they are said to be not unimportant for the history of the war. The letters of Louis, in the two last vols. of this work, are mostly of little consequence. The politeness and dignity with which this proud king writes to his ministers and generals are remarkable. This delicate tone was then general, and gave to language and manners that agreeable refinement which made Paris so attractive.

*Political Occurrences during this Reign.* The most splendid period of the reign of Louis XIV. extended from the peace of the Pyrenees, concluded by Mazarin, in 1659, to the death of the great Colbert, in 1683. That peace, however, lasted only till 1665, when Louis, on the death of his father-in-law, Philip IV., king of Spain, laid claim to the Spanish Netherlands, by virtue of the right of *devolution*, as it was called (which was a private law in part of the Netherlands, but could by no means be considered the rule of succession to the government of these states). Holland, therefore, concluded, in 1668, a triple alliance with Britain and Sweden, for the preservation of the Netherlands, of which alliance, although Louis was victorious in two campaigns, the peace of Aix-la-Chapelle was the result. Louis retained, indeed, the conquered places in the Netherlands, but was compelled to abandon his intentions in the country at large, and, as he attributed this to the triple alliance, he resolved on a retaliatory war against Holland, having previously succeeded in separating Britain and Sweden from their connexion with the republic, and uniting them with himself. His war, undertaken without regard to the commerce of France, to which it was very detrimental, and in which Spain, the German emperor and Brandenburg so engaged against France, continued from 1672 till the peace of Nimeguen, concluded 1678 and 1679, in which Holland lost nothing, while Louis IV. received from Spain, Burgundy (the Franche Comté), which the king of Spain had previously held, an appurtenance to the circle of Burgundy, under the sovereignty of the German empire, and sixteen acres in the Netherlands. Louis lost, in this war, his two greatest generals, Turenne and Condé; the former fell at Sasbach, in 1675; the latter retired in 1705, on account of his feeble health. Louis, however, still had Catinat, Crequi, Luxembourg, Schomberg, and Vauban. After the peace of Nimeguen, would have been politic for Louis to have ceased recruiting, for a while, his plans of aggrandizement; but he renewed, immediately after, the *réunions*, as they were called. In the three treaties of peace, a number of places, with all their appurtenances, had been ceded to France, though it had not been decided what really did pertain to them. Louis, therefore, abolished, in 1680, chambers of *réunions* at Metz and Brisach, whose office it was to accord him, under the form of right, every thing that could be considered in any way as belonging to those places. France, in this manner, acquired large districts on the borders of the Netherlands and of Germany. Louis would not gladly have obtained Strasburg, but, as even chambers of *réunions* could start no formal claim to this important place was quietly surrounded by soldiers, and compelled to surrender, in 1681, without blow. Spain and the German empire protested against this act, but both found it expedient, in 1684, to enter into a twenty years' truce with Louis XIV., which this monarch obtained, for that time, besides

Strasburg, all the places reunited prior to August 1, 1681. Meanwhile, Colbert had died, in 1683. From this time, France declined with the same rapidity that it had risen under his administration. The first blow it received, was the revocation of the edict of Nantes, October 22, 1685, after several years' oppressions of the Protestant party, by which measure the kingdom lost 700,000 of its most valuable subjects. To this measure the king was led by the united exertions of the two parties of the court, in other respects opposed to each other—the parties of the minister Louvois and of Maintenon, who co-operated with the generally benevolent confessor of the king, Lachaise. Colbert, to his death, had opposed the adoption of violent measures, which might induce the Protestants to emigrate. France was, soon after, involved in a new war. Several circumstances gave Louis XIV. and Louvois opportunity, in spite of the twenty years' truce, to enter the field anew. The war which Louis now waged from 1688 to 1697, against Germany, Holland, Spain, Savoy, and Britain, was terminated by the peace of Ryswick, in which Louis resigned all the *réunions*, and in addition, ceded to Germany, Brisach, Friburg, Kehl, and Philipsburg, besides all the smaller fortresses erected by France on the German side of the Rhine. Although, throughout the war, Louis was conqueror rather than conquered, he was bent on peace. The exhaustion of his kingdom, and especially the fear that a continuance of the war might frustrate his views on the Spanish succession, compelled him to yield. The death of Charles II., king of Spain, to which Louis had long looked forward, took place at the end of 1700. Louis had already concluded treaties of partition, with respect to the Spanish succession, with Britain and Holland; but Charles II., by a secret testament, had designated the grandson of Louis, Philip of Anjou, as heir of the whole monarchy, to the disadvantage of the house of Austria, in which the inheritance was legitimately vested. On the enforcement of this testament Louis insisted, after the death of Charles, and was thus involved in the Spanish war of succession, 1702—13, which he precipitated by acknowledging the British pretender (son of James II.), in violation of the peace of Ryswick. The finances of Louis were in great disorder; he had also lost many of his great men in the cabinet and field; while on the other hand, his numerous enemies—Britain, Holland, the emperor and the German empire, Prussia, Portugal, and Spain—could oppose to him two of the greatest generals Eugene and Marlborough. France suffered greatly by this war, which was terminated by the treaty of Utrecht, in 1713, and those of Rastadt and Baden, in 1714, brought about by the concurrence of several circumstances favourable to France, especially by the change that took place in the political system of Britain, in 1710, after Louis had several times proffered peace, without success, on account of the hard terms insisted on by his enemies. Louis made, indeed, some concessions to Britain, Holland, and Savoy, but saw his grandson acknowledged as king of Spain, under the name of Philip V. This, however, was connected with the condition of a renunciation, which should prevent the possibility of any future union of the Spanish and French crowns. The internal prosperity of the kingdom was totally ruined by this war, of which the expenses, in the year 1712 alone, amounted to 825,000,000 livres. The great army which he kept on foot, was what chiefly excited and nourished in Louis the love of conquest. He maintained a larger standing army than any other prince of his time. It rose from 140 to 300,000 men. Respecting the policy of Louis XIV. the following is the language of Flassan:—"The cabinet of Louis XIV., notwithstanding the

diversity of talents of his ministers, exhibits, in its most important negotiations with foreign powers, almost always the same character of lofty pretension. The spirit of his policy may be clearly seen in the manner in which he insisted on interpreting the treaties of Munster, of the Pyrenees, and of Nimeguen, and the renunciation of queen Maria Theresa. The means of imparting validity to such arbitrary explanations, were, force of arms, artful diplomacy, expert spies, and corruption. The king expended great sums in securing the favour of sovereigns—Charles II., for example, in Britain—their ministers and mistresses. Against his enemies, he employed, even in times of war, clandestine popular excitements; he encouraged the commotions in Catalonia, Sicily, Britain, Portugal, and Hungary. More than any king before him, he enlarged the boundaries of the kingdom, especially towards the north; by which means, he secured the capital against the accidents of war. Till the battle of La Hogue, May 29, 1692, in which the combined British and Dutch fleet, under admiral Russell, overcame the French admiral Tourville, he maintained the balance of power on the ocean, and made his flag respected by the natives of Barbary and by the most powerful maritime states. On the continent, he held a decided predominance till the peace of Nimeguen, so that he had no reason to fear any coalition of the other powers. To this his connexion with Sweden and some of the small German principalities mainly contributed. He subsequently fell somewhat from this high elevation, but continued to be the first sovereign of Europe, even after his defeats in the Spanish war of succession; for, after he had severed the league formed against him by the peace with Britain, neither Austria nor the German empire could long offer resistance." To this foreign policy, favoured by the weakness and political errors of his neighbours, was added an arbitrary internal administration. The system of police, organised by D'Argenson, in the last years of the reign of Louis, was, in its effects, as formidable as an inquisition.

LOUIS XV., the great grandson of Louis XIV., and son of that excellent duke of Burgundy who was educated by Fénelon, was born February 15, 1710, commenced his reign in 1715, and died May 10, 1774. He married, in 1725, Maria, the daughter of Stanislaus Leczynski (she died in 1768). The History of Louis XV., by Antoine Fantin Desodoards (Paris, year VI., three vols.), and the Age of Louis XV., by Arnoux Laffrey, published by Maton (Paris, 1796, two vols.), do not correspond to what might be expected from French writers, after Voltaire's work on the reign of this king. The memoirs of Duclos, St Simon and others, the History of France in the eighteenth century, by Lacretelle (Paris, 1811, six vols.), and the well known work *La Vie Privée de Louis XV.* (4 vols.), contain important materials for the history of this unworthy and degraded king, who, by his licentiousness, bigotry, prodigality, and despotism, rendered the evils of the state incurable. The age which educated and corrupted him, and on which he and his court reacted in a not less injurious manner, explains not only the origin, but also the spirit and malignity of the revolution. A great part, however, of this fault, falls on the regency, administered by Philip, duke of Orleans, and the cardinal Dubois, till 1723. See *Orleans, Philip of.*

The influence of the age of Louis XIV. on the religious and political notions of the cultivated classes, and especially the increasing power of public opinion in France during the reign of Louis XV., are conspicuous. The characteristic of the age of Louis XV. consists in the intellectual development of the nation, in the splendour and boldness

of new philosophic views, which had so strong an influence on society. From them proceeded the full separation of reason from morality, of the passions from rectitude, and of enlightened ideas from the forms of church and state. The immunities of pleasure, which, from the higher, descended to the lower classes, and was defended or excused by the philosophy of the day, was united with a vicious selfishness, which was awakened by the financial schemes of Law and the regret, connected with fraud, despair, and the bankruptcy of 500,000 citizens. From this love of pleasure and selfishness, proceeded most of the faults and vices of the contemporaries of Louis XV. The vices then spread farther and farther, and ate deeper and deeper into the roots of public spirit and every virtue.

Louis XIV. left his great grandson and namesake with the words, "I have, against my wishes, imposed great burdens on my subjects; he has been compelled to do it by the long war which I have been obliged to maintain. Love peace, and undertake no war, except when the good of the state and the welfare of your people render it necessary." A much deeper impression should have been made on the mind of the royal child, by the conduct of the people who accompanied the hearer of his law with insults and the grossest expressions of rage. But what an idea must the boy of six years have formed from the *lit de justice* (the atrocious scene of despotism), held by the regent, to confirm to regency! How different were the views of his father the noble duke of Burgundy, who intended, as he ascended the throne, to restore to the people their lost rights! In his seventh year, Louis was first placed under the care of men. But to see the marshal Villeroy, was no Montesquieu, Fenelon, or Fénelon. On one occasion, when Louis had recovered from a violent sickness, he always manifested their satisfaction by repeated remarks. The court and gardens of the Tuileries were full of men. Villeroy carried the king from one master to another. "See them, my king! your people and this people belongs to you; all that you see is your property; you are lord and master of it." The instructor of the young king, the prudent and noble Fleury, won the confidence of his pupil in a simple manner. A third, who had, however, less share on the young king, was his confessor, the Jesuit Linières. The cardinal Dubois had offered to be appointed to this important office against Fleury's wish and the advice of cardinal Negrier. Fleury, however, acquired the entire confidence of Louis, who, after the death of the regent, in 1723, by the advice of his instructor, appointed the duke of Noailles chief minister of state, who could undertake nothing, however, without the knowledge and consent of the prelate, then seventy-three years of age. Till now, the king, who entered upon the government himself in 1723, but had hitherto neglected the management of affairs to the former regent, as the minister of state, had shown no will of his own. A Spanish princess of six years had been destined to his wife, and had been subsequently sent back to her parents; the marshal Villeroy had been banished from the court, and the king had married Maria Leczynski, the daughter of Stanislaus, the deposed king of Poland, indifferent and submissive to all these proceedings. But when the party of the duke attempted to get rid of the prelate, and the cardinal Fleury had retired to his country seat, the king insisted on his return with such firmness, that the duke found himself obliged to apply to the prelate, and solicit his return. Soon after, in 1726, Fleury was placed at the head of the administration. He declined the title of first minister, but was, in fact,

such till his death, in 1743. His habit of dissimulation extended itself to the king, in whose private life a great change now took place, probably favoured by Fleury himself. The noble germ which his application and some generous expressions had manifested, was stifled in sensual pleasures and the luxury of a court life. The peaceful Fleury, who endeavoured to restore order and economy, now gave the enervated monarchy a seven years' tranquillity; but he was not sufficiently enlightened to compose the controversy respecting the bull *Unigenitus*. He soon saw himself, contrary to his will, involved in a war. After the death of Augustus II., king of Poland, in 1733, Louis wished to see his father-in-law chosen successor of Augustus, and declared that the freedom of election should be interrupted by no foreign power; but the emperor Charles VI., having concluded an alliance with the elector of Saxony, and supported his election as king of Poland, Louis's plan was frustrated, and a war broke out. After two campaigns, France acquired for Stanislaus, who had fled from Dantzic in danger of his life, the possession of the duchy of Lorraine, by the preliminaries of Vienna, in 1735. After the death of Charles VI., in 1740, the project of marshal Belleisle, to dismember the Austrian hereditary states, plunged the aged monarch into a war, the success of which was frustrated by the parsimony of the minister, then eighty-years old. The French armies fought on the side of the elector of Bavaria, who laid claim to the whole Austrian monarchy. Britain was on the side of Maria Theresa. The conquest of Bohemia was not accomplished; scarcely could Maillebois, Belleisle, and Broglie, effect the retreat of the wreck of the defeated army from Bohemia and Bavaria over the Rhine. Still greater were the losses of France by sea; for Fleury neglected the marine. After his death, in 1743, the victories of count Maurice of Saxony (see *Maurice*) gave new splendour to the French arms; and, by the peace of Aix-la-Chapelle, in 1748, France regained her lost colonies. But the state was more than ever, exhausted by an unjust and unpolitic war. Louis had himself taken a part in several campaigns, and, when he was attacked at Metz by a severe malady, received the appellation of the well-beloved (*le bien-aimé*). The affection for him by the French exceeded his deserts; for Louis became, from this time, more and more unworthy of the public respect, sinking into the gross indolence and sensuality, and abandoning the management of state affairs to the marchioness of Pompadour. (See *Pompadour*.) She was, in reality, the ruler, the monarch being absorbed in his orgies, childish amusements and despotic fears. He devoted himself, without dignity, the sport of petty passions, and the instrument of external influences. The nation, on which so powerless a government could have no effect, followed entirely its restless prices. Contests of public opinion, bold hopes, and new systems, amused and engaged all classes of society. Every one longed for a new and better state; obedience became more and more lax, the wish of change more decided; a few steps more would lead to insurrection. The sensuality of the age put him entirely in the power of the ambitious Pompadour. While she made him lead the shameful life of an Eastern monarch, she sacrificed, according to the caprice of the moment, the honour, wealth, and the prosperity of the state, to those who were able to gain access to her by their attractive abilities. She accustomed the king to the *acquits de virement*, or warrants for payment, which exhausted the treasury, and introduced confusion into the accounts. The cost of the *parcours-cerfs*, as it was called, — the most abominable instrument of the

king's voluptuousness, — was defrayed by such *acquits*, which, according to Lacretelle, amounted, eventually, to 100,000,000fr. Louis also loved to play deep, and appropriated, for this purpose, a private chest, the losses of which he supplied from the public chest. Those who lost to him were indemnified by lucrative public offices. In order to increase this fund, he engaged in stock-jobbing and in speculations in grain. The rise and fall of the stocks, and the price of corn, interested him in a manner entirely unbecoming a king. He appropriated a capital of ten millions, from his private treasury, to this disgraceful traffic, and even allowed the name of M. Mielavand to be introduced into the state almanack of 1774, among the officers of finances, as *trésorier des grains pour le compte de S. M.* To relieve his ennui, he printed several books, and was even pleased with the celebrated physiocratical system of his physician Quesnay. He called him his *thinker* (*penseur*), listened with satisfaction when he censured the policy of his ministers, but never troubled himself about the application of his ideas. Towards women he conducted himself, in public, with the courteousness of a French chevalier, mingled in their petty quarrels, and played the part of a confidant. He was inquisitive about the intrigues of all the courts of Europe, and, to inform himself respecting them, maintained secret agents, of which his ministers, in many cases, knew nothing. The dignified, manly conduct of the dauphin, the virtues of the dauphiness, made no permanent impression on him. He sometimes, however, seemed to feel remorse, especially after the death of the queen. But he soon sought and found solace in his old pleasures. From the year 1769, he was governed by Du Barry (see *Barry*), who is said to have cost the royal treasury, in five years, 180 million livres. As Louis became older, his bigotry and apathy increased, while he sank deeper in sensuality. His secret debaucheries dishonoured innocence, and poisoned the domestic happiness of his subjects. The public contempt was expressed in satires, caricatures, and songs, to which the people had already become accustomed under the regency. The hatred of the people gave credence to the most exaggerated accusations, and Louis, from fear and aversion, withdrew himself from the public eye. With this carelessness and apathy of the king, the French levity increased continually; every one was engaged with trifles and selfish plans; the most important affairs of state, on the contrary, were neglected. France, at the same time, saw itself involved, in 1754, in a maritime war with Great Britain, on account of the forts on the Ohio, and, as if this contest was of no importance, rashly took the side of Austria against Prussia, in 1756. The shrewd Kaunitz had gained the favour of the vain Pompadour, who was offended by the sarcasms of Frederic II. By her influence, the duke de Choiseul was appointed first minister, in the stead of the abbé Bernis, and, May 1, 1756, a new alliance was concluded with Austria, at Versailles, which was unique in history. The French suffered great losses by sea and land; even their military reputation had declined since the battle of Rossbach, Nov. 5, 1757; and, after seven unhappy years, they had reason to congratulate themselves, when Choiseul concluded a peace with Great Britain at Fontenbleau, in 1762, and the definitive treaty was settled at Paris, in 1763, although France had to relinquish to Great Britain, Canada, as far as the Mississippi, Cape Breton, and the islands Grenada, Tobago, St Vincent, and Dominica, together with Minorca. Louis remained indifferent to all these events. The first time that he saw marshal Richelieu after the conquest of Mahon, in 1756, he

turned to that general, who was adored by the whole nation, with the question, "How did you like the Minorca figs?" The famous family compact of the Bourbons, by which Choiseul hoped, in the course of the war (1761), to unite for ever the policy of Spain, Sicily, and Parma with the French interest, was of no great benefit to France. After the war, Choiseul's ministry was marked by several (often violent) reforms; especially by the expulsion of the Jesuits from France, in 1764, and by the acquisition of Corsica, in 1769. Shortly after, Mme. du Barry, in connexion with the chancellor, Maupeou, effected the overthrow of the duke de Choiseul, and elevated to his post the duke of Aiguillon. The quarrel of the latter with the parliament at Rennes, which had written against him in a violent tone, as former governor of Bretagne, and the refractoriness of all the parliaments, especially with respect to the new oppressive financial edicts, induced the king, in 1771, to banish the members of the parliament from Paris, and, soon after, to abolish the parliaments entirely, which were first re-established under Louis XVI., in 1774, with certain limitations. The notorious edict which the chancellor Maupeou then issued, called the king the sole and supreme legislator of his kingdom, who permitted parliament, indeed, to protest against a new law, but, after two considerations, might demand unconditional obedience. Thus Maupeou made the absolute will of the monarch a constitutional law! A worthy counterpart of Maupeou was the comptroller-general of finances, the abbé Terrai, who impoverished the country, while he received an income of 1,200,000 livres. In proportion as the king was despised at home, the authority of France was lessened abroad. The partition of Poland took place in 1773, without the knowledge of France. After having sunk into a complete nullity, the king, whom no domestic misfortunes, not even his own attempted assassination, in 1757, by a fanatic, Damiens (see *Damiens*), nor the public misery, could restore to consciousness, died of the small-pox, caught of a young girl, by whom the countess Du Barry wished to dispel his melancholy, leaving a debt of 4,000,000,000 livres.

*Age of Louis XV.*—In proportion as the reign of Louis was weak and pernicious to the state, the spirit of the nation rose, awakened by the times of Louis XIV., and by distinguished men in the arts and sciences. In Paris, public institutions arose; palaces and churches were built (for example, the church of St Genevieve, by Soufflot, &c.); the military school of Paris, and the *Champs Elisees*, were laid out in 1751, by the minister of war, count D'Argenson; the intendant, Trudaine, prosecuted, with success, the construction of roads. The commerce of Lyons, and Bourdeaux adorned these cities with regal splendour. Stanislaus Leczynski, who died in 1776, restored the public prosperity in Lorraine, and Pigal executed a splendid monument, which was erected in Strasburg, to the marshal Saxe, who died in 1750. Of the numerous painters of this period, the best were Lemonne and Vernet. But taste degenerated under the influence of a voluptuous court, and art paid homage to luxury. It delighted in empty show, but, at the same time, carried manufactures to perfection. The ingenious Vaucanson applied his talents to the improvement of the Gobelins manufactory. (See *Gobelins*.) Louis XV. himself took an interest in the porcelain manufactory established at Sevres, by the advice of madame de Pompadour. At the same time, he is said to have suppressed, from humanity, a means of destruction, which would have been more formidable than the Greek fire; but this is not historically proved. Enterprising and intelligent men, like La Bourdonnaye, founder of the colonies of the Isle de France and

Bourbon, and even his coloniser, Duplax, extended the commerce of France. Louisiana, Canada, especially St Domingo and the Lesser Antilles, as well as on the Senegal, and the parts of the Levant, supported the French activity, and enriched the treasury. But, by the unjust measures of La Bourdonnaye, the state deprived itself of the advantages arising from the East Indies over Great Britain, and, while France lost Canada and several islands by the manner in which it carried on the war; from 1756–62, it promoted the British power in India. The time was, however, gradually acquired, by its wealth and intellectual advancement, consequence and glory. Public opinion assumed, in the age of Louis XV., the character of levity, frivolity, and sensuality, and was afterwards so strongly developed in the revolution. Striking events, such as the trial of the unfortunate John Calas (q. v.), and the execution of the young chevalier De La Barre (q. v.), for mercy brought new opinions into general circulation. In the evil genius of France waisted that the decay of morals and religion, contemporary with the abuse of arbitrary power, with prevalent prejudice and oppressions of the priesthood, should change to a love of truth, just springing up in France, into a burning fire, and the defensive weapon of knowledge as a two-edged sword; that the egotism of men should gain possession of the territory of reason as that brilliant wit should be more extensive than a serious purpose and a solid character. The concurrence of the public misery with women's frivolousness, stifled those improved views, and the scientific cultivation, which Montesquieu and others to whom France was indebted for its intellectual influence on the higher classes of society, as great part of Europe, exerted themselves to disseminate. The ignorant, stupid Louis had no taste for all intellectual cultivation. He feared himself weak, and frequently said of them, that they were a cause of ruin to the monarchy. He, nevertheless, followed, in the first part of his reign, the advice of a cardinal Fleury, who highly esteemed the crown, and subsequently yielded to the opinion of the court, and especially of Pompadour, who took a pleasure in being denominated the patron of genius, and a man of the excellent. The most powerful and pernicious influence on the spirit of the nation was exerted by Voltaire, who commenced his epistolary career in 1716, with the tragedy of *Edipe*. Louis took an aversion to him, but the marchioness de Mouchy appointed Voltaire his historiographer and counsellor in the chambers. Meanwhile the preference was manifested by the court towards the poet, who inspired the author of the *Henriade* with a regard to residing in Paris. Simultaneously with him, the immortal Montesquieu awoke the power of criticism and of wit in the nation. His *Letters Persians* (1721) kindled the spirit of public criticism, and his work *Sur les Causes de la Grandeur et de la Decadence des Romains* (1734) like his *Esprit des Loix* (1734), became a classic manual for the study of politics. About this time, the abstract sciences felt in scientific subjects, induced curiosity. Four and count Maurepas to persuade the king to ascertain the truth of Newton's opinion respecting the form of the earth by the measurement of a degree at a high northern latitude and under the equator, which was undertaken in 1735 and 1736, and patronised Cassini's map of France. After 1750, La Fontaine, Rousseau, Diderot, D'Alembert, Dumas, Condorcet, and Helvetius are found in the ranks of the great writers of France. The greatest reaction in public opinion was caused by the *Encyclopedie* of Diderot and D'Alembert, against which the clergy, particularly the Jesuits, and the monarch,

rose en masse. No less attention was excited by the work of Helvetius, *De l'Esprit*. Even the ladies took a very active part in the contest of philosophy. *Bureaux d'esprit* were formed, and from the philosophical circles at the houses of the baron of Holbach and Helvetius, there proceeded several works in support of materialism and atheism, especially from 1758 to 1770. The most famous of them is the *Système de la Nature*, of which the baron of Holbach is regarded as the author. Religion was shamelessly assailed by La Mettrie, D'Argens, the abbé de Prades, who, banished from France, sought refuge with Frederic II., but whose opinions found reception in France. Condemnation by the *Sorbonne* only excited opposition, and the boldness of the age loved to defend such and splendid errors, if they afforded opportunity for the exhibition of acuteness. No work was more destructive of public morals than Voltaire's *Pucelle*—a talented poem, which the licentious spirit of the times of the regency alone could have inspired. But other men, such as Turgot and Malesherbes, laboured, not without the approbation of the better part of the public, to counteract this pestilence, and saved the honour of sound reason. Such a production is Duclos's *Considérations sur les Mœurs*, of which Louis XV. himself said, "It is the work of a man of honour." Thomas Marmontel, and Laharpe remonstrated loudly against atheism. Voltaire's wit was particularly directed against the Christian religion, fier the duke de Choiseul, in order to have all the voices against the Jesuits for himself, undertook the protection of the philosophers and of the author of the *Dictionnaire Philosophique* (Voltaire). Rousseau issued the most violent anger of the antiphilosophers, in his *Emilie*. Jesuits and Jansenists united against him, and, notwithstanding the general admiration which he received, he was obliged to leave France. Such was the revolutionary spirit of the age of Louis XV. The contempt for the court and royalty produced by his reign, the exhaustion of the state caused by his extravagance, the rise of a critical and liberal spirit, and the corruption of state and church, gave birth to the revolution, and the debased state of the public morals, poisoned by the example of the court, aided it with hideous excesses.

LOUIS XVI., who was destined to ascend the throne of France on the eve of a great political convulsion, and to atone with his life for the faults and crimes of his predecessors, was the grandson of Louis V., and the second son of the dauphin, by his second wife, Maria Josephine, daughter of Frederic Augustus, king of Poland and elector of Saxony. Louis was born Aug. 22, 1754, and, in 1770, married Marie Antoinette of Austria. The countess Marsan, governess of the royal family, had a large share in his education, and even after he became king, Louis resorted to her representations, of which the abbé Morgelet relates a remarkable instance in his memoirs. With the best intentions, but entirely inexperienced in matters of government, this unfortunate prince ascended the throne in 1774, at the age of hardly twenty years. He modestly declined the title of *le desiré*, given him by the nation, which he excused on the tax usual on the occasion. After the death of the Dauphin, in 1765, his grandfather had intemperately kept him from acquiring the knowledge connected with his destination; and the countess Du Barry sought to revenge herself for the contempt prohibited towards her by the serious, strictly moral prince, who dearly loved his wife, whom she hated, by making him ridiculous in the eyes of the king. His ministers, also, secretly spread the opinion that the prince was severe, and far removed from the indulgent kindness of his grandfather. He was retiring, silent, and reserved, and did not dare to express

his benevolent feelings. His reserve passed for distrust. He felt himself a stranger at a court where he was surrounded by vice under a thousand glittering forms. As he heeded not flattery, he was indifferent to the courtiers. The duke Choiseul therefore said, that, on the most desirable throne of the world, he was the only king who not only had no flatterers, but who never experienced the least justice from the world. In his countenance, which was not destitute of dignity, were delineated the prominent features of his character—integrity, indecision, and weakness. He was injured, however, by a certain stiffness of demeanour, repulsive to the communications of friendship. His manners had nothing of the grace possessed by almost all the princes of the blood. In confidential intercourse alone, he frequently expressed himself sensibly and ingeniously, but blushed if his observations were repeated. Facility of comprehension, industry, and an extraordinary memory, made him successful in his studies; but, unhappily, they had no immediate relation to the duties and knowledge of a prince. He employed himself too assiduously in unimportant particulars. Thus he printed, when dauphin, in 1766, thirty-five copies of *Maximes morales et politiques, tirées de Télémaque, imprimées par Louis-Auguste, Dauphin. Versailles, de l'imprimerie de Monseigneur le Dauphin*. He had himself collected these maxims from Fénelon's work. He was familiar with geographical and chronological details; but the practical lessons which kings should derive from history, were unknown to him, although, while dauphin, he had read several good historical works. A translation, by him, of some parts of Gibbon's History, appeared under the name of Le Clerc de Sept Chenes, his reader. Upright, pious, and indulgent, he was philanthropically disposed, both towards his nation and towards individuals. The virtues of his father, the quiet, domestic life of his mother, had deeply impressed upon him a moral, religious feeling. But his example was destined to show how insufficient, on a throne, are the virtues of a private man. He chose count Maurepas his minister of state, a man of talent and experience, but of little solidity of character, and desirous of shining in epigrams. In the room of the infamous abbé Terrai, he committed the financial department to the enlightened, able, and upright Turgot, who resolved to remedy the abuses of the state by thorough reforms on strict philosophical, and, in some degree, physiocratical principles, and looked upon the privileged orders as the sources of all evil. But the friends of ancient abuses, the high nobility, the court, and the clergy, immediately formed a combination against him. When the parliaments were restored, by the influence of Maurepas, against the judgment of Turgot, the contest of opinion, between old and new views, more than ever embarrassed the government. The count of Vergennes was at the head of foreign affairs; count Mury was minister of war; and Sartine, of the marine. The new theories, which Turgot proposed in the council of state, had, indeed, the approbation of the philosophers: even the talented men and women, whom madame Helvetius, madame Geoffrin, mademoiselle Espinasse, the princess of Beauveau, and the duchess D'Anville, collected around them, took a lively interest in Turgot's liberal plans, which were loudly praised by Joseph II. and Leopold; but his opponents found a support for their resistance in the old parliaments. The most oppressive feudal services, arbitrary exactions, slavery in the mountains of Jura, and the rack, were abolished, and many useful regulations established; but Turgot could not overcome the king's dread of an open struggle with the clergy, the nobility, and parliament. These bodies united against the minister,

and the people, which was on his side, could not, without representatives, afford any assistance against such a league. The foes of the minister stirred up the populace, and, on occasion of an edict declaring the corn-trade free, scenes occurred resembling those which subsequently marked the revolution. The timid and inexperienced Louis believed himself hated by the nation, and was indulgent towards the seditious; finally, by the advice of Turgot and Mury, he acted with vigour, and the disturbances, called, in Paris, *la guerre des farines*, were quieted after the amnesty of May 17, 1775. The coronation of the king, 11th June, 1775, was followed by the appointment of the virtuous Malesherbes as minister. He was the friend of Turgot. Their united influence might, perhaps, have done much towards reforming the old abuses, but, unhappily, the new minister of war, the count of St Germain, was too violent in his innovations. The corps that were disbanded or diminished, and the offended military nobility, loudly expressed their dissatisfaction at the system of innovation, which was disliked, moreover, by the higher classes. "The state will perish," was the general cry, and the parliament refused to register five edicts of the king. Louis resolved, indeed, to maintain his authority, by a *lit de justice*, March 12, 1776; but the queen, a princess who was equally superior to her husband in vivacity of understanding and in wit, and loved splendour and pleasure, supported the opposition together with Maurepas, who was Turgot's secret enemy. Her the king could not resist. He hesitated: the deficit produced by the payment of debts and the expenses of the coronation, in 1775, inspired him with distrust of Turgot's philosophical views. Malesherbes gave in his resignation. Turgot was obliged to follow his example. The privileged party was victorious, but the hatred of the third estate, and the desire of all enlightened and well-disposed persons for a thorough reform, was increased. They did not wish to overthrow the whole system, until the North American revolution threw a fire-brand into this inflammable mass. The day on which Louis concluded the treaty with the United States, Feb. 6, 1778, decided his fate: for the war to which it gave rise, from 1778 to 1782, and which cost France, according to Audouin, 1,400,000,000 livres, accustomed the nation and army to republican ideas, and produced a cureless deficit; this, a meeting of the states-general; and this, the fall of the monarch and monarchy. Louis himself was averse to engaging in this war; but he was outvoted in the council of state, the ministers hoping to establish French commerce on the overthrow of the British.

After Turgot's removal, the extravagance of the court increased: while Louis refused himself any great expenditures he yielded too easily to the tastes of the queen and the princes of the blood. Luxury and splendour made the expenses of the court very great: they played high; they built; they exhibited races; they gratified every whim; and Louis's dissatisfaction, which often withdrew him from these entertainments, was regarded as the indication of an ordinary mind. The regularity of his manner of life, in which study and domestic pleasures were intermingled with business, made no impression on the gay spendthrifts. Louis did not possess the art of inspiring the court and princes with respect. He paid the debts of count Artois. The queen, also, gave herself up to her love of gayety. Taste and love of the arts, clothed in all the humours of the fashion, reigned in the festivals of Versailles and Petit Trianon. Maurepas either did not see whither all this must lead, or, with his characteristic levity, yielded to necessity. Pleasure was his element. He remained the directing minister till his death, Nov. 21, 1781.

sharing the confidence of the king and the timid queen, and with every one who could secure to the monarch under the appearance of order the common welfare. The changes in the manner of his favour, which was committed, in turn, to Castellan, Necker, Joly de Fleury, and D'Armaignac, the confusion. The existence of great abuses was notorious; but the extirpation of their causes was impossible. The demand of a minister who had become an object of great dislike in the *compte rendu*, was considered as a public insult by the third estate, whose favour he sought himself to acquire. Thus, long before the revolution, a real anarchy prevailed in public opinion, which penetrated even to the council of state. The presence of Versailles, in 1783, which brought no advantages,—not, however, sufficient to pay the expense incurred,—the frivolous promises, few of which were redeemed, was a minister of finance. In foreign affairs he was in the dispute about the Scheldt, Vergennes maintained, though not without sacrifice of the honour of the French crown; but the treaty of 1786, with Great Britain, was deemed a greatest error of his administration, although it was a consequence of the peace of Versailles. He was also blamed for having rejected the overture proffered by Joseph II., and for thus causing the approximation of Austria to Russia. The king himself betrayed weakness in discussing the matter before the accomplishment of his plan, which he had at first approved. It is said that he spent his leisure hours in the labours of a blacksmith and this led him to the use of strong liquor. Drinking and working at the furnace had lost a blood, his understanding was weakened, and consequently, his natural indulgence, with an active corpulence, destroyed his mental activity and produced a phlegmatic indifference. Yet it is known that Louis took pleasure in literary occupations, he engaged with fondness in public enterprises, he framed, with much sagacity, the plan and preparations for Laperouse's voyage round the world in 1786. Several passages in those memoirs express, in a touching manner, the humane feelings of this artless prince. He often said: "Laperouse's unhappy fate, with the words, 'I am very well that I am not fortunate.'" His kind disposition made him particularly generous to the poorer clergy. He followed, however, the habit of Louis XV., not to give bishoprics to men of talents, to any but nobles. He drew a line of division equally unjust, and far more pernicious, with regard to the army, in which military rank was confined exclusively to the nobility. The third estate could not speak out; so much the more luxury and violently did the populace complain of the court and higher classes, when, in consequence of the affair of the necklace, the process against the royal prince of Rohan was commenced in 1785. (See Georgel's *Mémoires*, vol. ii.) The idea of the branded countess De La Motte and her husband, disseminated the grossest calumnies against the queen, which were but too easily credited by the people. By this means the throne was degraded to public opinion; and the duke of Orleans, the implacable enemy of the queen, was accused of being the infamous La Motte as the tool of his master. In this fermentation of public sentiment, Calonne persuaded the king to convene the *notables*, in order to find some resources for the exhausted treasury. Unhappily, the count of Vergennes died, February 22, 1787, and on the 22d February, the king opened the assembly with a speech, which was not favourably received. The deficit, which the *compte rendu* showed

had stated at 112,000,000, but which was estimated at more than 140,000,000, rendered Calonne's plans suspected. An opposition was formed, and Calonne received his dismissal. Parliament refused the imposition of two new taxes, which would have been burdensome to the large landed proprietors, and demanded the convocation of the estates. The nation read the proposition with exultation; the court trembled. Louis ventured on a *lit de justice*; but he parliament declared it void. According to Larettelle, a calembourg was the spark which kindled the mine that overthrew the throne, while the mass of the nation, excited by opinions and passions,asperated by hatred and contempt, reduced to desperation by the sight of multiplied wants, and inspired, by the example of America, with the love of freedom, became incapable of restraint or moderation. The king banished the parliament to Troyes. Thus war was declared between the throne and nation. The government, moreover, had acted without dignity in regard to the contest of the Dutch patriots with the hereditary stadtholder in 1787, and thus entirely lost the respect of the people. The king himself manifested a good nature, bordering on weakness, to his nearest connexions, who, like the duke De Coigny, consented only with the greatest reluctance to the restrictions of the royal household. A negotiation was finally commenced with the parliament; it returned; the measures, on both sides, became more violent; the rebellion broke out in Brittany, in June, 1788; the nobility and the officers of the regiment Vassigny, then, for the first time, dared to carry arms against the commands of the king. Even the clergy loudly demanded the convocation of the estates. (Respecting the pernicious artifices of the royalists, in general, much information is contained in Besenval's and Molleville's Memoirs.) The weak prime minister Brienne (see *Loménie*), opposed in all his projects, resigned, and never entered the council, in 1788, as minister of finances. Louis convened a second time the notables, to settle the form of the estates, and the manner of voting. May 5, 1789, the states-general met. Amidst the conflicts of the privileged orders, and the new opinions, the king remained gentle and mild, deserted and alone. "God forbid," said he to the nobility, who would not unite with the third state, "that a single man should perish for my sake." His sole object, which he pursued with earnestness of purpose, was the common weal; but around him very thing vacillated; how could he show firmness? The democrats hated him as a king; the emigrants and the aristocrats, who remained in France, deemed him incapable of governing. He himself made the readiest sacrifices to the state, even such as endangered his personal security, for instance, the dismissing of his body guard. He could not, nevertheless, escape the most envenomed calumny. Among other things, it was reported that, by a secret act, he had protested against every thing which had been carried from him in limitation of the ancient royal prerogatives. Meanwhile, even amidst the grossest calumnies, a flattering word was sometimes heard. When Louis XVI. attended the national assembly, February 4, 1790, the national guard of Versailles used a gold medal to be struck, on which was presented a pelican feeding its young with its blood. The device was, *Français, sous cet emblème aimez votre roi!* The 12th, 13th, and 14th of July, 1790; the night of August 4; the horrors of the 5th and 6th of October; the flight of the king, June 21, 1791, intercepted at Varennes, sixty leagues from Paris, when Louis, from his hesitation to use force, prevented the success of Bouillé's plan for his escape, and, at the same time, excited public opin-

ion against himself by the declaration which he left behind (see the statement of M. de Valory, in the *Minerve*, November, 1815, and the *Memoirs* of Bouillé and Choiseul); the acceptance of the constitution of September 14, 1791, which declared his person inviolable; the attack of the populace of Paris on the royal palace, June 20, 1792, when Louis, with equal firmness and dignity, rejected the demands of the insurgents, and, on the 22d, openly declared that violence would never induce him to consent to what he considered hurtful to the general welfare; the catastrophe of August 10, to which Louis submitted, because he had not the courage to overcome the danger; his arrest in the national assembly, to which he had fled for refuge; finally, his trial before the convention, where he replied to the charges with dignity and presence of mind;—these were the most important events in the history of the king. (See *France, from 1789 to 1814*.) He exhibited, under these circumstances, the courage of innocence, and a strength of mind before unknown in him. As a prisoner of the municipality of Paris, in the Temple, he was denied, till shortly before his death, pen, ink, and paper. (See the *Journal de ce qui s'est passé à la Tour du Temple pendant la Captivité de Louis XVI.*, by Cléry, the faithful servant of the king; and a work on the same subject by Hue, who followed Louis to the Temple.) His usual employment was instructing his son and reading. He preferred Latin authors to the French. He read, almost every day, portions of Tacitus, Livy, Seneca, Horace, and Terence; in his native language, chiefly travels. On the evening before his death, he found that he had read 157 volumes, in the five months and seven days of his imprisonment. He evinced himself a loving husband and an affectionate father. In his private capacity, no candid man can withhold from him his esteem. January 15, 1793, Louis was declared guilty of a conspiracy against the freedom of the nation, and of an attack on the general security, by a vote of 690 out of 719; on the 7th Jan., he was condemned to death, the law requiring for condemnation two-thirds of the votes, having been repealed on the 16th, during the trial, and a bare majority declared sufficient. After repeated countings, it was found that 366 votes were given for death, making, consequently, a majority of five in 727. Jan. 21, 1793, he was guillotined, in front of his former palace, in his thirty-ninth year, the appeal to the nation, proposed by his advocates, Malesherbes, Tronchet, and Desèze, having been rejected, on the 19th, by 380 votes out of 690. He died with the courage of Christian faith. His last words, which asserted his innocence and forgave his judges, were drowned in the rolling of drums and in the cry *Vive la république!* See the *Memoirs* of the Abbé Edgeworth (the priest who prepared him for death), containing his narrative of the last hours of Louis XVI. (London 1810.)

Even in his youth, Louis manifested a sensibility unusual in the higher classes. He needed not the sight of misery; when he heard it spoken of, he shed tears, and hastened to relieve it. Unknown, he alleviated misfortune in the cottage and garret. When he was first saluted at court, as dauphin, after the death of his father, the duke of Burgundy, he could not restrain his tears. Still greater was his grief at the death of Louis XV. "O God," he cried, "shall I have the misfortune to be king!" His favourite maxim was, "Kings exist only to make nations happy by their government, and virtuous by their example." The establishment of the *mont de piété*, the *caisse d'escompte*, the abolition of feudal services, of torture, and of slavery in the Jura, are only some of his benevolent measures. He caused

the state prisons to be examined, and liberated the unhappy victims of despotism. Louis declared that he would never sign, beforehand, a *lettre de cachet*. His great object was the happiness and love of his people. On his journey to Cherbourg, in 1786, where he had undertaken the construction of the celebrated harbour, in 1784, to which he had appropriated 37,000,000 livres, he received the most unequivocal marks of the love of the French. He wrote, at the time, to the queen, "The love of my people has touched me to the heart; think you not that I am the happiest king on earth?" And in his will of Dec. 25, 1792, he says, "I forgive, from my whole heart, those who have behaved towards me as enemies, without my giving them the least cause, and I pray God to forgive them. And I exhort my son, if he should ever have the misfortune to reign, to forget all hatred and all enmity, and especially my misfortunes and sufferings. I recommend to him always to consider that it is the duty of man to devote himself entirely to the happiness of his fellow men; that he will promote the happiness of his subjects only when he governs according to the laws; and that the king can make the laws respected, and attain his object, only when he possesses the necessary authority." In the same spirit he wrote to Monsieur (Louis XVIII.): "I submit to Providence and necessity, in laying my innocent head on the scaffold. By my death, the burden of the royal dignity devolves upon my son. Be his father, and rule the state so as to transmit it to him tranquil and prosperous. My desire is, that you assume the title of a regent of the kingdom; my brother, Charles Louis, will take that of lieutenant-general. But less by the force of arms than by the assurance of a wise freedom and good laws, restore to my son his dominions, usurped by rebels. Your brother requests it of you, and your king commands it. Given in the tower of the Temple, Jan. 20, 1793." Louis was buried in the Magdalen churchyard, Paris, between the graves of those who were crushed to death, in the crowd, at the Louvre, on the anniversary of his marriage, in 1774, and the graves of the Swiss, who fell on the 10th August, 1792, in his defence. Desoird's work on the history of this prince is of little value. J. J. Regnault's *Siccle de Louis XVI.* is not impartial. The *Vie privée et politique de Louis XVI., avec un Précis historique par Marie Antoinette, Mme. Elizabeth, etc., par M. A.*, contains little that is not to be found elsewhere. More important are the abbé Georgel's *Mémoires pour servir à l'Histoire des Evénements depuis 1760, jusqu'en 1806—1810*, published by the nephew of the author after his death (Paris, 1817, 2 vols.), and Madame Campan's *Memoirs of the Private Life of the Queen, with anecdotes of the Times of Louis XIV., XV., XVI.* (Paris, 1822, 3 vols.); and the abbé de Montgaillard's *Histoire de France depuis la Fin du Règne de Louis XV., &c.* (Paris, 1827, 4 vols., to 1793.)

LOUIS XVII., second son of Louis XVI. and of Marie Antoinette, was born at Versailles, March 27, 1785, and, in 1789, after the death of his elder brother, received the title of dauphin. He was four years old when his mother presented him to the seditious populace of Paris, and carried him to the capital on the terrible 5th and 6th October. Confined with his parents and his aunt Elizabeth in the Temple, his innocent gaiety and affectionate disposition were the chief solace of the unhappy prisoners. On the death of Louis XVI., he was proclaimed king by the royalists, and his uncle (afterwards Louis XVIII.) assumed the title of regent. He was soon after separated from his mother, sister, and aunt, and delivered (1793) to a shoemaker by the name of Simon, a fierce Jacobin, of a gross and ferocious dis-

position, who, with his wife, treated the poor pet with the most unfeeling barbarity. Reproaches, blows, scanty food, the damps and filth of a dungeon, and a sleep broken by menaces and torments, were the lot of the innocent child. He was compelled to drink strong liquors, and pass the obscene songs, and repeat the atrocious arguments of his tormentor. He survived this treatment only June 8, 1795, when he died at the age of ten years and two months. He was buried in the same grave in the cemetery of Ste. Marguerite, where his remains could not be distinguished in 1812, when impostors have appeared, pretending to be him, among them, Hervagant, a tailor's son, executed in 1812, in prison, and Bruneau, a shoemaker, who in 1818, was condemned to seven years' imprisonment. See Eckard's *Mémoires sur Louis XVI.*

LOUIS XVIII. (Stanislaus Xavier de France, formerly count of Provence, third son of the king (the son of Louis XV.), born November 17, 1755, married, May 14, 1771, the daughter of Louis Amadeus III. of Sardinia, Mary Josephine Louise, who died in 1810. At the accession of his uncle Louis XVI., in 1774, he received the title of duc de Nemours, and, after his death, became regent of France. After the death of his nephew, June 8, 1795, at which time he reckoned his reign, he took the name of Louis XVIII., king of France and Navarre. But, with the exception of Britain, the rest of Europe did not acknowledge him as king of France before the taking of Paris, March 31, 1814. His brother, Monsieur, count of Artois, an ardent general, became the head of the provisional government in Paris, April 13. Immediately after Louis XVIII. began his reign, by his marriage with Marie Antoinette, May 2, 1814. During the reign of his brother he had taken but little interest in the affairs of the pleasures of the court, and had principally occupied himself with books; his wife had pursued a different course. It is said that, in his youth, Louis had much taste for poetry, and was the author of several tolerably good poems. He translated some volumes of Gibbon's History, and applied himself to the study of the Roman poets and philosophers. The history of his emigration he has written in an agreeable manner, in a work which appeared at Paris, in 1823 (*Relation d'un Voyage à Brême et à Coblenze*, 1791); dedicated to *Stanislaus François d'Artois, son libérateur, Louis Stanislaus Xavier de France, plein de Reconnaissance*, &c. In the first assembly of the notables, in 1789, he sat at the head of the first of the seven bureaux, and appeared on the side of the opposition, against Calonne, *contrôleur général des finances*; at length, he was most violently attacked by the *bourgeois*, under the presidency of the count of Provence. The people, therefore, looked upon him with horror, and saluted him with cries of joy, when he returned from the king orders to compel the registration of some edicts, by the *cour des comptes*. His brother the count of Artois (Charles X.), on the other hand, who did not belong to the opposition, was loaded with reproaches. At the second assembly of the notables, November 9, 1788, he came before himself for the double representation of the nobility estate. During the revolution, it was impossible for him as for the king to escape the attacks of calumny. After the destruction of the Bastille, the king, accompanied by his two brothers, entered the hall of the national assembly, July 12, and declared that he counted upon the love and fidelity of his subjects, and had, therefore, given orders to the troops to withdraw from Paris and Versailles. But the people of Paris had already proclaimed the count of Artois, who, therefore, left the kingdom.

July 16, with his two sons. He was followed by the princes of Condé and Conti, and the dukes of Bourbon, Enghien and Luxembourg. Monsieur remained. As the people were clamorous for the execution of the marquis of Favras, who had sought means for the escape of the king, and had attempted a counter revolution, in which the count of Provence had taken part, the latter went to the *hôtel de ville*, in Paris, the day after the arrest of the marquis (December 26, 1789), to defend himself in person. He asserted that the only connexion he had ever had with the marquis, was, that he had bargained with him for 2,000,000 of livres, wherewith to pay his debts. The people believed that this money was to have been appropriated to the levying of troops. The marquis was condemned to death, by the *châtelet*, and hanged February 19. At last, the violence of the factions in Paris induced the king, June 21, 1791, to attempt to escape to the frontiers of the kingdom. Louis took the road to Montmedy, and the count of Provence that of Mons. The former was arrested at Varennes; the latter reached Brussels in safety. From Coblenz, he protested against the decrees of the national assembly, and the restraints put upon the freedom of the king. When the king, October 30 and 31, 1791, called upon him to return, the princes issued a declaration, that they regarded the constitution as the work of rebels, and that the king held the throne merely in trust, and was obliged to leave it to his posterity as he had received it. January 16, 1792, the legislative assembly, therefore, declared the count of Provence to have forfeited his right to the succession. The two brothers of the king, at the head of 6000 cavalry, now joined the Prussian army. After the death of Louis XVI. Monsieur, who had previously been residing at Hamm, in Westphalia, lived at Verona, under the name of count of Lille. In 1795, he was proclaimed, by the emigrants, king of France and of Navarre. The calamities which afterwards befell him he bore with dignity and resolution. In the following year, when the Venetian senate, through fear of Bonaparte, obliged him to leave Verona, he declared himself ready to do so, but required that the names of six princes of his house should first be struck from the golden book of the republic, and that the armour, which his ancestor, Henry IV. had given it, should be restored. He now led a wandering life, supported by foreign courts, especially the British, and by some friends of the house of Bourbon. He first went to the army of Condé, on the Rhine, to serve as a volunteer, but as afterwards obliged to leave it, and went to Dillingen, in Suabia. July 19, 1796, at 10 o'clock in the evening, as he was standing at a window, with the dukes of Grammont and Fleury, a musket ball was fired at him, which grazed his temple. "Never mind it," said he immediately to the alarmed dukes; a blow on the head, that does not bring a man down, is nothing." When the count D'Avary exclaimed, "If the ball had struck a line deeper—" Louis replied, "then the king of France would have been called Charles X." From thence he went to Lachenburg, a small town in the Harz, where he resided under the protection of the duke of Brunswick, and carried on a correspondence with his friends in France, especially with Pichegru. After the peace of 1797, he went to Mittau, where he celebrated the marriage of the duke of Angoulême with the daughter of Louis XVI. When Paul I. refused to permit him to reside any longer in his states, the Prussian government allowed him to remain in Warsaw. While there, Bonaparte, in 1803, attempted to induce him to renounce his claims to the throne. But he answered the messenger of the first consul, February 28, "I

do not confound M. Bonaparte with his predecessors; I esteem his valour and his military talents, and thank him for all the good he has done my people. But, faithful to the rank in which I was born, I shall never give up my rights. Though in chains, I shall still esteem myself the descendant of St Louis. As successor of Francis the first, I will at least say like him—'We have lost all except our honour.'" April 23, the princes concurred in the answer of the king.

In 1805, Louis, with the consent of the emperor Alexander, returned to Mittau; but the peace of Tilsit obliged him to leave the continent, and he, at last, took refuge in England, in 1807. His brother, the count of Artois, had lived in Great Britain, principally in Edinburgh, from 1796. Louis had taken several steps to procure the restoration of his family in France. With this view, he had written to Pichegru, and given him full powers. His letter of May 24, 1796, is a proof of the great confidence which he had in this "brave, disinterested, and modest" general, to whom, as he then thought, "was reserved the glory of restoring the French monarchy." When the army of the prince of Condé, in which, since 1798, the duke of Berri had commanded a cavalry regiment of nobles, first in Russian, and afterwards in British pay, had been by circumstances gradually broken up, and had obtained from the Russian emperor the liberty of residing in Volhynia, the princes of the Bourbon family ceased to take an active part in the operations of the war. Louis XVIII., until the conclusion of the great struggle, remained in England, where he lived at Hartwell, in Buckinghamshire, in a very simple manner, occupying himself partly with the Roman classics, especially Horace, of whom he translated much, and retained in memory a large part, and partly with political studies. That he resembled in character his unfortunate brother, we know from several examples of his kind feelings. Soon after the disastrous expedition of the French to Russia, he wrote to the emperor Alexander a letter, recommending the French prisoners of war, as his children, to the magnanimity of that monarch, and he refused to join in the rejoicings in England, for he could not but mourn the death of so many Frenchmen. When the allies invaded France, the count of Artois went to Bale, February 2, 1814. His eldest son, the duke of Angoulême, had gone to join Wellington. They published a proclamation from Louis XVIII. to the French, dated Hartwell-house, 1st February, 1814, which induced a party, first in Bourdeaux, and afterwards in Paris, to declare for the Bourbons. The king promised entire oblivion of the past, the support of the administrative and judicial authorities, the preservation of the new code, with the exception of those laws which interfered with religious doctrines; security to the new proprietors against legal processes; to the army, all its rights, titles and pay; to the senate, the support of its political rights; the abolition of the conscription; and, for himself and his family, every sacrifice which could contribute to the tranquillity of France. Soon after the dissolution of the congress of Chatillon, the count of Artois entered Nancy, March 19. But the duke of Angoulême first saw the lilies of the Bourbons planted on French ground at Bourdeaux, March 12.

The restoration of the Bourbons was a subject first brought strongly home to the French, at the time of the entrance of the allies into Paris, by the declaration of the emperor Alexander, March 31, that they would treat neither with Napoleon nor with any member of his family. Talleyrand, Jaucourt, the duke of Dalberg, Louis, and De Pradt contributed not a little to this in an interview with Alexander, the king of Prussia, Schwartzberg, Nesselrode, Pössa

di Borgo, and Liechtenstein, March 31, by the assurance that the restoration of the Bourbons was the wish of a large majority of the nation. (See De Pradt's *Récit historique sur la Restauration de la Royauté en France, le 31 Mars, 1814.*) The senate now appointed a provisional government under the presidency of Talleyrand, which, April 3, gave the authority of a law to the resolve of the senate of April 2, for the deposition of Napoleon, and published in the *Moniteur* the project of the constitution of April 5, according to which the Bourbons were to be recalled to the throne. A decree of April 4, also intrusted the government to the count of Artois, until the moment when Louis, called to the throne of France, should accept the constitution drawn up for the kingdom. Louis XVIII. now left Hartwell, and reached London, April 20, whence the prince regent (George IV.) accompanied him to Dover. From Dover, the duke of Clarence (now William IV.), April 24, conducted him to Calais. With Louis landed also the duchess of Angoulême, the prince of Condé, and his son, the duke of Bourbon. Upon landing, he pressed the duchess of Angoulême to his heart, and said, "I hold again the crown of my ancestors; if it were of roses, I would place it on your head; as it is of thorns, it is for me to wear it." The memory of his landing upon French ground, is perpetuated by a Doric column of marble erected at Calais, and the trace of his first footstep is carefully preserved in brass. The king remained some days in Compiègne, where, as at St Ouen, he received deputations from the authorities at Paris. He was welcomed at St Ouen by the emperor of Austria, and at Compiègne by the emperor of Russia. From St Ouen, May 2, he issued that remarkable proclamation, by which he accepted the most essential part of the constitution of the senate (April 5), in twelve articles, but submitted the whole, as being too hastily drawn up, to the revision of a committee of the senate and legislative body.

May 3, Louis made his entrance into Paris. The hopes of all now rested upon him. In compliance with the will of his unhappy brother, who had commanded forgiveness, he solemnly declared "that all examinations into opinions and votes, until the time of the restoration, are forbidden. The same oblivion is made the duty of the courts of justice and of the citizens." He formed his ministry of members of the former provisional government, and of zealous royalists, such as the chancellor D'Ambray. One of his first ordinances related to the continuance of the oppressive taxes (*droits réunis*), which the state of the kingdom rendered necessary. It had been promised that they should be abolished, but it was only possible to ameliorate the mode of their collection. He afterwards concluded peace with Austria, Russia, Britain, Prussia, Spain, Portugal, and Sweden, at Paris, May 30, 1814, and caused a constitution to be drawn up. Although his ministry too little understood the spirit of public opinion, yet, by prudence and firmness, it was able to restrain the disaffected. It inclined to the old prejudices, and fulfilled none of the just expectations of the nation, with regard to the freedom of the press, and the prevalence of liberal ideas. The old royalists, as well as the partisans of the empire, had been deceived in the dreams of their pride and covetousness. The former thirsted for revenge, and aspired to regain their lost advantages. The latter, including the soldiers of Napoleon, 100,000 of whom had returned from captivity, were indignant at the disgrace of the French arms. After the proclamation of peace, Louis caused his chancellor, D'Ambray, in his presence, to lay before the legislative body and the senators the constitution of the kingdom (*la charte constitutionnelle*), June 4, it

having been already approved by nine senators and nine deputies, after it had been drawn up by three ministers D'Ambray, Montesquieu and Barand. It was unanimously accepted as the will of the king, and recorded. (See *France, son état*.) The chamber of deputies, which was established by this instrument, requested the king to take the name of "the desired," *Louis le Désiré*. When the chamber was occupied with fixing the order of the throne, Louis answered the deputies, "Let them call me Louis, and neglect me." The king appeared from the new and old nobility, from the marshals, 151 members of the chamber of peers, fifty-three of the former senators, among whom twenty-three foreigners, were not appointed by the king; others were excluded, as (among others) Fesch, Fouché, Grégoire, Roederer, Sieyès. He retained, however, their property, and the value of those who had died received pensions. It was to be expected, that men who had voted for the death of Louis XVI. could now be peers of France. The king gave his full confidence to his minister X. de Blacas, and the chancellor D'Ambray. The former the five secretaries of state, (the minister of foreign affairs—Talleyrand—of the interior, of war, of finances, of the navy), and the directors-general of the police and the post-office, together with the counsellors and the *maîtres des requêtes*, first to the king's council, to which were admitted distinguished men of the old and new nobility, and the known officers, together with some whose only claim on that they had shared the sufferings of Louis. The new relations with foreign powers were regulated by Talleyrand with his usual ability, and not without dignity and a proper regard to the pride of the nation. His diplomacy now professed great respect for the rights of the people. On the other hand, the minister of the interior, abbé Montesquieu, did not succeed in gaining the public opinion in favour of the Bourbons. Still less did the minister of war, general count Dupont, succeed in gaining the favour of the army, which hated him. His successor, Soult, contributed much, by his own measures, to excite the anger of the army against the king.

The personal mildness of Louis XVIII. and his love of justice, were often betrayed, in spite of the judgment which he frequently showed, into dependent and inconsistent measures. He was accused of surrounding himself with the leaders of the Chamber and with emigrants, and admitting them to precedence to all others, into the royal guard. The king was exasperated by the diminution of the number of the members of the legion of honour, and the order, which had placed so many officers upon half pay. The chamber of peers, composed mostly of the old nobility, and attached to their old prejudices, thus thwarted the better views of the chamber of deputies. The chancellor D'Ambray showed great weakness in favouring the privileged classes, and was unable to discharge the duties of his office. The count Blacas, who was acquainted with France, was hated by the press. The censorship of the ministers limited the freedom of the press, while libels were promulgated against men who had displeased the government. In consequence of a political reaction, thirty honorable names were struck from the list of members of the national institute. Hired or functional writers maintained that the sale of the national domains was invalid, and that the crimes of the revolution were not to be pardoned. The restoration of titles and the old privileges was openly talked of in the country. The ordinance of Blacas with regard to the Sunday police excited so much ill feeling in Paris, that it was found necessary to repeal it. The peo-

hibition of masked balls during Lent, caused still greater dissatisfaction; and the obstinacy of the curate of St Roch, who opposed the burial of a celebrated actress in consecrated ground, exasperated the people against the priests. In short, every thing appeared to confirm the warning of Lally-Tollendal:—"But one more act of madness was wanting to France; and that we now have; we see the throne of the king shaken by his friends." Against the *pure*, or, as they were afterwards called, *ultra* royalists, were united the republicans and the military and constitutional royalists. In the midst of all this, Napoleon returned from Elba.

To understand the events of March, 1815, it is necessary to call to mind what the majority of the nation expected of Louis XVIII. (See Comte and Dunoyer's *Censeur ou Examen des Actes et des Ouvrages qui tendent à détruire ou à consolider la Constitution de l'Etat*; and the *Examen rapide du Gouvernement des Bourbons en France, depuis le Mois d'Avril, 1814, jusqu'au Mois de Mars, 1815*.) The nation wished, 1. to have its political liberties secured, or the right of being represented by deputies, chosen by the people; 2. the personal liberties of the individuals, or security from prosecutions for imaginary crimes, or contrary to the legal forms; 3. the equality of citizens in the eye of the law, and the rights of all to obtain any civil and military dignity, by merit and talents; 4. the abolition of feudal services; 5. the right, in criminal accusations, to be judged by a jury; 6. the independence of the judiciary upon every other power in the state; 7. the right of levying taxes by their representatives, and on all in proportion to their property; 8. the right of every individual to exercise any means of gaining a living which did not interfere with the rights of other citizens; 9. the right of every one to communicate his thoughts to his fellow-citizens, by public writings, being responsible only to the law; and, 10. the right of every one to perform divine worship in his own way, without molestation. But instead of satisfying the demands of the nation, the Bourbons, it was maintained by the parties above mentioned, had sought to destroy public opinion, and had thus lost the attachment of the French. The following grievances were particularly complained of: 1. the abolition of the national colours; 2. the surrender of all the fortresses beyond the ancient frontiers of France, to the king, by Monsieur, as lieutenant-general, April 23, 1814 (with these fortresses he had given up 13,000 annons, and had thus caused the loss of Belgium, and of the left bank of the Rhine); 3. the royal declaration, whereby the new constitution had been imposed upon the nation by virtue of the royal pleasure and prerogative, while it ought to have been proposed to it for acceptance (from the form used for this purpose, it would follow, that every successor of the king might abrogate or alter the charter at will); 4. the stain upon the national honour from the king's declaration that he owed his crown to the prince regent of Britain; 5. the exclusion of many respectable members of the state from the chamber of peers, and the filling their places by others, who, for twenty years, had borne arms against France; 6. the neglect to abolish the *droit réuni*, and other vexatious taxes; 7. the strictions on the freedom of the press; 8. the persecutions of the holders of the national domains, and the expressions of the minister, count Ferrand, on this subject in the chamber of deputies; 9. the libels against those who had taken part in the revolution, though these were forbidden by the constitution; 10. the exclusive appointment of the old nobility to *abbacies*; 11. arbitrary taxes, imposed without the

consent of the legislature; 12. the great influence of priests, &c. It ought to be observed, however, on the other hand, that Louis XVIII. had provided for the personal security of the subject by the independence of the tribunals, and the responsibility of the ministers; though the law on the latter point had not yet gone into effect when the revolution of March began. But the ministers should have forgotten their old ideas, and ruled in a popular manner. Henry IV. had, when he ascended the throne, changed his religion, and thus obtained the love of his people.

Napoleon at Elba was fully informed of the troubles in France, and the divisions at the congress. His appearance in France, March 1, 1815, was like a thunderbolt to the army and the nation. The state of popular feeling was entirely unknown to Louis. Those who surrounded him, as ignorant as himself, still deceived him with accounts of the devotion of the army, and of desertion among the soldiers of Napoleon. The defection of Labédoyère and Ney finally opened the eyes of the king, but it was too late. He was obliged to flee from Paris, in the night of March 20, after having dissolved the two chambers on the 19th. On the evening of March 22, he reached Lille, whence he issued several decrees, forbidding all levies and contributions for Napoleon, and disbanding the rebellious army. Twenty-four hours after, he was obliged to leave Lille, to avoid falling into the hands of his enemies, and went by Ostend to Ghent. The duke and duchess of Orleans, the old prince of Condé, the count of Artois, and the duke of Berry, hastily left Paris. The duke of Bourbon remained in Vendée, and the duke and duchess of Angoulême in the south of France. Their object was to awaken a popular sympathy in favour of the king. An army was, indeed, formed in Vendée, and the duke of Angoulême levied troops; but, deserted by a part of them, and surrounded by the generals of Napoleon, he was obliged to conclude the capitulation of Pont d'Esprit, April 8, in consequence of which he embarked, April 15, at Cette for Barcelona. The duchess of Angoulême, whose fortitude had been the subject of admiration, showed at Bourdeaux, the courage of a heroine. The city and the people were devoted to her, but the troops favoured the advance of general Clauzel, and the duchess was obliged to embark for England, April 2. Besides the ministers and several officers, marshals Berthier, Victor, Marmont, and the duke of Feltre, followed the king. The number of his followers amounted at last to a thousand. While in Ghent, he issued an official paper, the *Journal Universel*, which contained several pieces by Chateaubriand. In the meanwhile, Talleyrand, at Vienna, was actively engaged in the cause of the king, and Louis was included in the league of March 25, against Napoleon. When the allies invaded France, Louis XVIII. returned and went to Cambrai. He here proclaimed a general amnesty, with the exception of traitors, and promised to avoid all the faults he had committed in 1814, from ignorance of the new spirit of the nation, and to dismiss Blacas. In the meanwhile, the chambers, convoked by Napoleon, had appointed an executive commission under the presidency of Fouché, and deputies who were to negotiate with the allies upon the basis of their independent right to choose a form of government; but the allies would not consent to this. Blücher and Wellington besieged Paris, and Fouché, who had already induced Napoleon to leave France, put a stop to the shedding of blood, by the capitulation of Paris, July 3. Louis was thus again restored to the throne of France. July 7, the Prussians and British entered Paris, and on the afternoon

of the 9th, Louis followed, under the protection of Wellington. The king immediately appointed his new ministry, at the head of which was Talleyrand, and in which Fouché was minister of police. The most declared partisans of Napoleon now lost their places. July 13, the former chamber of deputies was dissolved, and a new one summoned. See *Chambre Introuvable*.

Among the most decided measures by which the king sought to support his throne, was the ordinance of July 16, disbanding the army, according to the wishes of his allies; which Macdonald effected with great prudence. To form a new army, 4000 officers were appointed, in part of those who had escaped the conscription; and according to the edict of May 20, 1818, of the half-pay officers of the army of 1815, only those were appointed who had served for fifteen years or more, and, consequently all French soldiers, since 1803, were made incapable of service. Yet the constitution of 1814 had secured to all officers the preservation of their rank and their pensions. An ordinance of July 24, 1815, designated the rebels who were excluded from the amnesty. According to this, nineteen generals and officers, Ney, Labédoyère, the brothers Lallemand, Erlon, Lefevre, Desnouettes, Ameilh, Drouot, Brayer, Gilly, Mouton Duvernet, Grouchy, Clausel, Laborde, Debelle, Bertrand, Cambronne, Lavalette and Savary, were to be arrested and brought before a court-martial. Thirty-eight others were exiled, according to a resolution of the chambers, including Soult, Carnot, Excelsmans, Bassano, Vandamme, Lamarque, Lobau, Barrère, Arrighi, Regnault de St Jean d'Angely, Real, Merlin de Douay, Hulin, the poet Arnauld, colonel Bory de St Vincent, Mellinet and others. Twenty-nine were degraded from the peerage, as Lefebvre, Suchet, Augereau, Mortier, Cadore, Piacenza, &c. A few exculpated themselves by proving that they had not received from Napoleon a seat in the new chambers. Of the rebels, towards whom many circumstances recommended mercy, Labédoyère was shot August 19; Ney, December 7, 1815; and Mouton Duvernet, July 26, 1816. Lavalette escaped from prison, December 21, 1815; Drouot and Cambronne were released; the greater number took refuge in flight; some, like Debelle, were pardoned; others, as Dejean the son, Laurence, Gamon, Alquier, Dubois-dubai and Grandpré received, in 1818, permission to return. In the mean while, the royalists, who called themselves *rectilignes*, obtained greater influence. The princes were dissatisfied with Fouché's appointment to the ministry. At the same time, he made himself obnoxious to the allies by his reports to the king on the new state of France. Talleyrand and Fouché, though devoted to the cause of the king, were looked upon by the royalists as men who ought not to be admitted to authority in the new system of things. Thus a change in the ministry took place, September 25, 1815. Fouché was dismissed, and, in order to please Russia, the duke of Richelieu was made minister of foreign affairs in his place. Decazes became minister of police, Corvetto, of the finances, and Clarke, duke of Feltre, minister of war, &c.

The ultra royalists now raised their heads. The state of things before 1789, alone appeared legitimate in their eyes. The election of the deputies was made accordingly, and many of those elected were but twenty-five years old, though forty was the legal age. A change of the constitution was openly talked of. On the other hand, the partisans of the fallen government, excited by the ultras, began to form conspiracies; but for their speedy punishment prevotal courts were introduced, which, however, were abolished in 1818. Decazes discovered several con-

spiracies, among which, however, that under Dalar alone broke out, in May, 1816, in the vicinity of Grenoble. The numerous arrests attracted attention, and several foreigners, as the Prussians who had favoured Lavalette's escape, lord Kinnaird (in a letter to lord Liverpool), and the Polish count Kosowski, complained of the arbitrary conduct of the French police. It excited great dissatisfaction that the duke of Richelieu, as minister, in the name of the king, had availed himself of the extreme rigour of the law in procuring his condemnation. Among the princes, the duke of Orleans (*Louis Philippe*) took a milder tone. When an address of thanks to the king, written by Chateaubriand, was read in the house of peers, the duke proposed to change the phrase in which traitors were given up to the justice of the king, so as to recommend the persons there named to the mercy of the king. The censor of the press would not allow his speech to be printed as the duke, for whom a party was already forming, sought without his own consent, soon after (October) to come to England. Richelieu now concluded with the allied powers the treaty of November 20, 1815, (*France*), which embarrassed the finances of the kingdom, since, from December 1, 1815, France was bound to pay 144,000,000fr. yearly, towards 700,000,000fr. which had been the expenses of the war, and 130,000,000fr. for the support of the army of occupation. A violent dispute soon after arose in the chambers on the subject of the law of amnesty. The royalists, January 6, 1816, proposed some changes, which extended and rendered more severe the propositions of the king. All the ministers of Napoleon were, under pain of death, banished from France; they lost the property conferred upon them and were obliged to sell what they had kept. Those, also, who had voted for the death of the king (*régicides*), and those who, in 1815, had received offices or honours from the usurper, or had acknowledged the Additional Act to the constitution, were banished from the kingdom, and forfeited all their civil rights, and the titles, estates and pensions, which had been conferred on them. (Of 360 who had voted for the king's death, 163, who were still living, were banished from France. Three only—Talleyrand and Richard—were allowed to remain. A violent measure was taken against the rest of the expected anti-Bourbonists (among others a captain imprisoned on suspicion, for having aimed to kill *Cossack*), the public authorities did not seem to restrain the commotions at Nîmes, and the department of Gard, where political and religious fanaticism had caused the persecution and murder of the Protestants, in 1815 and 1816. The voice of the Protestants—that of the noble D'Arques; but Trétailions, who was universally known to be a murderer, remained unpunished. (He died in 1816). The victory in the chambers gradually accumulated royalists, who were called *exagérés*, or *extrême droite*. The king, therefore, closed the session, April 22, 1816, after a law, prohibiting duelling, had been passed. Lainé, the former president of the chamber of deputies, was appointed minister of the interior, and, with Corvetto, Richelieu, and Decazes, headed the ministry, the constitutional majority in the chamber of the marine, Dubouchage, appeared to join them, so that the chancellor, D'Angbray, and the minister of war, Feltre, alone possessed the confidence of the ultras. (In September, 1817, marshal St Cyr took the place of the latter; count More, a peer of France, the place of Dubouchage; and, afterwards, lord Roy, the place of Corvetto.)

In the midst of continual seditions in France, the majority of the ministers, supported by the ultras,

of the Russian ambassador, Pozzo di Borgo, and of Wellington, succeeded in obtaining from the king the ordinance of September 5, 1816, by which he dissolved the chamber of deputies, and ordered that the new members should all be of the lawful age of forty. At the same time, he declared that the constitution should be subjected to no alteration. This victory of the constitutional party gave a check, for a time, to the ultra royalists, to whom Louis XVIII. himself did not appear to be enough of a royalist, and silenced, for some time, their *Vive le roi, quand même!* The organ of that party, Chateaubriand, in his work *De la Monarchie selon la Charte*, reproached the government with having taken away personal liberty and the liberty of the press. He was even bold enough to maintain, that that ordinance was contrary to the wishes of the king. The elections for the new chambers were such that the constitutionalists could raise their voices. They spoke in vain, though with great talent and boldness, for the freedom of the press and a jury. The law of censorship of November 9, remained in force. The state of the people, in the general dearth of all articles, and the weight of the taxes, needed every possible alleviation, and the king's spirit of order contributed greatly to this. From 1814 to 1816, the arrears amounted to more than 83,000,000 francs, which had increased the budget of expenses for 1817 to 1,088,000,294 being 220,000 more than in 1816; while the revenue for 1817 could not be estimated higher than 774,000,000, so that a deficit of 314,000,000 was to be covered. Recourse was had to loans; the same thing took place in 1818. The diminution of the standing army, and its entire dissolution in consequence of the congress of Aix, were, therefore, fortunate events. Among the events of the administration of Louis XVIII., it must, however, be remarked, that the national institute was restored in 1816, with its former academies, although the best institutions, as that of the decennial prizes, were not retained. The attempt to bring Hayti to submission, by the offer of favourable conditions, utterly failed, and the concordate was not effected with the pope.

Louis was himself inclined to use mild measures. In the day of St Louis, therefore, August 25, 1818, when the bronze statue of Henry IV. was erected in Paris, which had been paid for by private subscription, several persons arrested for political offences were pardoned. He allowed, also, some of the exiles who had voted for the death of the king, as Cambacérès, Rabaud, and fifteen members of the convention, to return. As, however, he gave way to the inclinations of the emigrant party, on several occasions, a nation conceived suspicions that the Bourbons did not sincerely forgive. The king neglected to give full security in their property to the possessors of the national domains, by a particular edict. At the same time, the constitutional party was strengthened by the passage of laws which contradicted the titles of the charter. The liberals, therefore, obtained for a time, the superiority, and Louis named, December 29, 1818, his third, and, November 19, 1819, his fourth ministry, under Decazes. (See *France*, vol. 1814.) From this time, the government of Louis did the support of public opinion. But, after the assassination of the duke of Berry, February 14, 1820, the party of the ultras again raised its head. Chelieu took the place of Decazes; the law of election was altered; the censorship of newspapers was introduced, personal freedom limited, &c. All this gave more power and influence to the extreme royalists.

The party of anti-Bourbonists, which thought that the welfare of France required a dynasty not belonging immediately to the Bourbon line, remained still a

large one, while the party of the princes, which showed a very great and very natural predilection for Louis, was supported by the ultras, who sought to form, in all Europe, a general coalition against liberal principles. The *white conspiracy*, as it was called, detected in 1818, showed that it was the object of the ultra royalists to destroy the constitution. They had given to the ambassadors of foreign powers a paper—written, it is said, by the baron de Vitrolles—*Note secrète exposant les prétextes et le but de la dernière conspiration*, to attract their attention to the dangers which menaced the reign of the Bourbons, that their troops might not be withdrawn from France, but a change made in the French ministry. This note, the giving of which was, according to the French laws, treasonable, caused so much dissatisfaction, that Chateaubriand, in his *Remarques sur les Affaires du Moment*, denies having had any thing to do with it. That party had in view to form a new ministry, of which Villèle, Chateaubriand, Donadieu, and others, were to be members. All examination into this business was, however, prevented, and the generals Canuel, Chapdelaine, with H. H. Joannis, Romilly, De Sorgis, &c., who had been already arrested as accomplices, were released August 19, 1818, from the secret prison (*secret*). By the ordinance, July 24, however, the baron Vitrolles was struck off the list of ministers of state and members of the privy council of the king. But Louis allowed what was called the *theocratic party*, in union with the friends to old privileges, to gain, continually, more influence in the internal management of the kingdom. This was shown by the prosecutions against the writers, who complained of abuses in the public administration, and, especially, of the measures of the secret police, by which those who were suspected of being political enemies were enticed to manifest their feelings by deeds. An instance of this kind was the punishment of the deputy Kochlin. By the change in the law of elections, in June, 1820, the system of the strict royalists was triumphant; Villèle was placed at the head of the ministry. But the strength of the king, who had, for several years, been unable to walk, now entirely failed him. His last triumph was the campaign in Spain in 1823. In August, 1824, it became evident that his disease was mortal. Until the day of his death, September 16, 1824, he gave proofs of firmness and resignation. “*Un roi doit mourir*,” said he, faintly, “*mais ne doit jamais être malade*.” Louis XVIII. possessed much intellectual cultivation and sagacity, but, enfeebled by disease, he had not sufficient strength of character to restrain the ultras, nor did he understand new France.—He had one remarkable maxim—*L'ex-actitude est la politesse des rois*.

LOUIS III. (called, in German history, *the Child*), born in 893, succeeded his father, the emperor Arnulph, when six years old. In his minority, archbishop Hatto, of Mentz, administered the government, and carried the monarch about with him, wherever the affairs of the empire required the presence of the regent. During the course of his reign, Germany was desolated by the Hungarians, and torn asunder by civil discord. He assumed the imperial title in 908, but was never crowned. He died in 911, or 912, and with him ended the royal line of Charlemagne.

LOUIS IV., the Bavarian, emperor of Germany, son of Louis the Severe, duke of Bavaria, was born in 1286. On the death of Henry VII. (q. v.), five electors were in favour of Louis, while the others supported Frederick, duke of Austria. The two rivals being both crowned, a war ensued, and Frederick was made prisoner, in the battle of Mühldorf, in 1322. (See *Bavaria*; and *Germany, History of*.)

In 1315, Louis had expelled his brother, Rodolph, who opposed his election from the Palatinate, but, after the death of the latter, had formed a convention with his sons, by virtue of which their patrimony was restored to them, and the electoral dignity was to belong alternately to Bavaria and the Palatinate. The vacant Mark of Brandenburg he conferred, in 1322, on his eldest son. In his disputes with pope John XXII., against whom he was joined by the Visconti party in Italy, he maintained the dignity of the German crown, and set up the antipope Nicholas V. In 1346, Clement VI. excommunicated him, and succeeded in causing five electors to set Charles of Luxembourg, king of Bohemia, on the imperial throne. In the midst of this dispute, Louis died (1347). See Mannert's *Louis IV., or the Bavarian*, in German, 1812.

LOUISA, AUGUSTA WILHELMINA AMALIA, queen of Prussia, daughter of Charles, duke of Mecklenburg-Strelitz, was born March 10, 1776, at Hanover, where her father was commandant. When six years old, she lost her mother; and her grandmother, at Darmstadt, took charge of her education. In 1793, the king of Prussia, then prince royal, saw her at Frankfurt, when she and her sister were presented to his father. The prince was immediately struck with her uncommon beauty, and was soon after betrothed to her. Prince Louis, of Prussia, was betrothed, on the same day, to her sister, the present duchess of Cumberland. Dec. 24, 1793, the princess Louisa was married to the crown-prince at Berlin, and, when her husband ascended the throne, Nov. 16, 1797, she became, in her exalted station, the model of a wife, a mother, and a queen, who alleviated misery wherever she could, and promoted merit. In 1806, when Prussia was suffering severely under the burdens of war, this princess became still more popular: indeed, her beauty and grace, her benevolent and pure character, her sufferings and her fortitude, rendered her an object almost of adoration. She died in 1810.

LOUISBURG; capital of Cape Breton; situated on a point of land on the south-east side of the island; lon. 59° 56' W.; lat. 45° 54' N. Its streets are regular and broad, consisting, for the most part, of stone houses, with a large parade at a little distance from the citadel, the inside of which is a fine square, nearly 200 feet every way. The town is half an English mile in length, and two in circuit. The harbour is excellent, and is more than half an English mile in breadth in the narrowest part, and six miles in length from north-east to south-west. The principal trade of Louisburg is the cod fishery. It was taken from the French by the British fleet, under Sir Peter Warren, and the American forces, commanded by Sir William Pepperel, in the year 1745, but afterwards restored to France, by the treaty of Aix-la-Chapelle, in 1748. It was again taken by the British, under the command of admiral Boscawen and lieutenant-general Amherst, in July, 1758, and its fortifications have been since demolished.

LOUIS D'OR; a French gold coin, which received its name from Louis XIII., who first coined it in 1641. (See the article *Coins*.) The value of the *Louis* is about eighteen shillings. Louis XIII. coined, likewise, a piece of silver money, called *louis blanc*, also *écus*, and, among us, *French crowns*.

LOUISIANA TERRITORY. The French, when in possession of a great portion of the continent of North America, seem to have applied this name, in a vague manner, to all the territories claimed by them south and west of Canada. In this sense, it must be considered as coextensive with the valley of the Mississippi, bounded on the east by the Alle-

ghanies, and stretching westerly as unknown an indefinite extent to the Spanish dominions and to then unexplored wilds of the interior. By the treaty of 1763, which made the Mississippi the boundary between the British and French colonies, the new was limited to that part of the valley west of the river, but still of an unsettled extent. This region was purchased of France by the United States, by which it has been explored and annexed into the states of Louisiana and Missouri, and the territories of Arkansas and Missouri. We shall here give a general account of the progress of discovery in this great region, and of its early settling, for local details, to the separate histories mentioned. The Spaniards were the first to discover, if not to discover, Florida, the western end of which were by no means accurately known, and Soto was probably the first white man who crossed the Mississippi, which he crossed in one of his expeditions, not far from the influx of the Red river. In 1673, a French missionary, Marquette, who was a citizen of Quebec, crossed the country from Michigan to the Mississippi, which then descended to the mouth of the Arkansas.—See *Annales des Voyages* (Paris, 1681), published by Barthelemy, a supplement to his collection.—Six years after, La Salle, commander of a fort on Lake Texas, was sent to explore the country, having as company him Hennepin. They passed the winter on the Illinois, and La Salle returned to Canada to prepare for leaving the missionary with orders to search for the Mississippi to its sources. In the spring of 1682, Hennepin accordingly descended to the mouth of the river, followed up its course to the falls of St. Anthony, and, on his return to France, published an account of his travels, in which he called the river *Louisiana*, in honour of Louis XIV.—See *Annuaire*.

The first attempts at the colonization of the new were not made till 1699, when an expedition was sent from Rochefort, under the command of Louis d'Iberville, a Canadian naval officer of reputation, who was the first to enter the Mississippi by an ascent, who laid the foundation of the first colony at Natchez. The Spaniards, who had not long before established a settlement at Pensacola, protested against the occupation of this country, which they claimed to be included within the limits of Mexico, by the French, but were not able to prevent their occupying a new post on Mobile river, in 1702. The French then kept up a communication between their colonies in Canada and Louisiana, and had been active in exploring the country, principally on the river and to the east of it. In 1713, a census of the new colony gave a population of 400. In the year 1712, Antoine de Crozat, who had advanced a sum of 40,000,000 livres in the Indian trade, purchased a grant of this country, with the exclusive right of commerce for sixteen years. Disappointed in his speculations, Crozat gave up the grant in 1717, and the Mississippi commercial company succeeded to it. A new government was formed, consisting of a governor, intendant, and royal council, and grants of land were made to individuals. New towns were founded, the cultivation of tobacco was abundant, and miners were sent to work the mines near the Louis; but, in 1731, the company gave up the country to the crown.

The early hostilities of the French with the Spanish and British colonists, and with the different native tribes, it is not our intention to review. (See the *Natchez*.) The struggle of the French and British power in North America, from 1754, is a subject of more interest. The French had scattered themselves over the more central parts of the continent, rather than the Mississippi. Kaskaskia, Cahokia, Vincennes,

Genièvre, the post of Arkansas, Nachitoches on Red river, Natchez on the Mississippi, were rallying points of the rural population in this immense region, who had adopted, in some degree, the manners of the Indian hunters, while New Orleans and Mobile had become places of considerable commerce. The French claimed all the country west of the Alleghenies, and had established a chain of communication from New Orleans to Quebec, which they meditated to strengthen by a line of fortified posts. The British, who claimed the country from the Atlantic to the St Lawrence, found themselves thus exposed to be shut in, upon the eastern slope of the Alleghenies. The French occupied and fortified the important position at the head of the Ohio, to which they gave the name of *fort du Queene*. The British general Braddock failed in his attack on this post, but the war terminated in the complete humiliation of France, who, by the peace of 1763, was obliged to cede Canada, and all her possessions east of the Mississippi, to Britain. The preceding year (November, 1762), she had ceded all her possessions west of that river, with the island of Orleans, to Spain, and the name of *Louisiana* now became limited to this part of the valley. In the war of the American revolution, Spain conquered Florida from the British, and, by the peace of 1783, that province was ceded to the Spaniards, while all the country between Florida and the St Lawrence, and the ocean and the Mississippi, was acknowledged as an independent state. (See *United States, Kentucky, Tennessee, Ohio, &c.*) The navigation of the Mississippi soon became a source of difficulty between Spain and the United States. After much delay, the treaty of 1795 was concluded between the two powers, by which a line of boundary was agreed on, and the free navigation of the river secured to the United States. In 1798, the Spanish posts, to the north of  $31^{\circ}$ , were evacuated, but Spanish ships committed depredations on the American commerce, and refused to allow the navigation of the Mississippi, and the right of deposit at New Orleans, which had been secured by treaties. A force was accordingly prepared on the Ohio, by the government of the United States, in 1799, intended to descend the Mississippi, and seize New Orleans. A change of administration was followed by the disbanding of these troops, but representations were made to Spain against the violation of the treaty, with a demand of redress, which was answered by the declaration that Louisiana had been ceded to France. The French force destined for the occupation of the country was blockaded in the Dutch ports by the British, and the first consul ceded Louisiana to the United States for the sum of 15,000,000 dollars, or about £3,875,000, by a treaty dated April 13, 1803. (See the secret history of this treaty in the *Histoire de la Louisiane*, by Barbé-Marbois, Paris, 1829.) The country passed peaceably into the possession of the United States, and measures were immediately taken for organizing its government, and examining its unknown regions. It was divided into the territorial governments of Orleans, which, in 1812, was admitted into the union as an independent state under the name of *Louisiana* (see *Louisiana, State of*), and of Louisiana, afterwards changed to *Missouri*. See *Missouri State*, and *Missouri Territory*.

The first national expedition was planned by president Jefferson, and placed under the command of captain Lewis, and lieutenant Clarke (afterwards governor of Missouri), with instructions to ascend the Missouri, cross the rocky mountains, and descend, by the Columbia, to the Pacific ocean. They began the longest river voyage since the time of Orellana, May 14, 1804. Having wintered at fort Mandan,

they continued their voyage next spring, and, after a course of 3000 miles arrived at the fountain-head of the Missouri. Fifty days were occupied in crossing the mountains by a difficult road; but shorter and more easy passages have since been discovered. Descending the Columbia to its mouth, they reached the Pacific ocean, at a distance of 4134 miles from their starting-point. They returned by a somewhat shorter route of 3550 miles, having been the first who had crossed the North American continent, from the Mississippi to the Pacific. (See Lewis and Clarke's *Expedition to the Sources of the Missouri*, Philadelphia, 1814.) About the same time, lieutenant (afterwards major) Pike was sent to explore the Mississippi, and, on his return from that expedition, to survey the country lying between the Rocky mountains and the Mississippi, and examine the sources of the Arkansas, and Red rivers. Having arrived at the head of the former, and suffered much from cold and hunger, on account of the elevated situation of the country, he reached a large river, which he supposed to be the Red river, but which proved to be the Del Norte. He had unconsciously entered the Spanish territories with his party, when they were arrested by Spanish soldiers, and carried almost without clothing, to Santa Fé, but were afterwards set at liberty, and returned to Nachitoches. (See Pike's *Expedition to the Sources of the Mississippi*, Philadelphia, 1810.) In 1819, the federal government organized a new expedition, of a military and scientific nature, to examine more carefully, with a view to colonization and defensive establishments, the country east of the Rocky mountains. It was commanded by major Long, and a narrative of it has been written by doctor James, botanist to the expedition. The party embarked at Pittsburg, in a steamboat, and reached the mouth of the Platte in the middle of September. Having passed the winter on the banks of that river, they resumed their route in June, 1820, and crossed the great sandy desert which extends, in a gentle slope, nearly 400 miles to the base of the Rocky mountains, and nearly 500 miles from north to south. Its surface is furrowed by ravines, several hundred feet deep, in which are a few stunted trees. On the elevated surface of the desert, not a tree is to be seen; but it is thickly set with the spiny cactus, or prickly pear. Proceeding southwardly, they descended the Arkansas, and returned with large collections of skins of rare animals, some thousand preserved insects, and an herbal of 400 or 500 new plants. (See *Account of an Expedition to the Rocky Mountains*, Philadelphia, 1828.) Another expedition, under general (now governor) Cass, proceeded to explore the British frontiers about the sources of the Mississippi. Schoolcraft was the historian of this expedition. (*Travels to the Sources of Mississippi*, in 1820, Albany, 1821.) To complete the survey of the frontier, major Long was sent, in 1823, with Mr Keating to ascend the St Peter's, a considerable river which falls into the Mississippi. They traced the river to its source (375 miles), and, proceeding northward, reached the Red river, which flows into lake Winnipeg. (See *Narrative of the Second Expedition to St Peter's River, Lake Winnipeg, &c.*, by William H. Keating.) This completed the general survey of this immense region. Its northern boundary was settled by the convention of 1818 with Great Britain, on a line drawn in  $49^{\circ}$  from the lake of the Woods to the Rocky mountains: the southern, by the treaty of 1819 with Spain, is from the Sabine river, in  $32^{\circ}$  N., to the Red river; then along that river to  $100^{\circ}$  W., thence directly north to the Arkansas, which it follows to  $42^{\circ}$  N., and thence, in that parallel, to the South sea. The states of Louisiana and Missouri,

and the territory of the Arkansas have already been set off, and are occupied with a thin, but active and rapidly increasing population. The great mineral and vegetable wealth of this vast region, and its almost unparalleled facilities of communication, open a wide prospect to the prosperous, free, and happy communities that are springing up in its bosom. The territory west of the Rocky mountains, which seems to belong to the United States rather by priority of discovery than as a part of the Louisiana purchase, will be described under the head of *Oregon*. Beside the works already mentioned, consult Charlevoix's *Description de la Nouvelle France*; Jefferson's *Account of Louisiana*; Stoddard's *Sketches of Louisiana*; and Flint's interesting work, *Geography and History of the Mississippi Valley* (Cincinnati, 1828.)

LOUISIANA; one of the U. States of America, formed in 1812. It is bounded north by Arkansas territory, east by the state of Mississippi and the gulf of Mexico. The eastern boundary line is formed by the river Mississippi, from lat.  $33^{\circ}$  to  $31^{\circ}$  N.; thence, by the parallel of  $31^{\circ}$ , to Pearl river; thence by that stream to its mouth. The gulf of Mexico forms the southern boundary, and Sabine river the western, from its mouth to lat.  $32^{\circ}$  N.; thence the boundary line proceeds due north to lat.  $33^{\circ}$ , thence due east to the Mississippi; lon.  $89^{\circ}$  to  $94^{\circ} 5' W.$ ; lat.  $29^{\circ}$  to  $33^{\circ}$  N.; 240 miles long, from north to south, and 210 broad; square miles, 48,220, or 31,463,000 acres: population, in 1820, 153,407; slaves, 69,064: in 1830, 214,693. The principal rivers are the Mississippi, Red, Ouachita, Black, Tensas, Sabine, Calcasieu, Mermentau, Vermilion, Atchafalaya, Teche, Pearl, Amite, and Iberville. The largest lakes are Pontchartrain, Maurepas, Borgne, Chetimaches, Mermentau, Calcasieu, Sabine, Bistineau, Bodcau, and Ocatahoola. All the southern part of this state is a vast alluvial tract of low champaign country, extending from lake Borgne to Sabine river, and from the gulf of Mexico to Baton Rouge and Red river; about 250 miles long, and from 70 to 140 wide. This extensive tract is intersected by numerous rivers, bays, creeks, and lakes, dividing the country into a great number of islands. The country about the Balise is one continued swamp, destitute of trees, and covered with a species of coarse reeds, from four to five feet high. Nothing can be more dreary than a prospect from a ship's mast, while passing this immense waste. A large extent of country in this state is annually overflowed by the Mississippi. According to Mr Darby, the average width of overflowed lands above Red river, from lat.  $31^{\circ}$  to  $33^{\circ}$  N., may be assumed at 20 miles, equal to 2770 square miles. Below lat.  $31^{\circ}$  to the efflux of the Lafourche, about 80 miles in extent, the inundation is about 40 miles in width, equal to 3200 square miles. All the country below the efflux of the Lafourche is liable to be inundated, equal to 2370 square miles. From this calculation, it appears that 8340 square miles are liable to be inundated by the overflowing of the Mississippi; and if to this be added 2550 square miles for the inundated lands on Red river, the whole surface of the state liable to inundation, will amount to 10,890 square miles. Of this extent, not one half is actually covered annually with water. The immediate banks of all the streams are seldom, and many of them never, inundated; and they afford strips of rich, tillable land, from a mile to a mile and a half wide. The country between the Mississippi, Iberville, and Pearl rivers is an important part of the state. The southern half is a level country, yet highly productive in cotton, sugar, rice, corn, and indigo. The northern part presents an undulating surface, covered with a heavy growth of timber, consisting of white, red, and yellow oak, hickory, black walnut, sassafras, mag-

notia, and poplar. The district of *New Orleans* is been considered, by some, as the garden of Louisiana. The south-western part of the state, comprising the districts of Opelousas and Attakapas, consists mostly of extensive prairies. Some of these prairies are detached, but the lines of woods between them are generally very narrow, and they may be considered as forming one immense meadow. A large portion of these tracts are barren, but some parts, particularly that bordering on the Teche, are very fertile, and contain flourishing settlements. It has been estimated that the prairie lands in the state, including the swamps along the gulf of Mexico, contain one-fifth of its whole surface. The country on both sides of Red river, from its mouth to the head of the river, is intersected with lakes, which are more than twenty in number, and all communicate with the river. The bottoms on the river are from one to ten miles wide, and of a very fertile soil. The timber on the banks is willow, cotton wood, honey-locust, poplar, and buckeye; on the rich uplands, elm, cucumber tree, hickory, mulberry, black walnut, with abundance of grape vines; upon the second-rate, or sandy spurs, white, pitch, and yellow pines, and various kinds of oak.

The climate of Louisiana is as cold as that of the Atlantic states about two degrees further north. The orange ceases at about  $30^{\circ}$ , and the sugar cane at  $27^{\circ}$ . Sugar and rice are the staples of the state a point south of  $30^{\circ}$ , and cotton north of that parallel. The latter, however, is extensively cultivated a great part of the state. Among the fruits are the apple in the northern parts, the peach, and several species of fig, the orange, the pomegranate, and grape. The olive-tree is found, and the Provençals, who were settled in Louisiana, affirmed that the oil was as good as that of their native country. Indigo was formerly much cultivated, but has been, of late, as a great measure abandoned. The rice is remarkably good, and yields abundantly. Some attention has not been paid to the cultivation of the tea plant, and the finest tobacco is raised, but is not so productive as sugar and cotton. The kinds of cotton cultivated are Louisiana, green seed, or Tennessee, and recently, Mexican cotton. The amount of sugar made in 1828 was 87,963 hhds.; of molasses, 2,574 hhds.: in 1829, the sugar made was 65,728 hhds., and as there are 40 gallons of molasses to each hogshead of sugar, the hogsheads of molasses must have been somewhat less than half as numerous. The tobacco exported, from Oct. 1, 1827, to Oct. 1, 1829, was, for the first 12 months, 35,111 hhds., for the second, 25,491; for the third, 28,028. The hogsheads of cotton which were exported in the same periods were 304,848, 267,949, 351,890. The total exports 1829, were 12,386,060 dollars, or nearly 12,000,000. The value of imports, for the same time, was 6,852,200 dollars, or about half that sum; amount of customs, 51,903, of which 17,000 was steam-boat tonnage. The arrivals at the port of New Orleans, from Oct. 1, 1829, to Oct. 1, 1830, were 286 ships, 643 barks, 166 schooners, 33 sloops, 778 steam-boats, and 3898. The United States granted the state 36,000 acres of land for a college, and one thirty-sixth of each township, or 873,000 acres, for schools. There are colleges at New Orleans and Jackson. In 1822, the legislature made a grant to each parish of 5 dollars 62½ cents to every voter, to be applied to the education of the poor; in consequence of which nearly 40,000 dollars are annually applied for this purpose. The Catholic is the predominant religion of Louisiana: there are a few Episcopal and Methodists. According to returns for 1828, the militia amounted to 12,274 men. The principal towns in the state are New Orleans, Des Moines, or

Donaldsonville (the seat of government), Natchitoches, Alexandria, Baton Rouge, Opelousas, Galveston, &c. The constitution differs little from those of the other states (see *Constitutions*); but the law is not the common law which prevails in the rest of the country, except so far as its provisions have been introduced by statute. The civil law, which prevailed under the French dominion, has been retained in its principal features. (See, below, *Louisiana, Code of*.) The present white inhabitants of Louisiana are descendants of the Spaniards, French, and Anglo-Americans, or emigrants from the other states, or from the Spanish colonies. The character of such a mixed population, scattered over a great extent of country, must, of course, be various. The English language and the Anglo-American institutions are, however, assuming the predominance. The early history of the state will be found in the preceding article. In 1812, the territory of Orleans, having been found to contain the requisite number of inhabitants, was admitted into the Union, under the name of *Louisiana*. Jan. 8, 1815, the attack of the British on New Orleans was repulsed by general Jackson. See *New Orleans*.

*Louisiana, Code of.* Most of the United States, even those which were formerly colonies of France and Spain, have adopted the common law of England, as the basis of their municipal law. The state of Louisiana, however, has steadily adhered to the civil jurisprudence which it derived from the continent of Europe, though, in criminal matters, the English jurisprudence has been followed. The custom of Paris, which the colonists brought with them, as the law of the new colony, was first reduced to writing in France in 1510, and enlarged and amended in 1580. The deficiencies of the customary law, both in the mother country and the colony, were supplied by reference to the Roman jurisprudence. Louisiana was ceded by France to Spain in 1762, and was taken possession of by this latter power in 1769, when the Spanish law was introduced. The great body of this law, called the *Siete Partidas*, was compiled as early as 1263. The *Recopilacion de Castilla*, published in 1567, was intended to clear up the confusion of the previous codes, but it leaves the authority of the *Partidas* generally unimpaired. The cession of Louisiana to the United States necessarily introduced the trial by jury in a modified form, and the writ of *habeas corpus*, which were unknown to the pre-existing laws. The legislative council of the territory of Orleans borrowed largely from the common law, but principally those forms of proceedings necessary to confer efficient powers on the courts organized under the authority of the Union. But, in the adjudication of suits between individuals, the Spanish jurisprudence was the sole guide, except in commercial questions. In 1806, the legislative council ordered two able jurists to prepare a civil code for the use of the territory, on the groundwork of the civil law which governed the territory. It was reported in 1808, and adopted, but was not allowed to supersede the previous laws, except as far as those laws were inconsistent with its provisions.\* The "Digest of the Civil Code now in Force in the Territory of Orleans," as it was called, though termed a code, is, in fact, little more than a synopsis of the jurisprudence of Spain. It continued in operation for four years, without any material innovation. In 1822, Messrs Derbigny, Livingston, and Moreau were selected by the legislature to revise and amend the civil code, and to add to it such of the

laws still in force as were not included therein. They were authorized to add a system of commercial law, and a code of practice. The code which they prepared, having been adopted, was promulgated in 1824, under the title of the "Civil Code of the State of Louisiana;" and the legislature resolved, that, "from and after the promulgation of this code, the Spanish, Roman, and French laws, which were in force when Louisiana was ceded to the United States, and the acts of the legislative council of the legislature of the territory of Orleans, and of the legislature of the state of Louisiana, be, and hereby are, repealed in every case for which it has been specially provided in this code." It would seem that where the code is silent on any subject, any pre-existing law on that subject, whether of French or Spanish origin, or of native growth, would be considered as still in force. The new code, independently of the great changes which it has introduced, is much more full and explicit in the doctrinal parts than the former digest. The theory of obligations, particularly, deserves to be mentioned, as comprising, in a condensed and even elegant form, the most satisfactory enunciation of general principles. The juriconsults appear to have profited much by the great work of Toullier, entitled *Le Droit civil Français*. The code contains 3552 articles, numbered from the beginning for convenience of reference. The most striking and material changes introduced by the new code, relate to the rules of succession, and the enlarged liberty of disposing of property by last will, by curtailing the portions which must be reserved for forced heirs. The new order of succession conforms to that established in France by the Code Napoleon, and will be found to be copied almost precisely from the 118th novel of Justinian, from which the Spanish rules of descent had deviated in some essential particulars.—The legislature of Louisiana provided also for the formation of a penal code, by an act passed in 1820, and intrusted the charge of preparing it to Mr Edward Livingston. A plan of a penal code was accordingly drawn up by him, and presented to the legislature in 1822. The manuscript copy of the part of the code which had been prepared, was destroyed by fire in 1824, and Mr Livingston has been since engaged in repairing the loss, and completing the code.

LOUISVILLE; a city of Kentucky, on the Ohio, opposite to the rapids or falls of that river, on a plain elevated about seventy feet above the level of the river; lon. 85° 30' W.; lat. 38° 3' N. The soil is rather sandy, with a substratum of rich clay, from which very good bricks are made. The town is regularly laid out: eight broad and straight streets, parallel with the river, are intersected by eighteen others, at right angles, running from the river to the southern boundary of the city, which is about three miles long, with an average width of upwards of one mile. The population, by the census of 1830, was estimated at about 10,500: a most rapid increase has since taken place. The public buildings in Louisville are a court-house, jail, ten houses of public worship, a poor-house, city school and marine hospital, all in good taste. The private buildings are mostly of brick, without much ornament; the warehouses, particularly those which have been erected within one or two years, are very extensive. Louisville is the most commercial city in the west, commanding the commerce of a great extent of country. It exports tobacco, whisky, cotton bagging and baling, hemp, flour, pork, bacon, lard, and many other productions of the country. Its imports are various and extensive, the easy circumstances of the people whom it supplies creating a large demand for foreign articles of comfort and luxury. The commerce is carried on by upwards of 300 steam-boats, measuring from 50

In 1819, a law was passed to encourage and authorize the publication of such parts of the *Partidas* as were conceived to be the force of law in the state, and such a translation was

to 500 tons each, some of which are daily arriving from, or departing for all parts of the immense valley of the Mississippi. The arrivals during 1832 exceeded 1500, and the departures were about the same number; this is exclusive of keel and flat boats, which must have amounted to at least that number. Louisville is the great commercial depot for the country bordering on the Ohio and its tributary waters, and the Mississippi above Natchez, the country lying near to the great lakes resorting to this city for many articles of trade: Great bodies of emigrants from the east and north pass through it; and it is not uncommon, in the autumn, to see the streets filled for days together, with continued processions of *mothers*, as they are called, going to the "great west." In former years, Louisville had the character of being unhealthy; but, since the introduction of steam-boat navigation, and the improved methods of living, no town of its size in the United States has been more healthy: the year 1822, so fatal to the health of the whole valley of the Mississippi, is the last in which anything like general sickness has been known in this city.

**LOUSE** (*pediculus*). These disagreeable and unseemly insects belong to the order *parasita* (Latr.), and are characterized by having six feet formed for walking, a mouth furnished with a proboscis, antennæ as long as the thorax, and the abdomen depressed, and formed of several segments. Almost every species of animal is frequented by its peculiar louse, sometimes by several kinds: even man is subjected to their attacks. They breed with amazing rapidity, several generations occurring in a short period. Certain circumstances appear to be exceedingly favourable to their increase; as infancy, and that state of the system giving rise to *phthiriasis*, or the lousy disease. The human race is infested by several species, among which are the *P. humanus corporis*, or body louse, principally occurring in adults who neglect cleanliness; and the *P. humanus capitis*, or common louse, most frequent in children. Cleanliness is the best antidote against these disgusting intruders. The lousy disease, though now of very rare occurrence, appears to have been by no means unfrequent among the ancients. Herod, Antiochus, Callisthenes, Sylla, and many others, are said to have perished from this disorder. Some nations consider them as a gastronomic luxury, and, at one time, they were used in medicine. Those of our readers who wish for full information on these disagreeable parasites, will find ample details respecting them in the works of Rhedi, Swammerdam, and Buonanni, who seem to have studied their habits and manners with great assiduity.

**LOUTH**, the smallest county of Ireland, is situated in the province of Leinster, and extends from N. to S. 27 miles, from E. to W. 18. The soil is in general fertile, and is almost wholly devoted to corn. The principal towns are Dundalk (the capital), Collon, Ardee, Dunleah, Carlingford, and Castle Bellingham. The chief manufactures of Louth are dowlas, sheetings, and cambric. See *Ireland*.

**LOUTHERBOURG**, or **LUTHERBURG**, PHILIP JAMES; a landscape painter of eminence, born at Strasburg, in 1740. He studied under Tischbein, and afterwards under Casanova, and displayed great talents in the delineation of battles, hunting-pieces, &c. After having been admitted a member of the academy of painting at Paris, where he was first settled, he removed, in 1771, to London, where he was employed in the decorations of the opera-house, and also at Drury-lane theatre. He subsequently contrived an exhibition, called the *Eidophysicon*, somewhat on the plan of the *Diorama*, which, however, did not prove a very profitable speculation. In 1782, he was nominated a royal academician; and,

as a landscape painter he possessed deserved celebrity. He also painted some historical pictures, as the Victory of Lord Howe, and the Siege of Valenciennes. His character was eccentric, and he was so far infatuated with the reveries of animal magnetism, as to have accompanied the impostor Cagliostro to Switzerland. He returned to England, and died near London, in 1812.

**LOUVAIN** (Dutch, *Loeven*, *Leuven*): formerly the capital of one of the four districts of the duchy of Brabant; more lately of a circle in the province of South Brabant, kingdom of the Netherlands, is present belonging to Belgium. Louvain is situated on the river Dyle, and a canal leading from it runs to the Rupel, five leagues E. N. E. from Brussels. lat. 50° 53' 26" N.; lon. 4° 41' 34" E. There are seven churches, five convents, a magnificent hospital, 4000 houses, and 25,400 inhabitants. Jan. 7. duke of Brabant, founded the university in 1462, in which belonged four colleges, a considerable library, a botanical garden, and an anatomical theatre in the sixteenth century, it contained eight colleges. Having become extinct during the French revolution, it was restored as a lyceum, and, in 1818, again formally re-established. The number of students is 580. In 1825, a philosophical college in Catholic clergymen was founded, with the avowed object of raising the standard of learning among the candidates for holy orders; but the clergy were so much against it, that in 1830, when a Catholic member was appointed for the affairs of Belgium, the philosophical college was abolished. Louvain has greatly contributed to nourish that spirit of opposition which the Catholics have manifested towards the government of the Netherlands, and of which the separation of Belgium has been the consequence. At the beginning of the fourteenth century, when the city had 200,000 inhabitants, the woollen manufactures supported 100,000 workmen, many of whom, after the insurrection of 1378, emigrated to Flanders and founded the English woollen manufactures. The most important article of industry is lace, of which 150,000 casks are exported annually. There are from ten to twelve lace manufactories. The commerce in corn and hops is considerable. During the late revolution, the inhabitants embraced with ardour the cause of independence, and repulsed with courage (Oct. 23, 1830) the attacks of the Dutch.

**LOUVEL**, PIERRE LOUIS, the assassin of the duke of Berry, was born at Versailles in 1733, and served as saddler in the royal stables. From his youth upwards, he was of a gloomy and reserved disposition, and impatient of contradiction, but otherwise moderate and temperate. He often changed his master, and altered his residence. From all circumstances, it is evident that he was fanatical and eccentric. He hated the Bourbons, and wished to extirpate the family of the duke of Berry in particular, because he was expected to continue the line. Feb. 13, 1820, about seven o'clock in the evening, when the prince was committing his wife from the opera to the carriage, Louvel pressed towards him, seized him by the left arm, and stabbed him with a knife in his right side. Upon the first cry of the prince, the soldiers of the guard pursued the murderer, who was apprehended and conducted into the guard-room of the opera-house. He was examined in the presence of the master Decrees, and immediately avowed, that, as was previous, he had formed the resolution of destroying France from the Bourbons, whom he considered the worst enemies of the country; that after the duke of Berry, he had intended to murder the queen, and, finally, the king. His trial was conducted in the chamber of peers. The investigation continued three months, and 1200 witnesses were examined, &

order to discover accomplices. At length Bellart, the attorney-general, declared in the indictment (May 12), that none had been discovered. June 5, Louvel, between his two counsel, was placed at the bar of the chamber of peers, sitting as a court of justice. The chancellor D'Ambray, president of the chamber, examined him. Louvel declared that no personal offence had induced him to commit the murder, but only an exasperation, created by the presence of the foreign troops, as early as 1814; that, in order to distract his thoughts, he had travelled, and visited the island of Elba, but, in that place had no conference with Napoleon or his attendants; that, after Napoleon's return from Elba, he was taken into service as saddler in the imperial stables, and, hence, had obtained this station in the royal stables. No political party, no individual, had persuaded him to commit this act. He had read no newspapers nor pamphlets. He admitted that his deed was a horrible crime; but stated that he had determined to sacrifice himself for France. Louvel's defenders alleged a *monomania*, or an insanity consisting in a fixed idea, and appealed to the dying request of the prince for the pardon of his murderer. Louvel then read his defence. The high court of justice condemned him to death. After a long delay he admitted the visit of a clergyman, but, on the day of his execution (July 7, 1820), paid no attention to his words, directing his eyes over the multitude, which witnessed his execution in silence.—See Maurice Méjan's *Hist. du Procès de Louvel, assassin*, &c. (2 vols., Paris, 1820).

LOUVET DE COUVRAY, JOHN BAPTIST; a French advocate, distinguished as an actor in the revolution. At the commencement of the political commotions, he joined the popular party, and displayed a decided aversion to royalty and nobility. He published a romance, entitled *Emilie de Varmon, ou le Divorce nécessaire* (1791), in support of the prevalent opinions relative to marriage, and spoke at the bar of the national assembly in favour of a decree of accusation against the emigrant princes. In 1792, he was chosen a deputy to the convention, when he attached himself to the party of the Girondists, and voted for the death of Louis XVI., with a proviso, that execution should be delayed till after the acceptance of the constitution by the people. He was denounced by the terrorists, and included in an order of arrest issued June 2, 1794. Having escaped from the capital, he retired to Caen, with several of his colleagues, and employed himself in writing against the Jacobins. He was declared an outlaw; on which he fled to Brittany, and thence to the department of the Garonne. At length he separated from his companions, and returned to Paris, where he kept himself concealed till after the fall of Robespierre. He subsequently published an account of his adventures during the time of his proscription, entitled *Notices sur l'Histoire et le Récit de mes Périls*—a work written in a romantic style, which has been translated into English and other languages. Louvet recovered his seat in the convention in March 1795, and he occupied the presidency in June following. He was afterwards a member of the council of five hundred, which he quitted in May, 1797, and died at Paris, August 25, of that year. He is chiefly known in literature as the author of a licentious novel—*La Vie de Chevalier Faublas*.

LOUVOIS, FRANÇOIS MICHEL LETELLIER, minister of war to Louis XIV., son of the chancellor Letellier, born at Paris in 1641, was early made a royal counsellor through the influence of his father. He displayed so little inclination for business, and so great a love of pleasure, that his father threatened to deprive him of the reversion of the secretari-

ship in the war department, which had been conferred on him at the early age of thirteen. From this moment young Louvois abandoned his habits of dissipation, and devoted himself to business. After 1666, he had the whole management of the ministry of war, and soon exercised a despotic control over his master, and over the army. His extensive knowledge, his decision, activity, industry and talents, rendered him an able minister; but he cannot aspire to the praise of a great statesman. He was too regardless of the rights of human nature; too lavish of the blood and treasure of France; too much of a despot, to deserve that honourable appellation. His reforms in the organization of the army; his manner of conducting the wars of his ambitious master, if they were not rather his own; and, above all, his successes, render his administration brilliant.—See Audouin's *Histoire de l'Administration de la Guerre* (Paris, 1811.)—But, justly appreciated, Louvois must be considered as the evil genius of the showy but disastrous reign of Louis XIV. While the king was flattered with the idea of having formed the young minister, and of directing his government in person, every thing was, in fact, done by Louvois, and according to his views. The generals were all required to communicate immediately with him; and, although Turenne would not submit to this order, yet the king showed all his letters to his minister, and answered them according to his suggestions. Bold and grasping schemes which could be executed only by the unwearied activity and industry of Louvois, were proposed by him for the purpose of rendering himself necessary to Louis, who, he was conscious, disliked him personally. Hence, notwithstanding the solemn renunciations of all claims to Franche-Comté and the Spanish Netherlands (see *Louis XIV.*, and *France*), war was undertaken (1667 and 1669) to get possession of them. The war of 1672, against Holland, was begun at the instigation of Louvois, and would have been finished much sooner, had he not, contrary to the wishes of Condé and Turenne, insisted upon occupying the fortresses, and thus given the Dutch time to open their sluices. The victories of Turenne (q. v.), in 1674 and 1675, were gained by a disobedience of the orders of the minister of war; but the desolation of the Palatinate was commanded by him. The system of *réunion*, as it is called (see *Louis XIV.*), was now adopted, and Louvois took possession of Strasburg, in the time of peace (1680). On the death of Colbert (1683), of whom he had been the enemy, his influence became still greater, and one of its most fatal effects was the revocation of the edict of Nantes (1685), the *dragonnades*, and the consequent flight of so many peaceful and industrious Calvinists. Louvois was now superintendent of the royal buildings, and, on occasion of a dispute with the king about the size of a window, in which the latter had spoken severely to him, "The king," said the minister "begins to meddle with every thing; we must give him something to do; he shall have a war;" and a pretext was soon found. The system of *réunion* had united the European powers in the league of Augsburg; and it was determined to seize on Philipsburg, one of the bulwarks of Germany. This was done with so much secrecy as to prevent the place being relieved. The French arms were successful, but disgraced by the horrid burnings and devastations committed by the direction of Louvois. The Palatinate was reduced to a wilderness in mid-winter (1689.) The war was conducted with great ability by Louvois; but his arrogance had long rendered him odious to Louis. The king's dislike had been increased by the cruel devastations of the Palatinate, and when the minister proposed to him to complete the desolation by the burning of Treves, he refused his consent. Louvois

replied, that, to spare his majesty's conscience, he had already despatched a courier with orders to that effect. Louis, filled with indignation, was prevented from striking his minister only by the interference of madame de Maintenon. Soon after, on presenting himself at the royal council, he discovered, or fancied he discovered, in the countenance and words of the king, marks of severity, and was obliged by faintness to retire to his hotel, where he died within half an hour. Whatever may be our feelings at the arrogance, cruelty, and despotism of Louvois, we cannot deny him the merit of having organised the brilliant victories of the reign of Louis.

LOUVRE; the old royal palace at Paris, on the north bank of the Seine, a splendid quadrangular edifice, with a court in the centre, completed by Napoleon. The origin of its name, and the time of the erection of the oldest part of it, are unknown. We only know that Philip Augustus, in 1214, built a fort and a state prison in this place; that Charles V., during the years 1364—80, added some embellishments to the building, and brought his library and his treasury thither; and that Francis I., in 1528, erected that part of the palace which is now called the *old Louvre*. Henry IV. laid the foundation of the splendid gallery which connects the Louvre, on the south side, with the Tuileries; Louis XIII. erected the centre; and Louis XIV., according to the plan of the physician Perrault, the elegant façade towards the east, together with the colonnade of the Louvre, which, even now, is the most perfect work of architecture in France. At a later period, Louis XIV. chose the palace built by him at Versailles for his residence. After Napoleon had taken possession of the Tuileries, he began a second gallery, opposite to the former, by which the two palaces would have been made to form a great whole, with a large quadrangular court in the centre; only 600 feet of it were completed at the time of his abdication, and it has not since been continued. Since the revolution, the collection of antiquities has been kept in the lower floor of the Louvre. Here, also, the exhibitions of national industry take place, and the academies hold their sessions.

To have the privilege of the Louvre, formerly meant, in France, a permission to drive, with a coach, into the courts of all the royal palaces. At first, this was the prerogative of the princes only; but, in 1607, when a duke, under the pretence of indisposition, rode into the Louvre, Henry IV. gave him (and, in 1609, the duke of Sully also) permission constantly to do so. At last, during the minority of the king Louis XIII., all the high officers of the crown, and dukes, obtained this privilege from Mary of Medici.

LOVAT (SIMON FRAZER, commonly called) lord; a Highland chieftain, who figured in the two civil rebellions of the last century, was born in 1667. He was educated in France, among the Jesuits, and, returning to his native country, he entered the army. In 1692, he was a captain in the regiment of Tullibardine. After having committed some acts of violence in taking possession of his hereditary estate, he fled to France, and gained the confidence of the old pretender, which he made use of, on his return to Scotland, in order to ruin his personal enemies. He again went to France, where he was imprisoned in the Bastille, and was liberated only on condition of taking religious orders, in pursuance of which engagement he is said to have become a Jesuit. In 1715, he a second time betrayed the pretender, and he was rewarded by the government of George I. with the title of Lovat, and a pension. He now led a quiet life, uniting in his own person the contradictory characters of a Catholic priest and a father of a

family, a colonel and a Jesuit, a Hanoverian lad, and a Jacobite laird. Notwithstanding the favour he had received, he engaged in the rebellion of 1745; and, after having displayed his usual cool and audacity, he was finally seized, tried, condemned, and executed in April, 1747, at the age of eighty. Notwithstanding his age, infirmities, and dangers supposed to be not wholly void of merit, he died, says Smollett, like a Roman, exclaiming, *Dato a decorum pro patria mori*. A volume of autobiographical memoirs, by this restless and unscrupulous politician, was published in 1797 (9vo).

LOVE-FEAST. See *Agape*.

LOVELACE, RICHARD, a poet of the seventeenth century, was born about 1618, and educated at Oxford. On leaving Oxford, he repaired to war, entered the army, and became a captain. He expended the whole of his estate in the support of a royal cause, and, after entering into the French service, in 1648, returned to England, and was imprisoned until the king's death, when he was at liberty. His condition was, at this time, very exalted, and strongly contrasted with Anthony Van Dyke's description of his handsome person and graceful appearance in the outset of life. He died in great poverty, in an obscure alley, in 1658. His poems, which are light and elegant, but occasionally naive and fantastic, are published under the title of *Lamia*, under which name he complimented Miss J. Sacheverell, a young lady to whom he was attached, who, on a false report of his death, married another person. Colonel Lovelace, who, for spirit and gallantry, has been compared to Sir Philip Sidney, also wrote two plays, the *Scholar*, a comedy, and the *Soldier*, a tragedy.

LOVER'S LEAP; the name of a cliff, 34 feet high, in the island of Leucadia (q. v.).

LOW COUNTRIES. See *Netherlands*.

LOW DUTCH and HIGH DUTCH, and so properly for Dutch and German. The two idioms are quite distinct, so that a German and a Dutchman cannot understand each other any better than a Frenchman and a German. In fact, the Dutch language resembles the English more than it does the German, so that a German understands it much better, if he has a knowledge of English. The reason is, that both, Dutch and English, are mainly derived from the Low German. The frequent confusion of the terms Dutch and German probably arises from the circumstance, that the proper name of *Germany* is *Deutsch*, and that of *Germany*, *Deutschland*, and that the Germans and Dutch were originally considered as one nation by the inhabitants of *Prussia*. See *Dutch*, and *Low German*.

LOW WATER; the lowest point to which the tide ebbs. See the article *Tide*.

LOWELL; an American town, situated twenty-five miles N. W. from Boston; noted for the force of its water power, its manufacturing establishments, and the rapidity of its growth. It was incorporated in 1826, and named from Francis C. Lowell, of Boston, who was distinguished by his successful efforts in introducing the cotton manufacture into the United States. The hydraulic power of Lowell is produced by a canal, completed in 1823, one mile and a half in length, sixty feet wide, and carrying eight feet a depth of water. A portion of the waters of the Merrimack is forced through this canal by a dam at the head of Pawtucket falls, and is distributed in various directions, by channels branching off from the main canal, and discharging into the Concord and Merrimack rivers. The entire fall is 30 feet, and the volume of water which the canal is capable of carrying, is estimated at 1250 cubic feet per second, furnishing 50 mill powers of 25 cubic feet

per second each. In some instances, the whole power is used at one operation, applied to wheels of 30 feet diameter; but more frequently the power is divided into two distinct falls of 13 and 17 feet each. The water power is held and disposed of by a company.

The quantity of cotton manufactured at Lowell, in 1831, is estimated at 17,000 bales, of 300 pounds each. Population, by the census of 1830, 6477.

LOWENDAL, ULRICH FREDERIC WOLDEMARE, count of, great grandson of Frederic III., king of Denmark, born 1700, at Hamburg, began his military career in Poland (1713), became captain in 1714, and entered the Danish service, as a volunteer, during the war with Sweden. In 1716, he served in Hungary, and distinguished himself at the battle of Peterwardein, and at the sieges of Temeswar and Belgrade. He next took part in the wars in Sardinia and Sicily, and was present at all the battles from 1718 to 1721. During the peace, he studied gunnery and engineering, and was made field-marshal and inspector-general of the Saxon infantry in the service of Augustus, king of Poland. The death of this monarch (1733), gave him an opportunity of distinguishing himself by his valiant defence of Cracow. Having entered the service of the empress of Russia, she was so well satisfied with his conduct in the Crimea and Ukraine, that she appointed him commander of her forces. In 1743, he was made lieutenant-general in the French service, and, at the sieges of Menin, Ypres, and Freiburg, was conspicuous for his courage and skill. In 1745, he commanded the corps of reserve at the battle of Fontenoy, in which he took an honourable share. After having taken many strong places in Flanders, he obtained possession of Bergen-op-Zoom, by storm, September 16, 1747. This place, till then, had been considered impregnable, and was occupied by a strong garrison, and covered by a formidable army. The following day, he received the staff of marshal. He died 1755. Lowendal was thoroughly acquainted with engineering, geography, and tactics, and spoke Latin, German, English, Italian, Russian, and French, with fluency. With these accomplishments, he combined modesty and amiableness of disposition, though a devotee of pleasure, like the marshal Saxe, his most intimate friend, whom he also resembled in his application to military studies.

LOWER EMPIRE (Bas Empire); a term applied to the Roman empire during the period of its decline. From the establishment of the seat of government at Byzantium (Constantinople), and the division of the empire into the Eastern and Western, the former is often called the *Byzantine* empire, and, after the restoration of the Western or Latin empire, under Charlemagne, the *Greek* empire. Lebeau's *Histoire du Bas Empire* begins with the reign of Constantine. Gibbon's *Decline and Fall of the Roman Empire* embraces the whole period.

LOW GERMAN (in German, *Plattdeutsch*, *Niederdeutsch*, *Niedersächsisch*; since the sixteenth century, also *Sassisch*) is that softer German dialect, which was formerly spoken over a great part of Germany, and even now is the language of the common people in most parts of North or Lower Germany, and many of the educated rank use it when they wish to be very familiar, or when they address people of the classes before mentioned. In some legal forms, it has maintained itself; thus the Hamburg oath of citizenship is in Low German. Recently, more attention has been directed to this interesting dialect. It is not, as is sometimes supposed, a corrupted language, but a distinct dialect, as much so as the high German, though circum-

stances have caused the latter to become the language of literature and the educated classes. (See the division *German Language*, in the article *Germany*; also *Dialect*.) It is difficult to decide which of the two dialects, High and Low German, is the more ancient. Probably, in very remote times, soon after the first Asiatic tribes had entered Germany, two chief dialects were formed—a softer and a harsher—whilst one of the Asiatic nomadic tribes went northward, and the other inclined to the south, along the Danube. Diversities of climate, soil, and way of living, may soon have exerted an important influence on the dialects of the tribes. The rough and woody mountains of the south of Germany, and the warlike occupations of the dwellers on the banks of the Danube, gave roughness and sharpness to the speech of this region, whilst the open and plain country of the north produced milder manners and a softer language. Yet an entire separation of these two dialects could not take place as long as the tribes speaking them led a nomadic life; and, even after they had formed permanent settlements, much similarity must have remained for a considerable time. Hence we find, in the most ancient records of the German language, a constant mixture of both the chief dialects. (See the article *Anglo-Saxon*.) The time of their separation is not to be fixed with certainty. So much, however, is clear, that both dialects, for a long time, were mixed, and, after their total separation, existed for a long time independently of each other—the harsher dialect in the southern part of Germany, in Austria, Bavaria, Franconia, Suabia, on the Upper Rhine, and in part of Upper Saxony; the smoother in the north of Germany, Lower Saxony, Westphalia, on the Lower Rhine, and in all Belgium.

The long and extended dominion of the Low German dialect is proved by the number of idioms derived from it. Of these the most important are, 1. the Anglo-Saxon (q. v.); 2. the Norman; 3. the Dutch, so called since the thirteenth century; 4. the Icelandic; 5. the Norwegian; 6. the Swedish; 7. the Low Saxon, as spoken at present. That the High German attained, nevertheless, at an early period, a somewhat superior standing, was chiefly owing to the circumstance, that the higher intellectual cultivation of Germany must be dated from the period of the Hohenstaufen or Suabian emperors, and with them, consequently, the High German gained the ascendancy. When, on the other hand, in the latter part of the twelfth century, at the time of the emigration from Holland into Germany, the Low German had become enriched from the Belgian dialect of the emigrants, and the Hansa produced so much activity in the North, Low German also became, for some time, a literary language, and affords works of much repute, particularly the incomparable Renard the Fox. But Luther's translation of the Bible gave predominance to the High German, and a natural consequence was, that, whilst this became the exclusive language of literature, Low German was checked in its development, and was obliged to give way to its rival in courts, churches, schools, and the circles of the well educated. In a few parts of the country only, it maintained its ground in works both of a spiritual and secular character, down to the beginning of the sixteenth century, as in Pomerania, Mecklenburg, Westphalia. As the language of the people, Low German still exists, but in a great number of different dialects, which, in several respects, differ considerably. A supercilious disparagement of this dialect, as if it were a mere corruption of the High German, has led many German scholars to neglect it entirely; and they

have thus fallen into etymological and other mistakes, from ignorance of this essential branch of their language. Leibnitz recommended the study of it as a means of enriching, correcting, and explaining the High German; and, of late, the scholars of Germany have begun to turn their attention to this idiom. The study of it is essential even to the English etymologist, to enable him properly to understand his own language, as far as it is of Teutonic origin. J. H. Voss made the attempt to revive this dialect, by several excellent poetical compositions in it. The most has been done, however, by Charles F. A. Scheller, who has lately published a series of Low German works, or such as are conducive to a knowledge of Low German literature; among them an edition of Renard the Fox; also the *Shigt-Bók der Stad Brunswyk*, as a supplement to G. G. Leibniz's *Scriptores Rerum Brunsvigensium* (Brunswick, 1829); *Der Laien Doctrinál* (Brunswick, 1825); *Bücherkunde der Sassiich-Niederdeutschen Sprache* (Literature of the Sassic Low-German Language) (Brunswick, 1826). In the preface to the *Laien Doctrinál*, Mr Scheller speaks of having made use of nearly 2000 Sassic writings, for a dictionary of this dialect, which he was preparing. The *Versuch eines Bremisch-Niedersächsischen Wörterbuchs* (5 vols., Bremen, 1771); the *Holstein Idioticon* of Schutzel; the *Geschichte der Niedersächsischen Sprache von Johann Friedrich August Kinderling* (Magdeburg, 1800); the *Versuch einer plattdeutschen Sprachlehre mit besonderer Berücksichtigung der Mecklenburgischen Mundart von J. Musaus* (New Strelitz and New Brandenburg, 1829), deserve mention.

**LOWLANDS**; a term applied to the southern parts of Scotland, in contradistinction to the *Highlands*, which comprise the northern and western parts. See *Highlands*, and *Scotland*.

**LOWRY**, WILSON, F. R. S., a modern English engraver of eminence, was born at Whitehaven, in January, 1762. After studying medicine for some years, he devoted himself to engraving. He is the inventor of a ruling machine, possessing the property of ruling successive lines, either equidistant or in just gradation, from the greatest required width to the nearest possible approximation; also of one capable of drawing lines to a point, and of forming concentric circles. In 1798, he first introduced the use of diamond points for etching—an invention highly important, on account of the equality of tone produced by them, as well as of their durability. Many other useful improvements in engraving were also discovered by him, and he was the first person who succeeded in what is technically termed "bitting steel in" well. Messrs Longman's edition of doctor Rees's *Cyclopædia*, which commenced in 1800, for nearly twenty years occupied a considerable portion of his time. He also laboured for Wilkins' *Itinerary*, and *Magna Græcia*, Nicholson's *Architectural Dictionary*, and, lastly, the *Encyclopædia Metropolitana*, on which he was employed till his last illness. He died June 23, 1824. His *chef-d'œuvre* is considered to be an engraving from the Doric portico at Athens, in Nicholson's *Architecture*. He was elected a fellow of the royal society in 1812.

**LOWTH**, ROWART, a distinguished English prelate, was born at Buriton, in 1710. He received his education at Winchester school, whence he was elected, in 1730, to New college, Oxford, of which he was chosen a fellow in 1734, and, in 1741, was elected professor of poetry in the university of Oxford. In 1753, he published his *De Sacra Poesi Hebræorum Prælectiones Academicæ* (4to), which has been translated into English, French, and Ger-

man. The best edition is that of Leipzig, 1814, with notes by Michaelis, Rosenmüller, &c. In 1738, he received the degree of D. D. from the university of Oxford, by diploma, and, in 1753, went to Ireland, as chaplain to the marquis of Harcourt, appointed lord lieutenant, who nominated him bishop of Limerick, which preferment he exchanged for a prebend of Durham, and the rectory of Solihull. In 1758, was published his *Life of William of Wykeham* (8vo), which, in 1762, was followed by a *Short Introduction to the English Grammar*. In 1736, a misunderstanding took place between doctor Lowth and Warburton, the latter of whom took issue at certain passages in the *Prælectiones*, concerning the book of Job, which he believed to be against the theory of his Divine Legation of Moses. Warburton, in an Appendix concerning the book of Job, sent to the second edition of his *Divine Legation* amongst the acrimony by which he was distinguished, and thereby produced a reply from doctor Lowth, a Letter to the Right Reverend the Author of the Divine Legation of Moses, which has become memorable at once for the ability and severity of its criticism. The ultimate silence of the Warburton gave the victory to their antagonists. In 1768, doctor Lowth was appointed bishop of St David's, whence, in a few months afterwards, he was translated to the see of Oxford. In 1777, he succeeded to the diocese of London, and the next year published the last of his literary labours—*Isaiah*, a new Translation, with a preliminary dissertation and notes. Rosenmüller says he understands and expresses the Hebrew poet better than any other writer. On the death of archbishop Cornwallis the primacy was offered to Dr Lowth, but he declined the dignity, in consequence of his age and family obligations. He died November 3, 1787, aged seventy seven.

**LOXODROMIC CURVE, or SPIRAL**; the path of a ship, when her course is directed constantly towards the same point of the compass, thereby cutting all the meridians at the same angle. See *Rhumb Line*.

**LOYOLA**, IGNATIUS (or, in Spanish, *LOPE*), was a saint of the Roman Catholic church, founder of the society of Jesuits, was born in 1491, in the castle of Loyola, in the Spanish province Guipuzcoa, the youngest of the eleven children of a Spanish nobleman. Ignatius spent his youth at the court of Ferdinand V. (surnamed the Catholic), king of Aragon. Till his 29th year, he served in the army, was distinguished for bravery, gallantry, and valour, and wrote indifferent verses. At the siege of Pamplona by the French, he was wounded in both legs, one of which being crooked after the cure, he caused it to be broken again, for the purpose of having it straight. During the siege, he had shown great valour and firmness, and when the commander wished to surrender, in consequence of want of provisions, he alone opposed it. As soon as the enemy saw him fall, they surrendered. During his illness, Ignatius beguiled his time with books, and there were no romances in the house, he read a Spanish translation of the life of the Saviour by Landolphus, a Carthusian, and a volume of the Lives of the Saints. His imagination was highly excited by these books. What others had done, as was recorded in those biographies, he thought he might do also, as he afterwards said himself. He determined to live a life of abstinence, penitence, and holiness. The Virgin, he thought, appeared to him, with the holy infant in her arms, both regarding him with looks of benign complacency and encouragement. His brother Martin Garcia observed the change which had taken place in him, and under-

vowed to dissuade him from his purpose, entreating him to remember his illustrious birth, and the reputation which he had already obtained; but Ignatius was firm. Leaving his brother at a sister's house, in Onate, he proceeded to Navarretta, where he collected some debts, and, having paid his servants and all his creditors, gave the rest for the restoration of the picture of the Virgin, and proceeded alone, upon his mule, to Montserrat. A Moor overtook him, who, in their conversation, uttered an opinion respecting the Virgin, which appeared to Ignatius blasphemous, and, while the Moor, luckily for himself, pricked forward, Loyola deliberated whether it was not his duty to follow and stab him. The Moor had gone to a village off the road, and Ignatius let his mule choose its own way, with the intention of killing the infidel, if the mule should carry him to the village; but it was not so ordered, and he arrived at Montserrat. Here he consecrated his arms to the Virgin, declared himself her knight, and proceeded to the hospital at Manresa, a small place not far from Montserrat, where he fasted rigorously, scourged himself, neither cut his nails nor combed his hair, and prayed seven hours a-day. He begged his bread, bread and water being his only food, and, eating very sparingly, he gave what remained to others. In the condition in which he was thus reduced, visions haunted him, and tempted him. Recollections arose of his birth and breeding, his former station, his former habits of life,—these compared with his present situation, in an hospital, in filth and in rags, the companion of beggars! This temptation he at once quelled and punished, by drawing closer to the beggar at his side, and courting more familiarity with him. He then brank from the prospect of living in this painful and, as he could not but feel it to be, beastly life, till he threescore and ten years of mortal existence should be numbered: Could he bear this? The question, he thought, came from Satan. To Satan he replied triumphantly, by asking him if it was in his power to insure life to him for a single hour; and he comforted and strengthened himself by comparing the longest span of human life to eternity. It is affirmed that, at this time, he was entranced from one Sunday to another, lying, all that while, so apparently lifeless, that certain pious persons would have had him buried, if others had not thought it necessary first to ascertain whether he were dead, and, in so doing, felt a faint pulsation at the heart. He awoke from this ecstasy, as from a sweet sleep, sighing forth the name of Jesus. Orlandini says it is a pious and probable conjecture, that, as great mysteries were revealed to Paul, when he was wrapt into the third heaven, so, during these seven days, the form and constitution of the society, which he was to found, were manifested to Ignatius. It is pretended that he fled from Manresa to a cave in a rock, not far from that city. The cave was dark, and not unlike a pulchre, but, for this incommodiousness, as well as for its solitude, and the beauty of the narrow vale, where thorns and brushwood concealed it, the more agreeable to him. Having remained some ten months at Manresa, a city which, his biographers say, he undoubtedly regards with peculiar favour in heaven, as the cradle of his Christian infancy, and the school of his first evangelical discipline, he determined upon going to Jerusalem, less for the desire of visiting those places which had been hallowed by the presence of our Lord than in the hope of converting some of the infidels, who were masters of the holy land, or of gaining the palm of martyrdom in the tempt, for of this he was most ambitious. A dangerous passage of five days brought him to Gaeta, from whence he proceeded to Rome on foot. This was a painful and perilous journey. It was seldom

that he was admitted into a town, or under a roof, for fear of the plague, his appearance being that of a man who, if not stricken with the disease, had recently recovered from it; and, for the most part, he was fain to lie down, at night, in a porch, or in the open air. He reached Rome, however, where there was either not the same alarm, or not the same vigilance. At Venice, he begged his bread, and slept on the ground, till a wealthy Spaniard, recognising him for a countryman, took him to his house, and afterwards introduced him to the doge, from whom he obtained a free passage to Cyprus. From Jaffa, he proceeded, with other pilgrims, to Jerusalem, in the usual manner; and, when they alighted from their asses, on the spot where the friars were waiting with the cross to receive them, and when they had the first sight of the holy city, all were sensible of what they deemed an emotion of supernatural delight. He now began his return to Spain, more unprovided even than he had left it. No difficulty occurred in re-crossing to Cyprus. He had obtained a good character from his fellow-pilgrims, and they, having taken their passage from that island in a large Venetian ship, besought the captain to give him a passage, as one for whose holy conversation they could vouch. The Venetian captain was no believer in such holiness, and he replied that a saint could not possibly want a ship to convey him across the sea, when he might walk upon the water, as so many others had done. The master of a smaller vessel was more compassionate; and this, though so much less sea-worthy than the other, that none of the other pilgrims embarked in her, reached Italy safely, after a perilous voyage, while the other was wrecked. He had been warned of the danger to which he would be exposed, in travelling from Ferrara to Genoa, where the French and Spanish armies were in the field, by both which he must pass, with the likelihood of being apprehended as a spy by both. Some Spanish soldiers, into whose company he fell, pointed out another route. But Ignatius liked to put himself in the way of tribulation; the more suffering, the greater merit, and, consequently, the more contentment; and he was contented accordingly, when, upon attempting to enter a walled town, which was in possession of the Spaniards, he was seized and searched as a spy. The journey to Jerusalem, notwithstanding all the hardships which he endured in it, had so greatly improved his health, that he thought the relaxation of austerity in his course of life, which had been enjoined him as a duty, had ceased to be allowable, having now ceased to be necessary. He did not, indeed, resume his former mode of apparel, in its full wretchedness; but he clad himself as meanly as he could, and cut the soles of his shoes in such a manner as to let the gravel in, and also to prepare for himself a further refinement of discomfort, for the fragments of sole which he had left, were soon worn away, while the upper-leather remained, and thus he contrived to walk, in winter, with his bare feet on the earth, and yet no one suspected that he was thus meritoriously afflicting himself.

In 1524, he returned to Barcelona, and began to study grammar. After a residence of two years, he went to the university of Alcalá, where he found some adherents; but the inquisition imprisoned him for his conduct, which appeared strange, and rendered him suspected of witchcraft. He was not delivered from the prison of the holy office until 1528, when he went to Paris to continue his studies, the subjects of which, indeed, were only works of an ascetic character. Here he became acquainted with several Spaniards and Frenchmen, who were afterwards noted as his followers; as Lainez, Salmeron, Bovailla, Rodriguez, Pierre Favre, and others. (See Lainez,

and *Jesuits*.) They conceived the plan of an order for the conversion of heathens and sinners, and, on Ascension day, in 1534, they united for this great work in the subterranean chapel of the abbey of Montmartre. Some of these men had not yet finished their theological studies, and, until this should take place, Ignatius returned to Spain. They then met again in 1536, at Venice, whence they proceeded to Rome, and received the confirmation of their society from pope Paul III. They took the triple vow of chastity, obedience and poverty, in the presence of the papal nuncio Veralli at Venice. (For the history of the order, and its final abolition in most countries, see article *Jesuits*.) The account of the origin of its name, given by Lainez, adopted by the society, and recorded by them upon a marble tablet, is, that Ignatius, losing his bodily senses, saw himself surrounded with the full splendour of heaven; saw the Father beholding him with an aspect full of love, the Son bearing his cross, and pointing to the marks of his passion; heard the Father earnestly recommend him to the Son, and heard these words from the lips of the Son, *Ego vobis Romæ propitius ero*. Therefore it was, according to Lainez, that he gave his order the name of the *Society of Jesus*. In 1541, Ignatius was chosen general of the society; but Lainez, his successor, must be considered, even from the commencement, as the person who gave to the order the organization, by which it has astonished the world, though Ignatius, by his ardent zeal, may have given it a great impulse. Ignatius continued his abstinence and penances during life. Even when general, he used to perform the meanest labours in his church in Rome, instructed little children, though not master of the Italian, and collected alms for the Jews and public women, for whose conversion he displayed great zeal. He died July 28, 1556, exhausted by fatigues. Forty-three years after, he was declared *beatius* by Paul V., and Gregory XV. canonized him. His feast in the Catholic church falls upon July 31. There are two works of Loyola, his Constitution of the Order, in Spanish, praised by cardinal Richelieu as a masterpiece; and his *Spiritual Exercises*, also in Spanish (Rome, 1548),—a work, the first plan of which was drawn up in the hospital at Manresa. It has been often translated. Among his biographers, we may mention Maffei, Bouhours and Ribadeneira. Of the miracles attributed to him, at a later period, his contemporary Ribadeneira says nothing, as Bayle remarked. A complete abstract of his life will be found in the *Foreign Review*, vol. v. No. 10.

LUBBER, a contemptuous name, given by sailors to those who know not the duty of a seaman.

*Lubber's Hole* is the vacant space between the head of a lower mast and the edge of the top. It is so termed from a supposition that a lubber, not caring to trust himself up the futtock shrouds, will prefer that way of getting into the top.

LUBECK, formerly the chief of the Hanseatic towns, at present one of the four free cities of the German confederacy, officially styled the "republic and free Hanseatic city of Lubeck," was founded by Adolphus II., count of Holstein-Schaumburg, in 1144, who, ten years afterwards, ceded it to Henry the Lion, duke of Saxony. Henry made it a free port for the northern nations, granted it municipal privileges, which were confirmed by several emperors, and gave it the celebrated Lubeck code, which was afterwards adopted by many German cities. In 1226, it became a free city of the empire, and was afterwards at the head of the Hanseatic union (see *Hansa*); its fleet commanded the Baltic; Gustavus Vasa found refuge within its walls from Christian II.; and its voice decided the affairs of the kingdoms of the

North. Lubeck contains 22,000 inhabitants, and is beautifully situated on an island between the Trave and the Wacknitz, on a slight elevation. The ramparts now serve as a promenade. The houses are substantially built, of stone, but old-fashioned. Since 1530, the Lutheran doctrines have prevailed. Lubeck was formerly a bishop's see, and the cathedral contains many tombs and monuments of antiquity. The church of St. Mary is remarkable for the beautiful altar by Quellinus, for its astronomical clock, and the allegorical paintings, called the *Flour of Death*. There are also a Calvinistic and a Catholic church. The charitable institutions are in excellent condition, as is also the gymnasium of seven classes. A drawing-school for mechanics, commercial institute, a society for the promotion of science and other societies and institutions, prove the public spirit of the citizens. Lubeck, which, by a station, is connected with the North sea and the Baltic, has an important carrying trade between Germany and the countries on the Baltic, and carries on considerable commerce in wine, leather, flax, and so on. It maintains important banking operations with Hamburg, Rostock, Copenhagen and Penzance. There are also two insurance companies and an exchange; and about 70—80 ships are owned by its citizens. In 1817, above 900 ships arrived at Lubeck, yet commerce and business have much declined. The Stecknitz, which falls into the Trave above the town, and which is connected, by the Dolvina, with the Elbe, the latter river is accessible from Lubeck, and much of the merchandise from the Baltic passes by Lubeck for Hamburg. Lubeck has sugar-refineries, tobacco, leather, starch-works, gold and silver, lace, hat, cotton and woollen manufactures, &c. The territory of the town, consisting of Breger and the Vierlands (which belong to Lubeck as common with Hamburg), is 116 miles square, with 18,000 inhabitants. To this territory belongs the small town of Travemünde, situated at the mouth of the Trave, with a harbour and bath. When the constitution of the empire was abolished, in 1806, Lubeck, though disconnected from the rest of Germany, remained a free Hanseatic city. After the battle of Lubeck (Nov. 6, 1806), Blücher forced its retreat by the capitulation of Ratkau. 1500 Prussians and 1500 Swedes were taken prisoner, and Lubeck was pillaged. In 1810, it formed a part of the French department of the mouths of the Elbe. By the congress of Vienna, Lubeck was then declared a free city. The government consists of four burgomasters and sixteen councillors. The body of citizens is divided into twelve guilds, each of which has one vote. The revenue is about 400,000 guilders; the debt, 3,000,000. In the German diet, Lubeck has one vote, with the three other free cities, and in the plenum, one vote. The contingent is 600 men. Lubeck is the seat of the supreme court of appeal of the four free cities.

LUCAGIORDANO (also called *Luce Fe Forte* See *Giordano*).

LUCANUS, MARCUS ANNÆUS; a Roman poet, born at Corduba, in Spain, about A. D. 39. His father, a Roman knight, was the youngest brother of the philosopher Seneca. Lucan went to Rome when a child, where he was instructed by the abridgers in philosophy, grammar, and rhetoric. Seneca introduced him into public life. He obtained the dignity of a questor before he was of lawful age, and entered the college of augurs. Having obtained some celebrity by several poems, he excited the jealousy of Nero, who aspired to the reputation of a great poet. The latter, on a certain occasion, had recited a poem upon the history of Nævius, before a numerous assembly, and obtained great applause.

when Lucan ventured to enter the lists as his rival, with a poem upon Orpheus, and the auditors adjudged him the superiority. From that time, Nero looked upon Lucan with hatred, forbade him to make his appearance in public, and spoke of his works with derision and contempt. This induced Lucan to conspire against him, with several distinguished persons, of whom Piso was the head. The plot was discovered, and Lucan, who, according to the assertion of an old grammarian, was so unnatural as to inform against his own mother as accessory, was condemned to death. He chose the death of his uncle, and had his veins opened. He died in the twenty-seventh year of his age. Of his poems, only his *Pharsalia* has come down to us, in which he narrates the events of the civil war between Cæsar and Pompey. The poem is unfinished, and is frequently disfigured with harshness and obscurity in the expression, rhetorical bombast, and exaggerated figures; but these defects are, at least in part, compensated by a nobleness of sentiment, and a love of freedom, which run through the whole work, and some passages are truly poetical. The best editions are the *Variorum* (Leyden, 1658, 8vo), Oudendorp's (Leyden, 1728, 2 vols., 4to), Burmann's (Leyden, 1740, 4to), and Weder's, with the notes of Bentley and Irtius (Leipsic, 1819, 2 vols.) Lucan has been translated into English by Rowe.

LUCAVAS. See *Bahamas*.

LUCCA; a city and duchy in Italy, originally a colony of the Romans, which, on the fall of the Lombard kingdom (774), was added by Charlemagne to his territories, and annexed by Otho I. (the Great) to his German dominions. During the middle ages, it was repeatedly sold by its masters, on account of the liberal principles of its citizens. Louis of Bavaria appointed the brave Castruccio Castracani duke of Lucca, but this dignity became extinct at his death. After many changes of its tyrants, having been sold to Florence, Lucca finally obtained its freedom, in 1270, of the emperor Charles IV., for 200,000 guilders. Though often at war with Florence, it maintained its independence until the time of Napoleon, under the government of a *gonfaloniere* and a council. The French obliged it to adopt a new constitution, and, in 1797, it was united with Piombino, and given to Bacciocchi, brother-in-law of Napoleon, as principality. In 1815, the Austrians took possession of it, and, by an act of the congress of Vienna, was granted to the Infanta Maria Louisa, daughter of king Charles IV. of Spain, and widow of the king of Etruria, with the title of a duchy, and with complete sovereignty. To the revenue of the country (30,000 guilders), an annuity of 500,000 francs was added, which Austria and Tuscany bound themselves to pay. In case of the extinction of the family of the Infanta, or its transference to any other throne, the duchy of Lucca is to be united to Tuscany. Maria Louisa accepted the government in 1818, after the cession of Parma was secured to her.

The duchy of Lucca (413 square miles, 137,500 inhabitants) is bounded by the Mediterranean, Modène, and Tuscany, and, although the soil is not universally fertile, the people are in good condition. The Apennines stretch along its boundaries; in other parts it is well cultivated. The Serchio is navigable, and is only used for floating down wood. The beautiful Val di Serchio. The produce is corn (not sufficient to supply the inhabitants), great quantities of fruit, as olives, chestnuts, pears, oranges, lemons, figs, and mulberries. It yields good wine; olives form the richest agricultural produce; the oil of Lucca is the best of the kind. The cultivation of silk, and the raising of cattle, are also lucrative. The legislative power of

the duke is limited by a senate, which he annually assembles.

Lucca, the capital, and ducal residence (with 18,000 inhabitants, on the river Serchio, in a fertile plain, encompassed by hills, which are covered with olive trees, and, at the summits, with oak and fir trees), is surrounded with ramparts planted with trees, and forming a beautiful walk. The streets are generally crooked and narrow; the churches and public buildings plain. The cathedral is large, but in a bad style; the palace is old, and without beauty. The *Accademia degli Oscuri*, founded in 1584, was reorganized in 1805, under the title *Accademia Lucchesina di Scienze, Lettere ed Arti*, by prince Bacciocchi. Here is also a university with an observatory. It is the see of an archbishop, and contains two large woollen and considerable silk manufactories. The inhabitants carry on a trade in oil and silk, and are actively engaged in agriculture. The beautiful environs of the town are adorned with country seats. In the vicinity are a mineral bath and the harbour of Viareggio.

LUCCHESINI, GIROLAMO, marquis of, formerly Prussian minister of state, descended from a patrician family of Lucca, where he was born in 1752, was introduced by the abbé Fontana to Frederic II., about 1778, who took him into his service as librarian, with the title of a chamberlain. Lucchesini, the literary friend of Frederic II., first received a diplomatic appointment under his successor, being sent to Warsaw, where, at the opening of the council of state, in 1788, he exerted himself with great activity, encouraged the advocates of independence against Russia, and, in March, 1790, brought about an alliance between Prussia and Poland. In 1791, he was present at the congress of Reichenbach, in the capacity of a plenipotentiary, for effecting, in conjunction with the British and Dutch ministers, a peace between the Turks and the emperor. In July, 1792, he went once more to Warsaw, where he was compelled, by existing circumstances, to break the alliance that he himself had signed. In January, 1793, the king appointed him his ambassador to Vienna; he, however, accompanied the king during the greater part of that campaign. In March, 1797, he was recalled from Vienna, and, in September, 1802, was sent as ambassador extraordinary to Paris, and afterwards visited Napoleon at Milan. The breaking out of the war between Prussia and France, in October, 1806, was unjustly ascribed to his instigation. He accompanied the king to the battle of Jena, then signed an armistice with Napoleon at Charlottenburg, of which, however, the king did not approve; in consequence of which, as he believed himself to have lost the favour of the king, he took his dismissal, in order to return to Lucca. He was afterwards chamberlain to Napoleon's sister, the princess of Lucca, and accompanied her to Paris on the occasion of her brother's second marriage. Count Ségur, in his *Tableau historique et politique de l'Europe*, passes the following judgment on his Polish mission: "No man was better adapted for the post than he. His activity left no opportunity unimproved. Vigilant in accomplishing his object, and rapid in choosing the best means, the marquis of Lucchesini combined the qualities of an experienced courtier with the practical knowledge of a statesman. Learned without pedantry, his great memory supplied him with useful facts for the purposes of business, as well as interesting anecdotes for conversation. His intimacy with Frederic II. procured him a great influence; his powers of insinuation enabled him to penetrate into the interior of all characters; his sagacity easily removed the veil from all mysteries; and his zeal and activity, which gave him an open and frank appearance, con-

created his real views, and persuaded the Poles that he was as ardently engaged for the promotion of their welfare as his own." His work concerning the confederacy of the Rhine, *Sulle Cause e gli Effetti della Confederazione Renana*, etc. (Italy, 1810), was published at Rome, and in a German translation also, by Von Halem, at Leipsic (3 vols, 1821). In the *Atti della R. Accad. Lucches. di Scienze, Lettere ed Arti. I.* (Lucca, 1821), he contributed a paper on the history of Frederic II. He died at Florence, October 19, 1825. He must not be confounded with the marquis Cesare Lucchesini, counsellor of state in Lucca, whose *Dell' Illustrazione delle Lingue antiche e moderne e principalmente dell' Italiana, procurata nel Secolo XVIII. dagli Italiani* (Lucca, 1819, 2 vols), is a continuation of the work of Denina. He has also published *Fragments for the Literary History of Lucca*.

**LUCERNE** (*Lucern*); a canton of Switzerland, bounded N. by Aarau and Zug, E. by Schwitz, and S. and W. by Berne; superficial area, 800 square miles; population, 105,600 Catholics. The elevation of the country is great, but it contains no very lofty summits; mount Pilate, 7,100 feet high, is the principal. The soil is generally fruitful, and more corn is produced than is consumed in the canton. Great numbers of cattle are raised, and cheese is therefore among the chief exports. The people are of German origin, and in a very comfortable condition. Lucerne joined the Swiss confederacy in 1332, its constitution is representative, but founded on aristocratic principles. The sovereign power resides in the *Aundred*, a senate elected for life by the richer citizens. Two presidents (*Schultheissen*) exercise the executive power alternately for a year. Lucerne was one of the eleven cantons in which fundamental changes in the cantonal constitutions were demanded by the people in October, 1830. An account of the movements at that time will be found in the article *Switzerland*.

Lucerne, the capital, is on the lake of Lucerne, and the river Reuss. It contains 6,700 inhabitants, and is, alternately with Berne and Zurich, the seat of a papal nuncio. The cathedral contains one of the finest organs in Europe. General Pfyffer's topographical model of a large part of Switzerland, in relief, is to be seen here; and in the vicinity is a lion, sculptured in relief on a rock (1820), to commemorate the massacre of the Swiss guards in the Tuilleries. The lake of Lucerne is a portion of the large lake of Vierwaldstadtersee.

**LUCIA**, St. or **ST. ALOUSIE**; one of the Caribbee islands, in the West Indies, belonging to Great Britain; twenty-seven miles long, and twelve broad; seven leagues south of Martinico; lon. 61° W.; lat. 13° 37' N. This island exhibits a variety of hills, and, among others, two that are remarkably round and high, said to be volcanoes. At the bottom of these are plains finely watered with rivers, and very fertile. The air, by the disposition of the hills, which admit the trade-winds into the island, is very healthy. The soil produces timber, cocon, and fustic, and is well adapted for the cultivation of sugar and coffee. It is provided with many bays and harbours, the chief of which, called *Little Carenage*, is accounted the best in all the Caribbees. Population in 1803, 16,610; whites, 1,290; people of colour, 1,660; slaves, 13,690; in 1810, 20,000. The town of Carenage contains 5,000 or 6,000 inhabitants, and Castres 3,000 or 4,000.

**LUCIAN**, a Greek author, distinguished for his ingenuity and wit, was born in Samosata, the capital of Comagene, on the Euphrates, during the reign of Trajan. He was of humble origin, and was placed, while young, with his uncle, to study statuary; but

being unsuccessful in his first attempts, he went to Antioch, and devoted himself to literature and classic rhetoric. He soon, however, combined himself with the latter, and travelled in several countries, and others, Greece, Italy, Spain, and Gaul; as a stoic. In the reign of Marcus Aurelius, he was made procurator of the province of Egypt, and died in the reign of Commodus, eighty or ninety years of age. The works of Lucian, of which many have come down to us, are narrative, rhetorical, critical, satirical, and in the form of dialogues. The most popular are those in which he ridicules with great wit the Greek mythology and the philosophical sects, particularly his *Dialogues of the Gods*, and of the *Dead*. They have given him the character of being the rival of ancient writers. He seems not to bring any system himself, but he attacks impudently an opposition freely and boldly wherever he finds one. The Epicureans, who, in this respect, were his enemies, are therefore treated with more freedom. The Christian religion, of which, however, he knew little, and that only through the medium of mysticism, was an object of his ridicule. In his casuism, he not unfrequently oversteps the limits of truth, sometimes repeats calumnies against certain characters, and occasionally, according to the usage of our time, offends against decency, though in general, he shows himself a friend of morality. The best editions of his works are by Bourdieu (Paris 1615, folio), by Hemsterhuis and Rees (Amsterdam 1743, 4 vols, 4to), and the Bipont: (1796, 4 vols, 8vo). Among the English translations are those of Thomas Hickes, and Franklin.

**LUCIFER** (*light-bearer*; with the *Gentile philosophers*); a son of Jupiter and Aurora. In most of the stars, his office, in common with the Sun, was to take care of the steeds and chariot of the sun; and he is represented riding on a white horse as the precursor of his mother; therefore the morning star. He is also the evening star (*Vesper*), and in this character has a dark-colored horse; for this reason riding horses (*desultores*) were dedicated to him, and the Romans gave him the name *Desultor*. It has long been known, that the evening and morning star are one and the same, viz. the beautiful and bright planet Venus.

The name of *Lucifer* is also given to the prince of darkness, an allegorical explanation of the text: the church making a passage of Isaiah 14, 12, which the king of Babylon is compared with, and morning star, refer to the evil one.

**LUCILIUS**, *C. P. F. ENNA*, a Roman Latin grand uncle to Pompey the Great, on the maternal side, born at Suessa (B. C. 149), served in the campaign against Numantia, under Scipio Africanus, with whom he was very intimate. He is considered the inventor of the Roman satire, because to him gave it the form under which this kind of poetry was carried to perfection by Persius, Horace, and Juvenal. His satires were superior, indeed, to the productions of an Ennius and Pacuvius, but in turn, was surpassed by those who followed him. His race compares him to a river which carries all the precious dust mixed with useless rubbish. Of his satires which he wrote, only some fragments have been preserved in various editions, of which those of Dousa (Leyden, 1597, 4to); Ammonius, 1611, 8vo; and Padua, 1735) are esteemed the best. In his time, these satires had an uncommon popularity, and died at Naples about 103 B. C.

There was also another Lucilius, who wrote a didactic poem, *Ætina*, edited by Carion (Leiden, Amsterdam, 1803).

**LUCINA**, a surname of Juno, promising to give of Diana; according to others, the name of a daughter

ter of Jupiter and Juno), is derived either from *lucus* (grove, because her temple stood in a grove), or *lus* (light, because children are brought to light at birth), or from *lucco* (I shine, as denoting the moon). Her festival was celebrated March 1, on which occasion the matrons assembled in her temple, adorned it with flowers, and implored a happy and brave posterity, fecundity and an easy delivery. See *Ilithyia*.

**LUCKNOW**; a city of Bengal, capital of a *circar* of the same name, in Oude, situated on the Goomty; 95 miles N. N. W. of Allahabad, and 215 S. E. of Delhi; lon. 80° 55' E.; lat. 26° 24' N.; population, in 1800, estimated at upwards of 300,000; since that time it is thought to have diminished; it was formerly estimated as high as 500,000. It is a very ancient city, and the residence of the governors or nabobs of Oude. It is by no means a handsome town, the streets being very irregular and narrow; some of the houses of brick, but most of them mud walls, covered with tiles. The situation is bad, and the soil is a white sand, which, in hot weather, is driven about by the wind, and pervades every thing. The gilded domes of the mosques and the mausoleum of Asoph ud Dowleh give it a gay appearance at a distance. In the vicinity of the city stand the houses of the British resident and other European inhabitants. The Goomty is navigable for middling-sized vessels at all seasons.

**LUCON, or LUCONIA**; the principal of the Philippine islands, in the Eastern seas, belonging to Spain, sometimes called *Manilla*, from its capital; between lat. 13° and 19° N.; lon. 120° to 124° E.; about 400 miles from north to south, and from 90 to 120 in breadth; square miles, about 65,000. The country is generally mountainous, an elevated ridge extending the whole length. There are several volcanoes, and earthquakes are frequent, and sometimes destructive; those of 1650, 1754, and 1824, are still remembered with terror. The climate is moist, but temperate for the latitude, and the soil fertile. Cotton, indigo, sugar, tobacco, coffee, and other tropical produce, grow in great abundance; also the richest fruits of the East and West Indies. There are forty different sorts of palm-trees, excellent cocoas and assia, wild cinnamon, wild nutmegs, ebony, sandal-wood, and excellent timber for ship-building. Gold is found upon the mountains, and is washed down by rains. Cattle abound; civet cats are common, and ambergris is thrown upon the coasts in great quantities. The commerce is considerable; the principal exports are indigo, coffee, pepper, rice, sugar, and pearls. In 1827, of eighty-one vessels engaged in it, twenty-nine were Spanish and twenty-one American. The population is 1,376,000, and is composed of Spaniards, who are few, aboriginal blacks, Malays, Metis, and Creoles. The negroes are chiefly the interior, and are in a very barbarous state. The Malays, among whom the principal tribe is the Malays, are in part independent, and in part subject to the Spaniards. Brave, active, gay, and industrious, they are not ruined by the tyranny of the Europeans, but are ruined by oppression cruel and rapacious. Lucon was discovered by Magellan, in 1511, and conquered by the Spaniards in 1571. See *Philippines*.

**LUCRETIA**; a Roman lady of distinguished virtue, whose ill treatment by Sextus Tarquin led to the destruction of the kingdom, and the formation of the republic of Rome. She was the wife of Collatinus, a relation of Tarquin, king of Rome. Sextus Tarquinus, who contrived to become a guest in the house of her husband, whose kinsman he was, found means to reach her chamber in the middle of the night, and threatened, unless she gratified his desires, to stab her, kill a slave, and place him by her

side, and then swear that he had slain them both in the act of adultery. The fear of infamy succeeded. She afterwards summoned her husband, father, and kindred, and, after acquainting them with the whole transaction, drew a dagger and stabbed herself to the heart. See *Brutus, Lucius Junius*.

**LUCRETIVS, TITUS CARUS**, a Roman knight, probably born 92 B. C., is supposed to have studied the Epicurean philosophy at Athens. He is said to have been made insane by a philtre, and, in his lucid intervals, to have produced several works, but to have committed suicide in his forty-fourth year. We possess, of his composition, a didactic poem, in six books, *De Rerum Natura*, in which he exhibits the principles of the Epicurean philosophy with an original imagination, and in forcible language. The unpoetical subject of the poem must, of itself, make it, on the whole, a failure; but parts, notwithstanding, such as the description of human misery, the force of the passions, the terrible pestilence of Greece, &c., demonstrate that Lucretius was possessed of great poetical talents. By reason of his antiquated terms, and the new meanings which he gave to words, Quintilian himself regarded his poem as very hard to be understood. The principal editions are those of Creech (Oxford, 1695; London, 1717; Basle, 1770, &c.), of Havercamp, (Leyden, 1725, 2 vols., 4to), and of Wakefield (London, 1796, 3 vols. 4to). A masterly German translation, in the metre of the original, has been executed by Knebel (Leipsic, 1821, 4to). The Italian version by Marchetti, and the French by Pongerville, are also good. The poem has also been translated into English by Creech, by Busby, and by Good. Good's translation is accompanied by the text of Wakefield, and by elaborate annotations.

**LUCULLUS, LUCIUS LICINIUS**; the conqueror of Mithridates. Being chosen *ædilis curulis*, at the same time with his brother Marcus Licinius, he manifested in the Marsian war, ability and courage. In the civil wars of Sylla and Marius, he sided with the former. In the year of the city 679, he was appointed consul and commander of the army which was to proceed to Cilicia against Mithridates. Having already served against Mithridates with an inferior command during his questorship, he was acquainted with this country. He first sought to restore the ancient discipline, which the Roman soldiers had forgotten among the voluptuous Asiatics. Mithridates had already made a victorious beginning of the campaign by a naval battle with the consul Aurelius Cotta, the colleague of Lucullus. Lucullus was therefore compelled to hasten the attack of his land forces. But when he approached the army of Mithridates, and ascertained its strength, he deemed it judicious to avoid a decisive battle, and contented himself with cutting off the king's communications. Mithridates now advanced with a considerable force to besiege the city of Cyzicum, the key of Asia, then in the possession of the Romans. Lucullus, however, defeated his rearguard on their march thither, and compelled the king to give up his attempt. Lucullus now advanced to the coasts of the Hellespont, prepared a fleet, and vanquished the squadron of Mithridates near the island of Lemnos. This victory enabled him to drive all the other squadrons of Mithridates from the Archipelago. The generals of Lucullus subdued, meanwhile, all Bithynia and Paphlagonia. Lucullus, again at the head of his army, conquered various cities of Pontus, and, although overcome by Mithridates in a battle, he soon acquired such advantages, that he finally broke up the hostile army, and Mithridates himself sought protection in Armenia. Lucullus now changed Pontus into a Roman province. Tigranes refusing to surrender Mithridates to the Romans,

Lucullus marched against Armenia, and vanquished Tigranes. Mithridates, however, contended with various fortune, till Lucullus was prevented from continuing the war against him effectually, by the mutiny of his soldiers, who accused him, perhaps not unjustly, of avarice and covetousness. In Rome, the dissatisfaction of the soldiers towards Lucullus was found well-grounded; he was deprived of the chief command, and recalled. He was received, however, by the patricians, with every mark of respect, and obtained a splendid triumph. From this time, Lucullus remained a private individual, spending in profuse voluptuousness the immense riches which he had brought with him from Asia, without, however, abandoning the more noble and serious occupations of a cultivated mind. During his residence as questor in Macedonia, and as general in the Mithridatic wars, he had become intimate with the most distinguished philosophers. His principal instructor was the academician Antiochus, who accompanied him in some of his campaigns. Lucullus was therefore most interested in the Platonic system. After his return, he pursued the study of philosophy, induced many scholars to come to Rome, and allowed them free access to his house. He also founded, by means of Tyrannion, whom he had taken prisoner in the Mithridatic war, an extensive library, which was free to every one, and of which Cicero made diligent use. His example, also, induced other distinguished Romans to draw learned men to Rome at their expense. At last, he is said to have lost his reason in consequence of a philtre, administered by his freedman Callisthenes, so that it was necessary to place him under the guardianship of his brother. He soon after died, in his sixty-sixth or sixty-eighth year. Lucullus first transplanted the cherry-tree to Rome from Cerasus, in Pontus, 680 years after the building of the city.

**LUDDITES**; a name given, some years since, in England, to the rioters who destroyed the machinery in the manufacturing towns. They were so called from one of their leaders, named Ludd.

**LUDLOW, EDMUND**, a distinguished leader of the republican party in the civil wars of Charles I., the eldest son of Sir Henry Ludlow, was born about 1602, at Maiden Bradley, in the county of Wilt, and received his education at Oxford, whence he removed to the Temple, in order to study the law. He served with distinction in the parliamentary army, and when "the self-denying ordinance" took place, he remained out of any ostensible situation, until chosen member for Wiltshire, in the place of his father. At this time, the machinations of Cromwell becoming visible, he was opposed by Ludlow with firmness and openness. With a view of establishing a republic, he joined the army against the parliament, when the latter voted the king's concessions a basis for treaty, and was also one of Charles's judges. With a view of removing him, Cromwell caused him to be nominated general of horse in Ireland, where he joined the army under Ireton, and acted with great vigour and ability. When Cromwell was declared protector, Ludlow used all his influence with the army against him, on which account he was recalled, and put under arrest. Although he refused to enter into any engagement not to act against the government, he was at length allowed to go to London, where, in a conversation with Cromwell himself, he avowed his republican principles, and, refusing all security or engagement for submission, he retired into Essex, where he remained until the death of the protector. When Richard Cromwell succeeded, he joined the army party at Wallingford-house, and was instrumental in the restoration of the long parliament, in which he took his seat. The

restoration was now rapidly approaching, and, finding the republicans unable to resist it, he quitted country, and proceeded to Geneva, whence he afterwards, with many more fugitives of the party, took refuge at Lausanne, where Luke was accompanied by some English royalists. Similar attempts were made on the lives of Ludlow and others, but the caution and the vigilance of the magistracy of these cities protected him, and he passed the remainder of his life at Vevay, with the exception of a brief visit to England after the revolution, from which he was driven by a motion in parliament for his imprisonment, by Sir Edward Seymour, the leader of the party. He closed his life in exile, in 1693, being then in his seventy-third year. Ludlow was one of the most and most honourable characters on the republican side, without any fanaticism or hypocrisy. His Memoirs contain many particulars as related to the general history of the times: they are written in a manly, unaffected style, and are replete with valuable matter.

**LUFF**; the order of the helmsman to put the ship towards the lee-side of the ship, in order to make the ship sail nearer the direction of the wind.

**LUGDUNUM**; the Latin name of several cities: 1. a colony of the Romans, also called *Lugdunum* the present *Lyons* (q. v.), though not on the same spot. 2. *Lugdunum Batavorum* (q. v. Bat.); a city in Gallia Belgica, at a later period, in the middle ages, called *Ledais*; at present, *Luth* (q. v.); hence, on the title page of *Commen. Lugdunum Batavorum*, many of which are very fine editions. 3. *Lugdunum*; a city of the Combronne, in Aquitania, most probably the present *St. Bernard*. 4. *Lugdunensis* (Gallia) was the name given to a province of Augustus, to a part of Caesar's Gaul. There were *Lugdunensis Prima*, afterwards *Lotharinga*; *Lugdunensis Secunda*, afterwards *Touraine*; *Lugdunensis Tertia*, afterwards *Toussaint*, then *Anjou*, and *Brittany*; *Lugdunensis Quarta*, or *Senonia*, comprising part of Champagne, south of the Marne, the southern part of *l'île de France*, (between *Perche*, and *Orléannais*).

**LUGGER**; a vessel carrying three masts with a running bowsprit, upon which she sets her sails, and sometimes has top-sails adapted to them.

**LUG-SAIL**; a quadrilateral sail bent upon a yard, which hangs obliquely to the mast, at one end of its length. These are more particularly used in the *barcalongas*, navigated by the Spaniards in the Mediterranean.

**LUKE**; author of one of the Gospels, which is distinguished for fulness, accuracy, and contains extensive information; also of the Acts of the Apostles, in which he gives a methodical account of the origin of the Christian church, and particularly of the travels of the apostle Paul. Though these two books were designed merely for his friends, they soon attained a canonical authority, and were publicly read in the churches. Concerning the circumstances of the life of this evangelist, nothing certain is known, except that he was a Jew by birth, and a contemporary of the apostles, and that he heard accounts of the life of Jesus from the mouth of eye-witnesses, and was for several years a companion of the apostle Paul, in his travels. He is mentioned in the Acts of the Apostles, he rears that he himself had seen and participated in. The supposition that he was a physician is more probable than the tradition which makes him a painter, and which attributes to him an old picture of Christ, preserved at Rome. On account of the latter tradition, however, he is the patron saint of painters, and a celebrated academy of those artists at *Rome*, bears his name.

**LUKE OF LEYDEN**, one of the founders of modern painting in the North, stands by the side of Dürer, Holbein, and Cranach, at the head of the old German school, though, strictly, he does not belong to Germany. He was born at Leyden, 1494, and enjoyed, in early life, the instruction of his father, Hugo Jacob, and afterwards that of Cornelius Engelbrechtsen, an eminent painter, and scholar of Van Eyck. At the early age of nine, he began to engrave, and, in his twelfth year, astonished all judges, by a painting, in water-colours, of St Hubert. In his fifteenth year, he produced several pieces, composed and engraved by himself, among which the Trial of St Anthony, and the Conversion of St Paul, in regard to composition, characteristic expression, drapery, and management of the graver, are models. After this, he executed many paintings in oil, water-colours, and on glass; likewise a multitude of engravings, which spread his fame widely. He formed, a friendly intimacy with the celebrated John of Mabuse and Albert Dürer, who visited him in Leyden. His unremitting application injured his health; and his anxious friends persuaded him to travel through the Netherlands. But his hypochondria was not removed. He imagined himself poisoned by envious painters, and hardly left his bed for almost six years; during which time he laboured uninterruptedly, and rose to the highest rank in his art. He died in 1533, in his fortieth year. This artist is excellent in almost all parts of his art, though he could not entirely divest himself of the taste which characterized the childhood of painting. His designs are striking, ingenious, and varied; his grouping judicious and natural; character appears in all his figures, particularly in the heads, though this character cannot be called noble. The situations and attitudes of his figures are very various, which is the more remarkable, from the great number of persons often found in his paintings. His drawing is correct, yet not ideal, but fashioned after the models of the country in which he lived. His drapery is, indeed, mostly arranged with truth, but without taste, heavy, and deformed by many small folds. His colouring is pleasing and natural, but the aerial perspective is neglected; and there is a certain harshness, not to be mistaken, peculiar to that period of the art. Notwithstanding his high finish, he painted easily. His engravings and wood-cuts bear evidence of a most careful and steady management of the graver. They are very rare, and highly prized, particularly those in which he selected the same subject with Albert Dürer, in order to compete with him. The friends often shared their ideas and compositions; but Luke ranks below Dürer. The fullest and most beautiful collection of engravings by his master, is in the library at Vienna. His paintings are scattered about in many galleries; the principal in Leyden, Vienna, Dresden, Munich, and in the Tribune at Florence.

**LULLY, RAYMOND**, a distinguished scholastic of the thirteenth century, author of the method called *lra Lulliana*, taught throughout Europe, during the fourteenth, fifteenth, and sixteenth centuries, was born at Majorca, in 1235. After having been attached to the gay court of James I. of Arragon, he became filled with pious feelings, and, at the age of thirty, retired to a solitude, and for the purpose of converting infidels, began the study of theology. Encouraged by visions, he undertook the task by studying the eastern languages, and invented his new method, or *ars demonstrativa Veritatis*, for the purpose of proving that the mysteries of faith were not contrary reason. He then visited Rome and France, in the schools of which he taught; and, while at Montier, composed his *Ars inventiva Veritatis*, in which he develops and simplifies his method. Pass-

ing over into Africa, for the purpose of convincing the Mohammedan doctors of the truth of Christianity, he narrowly escaped with his life; and, on his return to Europe, wrote his *Tabula generalis*, a sort of key to his former works, and, in 1298, obtained from Philip the Fair a professorship at Paris. From this period dates the establishment of his doctrine in Europe. His *Ars expositiva* and *Arbor Scientiæ* are his other principal works on this subject. A second visit to Africa, for the purpose of converting the disciples of Averroes, resulted in his banishment from that region; but he returned a third time, and was stoned to death, about 1315. The Lullian method was taught and commented on for several centuries in Europe. The principal commentators are Lefèvre-d'Étaples, Alstedius, Sebonde, &c. See Degerando, *Histoire comparée des Systèmes de Philosophie*.

**LULLY, JEAN BAPTISTE**; born at Florence, of obscure parents, in 1634. As a child, he exhibited a passionate fondness for music. The chevalier Guise, who had been commissioned by Mlle. de Montpensier to send her an Italian page, struck with his talent, engaged him, and despatched him to Paris in his tenth year. The lady, however, was so little pleased by his appearance, that she sent him into her kitchen, where he remained some time in the humble capacity of an under-sculion. His musical talent becoming accidentally known to a gentleman about the court, his representations procured him to be placed under a master. He now rose rapidly, till he obtained the appointment of musician to the court. His performance soon attracted the notice of the king, by whose direction, a new band, called *les petits Violons*, was formed, and Lully placed at the head of it, in 1660; about which period, he composed the music to the then favourite amusements of the court, called *ballets*, consisting of dancing, intermixed with singing and recitative. In 1670, Lully was made joint-director of the French opera, established the preceding year, on the plan of that at Venice, which situation he filled till his decease, in 1687. Lully contributed much to the improvement of French music, and is said to have been the inventor of the overture.

**LUMBAGO** (from *lumbus*, the loin); a rheumatic affection of the muscles about the loins. See *Rheumatism*.

**LUMPERS**; labourers employed to load and unload a merchant ship when in harbour.

**LUMP-FISH** (*cyclopterus*, Lin.). These fish are very remarkable for the manner in which their ventral fins are arranged. They are united by a membrane so as to form a kind of oval and concave disk. By means of this apparatus, these fish are enabled to adhere with great force to any substance to which they apply themselves. This has been proved by placing one of them in a bucket of water, when it fixed itself so firmly, that, on taking the fish by the tail, the whole vessel and its contents were lifted from the ground, although it held some gallons. (*Brit. Zoology*.) The largest of the genus is the *C. lumpus*: this is about nine inches long, and sometimes weighs seven pounds. The back is arched and sharp, of a blackish colour, variegated with brown. The body is covered with sharp, black tubercles; and on each side, there are three rows of large, bony scales, and another on the back. The great resort of this species is in the northern seas, about the coast of Greenland. Great numbers of them are devoured by the seals, who swallow all but the skins, quantities of which, thus emptied, are seen floating about in the spring months, when these fish approach the land for the purpose of spawning. It is said that the spots where the seals carry on their depredations can be readily distinguished by the smoothness of the water.

Crants says that the inhabitants of the barren tracts of Greenland, who are obliged to depend, for the greatest part of their subsistence, on fish, eagerly avail themselves of the arrival of this species. The roe is remarkably large: when boiled, it forms an exceedingly gross and oily food, of which the Greenlanders are very fond. The flesh is soft and insipid.

**LUMP-LAC.** See *Coccus*, end of the article.

**LUNA** (the moon), among the Greeks, *Σελήνη*, was the daughter of Hyperion and Terra (*Γαία*), and was the same, according to some mythologists, as Diana. She was worshipped by the ancient inhabitants of the earth with many superstitious forms and ceremonies. It was supposed that magicians and enchanters, particularly those of Thessaly, had an uncontrollable power over the moon, and that they could draw her down from heaven at pleasure, by the mere force of their incantations. Her eclipses, according to their opinions, proceeded from thence, and, on that account, it was usual to beat drums and cymbals, to ease her labours, and to render the power of magic less effectual. See *Helios*.

**LUNAR CAUSTIC.** See *Nitrate of silver*.

**LUNAR YEAR.** See *Year*.

**LUNATICS**, in medicine. See *Mental Derangement*.

*Lunatics*, in law. See *Non Compos*.

**LUND**, or **LUNDEN**; a town in Sweden, province of Skonen, and government of Malmöhus, five miles from the Baltic; lon. 13° E.; lat. 55° 44' N.; population, 3,224. It is a bishop's see, and contains a university, founded in 1660, by Charles IX., which has fifteen professors, a botanic garden, an anatomical theatre, a cabinet of curiosities, an observatory, and a library of 40,000 volumes. The number of students, in 1827, was 631.

**LUNEBURG**; formerly a principality of Lower Saxony, at present, a province of Hanover, with 4325 square miles, and 264,000 inhabitants. The Elbe forms its boundary on the north and north-east. Luneburg is a vast plain of sand, interrupted here and there by deep moors and forests of pine. The marshes on the rivers are, however, wonderfully productive, but are better fitted for pasture, and the cultivation of garden vegetables, than for tillage. The rivers of the province flow into the Elbe or the Weser, the high land which divides the basins of those two rivers being the great Luneburg heath. The dykes, which protect the country from the inundations of the Elbe, are enormously expensive. About seven tenths of the whole province are incapable of cultivation, and corn is not produced in quantities sufficient to supply the inhabitants. Flax is extensively raised, and the cattle are numerous and of a good description. Bees are kept on the heaths, and the fisheries in the rivers are important. Salt, wool, linen, bees-wax, and wooden-ware, are the chief exports. The great commercial road from Hamburg to Hanover and Brunswick, runs through the province, and the towns of Luneburg and Celle carry on a considerable commission business. Luneburg was originally an allodial estate of the house of Brunswick, and gave its name to one of the branches of the family. See *Brunswick*.

*Luneburg*, the capital of the province, is an old town, with about 11,300 inhabitants, situated on the Ilmenau, which is navigable to this place for small vessels. The Kalkberg is a curious gypseous rock, 118 feet high, on which are remains of ancient fortifications, and in the quarries of which is found the rare mineral boracite. The salt springs are capable of yielding 2000 tons of salt a week. The transit trade between Hanover and Brunswick is extensive, a large number of horses being brought to Lune-

burg annually, and is estimated at 15,000,000 m. burghs.

**LUNETTE**, in the art of fortification; a very vague expression, which in its original significance probably comprised every detached work built in the form of an angle, and consisting of but two bastions. It was afterwards used in a more limited sense to denote, 1. Small, generally irregular, works with or without flanks, that are placed in the principal ditch, before the ravelins, or other out-works for the purpose of covering such places of the defence part, as may be seen from the open field of retreating from the side such points as track a mistake in the original plan of the fortification, or left unprotected, the guns from the bastions were able to reach them. 2. Advanced works in the face of the glacis, sometimes constructed in the form of an angle, sometimes in the form of the bastion. The kind of lunettes, skilfully disposed on the two fronts of a place, and arranged, in one or two lines so as to flank one another, may check the progress of the enemy for a considerable time, by obliging him to make his trenches at a greater distance than he would otherwise have done, and subjecting him to losses in the capture of each lunette. Particular attention must be paid to dispose them in such a manner as to render it impossible for the enemy to attack two lunettes at the same time.

**LUNEVILLE**; an open city of Lorraine, department of the Meurthe, in a fruitful plain, with 10,000 three churches, and 12,378 inhabitants. Stanislaus Leszynski, king of Poland, to whom the town and Bar had been granted, resided here lat. 48° 35' N.; lon. 6° 30' E.

*Luneville, Peace of*; concluded Feb. 2, 1765, between Austria (also in the name of the German empire) and the French republic, upon the basis of the peace of Campo-Formio. Belgium and the left bank of the Rhine were ceded to France; Mantua to the Cisalpine republic; Venice, and the country as far as the Adige, Istria, and Dalmatia to Austria. The princes on the left bank of the Rhine were to be indemnified by territories within the empire. Austria ceded the Frickthal, and the strip of land between Basle and Zurich, to France, who, in 1802, gave them to Switzerland. Austria ceded Brisgau to the duke of Modena, and confirmed the erection of the kingdom of Etruria, for which the grand-duke of Tuscany was to be indemnified in Germany. The valley of the Rhine formed the boundary of France. The navigation of the river was declared free, and remained so until 1814, when toll was imposed for the complete indemnification of several members of the empire.

**LUNGS**; the organs of respiration in the mammalia (man, quadrupeds, and the cetaceous animals), birds, and reptiles. The lungs are situated in the chest and are divided into two parts, called lobes. They are enveloped in a delicate and transparent membrane derived from the pleura, through which they derive the appearance of net-work, and are connected with the spine by the pleura, with the neck by the trachea, and with the heart by the roots of the pulmonary artery and veins. In their specific growth, they are the lightest of all the animal organs, even when exhausted of air; hence their name of *légères*. To the touch, they are soft, spongy, and elastic. In their internal structure, they are composed of an infinite number of membranous, celled blood-vessels, arteries and lymphatics, all connected by cellular substance. The cells communicate with each other, but have no communication with the cellular substance, and tubes arise from them, which are finally united in one large tube from each lobe; and these two large tubes join to form the windpipe. The blood enters

called the *pulmonary* vessels are destined to distribute the blood through the cells, for the purpose of subjecting it to the action of the air (see *Blood*, and *Heart*); while the bronchial vessels are intended to supply the blood which nourishes the lungs. (For the action of these organs in respiration, see *Respiration*.) The cetacea (whales, seals, &c.) breathe by lungs, and are therefore obliged to ascend, at intervals, to the surface of the water, to obtain a supply of atmospheric air. The respiratory orifice, in these animals, is not situated at the extremity of the snout, but on the top of the head. In birds, the lungs are smaller than in quadrupeds, but they have air distributed throughout their muscular system and in the cavities of the bones.

The lungs afford a means of ascertaining whether a new-born child, which is found dead, was or was not living, when born,—a question often of great importance in forensic medicine. The lungs of the infant are placed in water, to see whether they will swim or sink. Before birth, the lungs are dark red, contracted into a small place within the cavity of the breast, firm, and specifically heavier than water. They therefore sink in water, whether they are entire or cut into pieces; and when cut, no air-bubbles come forth, either in or out of the water, nor does much blood appear. But if the babe has lived after birth, and therefore breathed, air has entered the lungs, has thus enlarged the cavity of the chest, and the lungs themselves are expanded, appear of a loose, spongy texture, of a pale red colour, cover the heart, and fill the chest. They then swim in water, as well in connexion with the heart as without it, as well entire as in pieces. If cut, a peculiar sound is audible; air proceeds from them, and rises, if they are pressed under water, in small bubbles. From the incisions in the lungs, red, and generally foamy blood issues. Against this test, it has been objected—1. that air may be found in the lungs, though the infant never breathed. This could happen, however, only (a) from air having been blown into them; but, in this case, the chest of the infant is not arched, very little blood is to be found in the lungs, and it is not bright red nor foamy; (b) from putrefaction; but, in this case, the other parts of the body would also be affected by putrefaction: the lungs are not expanded, pale-red air-bubbles show themselves only on the surface, and not in the interior substance, unless the highest degree of putrefaction has taken place. 2. It is said that the child may have breathed, and therefore lived, without air being found in the lungs. This is not proved, and is at variance with the received ideas of the manifestation of life. 3. That part of the lungs may swim, another may sink. This can happen only with lungs in a diseased state, and would only prove an attempt of the infant to breathe, without the possibility of living. 4. That a child may have lived without breathing; but this state of apparent death cannot be called life: life cannot be supposed without breath. If all precautions are taken, all attending circumstances considered, the external appearance of the infant well observed, and the state of the other intestines examined, the foregoing test may be considered as sufficient for the decision of the question, whether a child has lived after birth or not. Another kind of test by means of the lungs has been proposed, which is founded on the proportion of the weight of the whole body to a lung which has breathed, and one which has not; and still another, which rests on the circumference of the chest before and after breathing has commenced; but both are more complicated, troublesome, and less certain than the former one.

LUPERCALIA; a yearly festival observed at Rome, the 15th of February, in honour of the god

Pan, surnamed *Lupercus* (from *lupus*, wolf, and *arceo*, to drive away), the defender from wolves. It was usual first to sacrifice two goats and a dog, and to touch, with the bloody knife, the foreheads of two illustrious youths, who always were obliged to smile while they were touched. The blood was wiped away with soft wool dipped in milk. After this, the skins of the victims were cut into thongs, with which whips were made for the youths. With these whips the youths ran about the streets, all naked except the middle, and whipped those they met. Women, in particular, were fond of receiving the lashes, as it was believed that they removed barrenness, and eased the pains of child-birth. This excursion in the streets of Rome was performed by naked youths, because Pan is always represented naked, and a goat was sacrificed because that deity was supposed to have the feet of goats. A dog was added as necessary for the shepherd. The priests which officiated at the Lupercalia were called *Luperci*.

LUPINE; a genus of leguminous plants, containing about thirty species, which are herbaceous or frutescent, bearing petiolate and usually digitate leaves, and large, handsome flowers, which are disposed in a terminal raceme. The *lupinus perennis* grows wild in sandy places, from Canada to Florida, and bears beautiful blue flowers. It has been cultivated in Europe for more than 150 years.

LUPULIN. M. Planché first ascertained that the three active ingredients of the hop, viz. the oil, resin, and bitter principle, reside in the brilliant yellow grains scattered over the calicinal scales of the cones, which serve as their envelope. Doctor Ives of New York, and MM. Payen, and Chevalier, have since confirmed this position. This matter, when insulated, is of a golden yellow colour, in little grains, without consistence, which attach themselves to the fingers, and render them rough. It has a penetrating aromatic odour: 200 parts of it afforded, 1. water; 2. essential oil; 3. carbonic acid; 4. subacetate of ammonia; 5. traces of osmazome; 6. traces of fatty matter; 7. gum; 8. malic acid; 9. malate of lime; 10. bitter matter, 25 parts; 11. a well characterized resin, 105 parts; 12. silica, 8 parts; 13. traces of carbonate, muriate, and sulphate of potash; 14. carbonate and phosphate of lime; 15. oxide of iron and traces of sulphur. The bitter matter, introduced into the stomach, destroys appetite.

LUSATIA (in German, *Lausitz*); an extensive country, bordering on Bohemia to the south, Meissen to the west, Brandenburg to the north, and Silesia to the east. It was formerly a margraviate, and was divided into Upper and Lower Lusatia, with a superficial area of 4250 square miles, the population of which is about 500,000. With the exception of the circle of Kottbus, which had fallen into the hands of the house of Brandenburg in 1550, Lusatia was granted to the elector of Saxony, in 1635. In 1815, all Lower Lusatia (1740 square miles), with a large part of Upper Lusatia, was ceded to Prussia (in all 3200 square miles, with 294,700 inhabitants), and was annexed to the governments of Frankfort and Liegnitz. The part of Upper Lusatia, which remained to Saxony (1050 square miles, with 195,000 inhabitants), now forms the circle of that name, comprising the eastern part of the kingdom; chief town, Bautzen (q. v.). It is not very fertile, hardly supplying half of the consumption of its inhabitants. Flax is raised in all parts, but great quantities are imported for the use of the manufactures. Linen, woollen, and cotton are the principal manufactures. See *Saxony*.

LUSIAD. See *Camoens*.

LUSITANIA; a part of Spain, whose extent and situation have not been accurately defined by the ancients. According to some descriptions, it ex-

tended from the Tagus to the sea of Calabria. The inhabitants were warlike, and the Romans conquered them with great difficulty. They generally lived upon plunder, and were rude and unpolished in their manners. See *Spain*, and *Portugal*.

**LUSTRATION**; purification; in particular the solemn purification or consecration of the Roman people, by means of an expiatory sacrifice (*sacrificium lustrale*), which was performed after every census. (See *Census*.) The name may be derived from *luere*, in the sense of *solvere*, for, on this occasion, all public taxes were paid by the farmers-general to the censor; or from *lustrare* (to expiate), because, after the census, an expiatory sacrifice was offered for the whole Roman people. The sacrifice consisted of a bull, a sow, and a sheep or ram (*suovetaurilia*). The ram was dedicated to Jupiter, the swine to Ceres, and the bull to Mars. This solemn act was called *lustrum condere*. As this lustration took place at the end of every five years, *lustrum* came to signify a period of five years.

**LUSTRE**. See *Lustration*.

**LUTE** (in Italian, *liuto*; French, *luth*; German, *laute*, perhaps from the German *lauten*, to sound) is an instrument which originated from the ancient lyre. Some, however, think that it was introduced into Spain by the Moors, where it was called *laoud*; and from thence into Italy, where it received the name of *liuto*. The *chelys*, or *testudo*, of the Romans, was probably a similar instrument. It is a stringed instrument, formerly much in use, anciently containing only five rows of strings, but to which six, or more, were afterwards added. The lute consists of four parts, viz., the table; the body, which has nine or ten sides; the neck, which has as many stops or divisions; and the head, or cross, in which the screws for turning it are inserted. In playing this instrument, the performer strikes the strings with the fingers of the right hand, and regulates the sounds with those of the left. The notes of the lute are generally written on six lines, and not on five. There were formerly various kinds in use. The lute, simply constructed, is called the *French lute*; if it has two necks, one of which sustains the base notes, it is called a *theorbo*; if the strings of the *theorbo* are doubled, it is called an *arch-lute*. The difficulty of playing upon this instrument, as well as that of tuning it, is probably the reason that it has gone out of use.

**LUTHER, MARTIN**, the great ecclesiastical reformer, was born at Eisleben, November 10, 1483. Hans Luther, his father, a miner, removed with his family to Mansfeld, in 1484, and was appointed to a seat in the council. Martin was educated in the deepest respect for religion, and, at the age of fourteen, was sent to the school at Magdeburg; but receiving no assistance there, he was sent, in 1498, to Eisenach. At first he obtained his support by singing songs at the doors, like many other poor scholars; but he was soon taken under the care of a maternal relation in easy circumstances. At school, he made rapid progress in Latin and other studies; in 1501, entered the university of Erfurt; in 1503, received the degree of master, and delivered lectures on the physics and ethics of Aristotle. About this time, he discovered, in the library of the university, a Latin Bible, and found, to his no small delight, that it contained more than the excerpts in common use. He was destined by his father to the law; but his more intimate acquaintance with the Bible, of which the clergymen of that time knew only the Gospels and Epistles, induced him to turn his attention to the study of divinity. The impression produced on him by the death of his friend Alexis, who expired at his side, on a journey from Mansfeld to Erfurt, by a stroke of lightning or the blow of an

assassin, uniting with the effect of his early religious education and his poverty, decided him to devote himself to the monastic life. Contrary to the wishes of his father, he entered the monastery of the Augustines, at Erfurt, in 1505, and submitted patiently to all the penances and humiliations which the austerities of the order imposed upon novices. But he always regarded himself as an unprofitable servant. Poor and innocent as he was, he tortured himself with bitter reproaches, and was attacked by a severe fit of sickness; during which, one of the choir brothers consoled his troubled heart, and promised him the forgiveness of his sins through faith in Jesus Christ. This doctrine, almost forgotten in the east of the clergy for good works, as they called them, set on the traffic in indulgences, brought a new light to the soul of Luther. He was also encouraged by the paternal mildness of Staupitz, the provisor of the order, who, perceiving his extraordinary talents and acquirements, delivered him from the narrowness of the cloister, and encouraged him to continue in theological studies.

In 1507, he was consecrated priest, and, in 1510, by the influence of his patron, Staupitz, he was appointed professor of philosophy in the new university of Wittenberg. In this sphere of action, his powerful mind soon showed itself. He threw off the yoke of the scholastic philosophy, so intimately connected with the papal hierarchy, asserted the rights of reason, and soon collected a large number of disciples. In 1510, he visited the court of pope Leo X. at Rome, on business intrusted to his order. The journey revealed to him the irreligion and corruption of the clergy at Rome, and destroyed his reverence for the sanctity of the pope. After his return, he became a preacher at Wittenberg, and, in 1512, he was made a doctor in theology. As such, he was bound him, as he thought, to the freest use of the Holy Scriptures. His profound learning was embraced an intimate acquaintance with the sacred classics, the fathers of the church, and the quest of the Greek and Hebrew languages, together with the fame of his eloquence, soon made Luther known to the principal scholars, and esteemed as a powerful advocate of the new light which was breaking upon the world. Great, therefore, was the sensation excited by his ninety-five propositions, given to the world October 31, 1517, and intended to put an end to the sale of indulgences, by the Dominicans. Luther was compelled to this course solely by the love of truth, and by his indignation against the sale of indulgences, the unhappy effects of which had appeared already in his congregation at Wittenberg. Ambition or hatred of the Dominicans had no influence in producing this measure. His propositions were condemned as heretical as soon as they appeared. Hogstraaten, a Dominican at Cologne, doctor both at Ingolstadt, and Prierias, an officer of the Roman court, immediately began an attack upon Luther; but neither their invectives, nor the papal summons to Rome, which he did not obey, nor the oral observations of the cardinal Cajetan, at Augsburg, in 1518, and of the nuncio Militiz, at Altenburg, in 1519, with alluring offers from the pope himself, were sufficient to induce him to recant. He replied to his opponents with boldness and determination, and even entered the dispute with Eck at Leipsic, in 1519, he still maintained the invalidity of indulgences, and of the papal supremacy. No one answered him, and he separated with justice from the decision of Cajetan, to the pope, and from the pope to a general council.

In 1520, Luther and his friends were excommunicated. His writings were burned at Rome, Cologne, and Louvain. Indignant at this open act of hostility after his modest letter, in which he had showed him-

self desirous of reconciliation, declared his submission to the pope, and advised a reform in the church. Luther burned the bull of excommunication, and the decretals of the papal canon, at Wittenberg, December 10, 1520. By this act, he dissolved all connexion with the pope and the Roman church. Frederic, the elector of Saxony, seemed in a doubt whether he should protect him. But the worthiest of the German noblemen, Hutten, Sickingen, Schaumburg, whom he called upon to defend the new opinions, hailed him as the champion of religious liberty, and offered him their fortresses and their arms. But Luther wished no protector but God. He refused to listen to his anxious friends, who advised him not to brave the Roman hierarchy; a spirit within urged him forward, and he could not resist. The people received, with amazement, the words of a monk, who leaped at once the pope and the clergy, the emperor and the princes. For this he did, when he presented himself at the diet of Worms, April 4, 1521, accompanied by a few friends and the imperial herald, who had summoned him. He was met by about 2000 persons on foot and on horseback, at the distance of a league from Worms. Such was his conviction of the justice of his cause, that when Spalatin sent a messenger to warn him of his danger, he answered, "If there were as many devils in Worms as there are tiles upon the roofs of its houses, I would go on." Before the emperor, the archduke Ferdinand, six electors, twenty-four dukes, seven margraves, thirty bishops and prelates, and many princes, counts, lords, and ambassadors, Luther appeared, April 17, in the imperial diet, acknowledged all his writings, and, on the following day, made his defence before the assembly. He concluded his speech of two hours in length with these words: "Let me then be refuted and convinced by the testimony of the Scriptures, or by the clearest arguments; otherwise I cannot and will not cant; for it is neither safe nor expedient to act against conscience. Here I take my stand; I can do otherwise, so help me God! Amen." He left Worms, in fact, a conqueror; but it was so manifest at his enemies were determined upon his destruction, that Frederic the Wise conveyed him privately to the Wartburg, to save his life. Neither the prohibition of the emperor, nor the excommunication of the pope, could disturb him in his retirement, of which he took advantage to translate the New Testament into German. But this retirement continued only ten months. When informed of the disturbances excited by Carlstadt, on the subject of images, he did no longer endure restraint, notwithstanding the new outlawry which the emperor had just issued against him, at Nuremberg; and, at the risk of provoking the displeasure of the elector, he hastened to Wittenberg, through the territory of George, duke of Saxony, who was one of his most bitter enemies. A letter to Frederic, in which he justified his attitude, proves, not less than his conduct before the diet at Worms, his fearless courage and the greatness of his soul. The sermons which he delivered eight successive days after his return (in March, 2), to quell the violence of the enraged insurgents at Wittenberg, are patterns of moderation, and wisdom, and popular eloquence. They show, in a striking light, the error of those who consider Luther only violent and rude fanatic. He was violent only against malignity, or when he thought the great truths of religion in danger. Such motives sufficiently warrant his caustic reply to Henry VIII., king of England, and the bitterness of spirit manifested in his controversies with Carlstadt and Erasmus. The latter, not without reason, he charged with worldliness and lukewarmness in a good cause. He viewed

Carlstadt as an open apostasy from the faith, and an act of ambitious jealousy.

Amidst these disputes and attacks, his plans for a total reformation in the church, which was called for by the voice of the nation, were matured. In 1523, at Wittenberg, he began to purify the liturgy from its empty forms, and, by laying aside his cowl, in 1524, he gave the signal for the abolition of the monasteries, and the better application of the goods of the church. In 1525, he married Catharine von Bora, a nun, who had left her convent. After overcoming numerous difficulties, he took this important step at the age of forty-two years, as much from principle as inclination, with the design of restoring the preachers of the gospel to their natural and social rights and duties. Warm as was the zeal of Luther for a reform in the church, he was desirous of avoiding disorder and violence. While he went hand in hand with the imperial cities and foreign princes, both in words and actions, he opposed, most decidedly, the violence of the peasantry and of the Anabaptists. His enemies have shown great injustice in implicating him as the author of those outrages which arose from the enthusiasm of the ignorant, and were displeasing to his noble and generous mind. Luther prepared, from 1526 to 1529, a new church service, corresponding to the doctrines of the gospel, under the patronage of the elector, and with the aid of Melancthon and other members of the Saxon church. His larger and smaller catechisms, to be used in schools, were also of great service. But every one must look with pain upon the severity and intolerance which he manifested towards the Swiss reformers, because their views differed from his own in regard to the Lord's supper. (See *Lord's Supper, and Sacrament.*) He was thus the chief cause of the separation which took place between the Calvinists and the Lutherans. But, without his inflexible firmness, in matters of faith, he would have been unequal to a work against which artifice and power had arrayed all their forces.

The rapidity with which the reformation advanced after the confession of Augsburg, in 1530, rendered the papal bulls and the imperial edicts against Luther inefficient. But he was obliged to be continually on his guard against the cunning Papists, who strove to make him give up some parts of his creed; and it required a firmness bordering on sternness and obstinacy to maintain the victory which he had won. With a spirit incident to such a state of things, Luther wrote, in 1537, the Smalcaldic articles; he gave a refusal to the ambassadors of Brandenburg and Anhalt, who were sent, in 1541, by the diet of Ratisbon, to make him more compliant towards the Catholics; and, in 1545, he refused any participation of his party in the council of Trent.

The severity which he used in the defence of his faith, by no means diminishes the merit of his constancy; and an apology may easily be found for the frequent rudeness of his expressions, in the prevailing mode of speaking and thinking; in the nature of his undertaking, which required continual contest; in the provocations by which he was perpetually assailed; in his frequent sickness; and in his excitable imagination. The same excitability of temperament will serve to explain those dreadful temptations of the devil, which disquieted him oftener than would seem compatible with his strength and vigour of mind; for that age regarded the devil as a real personage, an evil principle ever active; and, if any one devoted himself to the cause of God, he was constantly obliged to resist attacks of the evil one upon his virtue. He says himself, "I was born to fight with devils and factions. This is the reason that my books are so boisterous and stormy. It is my business to remove obstructions, to cut down thorns, to fill up quagmires, and to open

and make straight the paths; but, if I must, necessarily, have some failing, let me rather speak the truth with too great severity, than once to act the hypocrite and conceal the truth." Even the enemies of Luther are forced to confess that he always acted justly and honourably. No one can behold, without astonishment, his unwearied activity and zeal. The work of translating the Bible, which might well occupy a whole life, he completed from 1521 to 1534, and thus rendered his name immortal. He equalled the most prolific authors, in the number of his treatises on the most important doctrines of his creed. After the year 1512, he preached several times every week, and, at certain periods, every day; he officiated at the confessional and the altar; he carried on an extensive correspondence in Latin and German, on various subjects, with men of rank, and of distinguished literary attainments, and with his private friends; and, notwithstanding all this press of occupation, he allowed himself some hours every day for meditation and prayer, and was always accessible to visitors. He gave advice and assistance wherever it was needed; he interested himself for every indigent person who applied to him, and devoted himself, with his whole soul, to the pleasures of society. In company, he was always lively, and abounded in sallies of wit and good humour (preserved in his *Tischreden* [Table-Talk]); he was temperate in his enjoyments. Luther was no stranger to the elegant arts. His excellent hymns are well known. His fondness for music, too, was such, that, as often as circumstances permitted, he would relax his mind with singing, and playing on the flute and lute. But few men are equal to such excessive labour; and, with a weaker constitution, such a constant round of action, and vicissitude, and toil, would soon have overcome the great reformer. Indeed, from the year 1531, he had a painful disease (the stone, accompanied with vertigo) to contend with, and, in several fits of sickness, was brought near the grave; but he lived to the age of sixty-three. Just before his last journey to Eisleben, where he was summoned by the count of Mansfield to settle a dispute, he wrote, in a letter to a friend, the following description of his condition:—"Aged, worn out, weary, spiritless, and now blind of one eye, I long for a little rest and quietness; yet I have as much to do, in writing, and preaching, and acting, as if I had never written, or preached, or acted. I am weary of the world, and the world is weary of me; the parting will be easy, like that of the guest leaving the inn; I pray only, that God will be gracious to me in my last hour, and shall I quit the world without reluctance." He wrote this in January, 1546. On the 18th of the succeeding February, he died at Eisleben, and was buried in the castle-church of Wittenberg. He left a wife, whom he tenderly loved, and two children (two others having previously died), in straitened circumstances. His wife died in 1552. The male line of his posterity became extinct in Martin Gottlieb Luther, who was a counsellor at law, and died at Dresden, in 1759. Against his will, his adherents styled themselves Lutherans; against his will they engaged in a war which broke out immediately after his death and desolated Germany. As long as he lived, Luther was for peace; and he succeeded in maintaining it; he regarded it as impious to seek to establish the cause of God by force; and in fact, during thirty years of his life, the principles of the reformation gained a firmer footing, and were more widely propagated, by his unshaken faith and unwearied endeavours, than by all the wars, and treaties, and councils, since.

Luther's *Sammte Werke* (Complete Works) ap-

peared in 1826, at Erlangen, in 60 vols. Five different collections of his writings were published earlier, of which the most complete is that by Voss (24 vols., 4to). There is a life of Luther, by Schrockh, in his *Lebensbeschreibungen berühmter Männer* (Lives of distinguished Scholars), (part i. 1798). For further information, see the articles *Reformation* and *Protestants*. See also the *Life of Luther as an Account of the Reformation*, by A. R. Ludon, 1813), and the articles on *Calvin*, *Benedictus Erasmus*, *Zwinglius*; also Robertson's *Church* i and Mosheim's *Ecclesiastical History*.

LUTHERANS; the followers of the doctrine of Luther, though the reformer himself, in his writings, expresses his disapprobation of making it the name of a sect. In Spain, and some other countries, the name *Lutheran* is, in common language, almost synonymous with *heretic*. In Prussia (see *Lithurgy*); but, as far as church government is concerned, they are merely *Protestants*. They may have been the intention of their establishment. They are, however, neither *Lutherans* nor *Calvinists*, but evangelical. The Lutherans in Germany are bound to adhere, strictly, to all the doctrines of Luther, so great a freedom of opinion, on religious matters, having gained ground in that country. A few German Calvinists adhere to protestantism, but Lutherans adhere to consubstantiation, in the last supper. See *Luther*, and *Reformation*.

LUTHERN, in architecture; a kind of vault over the cornice in the roof of a building, serving to illuminate the upper story.

LUTZEN, a small town in the present Prussia, duchy of Saxony, to which two centuries have given historical renown, containing 1100 inhabitants, and belonging to the government of Meissen, lies eleven miles S. W. of Leipzig. Saxony shows why Saxony has so often been the theatre of battle between the powers of the north-east and the powers of the south-west of Europe. Here also have the plains of Leipzig and Lützen, the neighbourhood of Dresden and Bautzen, been the scene of conflict! The first battle of Lützen was fought in the thirty years' war, Nov. 6 (16th) 1632, between Gustavus Adolphus, king of Sweden, and Wallenstein, duke of Friedland. The imperial army, under the latter, amounted to 40,000 men, to Swedish troops, under Gustavus, to 27,000, whilst the Saxons under Bernard, duke of Saxe-Weimar, under the latter, amounted to 40,000 men. The battle was extremely obstinate, and neither party was decisively victorious during that day. Wallenstein began retrograde movements the next day. In his army, the famous general Peppel was mortally wounded, and soon after died. On the side of the Protestants, the hero of three campaigns, Gustavus Adolphus, fell. The circumstances of his death are uncertain; but it is a mistake to suppose that he fell a victim to revenge and treachery. His body was found, by the soldiers, in a mass of slain by Bernard, under a heap of dead, and so severely mutilated by the hoofs of horses, as to be recognized with difficulty. A plain stone marks this spot, as far from Lützen, on the great road to Leipzig; a few poplars and some stone seats surround it. His body was carried to Lützen, where traces of the blood are still shown, in the town house. See *Continental*, and *Thirty Years' War*.

A second battle, fought near Lützen, May 2, 1806, between Napoleon and the combined Russians and Prussians, was the first great conflict after Napoleon's disasters in Russia; and on this occasion, the joint French and Prussian forces lost more than 100,000 men.

strength. Several reasons induced the allies to attack Napoleon, though his army, according to the best calculations, was much superior in numbers. The French corps in Saxony amounted to about 150,000 men; the allies had 55,000 Prussians and 30,000 Russians beyond the Elbe. The latter were superior in cavalry, the French in artillery, and each was desirous to decide by the species of troops in which his superiority consisted. Count Wittgenstein commanded the allied forces. Napoleon's troops were moving in the direction of Leipsic, and had already advanced considerably, while they were still supposed by the enemy to be near Lutzen. General Kleist became engaged in a sharp conflict with the French van, which was much superior to him in numbers. The mass of the enemy was thus directed against the flank and rear of the allies. Between the allies and Lutzen lay the villages Stariedel, Kaya, Rana, Gorschen, hardly guarded by Ney's corps, which was quietly bivouacked behind them. Wittgenstein took this corps for Napoleon's van, and ordered the attack accordingly. The Russian troops took these villages with great promptness. It was necessary that Ney should sustain himself until Napoleon could bring back his masses from the road to Leipsic. The possession of these villages was, therefore, warmly contested; they were taken and retaken with equal courage and obstinacy; but the successive arrival of new bodies of French caused some changes in Wittgenstein's orders; the allied cavalry could not operate so effectually as had been hoped, and the want of infantry soon to be felt severely. Both armies displayed great courage. The Prussian troops fought with a resolution corresponding to the ardour which had carried them into the field, and its effect became visible on the French centre, which did not escape Napoleon's experienced eye. "The key of the position," says the duke of Rovigo, "was the village of Kaya, occupied by Ney, and through which ran the road from Pegay to Lutzen. Had the allies succeeded in carrying this place, they could have advanced to Lutzen, and thus have divided the French army into two portions, which could only have been united on the other bank of the Saale. Great efforts were therefore made by the French to maintain Kaya, which was taken and retaken several times in the course of the day." The emperor Napoleon now ordered general Drouot, his aid-de-camp, to advance all haste, with sixty pieces of artillery, as near as possible to the enemy's columns, and to attack him suddenly, on his left flank; for this, the course of Flossgraben, which had also been used to great effect 200 years before, in the battle first described, offered an advantageous position. The artillery made such ravages in the enemy's columns, for the space of an hour, that he could not resist the vigorous attack which Napoleon renewed on Kaya, by means of marshal Mortier's corps. This village was at last carried, as well as the others: night came on, the last attempt by the Prussian cavalry was repulsed. Thus both armies occupied nearly the same ground after the battle as before. According to the most accurate and impartial accounts, there were about 69,000 of the allied troops engaged against 102,000 French. The latter are said to have killed 15,000 men, killed and wounded, among whom were five generals; the Russians are said to have killed 2000, and the Prussians 8000. Generals Blücher and Scharnhorst were wounded; the latter died of his wounds—a severe loss for the Prussians. The French had lost Bessières, duke of Istria, on the following day. The allies were obliged to make retrograde movements, and, owing to this battle, Napoleon was again master of Saxony and the Elbe

on May 10. The French say, that, had they possessed sufficient cavalry to pursue the enemy briskly, the campaign might have been ended by this battle; the allies assert, that had they been better supplied with artillery, they would have remained in possession of the villages, and the most serious consequences might have followed for the French. This battle had the best effect on the spirit of the Prussian troops and nation. It was the first in which the Prussian forces had measured themselves with the French since the disastrous campaign of 1806, and they were now convinced of their ability to withstand their former conquerors. The result of the battle was, indeed, advantageous for the French; but the advantage was so dearly bought, and the Prussians, whom the French troops had been taught to consider as "schoolboys," and inexperienced peasants, had conducted in such a manner as to show that campaigns like those of 1804, 1806, and 1809, were no longer to be expected.

**LUTZOW'S FREE CORPS, or VOLUNTEERS;** a Prussian corps, during the war of 1813 and 1814, which originated from the *Tugendbund*, and was commanded by major Lutzow. Many young men of the best families, and most patriotic spirit, joined it. Korner belonged to this corps, and celebrated it in several of his poems.

**LUXATION**, in surgery, is the removal of a bone out of its place or articulation, so as to impede or destroy its proper motion or office; hence luxations are peculiar to such bones as have moveable joints.

**LUXEMBOURG, PALACE OF;** one of the most magnificent palaces in Paris, built in imitation of the Pitti palace at Florence, completed in 1620, after four years' labour, by Jacques Desbrosses, for Mary of Medici, widow of Henry IV., on the site of the hotel of the duke d'Epinaux-Luxembourg, and successively inhabited by mademoiselle de Montpensier, the duchess de Guise, the duchess of Brunswick, and mademoiselle d'Orleans. Louis XVI. gave it to Monsieur, his brother; during the revolution, it was converted into a prison; it was afterwards occupied by the senate; at present, the chamber of peers assembles there. The building is very spacious, and its rooms contain beautiful specimens of architecture and statuary.

**LUXEMBOURG (*Hôtel du Petit*);** an edifice in Paris, adjoining the garden of the Luxembourg palace. It was built by cardinal Richelieu for his mother, and afterwards belonged to the prince de Condé. During the republic, the directory was established here, and here it received general Bonaparte, on his return from Egypt, a few days before the 18th of Brumaire. It was next occupied by the first consul, during the first six months of his consulship. Ney was confined here, and shot in the garden; and, more recently, prince Polignac, and his colleagues were confined here, previous to their trial.

**LUXEMBOURG** (Francis Henry de Montmorency), duke of, marshal of France, was born in 1628. He was the posthumous son of the count de Bouteville, who was beheaded in the reign of Louis XIII., for fighting a duel. He served, when young, under the prince of Condé; and, in 1662, he was made a duke and peer of France; and, in 1667, a lieutenant-general. In 1672, he commanded during the invasion of Holland; and, having gained the battle of Senef, in 1674, he was created a marshal of France. In the war of France against England, Holland, Spain, and Germany, he won the three great battles of Fleurus (July 1, 1690), Steinkirchen and Neerwinden (June 29, 1693). He died in 1695.

**LUXEMBURG;** a late province of the kingdom of the Netherlands, with the title of grand duchy,

and, at the same time, a member of the Germanic confederation, comprising the duchies of Luxemburg and of Bouillon, bounded by Liege, the Lower Rhine, Namur, and France. The superficial extent is about 2400 square miles, with 293,555 inhabitants. The surface is covered with woods, mountains, and desert heaths, among which, however, are some pleasant valleys and fertile hills. The Ardennes are the chief mountains. The soil is stony, marshy, and not very productive. The Moselle and the Ourthe are the principal rivers. Agriculture is the chief occupation of the people, but potatoes form the principal food, corn not being raised in sufficient quantities. The forests belonging to the state alone, extend over 117,971 hectares. Cattle are abundant; great flocks of sheep are reared on the plains of the Ardennes; the horses are small, but celebrated for their spirit and activity. The iron mines are extensively wrought, and the slate quarries yield large quantities of roof-slates. The inhabitants are Walloons and Germans, and are in general rude, superstitious, and ignorant. They are of the Roman Catholic religion. Till the late revolution, the king of the Netherlands, as grand duke of Luxemburg, was a member of the Germanic confederation, with one vote in the diet and three in the *plenum*, and furnished a contingent of 2256 men to the army of the confederacy. The Belgians have laid claim to Luxemburg. (See *Netherlands*.) As a province of the kingdom of the Netherlands, it sent four members to the lower house of the states-general. The provincial estates consist of sixty members, named by the three orders, that of the nobles, that of the cities, and that of the country. Luxemburg was erected into a duchy, by the German emperor, in 1354, and formed a part of the Austrian Netherlands. In 1815, it was granted to the king of the Netherlands, by the congress of Vienna, as an indemnification for his cessions in Germany. (See *Nassau*.) Luxemburg, the capital, with 11,430 inhabitants, is one of the strongest fortresses in Europe. The upper town is situated on an elevated rock, rising precipitously from a plain, and defended by strong works. Five batteries on the neighbouring heights command all the country round, and particularly the roads from Treves and Thionville. It is one of the four great fortresses reserved by the Germanic confederation, and garrisoned by a large body of German troops. Lat. 49° 37' N.; lon. 6° 9' E.; 27 leagues S.E. of Liege; 39 S.E. of Brussels.

**LUXOR**; a village of Upper Egypt, on the right bank of the Nile, containing splendid ruins of Thebes, the site of which it occupies. See *Thebes*.

**LUYNES**, CHARLES D'ALBERT, duke de, favourite and premier of Louis XIII. and constable of France, born in 1578, was descended from a noble Florentine family (Alberti), which had been banished from Florence. Having become one of the pages of Henry IV., he was the playmate of the dauphin, whose favour he soon won by consulting all his caprices. When Louis ascended the throne, he appointed Luynes his grand falconer, and marshal D'Ancre, who was all-powerful at court, showing some jealousy of his influence, the favourite soon effected his disgrace. The marshal was assassinated, and Luynes obtained a grant of all his immense estates, and succeeded to all his places and charges (1617). In 1619, his estate of Maille was erected into a duchy, under the title of Luynes. He next supplanted Mary of Medici, mother of the king, whom he caused to be exiled; and the whole administration was now in his hands. In 1621, the dignity of constable of France was revived for him. Though the feeble king often complained of his cupidity and arrogance, though the whole court

was intriguing against him, and the nation indignantly called for his disgrace, Luynes died in 1621, without having experienced any value less of favour or influence. See *Louis XIII.*

**LUZAC**, JOHN; a distinguished philosopher, jurist, and publicist, born at Leyden, in 1718. His parents were French Protestants, who had left France to avoid religious persecutions. After completing his studies, under Valckenner and Rabanin, he obtained the chair of jurisprudence offered him at Leyden, and that of Greek at Groningen, and went to the Hague to prepare himself for the law. In 1772, he returned to Leyden, to assist in editing the *Leyden Gazette*, which was read by all European scholars and statesmen at that time, in account of the valuable character of its materials. In 1775, he had almost the entire direction of the journal. His editorial and professional labours did not prevent him from the assiduous study of classical literature. He corresponded with the most distinguished personages of the time, and received the most flattering marks of esteem from Washington, Jefferson, Adams, the emperor Leopold, and Stanislaus, king of Poland. In the midst of these various occupations, he accepted the Greek chair at the university of Leyden, to the regular duties of which he added private lectures and exercises for drawing students. In 1795, he published an address to *Socrates Cive*, accompanied with learned and judicious notes, and dedicated to John Adams, whose eldest son had studied under his direction. During the revolutionary troubles which succeeded in the land, Luzac, who was no less a friend of order than of liberty, was forbidden to continue his course in history (1796), but was permitted to continue to instruct in Greek literature. He refused to accede to this arrangement, and was therefore entirely suspended from his professorial functions. On this occasion, Washington wrote to him, availing him of his esteem, encouraging him to bear true justice when the ferment of the moment seemed to over, and professing that America was under great obligations to the writings and conduct of one like him. In 1802, he was restored to his former post, with an increase of salary and power. He continued actively engaged in his literary labours till 1807, when he was killed by the explosion of a vessel with gunpowder aboard, in the harbour of Leyden. His *Lectures Attice*, a delivery of lectures (1809), was published by professor *Leide*. His colleague, professor Siegenbeck, has given an account of Luzac, in his history of the catastrophe which caused his death.

**LUZERNE**, ANNE CESAR DE LA; a French diplomatist, born at Paris, in 1741. After having served in the seven years' war, in which he rose to the rank of colonel, he abandoned the military career, and turning his views to diplomacy, was sent, in 1782, envoy extraordinary to Bavaria, and distinguished himself in the negotiations which took place in regard to the Bavarian succession. In 1783, he was appointed to succeed Gerard, as minister to the United States, and conducted himself during the years in which he remained there, with a profound wisdom, and concern for their interests, that gained him the esteem and affection of the Americans. In 1780, when the American army was in the most destitute condition, and the government without resources, he raised money on his own responsibility, and without waiting for orders from his court, to relieve the distress. He exerted himself to collect private subscriptions, and placed his own name at

\* The *Leyden Gazette* (*Gazette de Leyden*), was established in 1738, by the uncle and father of John.

the head. In 1783, he returned to France, having received the most flattering expressions of esteem from congress; and, in 1788, was sent ambassador to London, where he remained till his death, in 1791. When the federal government was organized, the secretary of state (Jefferson) addressed a letter to the chevalier De la Luzerne, by direction of Washington, for the purpose of making an express acknowledgment of his services, and the sense of them entertained by the nation.

**LYCANTHROPY** (from the Greek *λύκος* a wolf, and *άνθρωπος*, a man); as defined by Cottgrave, "a frenzy or melancholie, which causeth the patient who thinks he is turned woof to flee all company and hide himself in dens and corners." Herodotus, with great naïveté, tells us, that, when he was in Æthiopia, he heard of a people which once a year changed themselves into wolves, and then resumed their original shape; "but," adds he "they cannot make me believe such tales, although they not only tell them, but swear to them." But the lycanthropes of the middle ages, or *loup-garoux*, as they were called by the French, were sorcerers, who during their wolfhood, had a most cannibal appetite for human flesh. The Germans called them *Währwölfe*. Many marvellous stories are told by the writers of the middle ages, of these wolf-men, or *loup-garoux*, and numerous authentic narratives remain of victims committed to the flames for this imaginary crime, even on their own confessions.

**LYCEUM**; an academy at Athens, which derived its name from its situation near the temple of Apollo, *λύκος* (slayer of the wolf). In its covered walks, Aristotle explained his philosophy. In modern times, the name of *lyceum* has been given to the schools tended to prepare young men for the universities; and in them the Aristotelian philosophy was formerly taught in the scholastic form.

**LYCIA**; a maritime province of Asia Minor, bounded by Caria on the west, Pamphylia on the east, and Pisidia on the north. Its fertility and opulence are attested by the twenty-seven cities mentioned by Pliny, which formed a confederated republic, by a congress which regulated the public concerns, and a president called the *Lyciarch*. Little is known of the early history and geography of this country. See Beaufort's *Karamania*, London, 1817.

**LYCOPHRON**, born at Chalcis, in Eubœa, a Grecian grammarian, and the author of several tragedies, died at Alexandria, 280 years B. C., under Ptolemy Philadelphus, whose favour he won by the invention of anagrams. He is said to have died of a wound, inflicted by the arrow of an antagonist with whom he was contending on the merits of the ancient poets. Of all his writings, there remains but one tragedy, *Andromeda* (Alexandra), which is written in iambics, and bears the marks of learning acquired by patient study; it is therefore very difficult, and filled with obscure allusions. It is, properly speaking, a continued soliloquy, in which Cassandra predicts the fall of Troy, and the fate of all the heroes and heroines who shared its ruin. It affords some information of value respecting antiquities and mythology. A commentary, named John Tzetzes, has written a commentary upon it.—See the edition, *cum Commentariis Johannis Tzetze, Cura Jo. Potteri* (Oxford, 17 and 1702, folio); also those by Reichard, with commentary of Canter (Leipsic, 1788), by Sebastiani (Rome, 1803), by C. G. Muller (Leipsic, 1811, 2 vols.)

**LYCURGUS**, the Spartan lawgiver, supposed to have flourished in the latter half of the ninth century B. C., was, according to the commonly received tradition, the youngest son of the Spartan king Euno-

mus. His eldest brother, Polydectes, succeeded his father in the government, but died soon after, leaving the kingdom to Lycurgus. As the widow of Polydectes was known to be pregnant, Lycurgus declared that, if she bore a son, he would be the first to acknowledge him for his king. To convince the Lacedæmonians of his sincerity, he laid aside the royal title, and administered the kingdom as guardian to the future heir. In the mean while, the queen sent word to him, that, if he would marry her, she would without delay cause the death of her child. He flattered her with the idea that he would comply with her wishes, until he obtained possession of the child. From the joy of the people at his birth, the child received the name of *Charilaus* (joy of the people). Lycurgus, by the wisdom of his administration, had already won general esteem; and his noble disinterestedness now raised his glory to a height which awoke envy against him in the minds of some of the most distinguished Spartans, with whom the queen conspired to revenge her disappointment. She spread among her people the opinion, that it was dangerous to intrust the future heir of the throne to the man who would gain most by his death. To avoid this suspicion, Lycurgus was obliged not only to resign the guardianship of the young king, but even to leave his country. Whether this resolution was partly induced by the desire of seeing foreign nations, and learning their manners, or not, we do not know; but, at any rate, he is described as employing the time of his absence in this way. After visiting Crete, and admiring the wise laws of Minos, he went to Ionia. The effeminate and luxurious life of the inhabitants, the feebleness of their laws, which formed a striking contrast with the simplicity and vigour of those of Crete, made a deep impression upon him. Here, however, he is said to have become acquainted with the poems of Homer. From hence he is said to have travelled into various countries, including Egypt, India, and Spain. But, as we do not find in his laws any traces of Indian or Egyptian wisdom, this seems to be doubtful.

In the mean while, the two kings, Archelaus, and Charilaus, were esteemed neither by the people nor by the nobility; and, as there were no laws sufficient to maintain the public tranquillity, the confusion passed all bounds. In this dangerous situation, Lycurgus was the only man from whom help and deliverance could be expected. The people hoped from him protection against the nobles, and the kings believed that he would put an end to the disobedience of the people. More than once, ambassadors were sent to beg him to come to the assistance of the state. He long resisted, but at last yielded to the urgent wishes of his fellow-citizens. At his arrival in Sparta, he soon found that not only particular abuses were to be suppressed, but that it would be necessary to form an entirely new constitution. The esteem which his personal character, his judgment, and the dangerous situation of the state, gave him among his fellow-citizens, encouraged him to encounter boldly all obstacles. The first step which he took was, to add to the kings a *gerousia*, or senate of twenty-eight persons, venerable for their age (see *Gerontes*), without whose consent the kings were to undertake nothing. He thus effected a useful balance between the power of the kings and the licentiousness of the people. The people, at the same time, obtained the privilege of giving their voice in public affairs. They had not, however, properly speaking, deliberative privileges, but only the limited right of accepting or of rejecting what was proposed by the kings or the senate. The Spartans conformed in general to the institutions of Lycurgus; but the equal division of property excited among the rich such violent commotions, that the

lawgiver, to save his life, fled towards a temple. On the way, he received a blow, which struck out one of his eyes. He merely turned round, and showed to his pursuers his face streaming with blood. This sight filled all with shame and repentance; they implored his pardon, and led him respectfully home. The person who had done the deed, a young man of rank, and of a fiery character, was given up to him. Lycurgus pardoned him, and dismissed him covered with shame.

After having thus formed a constitution for Sparta, Lycurgus endeavoured to provide for its continuance. He made all the citizens take a solemn oath, that they would change nothing in the laws which he had introduced, before his return. He then went to Delphi, and asked the god whether the new laws were sufficient for the happiness of Sparta. The answer was, "Sparta will remain the most prosperous of all states as long as it observes these laws." He sent this answer to Lacedæmon, and banished himself. He died, as it is said, of voluntary starvation, far from his country; according to some, at Cirrha; according to others, at Elis or Crete. According to his commands, his body was burned, and the ashes thrown into the sea, lest they should be carried to Sparta, and the people thus think themselves released from their oath. A temple was erected in honour of him at Sparta, and a society was instituted by his friends, which continued until the latest times of Sparta, and had for its object to celebrate the memory of his virtues.

The principal object of the laws of Lycurgus was, to introduce into his country a mixed form of government, composed of monarchy, aristocracy and democracy, in such a manner that each element was restrained by the others. The two kings, and with them the council of Gerontes, stood at the head of the government; the people, however, having an indirect influence upon their measures. He divided all the inhabitants of Sparta into three, according to some into six or more classes, subdivided into thirty tribes. With this was, probably, connected the administration of the police and of justice, and the rules of military service. As the Spartans had already made some progress in civilisation, we may well admire the resolution and the genius of Lycurgus, who was able to change not only their civil relations, but their morals and manners, and to induce such a nation to sacrifice even the comforts of life. Even his proposition of the equal division of property, which at first was violently opposed, was still accepted as a law by all the citizens. At the time when Lycurgus altered the constitution, there existed three classes—the ruling Spartans, the tributary Lacedæmonians, and the Helot slaves. (See *Helots*.) Though it appears cruel in him to have left the Helots in slavery, this was not shocking in the eyes of the Greeks. They had no idea of the injustice of such a distinction between men. Lycurgus sought to use, in the way which he thought most for the good of the state, the bonds which nature, relationship, and love form among men. He treated love only as a means of producing vigorous citizens for the state, and thus preserving national independence. He appointed punishments for unmarried men, and for those who married too late, or married persons of a very unequal age. He made it difficult for those who were newly married to meet their wives, that their passions might remain unabated; and he allowed old or impotent men to lend their wives to vigorous youths, and men of a sound constitution, if their wives were weak and impotent, to take others. Children were not the property of the parents, but of the state. The state determined on their life or death, and directed their education without regard to the parents. To intro-

duce temperance and moderation among the people he ordered that the houses should be built in the most simple manner, and that all should eat the same meals in public, affixing also severe penalties to debauchery and drunkenness. No foreigner could remain in Sparta longer than was necessary; no Spartan, except in times of war, could leave the country. The people were allowed to possess neither gold nor silver; but iron was used for money. The Spartans were never to devote themselves to the sciences, but only to learn the most indispensable branches of knowledge; they were not to leave their arms or to perfect their music; they could have many slaves, neither artists nor orators without the consent of the government. Lycurgus made no change in the religious constitution of Sparta; he used it, on the contrary, for his political ends, and united the sacred priestly dignity with the royal office. He ordered a simple burial for the dead, forbade all public manifestations, and limited private mourning to eleven days. He allowed, however, the dead to be buried in the city, and monuments to be erected to them in the temples, in order that the hope of obtaining such honours after death might lessen the fear of losing it. With regard to the administration of justice he gave but few laws; but these were sufficient, if the other laws were obeyed. The quarrels which arose were decided either by the kings, or by the *gerontes* of the people, or by the *gerousia*, or, more generally, by impartial and equitable citizens. One of the most remarkable institutions of Lycurgus, was the military education of the Spartan youth, which was such as to destroy all sensibility to suffering, and to overcome the fear of death. The beginning of a war was to them the beginning of a festival, and the camp was a place of recreation, for here ceased all that business of life which was observed at home; even the bodily exercises were less frequent. Victory or death was their highest glory; eternal shame followed the cowards and those who fled. The courage of the Spartans was maintained, also, by their laws which forbade them to surround their city with walls, to fight often with the same enemy, to pursue the routed enemy, to plunder the dead enemy, and also by the solemn burial of their heroes, the monuments to their memory, the funeral and trophies to their honour. Nevertheless, Lycurgus did not intend that the Spartans should become a conquering nation, as is evident from his forbidding them a navy.

The institutions of Lycurgus have been blamed as much as they have been praised. Plutarch, in particular, accuses them of destroying every thing beautiful, and making mechanical valour the highest virtue, and thinks that this suppression of all the feelings of humanity was the cause of the countless evils which fell upon Lacedæmon, and were prepared by them for other nations. Thucydides makes Pericles say, that the virtue of the Spartans is more, and more cruelly upon fear, and that their education made them cruel and inhuman.

We have here given the commonly received opinions concerning Lycurgus and his institutions, which, however, must be received with much caution. If there were such an individual—his existence is doubtful,—he lived before the time of historical certainty; and what are called his laws, were probably the usages and institutions which were common to the whole Doric race from the earliest period. A very full and critical examination of the subject may be found in Muller's *Journal de la Dorie*, which has been translated into English, under the title of the *History and Antiquities of the Doric Race* (2 vols, 8vo, London, 1833).

Lycurgus was also the name of an *Athenian* of some celebrity. He was a contemporary of Pericles.

thenes, whom he survived, and was famous for his integrity. Only one of his orations, distinguished for strength and dignity, has been preserved to us. The latest editions are those of Heinrich, Osann and Becker, all of 1821.

LYDIA (in ancient times, *Maonia*); a large and fertile country of Asia Minor. The Ionians inhabited the part on the coast of the Ionian sea. Towards the south, it was separated from Caria by the Mæander (now Meander); towards the east, it was bounded by Ilyria, and on the north by Mysia. It was, in early times, a celebrated kingdom, divided from Persia by the river Halys (now Kizil Ernak). Cyrus conquered Croesus, the last Lydian king. The people, especially under this king, were the richest, and, perhaps, also, the most effeminate and luxurious in Asia. The Lydians invented luxurious garments, costly carpets, precious ointments, and exquisite arts; and a kind of Grecian music, which was said to bear the character of effeminacy, was called the *lydian*. They also laid out beautiful gardens. They first discovered the secret of communicating opotence to men, that they might use them to ward their wives and concubines. In the time of Herodotus, the corruption of manners among the Lydians was already so great, that the women publicly sold their charms. Their example corrupted also the Ionians. The wealth of the Lydians, however, was probably, in a great measure, confined to the kings and chief men. These could fill their coffers with the gold washed down by the Hermus (now Sarabat) and the Pactolus, and that obtained from the mines; and they procured all the necessities of life by the labour of their slaves, whose services they required, not with money, but with the products of the soil. They could thus accumulate the precious metals. Croesus was richer than all his predecessors, for he subjected the whole coast of other Asia, and plundered all the commercial cities. Though it cannot be proved that the Lydians had, in ancient times, any considerable commerce, it cannot be denied that they had, long before the Greeks, attained a certain degree of civilisation, and that the Grecian colonies in Lower Asia owed to the Lydians their superiority over the mother country in the arts and sciences. Among other things, they owed to them the invention of gold and silver coins, the use of certain musical instruments, the art of spinning wool (which was afterwards carried to such perfection in Miletus), also the art of melting and working ore, and, perhaps, the first rudiments of painting and of sculpture. At Sardis, the capital of the country, the Grecians, Phrygians, and even the nomadic tribes, bartered their goods. There was a great market for the slave-trade, which furnished the harems of Persia with eunuchs. Lydia belongs to the Turkish district of Natolia (Anatolia). See Clarke's and Chandler's *Travels*.

LYDIAT, THOMAS; a learned English divine, mathematician, and chronologer of the seventeenth century, who composed several learned works, some of which he was prevented from publishing by his pecuniary embarrassments, which were occasioned by his having become security for another person's debts, and subjected him to imprisonment. He afterwards suffered greatly for his attachment to the royal cause, in the civil wars, and died in obscurity and indigence, in 1646.

LYDUS. John Laurentius, commonly called *lydus*, from the province in which he was born (D. 490), lived at Constantinople, where he held several offices of trust under Justinian. He is principally known by his work *De Magistratibus Reipublice Romanæ*, which was printed, for the first time, in 1812, from a manuscript, obtained in 1785,

by Choiseul-Gouffier, French ambassador at Constantinople. It was edited, with a learned commentary on the life and writings of Lydus, by M. Hase. Niebuhr calls it a new and rich source of Roman history. His other works are on the Months (in Greek), of which we have only fragments, and on Omens (in Greek), of which some fragments only were before known, but nearly the whole of which is contained in the manuscript of Choiseul.

LYING-TO; the situation of a ship when she is retarded in her course by arranging the sails in such a manner that they counteract each other with nearly equal effect, and render the ship almost stationary with respect to her head-way. A ship is usually brought-to by laying either her main-top-sail or fore-top-sail aback, the helm being put close down to leeward. This is particularly practised in a general engagement, when the hostile fleets are drawn up to battle.

LYMPH (*lymphe*); an aqueous liquid, colourless, insipid, and diaphanous, diffused through the whole animal economy, in vessels called *lymphatics*. If allowed to stand, it separates into two parts, like the blood—a serous fluid, and a solid, or clot. The lymph serves to repair losses of the blood, by bringing to it various materials from different parts of the system, and chyle, which is mixed with the lymph in the thoracic duct. It seems also to remove those elements of nutrition, whose place is to be supplied by others, and to transmit them to the surface. The uses and history of lymph, however, are yet imperfectly known. The lymphatic vessels were not known till towards the middle of the seventeenth century. They are small, thin, transparent, furnished with valves, like the veins, and spread through different parts and organs. The cause of the circulation of the lymph is unknown, as there does not appear to be any impelling organ analogous to the heart. It has been supposed that the absorbent power exercised at their mouths impels the liquid forward, that already absorbed being thus displaced by the new absorptions. These vessels arise in every part of the body, and terminate in the thoracic duct.

LYNCEUS. See *Danaïdes*.

LYNX. This name has been applied to most of the cats with short tails: several species were formerly confounded by Linnæus under this head, and there is still much confusion respecting them. The largest and most beautiful, the *Felis cervaria*, is found in Asia and Russia. The lynx of Europe, the *F. lynx*, has become rare, except in the Pyrenees, and part of the Apennines. This animal is about three feet long, and is very destructive to the smaller quadrupeds. It was celebrated, among the ancients, as having been harnessed to the car of Bacchus, in his conquest of India. They also attributed great quickness of sight to it, and feigned that its urine was converted into a precious stone. The skin of the male is spotted, and is more valuable in winter than in summer. The caracal (*F. caracal*) is somewhat larger than a fox, and derives its name from the black colour of its ears, the word *caracal* signifying black in the Turkish language. There are several species of these animals in North America, the best known of which is the Northern or Canada lynx (*F. Canadensis*). Pennant considered it as identical with the lynx of the old world; Geoffroy St Hilaire named it as a distinct species, and Temminck has again, under the name of *F. borealis*, described the species as the same in both hemispheres. It is known by the name of *loup-cervier*, and *le chat*, among the French Canadians. It is found in great abundance in the districts about Hudson's bay, from whence seven to nine thousand skins are annually

exported. It is a timid creature, incapable of attacking the larger quadrupeds, but very destructive to rabbits and hares, on which it chiefly preys. It makes but little resistance when brought to bay by a hunter; for though, like a cat, it spits, and erects the hair on its back, it is easily destroyed by a blow with a slender stick. It is about three feet long from the tip of its nose to the end of its tail, which is about six inches in length, with a black tip. Its large paws, slender loins, and long, but thick hind legs, with large buttocks, scarcely relieved by a short, thick tail, give it a clumsy and awkward appearance. Its gait is by bounds, straight forward, with the back a little arched, and lighting on all the feet at once. It swims well, and will cross the arm of a lake of two miles in width, but is not swift on land. Its flesh is eaten, being fat, white, and somewhat resembling the rabbit in flavour. It breeds once a year, having two young at a time. The other American species are *F. rufa* and *F. fasciata*, both of which are smaller than the preceding. The former occurs in the Atlantic states as well as to the north and west; the latter appears to be confined to the borders of plains, and the woody country in the vicinity of the Pacific.

**LYONNAIS**; a ci-devant province in the eastern part of France, of which Lyons was the capital. It consisted of Lyonnais Proper, Beaujolais, and Forez. It now forms the departments of the Rhone and the Loire. See *Department*.

**LYONNET, PETER**, a celebrated naturalist, born in 1707, at Maestricht, graduated at Utrecht, and was for some time a counsellor at the Hague. He afterwards became secretary, and Latin and French interpreter to the states of Holland. This situation occupying but little of his time, he employed himself in researches into the natural history of insects and other animals, particularly such as were to be found in the vicinity of the Hague. He formed a valuable collection of shells, and was admitted into many of the principal scientific societies in Europe. His death took place January 10, 1789. His most important production is entitled *Traité anatomique de la Chenille qui ronge le Bois de Saule* (1760, 4to)—a work no less remarkable for originality of design than for splendour of execution. Lyonnet was distinguished for his skill as a painter and engraver, and he displayed much ingenuity in improving microscopes, and other instruments used in making his observations.

**LYONS**, or properly, **LYON** (*Lugdunum*); the second city of France, situated on the Rhone and Saone, ninety-three leagues S. E. of Paris, and sixty-three N. W. of Marseilles; an archiepiscopal see; capital of the department of the Rhone; headquarters of a military division; and seat of numerous administrative and judicial authorities; lat. 45° 46' N.; lon. 4° 49' E.; population, including the suburbs, in 1828, 185,723. Three bridges cross the Rhone, which is here about 650 feet wide, and often occasions great destruction by its inundations, as was the case particularly in 1812 and 1825. The Saone, which is 480 feet wide, is crossed by six bridges. The rivers are lined with wharves, some of which are adorned with handsome buildings, thronged with boats of various descriptions, and resound with the hum of numerous mills and water-shops. The interior of the city presents the aspect of an old town, with narrow and dark streets, lined with houses seven or eight stories high, built solidly of stone. The pavements are pebbled, and there are no side-walks. Some of the streets, in the more modern quarters of the city, are more spacious and handsome. There are fifty-nine public squares, among which that of Louis le Grand, or Bellecour, one of the most magnificent in Europe, is adorned

with beautiful lime-trees, and an equestrian statue of Louis XIV. The monastic grounds and gardens have been mostly covered with buildings since the revolution. Among the principal buildings are the splendid *Hôtel de ville*, next to that of Amsterdam, the finest in Europe; the palace of commerce and the arts, connected with which are lecture-halls, where various courses of lectures are delivered; the vast prefect house, formerly a Dominican convent, with an extensive garden; the principal hospital, or *Hôtel Dieu*; the Gothic cathedral of St. John, &c. There are also numerous hospitals and churches, a *palais de justice*, and an extensive prison. The tower of Pitrat, erected on an elevation to the west of the city, for an observatory, fell down in 1823, and has since been reconstructed. Many antiquities have been found in the part of the city situated on the ancient *Forum Trajani*, and on the site of an imperial Roman palace. Medals, coins, vases, urns, lachrymatories, &c., with remains of aqueducts, a theatre, and Roman baths, are among the relics of antiquity. On the hill of Fourvières is a pagan cemetery, adorned with trees and handsome walks, laid out in 1806. Lyons contains one of the best libraries in France, consisting of 92,000 volumes. Among its scientific and useful institutions are a royal college, medical and theological schools, an academy of science, literature, and the arts, agricultural, Linnæan, medical, law, Bible, and other societies; a *mont de piété*, savings-bank, &c. The commerce and manufactures are extensive. Its most important article is silk, the manufacture of which are celebrated for their fineness and beauty; silk and woollen, and silk and cotton stuffs, beautiful shawls, crape, silk hose, gold and silver lace, &c., are among the products of her industry. A large proportion of all the silk raised in France, and great quantities imported from Italy, are wrought up here. The silk raised in the vicinity is remarkable for its whiteness. In 1828, the number of establishments for the manufacture of silk was within the walls 7140, and that of the towns 16000. Printing and the book trade, paper hangings, the manufacture of glass, jewels, artificial flowers, &c., give occupation to numerous hands. Lyons has an extensive transit trade of provisions for the southern cities, and of the oil and soap of Provence, and the wines of Languedoc, for the north. Numerous and extensive warehouses and docks facilitate the great commercial operations of this quarter of Eastern France. The Lyonnese are industrious, independent, acute, intelligent, and honest.

The time of the foundation of Lyons is uncertain. Augustus made it the capital of *Celtic Gaul*, which received the name of *Lugdunensis*. In the reign of Nero, it was burned to the ground. In the 5th century, the Burgundians made it their capital. In the twelfth century, the sect of Waldenses was founded by Peter de Vaud, a merchant of Lyons. Italian fugitives, who came to seek refuge from the rage of parties in their country, in the thirteenth century, brought with them their arts and wealth. Lyons suffered much during the religious wars of the sixteenth century, and was recovering from its ruins when the revolution of the eighteenth again visited it with desolation. The citizens having massacred the terrorists, in their municipal government, the Jacobin club (May 29, 1793), the convention sent an army of 60,000 men against the devoted city, which, after a brave resistance of sixty-three days, was taken. Collet d'Herbois and Coustou ordered the guillotine, on permanent, and, decorated with this slow method of execution, massacred the citizens, in crowds, with grape-shot. The fortifications, and many buildings were demolished the same of Lyons

abolished, and that of Ville-Affranchie substituted for it. In 1614, it was the theatre of several bloody actions between the French and the allies. In 1834, serious political disturbances broke out at Lyons, which, after continuing for two or three days, were suppressed, with great severity, by military force.

LYONS, GULF OF (*Gallicus Sinus*); a bay of the Mediterranean, on the south-eastern coast of France, between lat. 42° 20' and 43° 35' N., and between lon. 3° and 6° 20' E. The principal ports on this gulf are Toulon, Marseilles, and Cette. It is now called, by the French writers, *Golfe du Lion*, the name being derived from the agitation of its waters. See *Lion, Gulf of*.

LYRE; the most ancient stringed instrument among the Egyptians and Greeks. The mythological tradition of the origin of the Egyptian lyre, the more ancient of the two, is curious. After an inundation of the Nile, a tortoise was left ashore among other animals; after its death, its flesh decayed, and some of the tendons were dried by the sun, so as to produce a sound when touched by Hermes, as he was walking on shore. He immediately made an instrument in imitation of it, and thus invented the lyre. This lyre, originally, had but three strings. The Greeks ascribed the invention of the lyre to their Hermes (Mercury), the son of Jupiter and Maia. (*Paus. v.*) But the Greeks also say, that Hermes first used the shell of a tortoise. According to others, Mercury merely improved the invention of the Egyptian. Diodorus tells us that Apollo felt so much repentance for his cruelty towards Marsyas, that he tore the strings from his cithern. The muses, after this, invented a tone, and Orpheus, Linus, and Thamyras, one each. These, being added to the three-stringed Egyptian lyre, gave rise to the heptachord, or seven-stringed lyre of the Greeks. The invention of the instrument has also been ascribed to each of its chief improvers. The Egyptian and Grecian lyres were, at first, strung with the sinews of animals. The number of the strings was at last increased to eleven. It was played with the *plectrum*, or lyre-stick, of ivory or polished wood, also with the fingers. The *re* was called by different names—*lyra*, *phorminx*, *cithara*, *barbitos*, *barbiton*, *cithara*. The body of the *re* was hollow, to increase the sound. Few objects are so graceful in form, and susceptible of such various application in the fine arts, as the lyre, which even yet used as a musical instrument. It is the emblem of Apollo, yet other deities also bear the *re*; and mythology mentions many gods, who distinguished themselves on this instrument. It was used by educated Greeks in general; and Themistocles having once declined playing when requested, was considered a person without cultivation. *Unmusical* (unmusical) signified an illiterate man. In the work of Doni, entitled *Lyra Barberina*, the various names of the lyre are collected in two large volumes. *Lyric* was, originally, what belongs to the lyre; was applied to songs sung to the lyre, odes, &c., and soon came to designate a species of poetry distinguished from dramatic poetry, which was accompanied by flutes. See *Lyrics*.

LYRICS. Lyric poetry is that species of poetry which the poet directly expresses his emotions. The predominance of feeling in lyric poetry is what chiefly distinguishes it from dramatic poetry, in which action and character, independent of the individualization of the poet, predominate; and from epic poetry, of which a series of actions and characters, contemplated and exhibited by the poet, is the characteristic. No definite limit can be readily drawn between such departments of the art. There may be lyrical passages in an epic, or a drama, when

opportunity is afforded to the poet to pour out his own excited and exalted feeling; but it is an irregularity, and a dangerous one. Poets of moderate talents, or little experience, are apt to burden the reader with themselves, unable to follow up the representation of life in a form not individually their own. Lyric poetry is more limited than the drama (q.v.), and the epic (q. v.) because feeling is limited to the present; but, on this account, it is more excited and stirring. From the nature of lyric poetry, it has flourished better at court than the dramatic and epic, both of which, like history, require liberty, because they must represent truly the character of man in his manifold strivings, which cannot be done but by viewing life impartially, and depicting it freely; whilst the lyric poet, in most of his highest efforts, aims to express his adoration, be it of a hero, or his mistress, or nature, or God; and this tone coincides very well with the adulation of courts. Hence, when the drama and epic have gone down with the decay of national independence and spirit, and genius, debarred from action, lives only in contemplation, lyric poetry continues, and not unfrequently even flourishes, because man always feels; admiration, love, and hatred cannot die. Even the slave may express in verse the accents of love or adulation; and religion, in all circumstances, is a never-failing spring of elevated feeling. We must not suppose, however, that every expression of feeling, in verse, deserves the name of a lyrical poem, although the mistake is a very common one, as the crowds of unledged aspirants to lyric honours testify. It is necessary that the feeling represented should be itself poetical, and not only worthy to be preserved, but accompanied by a variety of ideas, beauty of imagery, and an eloquent flow of language. One distinct feeling should predominate, giving tone to the whole: the feeling must be worthy of the subject which caused it, corresponding to the same both in degree and kind, and must be so exhibited as to give a living picture of the poet's mind; while, at the same time, what is merely individual and accidental must be excluded, so that the poet shall be truly the representative of his race, and awaken the sympathy of all. But this requires genius of a high order. From the nature of feeling results the limited range of lyric poetry, and the variety of style and rhythm, exhibited in almost numberless metres, the bold associations of ideas, and the peculiar imagery belonging to this species of poetry. The tone of lyric poetry is warmest if it expresses feeling called forth by present circumstances. It is more composed when it represents feelings which are past. The hymns of the ancients, the ode in general, the song and hymn, with which are connected several metrical forms of the Italians and Spaniards (sonnets, *canzoni*, &c.), belong to the former; the epigram, in the Greek sense of the term, the elegy, &c., to the latter. See the various articles, and *Lyre*.

LYSANDER; a Spartan general, who terminated the Peloponnesian war by the conquest of Athens, B. C. 404. With the activity, and ambition, and penetration of Themistocles, he united the pliancy and insinuating address of Alcibiades. He gained more easily, and retained longer the favour of the great and powerful, than Alcibiades did the hearts of women and of the multitude. He sacrificed the welfare of his country to his own ambition. He used every means to elevate his friends and ruin his enemies. Justice and truth to him were empty words. He used to say, that if one cannot accomplish his purposes in a lion's skin, he must put on the fox's. Force and fraud were his political instruments. In the court of Cyrus the Younger, where he resided a long time, he endured, without a mur-

mur, the haughtiness of the Asiatic satraps; and, soon after, he exhibited the same arrogance towards the Greeks. His hatred was implacable, and his revenge terrible. His ruling passion was ambition. He destroyed the powerful city of Athens, and conceived the plan of raising his country to the summit of greatness, at the same time, it was to be under his own rule. He used every means to accomplish this object; he collected a fleet, and repulsed the Athenians, who lost in the engagement fifty vessels. The glory of this victory he endeavoured to increase by intrigues. When, therefore, Callicratides, who succeeded him in the command, had been defeated by the Athenian Conon, in an engagement near Arginusæ, in which he lost his life, Lysander, contrary to the established custom of Sparta, was a second time appointed admiral of the fleet. He immediately sought the Athenian fleet, which was much superior to the Spartan; it lay at anchor before Ægospotamos. Only nine of the ships escaped the fury of his attack; one carried the news of the defeat to Athens; with the rest, Conon, the Athenian admiral, escaped to Evagoras, king of Cyprus. The remainder of the fleet fell into the hands of the Spartans, almost without resistance, and Lysander sailed with it into the port of Lampacus in triumph. He put to death the prisoners (3000), with their generals, because they had thrown from a rock the crews of two Corinthian vessels, and had determined to cut off the right hand of all the Peloponnesian prisoners. After this defeat, all the Athenian allies went over to the Spartans. In the cities and islands which had surrendered, he abolished the democratic government, and founded an oligarchy. With a fleet of 180 ships, he then surrounded Athens by sea, while Agis and Pausanias enclosed it with a powerful army on land. Famine at length compelled the Athenians to surrender. They lost their independence, and considered themselves happy that their city was not destroyed. An oligarchy of thirty tyrants was now established, which was administered with the most terrible cruelty. Lysander then returned to Lacedæmon, where his character was well understood; yet the splendour of his victories, his extraordinary liberality, and his apparent disinterestedness, gave him such an ascendancy that, in fact, if not in name, he was sovereign of all Greece. Contrary to the laws of Lycurgus, he brought into Sparta immense sums of money, and valuable treasures, and thus ruined the Spartan virtue. He now attempted to accomplish, by artifice, his long-conceived plan of destroying the constitution of his country, by admitting to the throne not only all the Heraclidæ, but all native Spartans, and, finally, assuming the sceptre himself. Apollo himself was said to have declared that, to secure the prosperity and happiness of Sparta, its worthiest citizens should sit upon the throne. But the moment that the fraud was said to have been committed in the temple at Delphi, one of the priests retracted his consent, from fear of the consequences, and frustrated the whole plot, although it was not discovered until after the death of Lysander, when the plan was found among his papers. He was killed in a battle, in the Boeotian war, in which he commanded the Spartan forces (B. C. 394). His memory was honoured in Sparta; for the nation, blind to his guilt, regarded him as a virtuous citizen, since he did not enrich himself, but lived always in great poverty. His life has been written by Plutarch.

LYSIAS; an Athenian orator, who flourished between the eightieth and hundredth Olympiads, about 458 B. C. His father, Cephalus, was likewise an orator, of whom Plato makes honourable mention in his Republic. Soon after his father's death, Lysias, then in the fifteenth year of his age, went to Thurium,

in Magna Græcia, to study philosophy and eloquence under Tisias and Nicias of Syracuse. Having settled in Thurium, he was employed in the government, but, on the defeat of the Athenians in Sicily, he was banished, with many of his countrymen. He returned to Athens; but the thirty tyrants banished him from that city, and he retired to Megara. After Athens had recovered its freedom, he exerted himself for the advantage of the city, and even sacrificed much of his property for the public welfare. Yet, notwithstanding his generosity, the rights of an Athenian citizen were never granted him. At last, he gave instruction in eloquence; but, finding himself surpassed by Theodorus, another teacher of oratory, he devoted his time to writing orations for others. He wrote more than 800, some say 600, orations: *oratio* however, were regarded as genuine. In these he excelled all the orators of his time; and has rarely been surpassed by succeeding orators. Dionysius praises the purity, clearness, conciseness, and elegance of his expression, the beautiful simplicity of his style, his knowledge of men, and his lively description of their peculiarities, and, above all, his unperfeitedness. His style is applauded as a perfect example of the simple Attic eloquence. The efforts of Lysias in panegyric, however, according to Dionysius, was unsuccessful; he strives to be magnificent and lofty but does not fully reach his object. None of these eulogies is extant, except the one entitled *Epitaphium*, and the genuineness of this is doubted; hence we cannot form an opinion of this class of his works. Only thirty-four of his orations have come down to our times: editions of them have been published by Taylor (London, 1739, 4to; and Cambridge 1749), Auger (Paris, 1783, 2 vols.), and Reiske (in the Collection of Greek Orators). John Gillies, the historian of Greece, translated the orations of Lysias on Isocrates, and accompanied his translation with an Account of their Lives, and a Discourse on the History and Manners of the Greeks (London, 1779).

LYSIMACHUS; son of Agathocles, a general and friend of Alexander, in the division of whom conquests he received a part of Thrace. The inhabitants stubbornly opposed his authority, and he was obliged to conquer the country. After that, he took the city of Lysimachia, on the Thracian Chersonese, assumed the royal title, like the other generals of Alexander, and formed a league with some of them against Antigonus, who had brought under his own power the territories conquered by Alexander in Asia. After the battle of Ipsus, in Phrygia (B. C. 301), which cost Antigonus his life and his crown, Lysimachus became master of Asia Minor, Cappadocia Proper, and all the provinces between the Taurus and the Antitaurus. He next made war on the nations on the borders of Thrace, and enlarged his territories by conquest. In attempting to subjugate the Getae, who lived beyond the Danube, he and himself fell into their hands. He was compelled to surrender, with his army, to the barbarians, who, with horrid cries, demanded his death. But their king treated him more generously than the ambitious Lysimachus dared to hope. He provided for his prisoners an entertainment in the manner of the Greeks, and left them their own splendid furniture and utensils; his own food, on the contrary, was mean, and his vessels were all made of clay or wood. After the meal was concluded, he asked the captive monarch whether the rude living of the Getae, or the splendid banquets of his own country, seemed to him most desirable, and advised him to make peace with a nation from whom so little was to be gained, returned him his power, admitted him to his friendship, and dismissed him without a ransom. The generous conduct made a deep impression on the Spartan

*conqueror*. He restored to the king of the Getæ the countries which he had gained beyond the Ister, and gave him his daughter in marriage. From this time, the power of Lysimachus became more and more extended, till his domestic relations involved him and his kingdom in ruin. Having put away his first wife, he married Arsinoë, a daughter of Ptolemy, who led him to commit many acts of folly, and even revealed upon him to murder Agathocles, his son by his first wife, in order to secure the succession to her own children. The virtues of Agathocles had gained him many powerful friends, who determined to take vengeance upon his weak and cruel father. They fled to Seleucus, and engaged him in a war against Lysimachus. Seleucus conquered all Asia Minor almost without a blow. A general battle was fought at Courpedium, in Phrygia, and, after a slight resistance, Lysimachus was totally defeated and slain, B. C. 282, in the seventy-fourth year of his age.

LYSIPPUS; a sculptor, who flourished in Sicily, about 330 B. C., in the time of Alexander the Great. Alexander would permit no one but Apelles to paint his portrait, and no one but Lysippus to make his statue. The statues of Lysippus were principally portraits. He was first a coppersmith, and afterwards devoted himself to sculpture. The painter Apollonius, whom he asked what master he should follow, told him to follow nature. His statues were wrought with much greater beauty and elegance than those of his predecessors. He made the body more slender; the head smaller; the hair more natural, flowing, and delicate; he avoided angularity, and endeavoured to give to every part more roundness and softness of outline. He used to say, he represented men as they appeared to his imagination, but his predecessors represented them as they really were. Even the minutest parts were laboured with the greatest care. It is not known whether he executed any marble statues, but many in bronze are still preserved. The most celebrated are, a man bathing himself in a bath (*Apoxyomenus*); several statues of Alexander, representing him in all the different stages of his life; a group of Satyrs, which is found at Athens; Alexander and his friends, a number of statues which were intended to bear an exact resemblance to the original; and a colossal piper at Tarentum. The first mentioned statue (*apoxyomenus*) was placed by Agrippa in front of the public baths at Rome. The emperor, Tiberius, having removed it to his palace, was compelled by

the populace to restore it to its original station. It has been supposed that the mutilated statue now at Rome, called the Torso, which was so much admired by Michael Angelo, is in fact the remaining portion of this very celebrated statue; although Winckelman considered it as being a fragment of a Hercules reposing after his labours.

LYTTLETON, GEORGE, lord, an elegant writer and historian, was the eldest son of Sir Thomas Lyttleton, baronet, of Hagley, in Worcestershire, where he was born in January, 1709. In his nineteenth year, he set out upon a tour to the continent, and, on his return, in 1730, was chosen member of parliament for Okehampton, and concurred in the measures of the opposition, led by Pitt and Pulteney. When Frederic, prince of Wales, formed a separate court, in 1737, he was appointed his secretary. On the expulsion of Walpole, he was appointed one of the lords of the treasury; but, although he spoke with elegance and fluency, his oratory wanted force, and he never attained the rank of a political leader. In early life, he had imbibed sceptical opinions; but, being subsequently led into a conviction of the divine origin of Christianity, he composed his well-known Dissertation on the Conversion of St Paul, first printed in 1747. About this time he lost his first wife, on whom he wrote the celebrated monody, and, in 1749, married a lady from whom, after a few years, he separated by mutual consent. In 1751, he succeeded his father in his title and ample estate, and, by his elegance and taste, rendered Hagley one of the most delightful residences in the kingdom. At the dissolution of the ministry, he was raised to the peerage by the title of baron Lyttleton, of Frankley, in the county of Worcester. From this time, he lived chiefly in literary retirement, and, in 1760, published his Dialogues of the Dead. The latter years of his life were chiefly occupied in his History of Henry II., which is the result of assiduous research, but too prolix. He died in August, 1773, in the sixty-fourth year of his age, leaving a son, who succeeded him in his titles, and, with great talents, became conspicuous for a conduct entirely opposite to that of his father. The poems of lord Lyttleton maintain a place among the collection of British poets, for their correct versification, and delicacy of sentiment, rather than for higher qualities. His miscellanies, in prose, also display good taste, and a cultivated mind. His works were first collected and printed, in 1774, 4to, and since in 8vo. See Johnson's *Lives of the Poets*.

## M

the thirteenth letter and the tenth consonant in the English alphabet, a labial, produced by a slight vibration with a compression of the lips. It is one of the liquids or semivowels, and was not therefore considered by the Romans a consonant; but, was faintly pronounced, rather as a rest between two syllables, than as an articulate letter (*Quint. ix. 4*), which explains why it was subject to elision. 1. It is one of the first letters which children learn to pronounce, in connexion with the easy vowel *a*. (See

2. It passes easily into other letters, losing *f* in the preceding or succeeding letters—a circumstance which the etymologist must bear in mind, seeking the derivation or connexion of words hav-

ing an *m* in their root; thus, for instance, the German *Wange* (cheek) is the ancient *Mangon*, and the middle Latin gives *hombarius* as well as *hobarius*. The Italians use *o* for the Latin *um*, at the end of words. We even find the *m* suppressed at the end of words, on some ancient medals and inscriptions; thus, on the medals of the Æmilian and Plautian families, we find PREIVERNV. CAPTV.; on others, AVGVSTORV. If the *m* is fully pronounced, the sound passes partly through the nose, as is also the case with *n*. Hence, in French, it is nasal at the end of a word, as in *parfum*, *faim*, some foreign words excepted, as *Abraham*, *Jerusalem*. The *mem* of the Hebrews, as a numeral, signified forty; the

same was the case with the Greek  $\mu'$ ;  $\mu$ , however (characterized by the stroke before it) signified 40,000. In Latin it signified 1000; the original designation of this number was double D or (CIC), which gradually became an M. MM denotes 2000, and  $\overline{M}$  1,000,000, or a thousand thousand. In numismatics, M stands for a great number of words; for Macedonia, as LEG. M. XX. *Legio Macedonica Vicesima*; Malea, *Massilia*, *Mamertini*, and many other places or countries; for *Marcus*, *Manlius*, *Marcellus*, and other names; for *magnus*, *militaris*, *menses*, *mater*, *magister*, &c.; EQ. M. for *equitum magister*. M. D. signifies *medicinæ doctor* (doctor of medicine); A. M. *artium magister* (master of arts); MS. *manu scriptum* (manuscript); MSS. (manuscripts). D. O. M. signifies *Deo optimo maximo* (To the best and greatest God, or, To the Most High). On tombs, D. M. S. means *Dis Manibus Sacrum*. M stands for noon, from the Latin *meridies*. Hence P. M. *post meridiem* (afternoon). A. M. *ante meridiem* (forenoon). In medicine, it signifies *misce or misceatur* (mix); also *manipulus* (a handful). On modern coins, it signifies—1. the mint of Toulouse; 2. with a small o over it, Mexico; 3. with a crown, Madrid. M, in French, often stands for *Monsieur*; MM. for *Messieurs*. In music, it is used for the Italian words *meno* (less), *mano* (hand), *mezzo* and *moderato* (moderate). M' stands, in Scotch and Irish names, for *Mac*. M is likewise used by printers for the unit of measure of printed matter. Types of the same fount have bodies of equal thickness in one direction, and the square of this dimension is used in determining the amount of printed matter in a given space, as a page for instance, and is termed an m.

MAB; the queen of the fairies, so fancifully described by the sportive imagination of Shakspeare, in *Romeo and Juliet*. Chaucer speaks of a king and queen of Faerie, but seems to attribute the royal dignity to Proserpine and Pluto. The origin of the more amiable Oberon and Titania or Mab (if they are not the same) is uncertain. Poole, in his *Parnassus* (1657), thus describes the Fairy court: Oberon, the emperor; Mab (*amabilis*), the empress; Periwiggin, Puck, Hobgoblin, Tom Thumb, &c., courtiers; Hop, Mop, Drop, Tib, Tit, Tin, Tick, Pip, Trip, Skip, &c., &c., maids of honour; Nymphidia, mother of the maids. Puck is the emperor's jester. Dryden's *Nymphidia*, and the *Midsummer Night's Dream*, are delightful illustrations of the antiquities of queen Mab's empire.

MABILLON, JOHN, a learned French Benedictine of the congregation of St Maur, a writer on ecclesiastical antiquities and diplomatics, was born in 1632, in Champagne, and studied at the college of Rheims. He took the monastic vows in 1654, and, in 1660, was ordained a priest. After having assisted father D'Acheri, in his *Spicilegium*, he edited the works of St Bernard; and, in 1668, published the first volume of the *Acta Sanctorum Ordinis S. Benedicti*, of which the ninth and last volume appeared in 1702. One of his most important productions is his treatise *De Re Diplomatica*, Lib. vi. (1681, folio). This procured him the patronage of the French ministry. He was sent to Italy, with a commission from the king, to make a literary collection; and, returning to France with books and MSS. for the royal library, he published an account of his journey, &c., under the title of *Musæum Italicum* (1687, 2 vols., 4to). In 1701, he was chosen a member of the academy of inscriptions, and, in that year, began to publish his *Annales Ordinis S. Benedicti*, four volumes of which appeared previously to his death, in 1707. Father Mabillon was the author of many other works of research, distinguished for

liberality of sentiment and freedom of opinion, as well as for profound learning.

MABLY, GABRIEL BONNOT DE, a French jurist and historical writer, was born at Arvieux, in Savoy, and died at Paris, 1785. He was educated by the Jesuits at Lyons, but as soon as he was at liberty to follow his inclination, he abandoned those studies for Thucydides, Plutarch, and Luc. The young abbe now went to Paris, where he was favourably received by madame De Tenac, one of the cardinal, to whom he was related, and on whom published his *Parallèle des Romains et des Français* (1740), which was received with applause and obtained him the patronage of cardinal Tencin. This minister employed Mably to write his memoirs and reports; and it was from his memoirs that he himself, for the use of the cardinal, then prepared his *Droit public de l'Europe jusqu'en 1713*. He was appointed, in 1763, to be at the secret negotiations with the Prussian ambassador at Paris, with whom he concluded a treaty against Austria. The instructions of the French minister at the congress of Brede (1746) were drawn up by him. Notwithstanding this prospect of success in politics, a misunderstanding with the court induced him to retire from affairs, and devote himself to study. The tone of his subsequent productions is somewhat different from that of his first. Among them are *Observations sur l'histoire de la Grèce*; *Observations sur les Romains* (1771); *Entretiens de Phocion* (in which he gives us a view of virtue, patriotism, and the modern signs of the state and the citizens towards each other); *Observations sur l'Histoire de France* (1772); and *Entretiens sur l'Histoire*. His other works appeared at Paris, in 1794, 15 vols. His style is easy, pure, often elegant, but with a views often partake of the asperity of his subject.

MABUSE, or MAUHEUZE, JACQUES, an artist, was born at Maubeuse, a village of France, in 1492, and studied the works of the great masters in Italy. His habits were so disengaged that he had patience, fidelity, and beauty with which his pictures were executed, were doubly remarkable. He painted a great altar-piece, representing the descent from the cross, for a church in Middleburg. But the church and the picture were destroyed by lightning. Another descent from the cross, by him, is said to be in Middleburg. His irregularity occasioned his imprisonment in this place; and, during his confinement, he painted several fine pieces, which are lost. He afterwards came to England, and painted several pictures in the reign of James II. Several excellent works of his are at Middleburg; the best of which is the altar-piece, representing the descent from the cross. Having received a piece of rich brocade, in order to appear before emperor Charles V., he sold it as a tapestry, and painted a paper suit so exceedingly like a real one, that the emperor could not be convinced of the deception until he examined it with his own hands. He died in 1562.

MACABER; according to some, an early Greek poet, author of a work entitled the *Dance of Death*, or the Dance of Macaber, consisting of a series of dialogues between Death and a number of various ages belonging to various ranks of society. We suppose the word merely a corruption of the Hebrew *magbarah*, a cemetery. (See *Dance of Death*.) English translations of these dialogues were published by Dugdale and Dodsworth, in the third volume of the *Monasticon Anglicanum*; and French and Latin versions have been repeatedly printed.

MACAO, China, in Quantonian: lat. 22° 13' N. This town is built on a point

islands, or rather on a small island, which has an area of 106 square miles, and contains 33,800 inhabitants. It is the only European settlement in China, and was ceded to the Portuguese in 1580. (See *India, Portuguese*.) The Portuguese fortified the place, and surrounded it with strong walls. Macao has a Portuguese governor, and a Chinese mandarin; and the English and other nations have factories here. The houses are of stone, built after the European manner; but they are low, and make little show. The city is defended by three forts, built upon eminences; its works are good, and well planted with artillery. It was formerly a place of the greatest importance, being the centre of the trade of the Portuguese in the eastern part of Asia. Since the decline of the Portuguese trade, the town has sunk into a place of comparatively little importance. In the garden of the English factory is shown a cave, called the *grotto of Camoens*, in which he is said to have composed the *Lusiad*.

MACARTHY, SIR CHARLES, an Irish officer, who commanded at Cape Coast, in 1821. Whilst making preparations to repel the Ashantees, the king sent his compliments to him, and said he hoped to have his head, as an ornament to his great war-drum. In 1823, Sir Charles marched against the Ashantees, with a mixed force of Europeans and blacks, the latter of whom ran away, and the whites being defeated, their commander was captured by the victor, who ferociously realized his menace, January 21, 1824. In a subsequent battle, the Ashantees were entirely defeated, and this barbarous trophy was recovered and conveyed to the relations of Sir Charles.

MACARTNEY, GEORGE (earl Macartney), the son of a gentleman of Scottish descent, was born in Ireland, in 1737, and educated at Trinity college, Dublin; after which he became a student of the Temple. In 1764, he was appointed envoy extraordinary to Russia, afterwards became secretary to the lord-lieutenant of Ireland, and was created knight of the Bath. In 1775, he was made captain-general and governor of the Caribbee islands, Grenada, the Grenadines and Tobago. Grenada was invaded and taken by the French, and the governor was sent a prisoner to France. On his return to England, he was appointed to the presidency of Madras, having previously received an Irish peerage. On his embassy to China, in 1792, he behaved with great address, and succeeded in the chief object of his mission. His only subsequent public situation was that of governor of the cape of Good Hope, whence he returned, on account of ill health, in 1797. He died March 31, 1806. His English earldom was bestowed on him for his services in China. Lord Macartney was the author of a *Journal of his Chinese Embassy*, and other publications. See Staunton's *Embassy to China*, and Barrow's *Life of Lord Macartney*.

MACASSAR; a city of Celebes, on the south-east coast, capital of a kingdom called *Macassar*. *Bony*; lon. 119° 50' E.; lat. 5° 10' S.; population, according to Hassel, 100,000. This town is the chief settlement of the Dutch on the island, and called by them *Fort Rotterdam*. The town is built on neck, or point of land, at the mouth of a river which forms a harbour, with water enough for a ship to come within cannon shot of the walls. The town large; the houses are of wood, built on piles, to ward against the inundations. The country round out is level and beautiful, abounding with plantations and groves of cocoa-nut trees. At a distance land, the country rises into hills of great height, and becomes rude and mountainous. See *East India Company, Dutch*.

MACASSAR, STRAITS OF; the channel or narrow

sea between Celebes and Borneo, about 350 miles long, and from 110 to 140 wide, except at the north entrance, where it is contracted to fifty miles.

MACAULEY, CATHERINE, or GRAHAM, the name of her second husband, was born in Kent, at the seat of her father, John Sawbridge. She was well educated, and became early attached to the perusal of history. In 1760, she married doctor George Macauley, a physician, and, in 1763, published the first volume (4to.) of her *History of England from the Accession of James I., to that of the Brunswick line*. This was continued in successive volumes, to the eighth, which completed the work, in 1783. The spirit of this history is almost purely republican. The other works of Mrs Macauley are *Loose Remarks on some of Mr Hobbes' Positions*; an *Address to the People of England on the present Important Crisis* (1775); a *Treatise on the Immutability of Moral Truth*, afterwards republished, with additional matter under the title of *Letters on Education* (1790). Her last publication was a *Letter to Earl Stanhope, in reply to the opinions of Burke on the French Revolution* (1791). In 1785, Mrs Macauley married a young man of the name of Graham, and the disparity of their ages subjected her to much ridicule. She paid a visit to general Washington, in America, in 1785, and died in 1791.

MACAW. These magnificent birds belong to the parrot tribe, and are distinguished by having their cheeks destitute of feathers, and the feathers of the tail long. They form the sub-genus *ara*. They are only found in the tropical regions of South America. They prefer moist situations, from the palm growing in such spots, of the fruit of which they are very fond. They usually go in pairs; sometimes, however, they assemble, in the morning and evening, in great numbers. Although they fly well, they seldom wander far, except in quest of food, and regularly return in the evening. They build their nests in the hollow of rotten trees, and lay twice in the year, generally two eggs at a time. The male and female share alternately in the labour of incubation and rearing the young. When young they are easily tamed, and soon grow familiar with persons whom they frequently see. But like all the parrot tribe, they have an aversion to strangers, and particularly to children. In a domesticated state, they will feed on almost every article, but are especially fond of sugar, bread, and fruits. They do not masticate the latter, but suck them by pressing their tongue against the upper mandible. Like the other parrots, these birds use their claws with great dexterity, though, in climbing, they always begin by taking hold with their bill in the first instance, using their feet only as a second point of their motion. When they were first carried to Europe, their great beauty and size caused them to be in much request, and they were considered as valuable presents between sovereign princes. This bird was spoken of, by Aldrovandus, as early as 1572.

MACBETH lived about the middle of the eleventh century. He served against the Danes as general of his relation Duncan I. or Donald VII., king of Scotland. The Danes were completely defeated, and Macbeth now conceived the idea of obtaining possession of the Scottish throne. He appears, like most men in his time, to have believed in the predictions of the pretenders to supernatural knowledge. On his return from his victory over the Danes, three old women met him with the insignia of the witches of that period, and saluted him—the first, as *thane of Glamis*; the second as *thane of Cawdor*; the third, as about to be king of Scotland. The two first predictions being almost immediately fulfilled, Macbeth was led to hope for the accomplishment of the last,

and, after brooding over the subject for a time, determined to assassinate the king; and perpetrated the crime when the king was visiting him at his castle of Inverness. The king's sons were obliged to save themselves by flight; and Macbeth brought the nation to favour his cause, by liberality to the nobility, and by strict justice in his administration. For ten years, he reigned with moderation; but, after this period, he suddenly became a tyrant. His first victim was Banquo, who had been privy to the murder of the king. Feeling insecure, he erected a castle on Dunsinane, from which he could overlook the whole country. This is the legend, which has been adopted by poetry. But history shows no such person as Banquo; Duncan was slain near Elgin, and not in Macbeth's own castle; and Macbeth, though he ascended the throne by violence, had in fact a better claim to it than Duncan, and was a firm, just, and equitable prince. Macduff,thane of Fife, fled to England, and urged Malcolm, the son of the murdered Duncan, to take vengeance. Assisted by Siward, earl of Northumberland, they returned to their country. Macbeth was defeated, fled to his castle, and was slain in the seventeenth year of his reign, A. D. 1057.

**MACCABEES**; two apocryphal books of the Old Testament, which contain the history of Judas surnamed Maccabeus, and his brothers, and the wars which they sustained against the kings of Syria, in defence of their religion, and the independence of their country. (See *Jews*.) The author and the age of these books are uncertain. The council of Trent placed them among the canonical books, but the Protestants have rejected them as apocryphal.

**MACCARONI**, **MACARONI** or **MACCHERONI**; a preparation of fine flour, which forms a favourite article of food among the Italians. It is eaten in various ways, generally simply boiled, and served up with grated cheese. Macaroni is generally made in pieces resembling a long pipe handle, of small diameter; sometimes, however, in other shapes, as flat, square, &c. It is a wholesome food, and a national dish of the Italians, particularly of the Neapolitans. It is made best in the neighbourhood of Naples, whole villages living almost solely by the manufacture; and, in Naples, it is continually sold in the streets, cooked for the lower classes, particularly for the *lazzaroni*. The pieces being very long, and being held in the fingers during the process of eating, some skill is required to manage them. This fashion of eating yard-long macaroni, forms a subject of ridicule against the Neapolitans, in more than one Italian comedy. The modes of cooking macaroni are various; the simplest are the best. The fashion of cutting it into pieces, and stewing it with eggs, &c., as is done in England, is not to be recommended. Macaroni is well made at Aix in France, and pretty well also in Germany.

*Macaroni* is also used as a term of contempt for a coxcomb—*homo crassa Minerva*.

**MACCARONI POEMS**; a kind of facetious Latin poems, in which are interspersed words from other languages, with Latin inflections. They were first written by Teofilo Folengi, under the name of *Merlino Coccaino*, a learned and witty Benedictine, born in 1484, at Mantua. He was a contemporary and friend of Sanasario. Ferdinand of Gonzaga, with whom he resided ten years in Sicily, was his patron, and Folengi often celebrates his praises. He spent the rest of his days in a monastery at Bassano, where he died in 1544. Various grave and religious poems of his, in Italian and Latin, are still extant, and are not without value. He is regarded by the Italian poets as the inventor of heroic-comedy poetry. His principal poem in this style was called *Maccaronea*, because it was mixed up of Latin and Italian, as macaroni is

made up of various ingredients. An edition of the poem, printed in 1521, is still extant. A mistake of Virgil, he carries the hero of his poem through numerous circumstances, and, at last, to the *mare magnum*. Here, among other things, he uses the punishment of poets. For every *macaroni* exaggeration in their works, devils were appointed to gnaw a tooth, which grew again every day. The poem contains many satirical accounts of the manners of the age, with beautiful passages in genuine *latine*. Besides this, he wrote a smaller comic poem, named *Moschea*, or the War of the Gosses and the Ladies—a youthful production; also *Ectlogus satiricus*; all in the macaronic style. Heinsius *Tristram*, p. 171) mentions a German poem of the *Macaroni*. *Cortum versicale de Flos sarracenis, ubi invenitur quæ omnes fere Minuscos, Marinos, Nidros, Jucos, &c., behupere, et Spitzibus suis archibus ducere a bitere solent; Autore Grifphodo A. sarracenis a Solandia (anno 1593, 4to)*, of which he gives the introduction. A new edition of this work appeared in 1822, at Hamm; and a translation at Leipzig, in 1824. We find an example of French macaronic verse in the third interlude of Molière's *Masque noir*. It was introduced into England in the reign of Henry VII., when Skelton exhibited some specimens of it. It was fashionable under Elizabeth, in whose reign a poem on the Armada, of which Warton gives a specimen, was written. Drummond, of Hawthornden, also wrote a macaronic poem, of which the following will be a sufficient specimen:—

*Contraact extemplo burlesco-minuscos aliquid Ludus.  
Jackmannusque Minuscosus, plerumque Minuscosus capis pugnam  
minuot.  
Tumultuanteque simul, recessu ex hinc-hinc huius,  
Hunc qui durtiferas terit cum discipulis ducit, &c.*

**MACCHIAVELLI**, **NICCOLO**. It is not easy to determine a man's disposition and character from his writings. When, however, as was the case in the governments of antiquity and the Italian republics of the middle ages, a man's writings are more the offspring of his political situation than mere exercises of his intellect, and especially if they coincide with his conduct, they afford fair grounds for judging of the author's character. This is the case with Niccolò Macchiavelli, the famous Florentine secretary. The prejudices against him, arising from an imperfect understanding of his treatise called *Il Principe* (The Prince), have caused him to be regarded as the teacher of a detestable line of policy, called even *Macchiavellism*, intended to enable despots to perpetuate its existence by fraud and violence, though there are few men on record who have shown so much of a truly civic spirit.—He was born at Florence in the year 1469, of a noble family, whose members had enjoyed the highest dignities in the republic. Little known of his youth, and nothing of his education, except that he studied under Marsilio Ficino. On account of his distinguished talents, he was early appointed chancellor of the Florentine republic, and, not long afterwards, was advanced to the post of secretary of state, for which reason he is most commonly called *Segretario Fiorentino*. When Florence had recovered her liberty by the expulsion of the Medici (see *Medici*), and, from fear of the exiled family, had become involved in the ambitious wars and intrigues of Charles VIII., it was a time when great political adroitness, and a spirit of genuine republicanism, were required in her counsels. Macchiavelli was several times charged with important embassies. He was four times ambassador at the French court, twice at that of the pope, and twice, also, at that of the emperor Maximilian. The republic acknowledged his great services, but rewarded them sparingly, so that he was sometimes

obliged to petition the *signoria* (supreme authority of the state) on account of his poverty. His advice was of great use to the commonwealth, at the time of the insurrection of Val di Chiana. The leading principles of his counsels, at this juncture, may be deduced from his numerous letters, preserved in the Florentine archives. They were to maintain a peaceful and friendly spirit in the settlement of difficulties, to provide for an upright and strict administration of justice, to make the burden of taxes as light as possible, and to keep a watchful eye on the smallest circumstances that had relation to public concerns. Even in regard to military affairs, the late was so convinced of the sagacity of his views, that they preferred his counsel to any other. Among other things, a Tuscan legion was established by his device. This band, at a later period, distinguished itself remarkably under the command of Giovanni de' Medici. When pope Julius II. had succeeded in establishing a league in Italy against the overwhelming power of the French, Louis XII., to revenge himself, and wound the dignity of the pope in the tenderest point, attempted to assemble a council in Italy, and requested the Florentines to allow Pisa, which had become again subject to them, to be the place of meeting. Macchiavelli feared the papal humors, and advised his countrymen to evade the proposal. He went with this view as envoy to the king, but the king would not be refused. After his return, he was sent to Pisa, to watch the proceedings of the council, and to labour for its dissolution. Nevertheless, the pope was so indignant against the Florentines, that he formed an alliance with Ferdinand of Arragon to deprive them of their freedom, and, by their means, the power of the Medici was re-established. As Macchiavelli had laboured incessantly for the good of the republic, Lorenzo de' Medici, now dictator of Florence, seized the opportunity, in spite of a public decree, to strip him of his dignities. He was afterwards accused of participating in the conspiracy of the Boscoli and Capponi against the cardinal Giovanni de' Medici, imprisoned, put to the torture, and banished; all which he endured with a firmness approaching to indifference. After the cardinal became pope (Leo X.), his punishment was remitted. He returned to his native country, and wrote his discourses on the ten first books of Livy; also his Prince, which he dedicated to Lorenzo de' Medici. Upon this, he was received again into favour by this powerful family; and cardinal Julius, who ruled Florence in the name of Leo X., and earnestly desired to reform the condition of the place, availed himself of the advice of Macchiavelli, in extinguishing various civil commotions. He was suspected of being concerned in a new conspiracy against the Medici; but the only consequence was, that he was obliged to return to private life and indigence. When Julius, under the name of Clement VII., ascended the papal chair, Macchiavelli was again employed in public business: in particular, he was sent to aid the allied forces of the pope and the Florentines in the defence of Tuscany against the army of Charles V. The confidence now reposed in him by the Medici alienated from him the affections of the Florentines; and, after his return to Florence, he died, June 22, 1527, neglected and poor. It appears, from the letters of his son Pietro to Francisco Nelli, that he manifested on his death-bed the feelings of a Christian. The account of the inaccurate Paolo Giovio, that he died a suicide and an atheist, is not to be depended on. The writings of the immortal Florentine may be arranged under four heads,—history, politics, belles lettres, and military treatises. His eight books on the history of Florence, written at the command of

Clement VII., begin with the year 1215, and end with Lorenzo de' Medici, in the year 1492. They are among the first historical works of modern times, which deserve to be placed side by side with the beautiful remains of antiquity. Macchiavelli was probably prevented by death from completing this work, and is said to have left his collection of materials to Guicciardini. The history is distinguished for its pure, elegant, and flowing style: its impartiality is doubtful. The Life of Castruccio Castracani, lord of Lucca, is more properly a romance than a biography. The hero, who is as great a villain as Cæsar Borgia, is continually quoting apophthegms from Plutarch. Under the head of politics are included his two most important works—the Prince (of which more will be said hereafter), and the Discourses upon the ten first books of Livy. His purpose, in these last, is to show how a republic may be supported, and how it is exposed to ruin. The work breathes, throughout, a warm love of freedom. Filippo Nerli relates, in his commentaries, that Macchiavelli was induced to write these discourses, and those on the Art of War, by a number of young men who were accustomed to assemble with him in a garden in Florence, and had been made republicans by the perusal of the ancients. Montesquieu and Rousseau have both drawn freely from these works. In a treatise, composed in the year 1519, upon a reformation in the state of Florence, he advises the pope Leo X. to restore the republican form of government to this city, although he pretends to have the aggrandisement of the Medici in view. His object in the seven books on the Art of War was, to show the Italians that they were able to recover their freedom without the assistance of the foreign mercenaries, so generally employed in the states of Italy; and he shows himself fully sensible of the great importance of infantry, then little valued. Frederic the Great knew and esteemed this treatise. For the restoration of the comic drama, also, the world is indebted to the Florentine secretary. His comedies, *La Mandragola* and *La Clizia*, are the first regular dramas written since the time of the Romans. Voltaire preferred the first to any of the plays of Aristophanes. His other poems are full of thought. The novel entitled *Belfagor* is very fine, and has been versified by La Fontaine. His description of the pestilence, which raged in Florence in the years 1322—3, may be compared to the similar account in Thucydides. He has written, also, many other treatises, all of which show the great man, and several poems. Among his papers is a constitution for the regulation of a gay company, called *Compagnia di Piacere*.

The Prince has been often translated. The opinions on this work are very various. Some persons condemn it as intended to instruct tyrants in the art of oppression. This idea originated with the archbishop of Consa, Ambrosio Catarino, long after the book was given to the world. Bayle, in his famous dictionary, and Frederic the Great, in his *Anti-Macchiavelli*, which was translated, together with the Prince, by the order of Mustapha III., are of the same opinion. But they mistake Macchiavelli's meaning, for his other writings, as well as his life, prove that he loved liberty ardently. Others consider the Prince as a satire; but this is impossible. The tone of the work is most serious throughout: no trace of satire can be discovered. Others think it a work full of valuable counsel for princes, but infected with a looseness of morals which prevailed in the age of the writer: but Macchiavelli hated Alexander VI., Cæsar Borgia, and all the tyrants of his age; and the full consideration with which he advances his startling principles, shows that they could not have sprung

from the unconscious influence of his time. They are well weighed and thoroughly understood. Others believe that Macchiavelli's object was to make tyrants odious; but tyrants, such as he describes, need no colouring to make them abhorred. Others maintain that Macchiavelli treated the question of tyranny, in the abstract, without reference to morality, not in order to give advice, but as a mere scientific question, on the ground of lord Bacon, that "there be not any thing in being or action which should not be drawn and collected into contemplation and doctrine;" just as a person might write a treatise on poisons, investigating all their effects, without touching on their antidotes. But could a mind like Macchiavelli's, if his object had been merely scientific discussion, have contemplated, long and closely, crimes so shocking to his love of liberty, without ever betraying his horror? Could we believe a man to possess a pure spirit, who could write a long and scientific treatise on the seduction of innocence, as skilful in its way as Macchiavelli's in his, though such a treatise might afford much interesting analysis of the springs of human conduct? In our opinion, the Prince must be considered as a work written for a certain purpose, time, and person, although particular questions, doubtless, are often treated abstractly, and the application left open. As a whole, the Prince is not to be considered, originally, nor in its execution, as a mere scientific treatise. Many questions are left undiscussed; the titles of the chapters are often of a general nature, while the chapters themselves are not. Macchiavelli's feeling was, that union and freedom from a foreign yoke were even more important than civil liberty; that they formed the very elements of the life of a nation. In the first part of his career, he had been thoroughly Florentine in spirit, but his misfortunes forced him to elevate his views, to become Italian; and, for the purpose of saving Italy, he could have seen, with patience, even Florence enslaved. No noble-minded Italian has written or sung, since Dante's *di dolor ostello*, without giving vent to his grief for the unfortunate condition of his beautiful country; and Macchiavelli, one of the noblest spirits of Italy, burned to see her united and freed from foreigners. He sought the cure of Italy; yet her state appeared to him so desperate, that he was bold enough to prescribe poison. But it must be kept in mind that he does not advise all the measures which he discusses. He often treats them like mechanical principles in the abstract, and leaves the consideration of their expediency in practice to him who wishes to make the application. Undoubtedly Macchiavelli believed that many things are permitted for the purpose of uniting a distracted country, which would be criminal in any other case; and, to determine the true spirit of his famous work, the reader should have a full knowledge of the history of the age. If he had written at the present day, he must have recommended very different means. In the last chapter of the Prince, he calls upon Lorenzo of Medici to save his country. Lorenzo was the nephew of pope Leo X. Julian, brother to Leo, was expected to become king of Naples, while Lorenzo, a man of a warlike and fierce spirit, was expected to unite the country between the Tuscan and Adriatic seas, and to found a kingdom of Tuscany. On him all eyes were turned, and him it was Macchiavelli's purpose to urge to the deliverance of Italy. Macchiavelli was far from being alone in expecting salvation for Italy only from a conquering king. Polydore Virgil, in 1526, when he dedicated his work *De Prodigis* to Francesco Maria of Urbino, expressed this opinion. Twenty years earlier, John Anthony Flaminus said the same to pope Julius; and Varchi says, "Italy cannot be tranquil until ruled by

one prince." Some of the best observations on Macchiavelli are to be found in a work probably less known to our readers,—professor Lasker's *Zur Kritik neuerer Geschichtsschreiber* (Bonn and Leipzig, 1824.)

In regard to Macchiavelli's personal character, even his enemies acknowledge that he was kind and affable, a friend of the virtuous, cautious and brave. He was one of the greatest thinkers of his age, indefatigable in the service of his country as long in his manner of life. He well deserves a inscription placed over his tomb in the church of Santa Croce, in Florence—

*Tanto nomini nullum par obsequium.*  
Nicolaus Machiavellus  
Obiit An. A. P. 1550. MDXXII.

The reader will recollect the stanza in *Chastel* (canto four, stanza liv.), in which his remains are described as lying in company with those of Dante, Michael Angelo, and Alfieri.

**MACCHIAVELLISM**, in politics; that view of policy which overlooks every law, and makes use of any means, however criminal, to pursue its purposes. The word originated from a erroneous view of Macchiavelli's Prince. See *Macchiavelli*.

**MACE**. Clubs of various descriptions are found among almost all savages, formed of a kind of heavy wood, some broad and flat, others oval, angular, long or short, some plain and rude, others neatly carved. From this simple implement, a mallet, hammer of arms, and mace originated, which were generally used, of old, both in Great Britain and on the continent of Europe. The gradual progress of improvement having rendered armor impenetrable by edged weapons, some instrument of effectual demolition became necessary. As early as in military affairs, of the sixteenth century, recommends a leaden mallet, five feet long. The mace was wielded with both hands, and harnessed to a hung by a thong or chain from the pommel of the saddle. The hammer of arms greatly resembled a common hammer. It differed from the mallet in being square or a little rounded or convex, whereas the side of the mallet was square and the other pointed or edged. The mace, in its simplest form, is only an iron club, short and strong. Its shape varied among different nations and at different times. One, well preserved, is of iron, two feet one inch long, with a hollow handle, and a head seven inches long, consisting of seven iron leaves perpendicularly fixed round a cylinder, and equidistant. The whole weighs three pounds nine ounces. Two maces, used in 1380, belonged to Roland and Olivier de Barre, famous champions under Charlemagne, were preserved in France towards the beginning of the last century, and perhaps later, consisting of a handle two feet long, to which an iron ball was attached by a triple chain. It appears that the head was frequently covered with iron spikes, and was attached to the handle by a single chain. Mr Green states that similar implements were long used by the trained bands of London, under the name of *morning stars*. (See *Battle-Axe*, and *Arms*.) At present, the mace is used as an emblem of the authority of officers of state (e. g. the speaker of the house of commons, before whom it is carried). It is made of the hardest metals, or of copper, gilt, and ornamented with a crown, globe, and cross.

**MACE**; the outer, fleshy, and coriaceous coat of the nutmeg. When the fruit is gathered, the mace is carefully separated from the nut, dried in the sun, and afterwards is packed in chests of different sizes, in which state it is obtained in commerce. See *Star-meg*.

MACEDONIA (now Makdonia or Filiba Vilajeti, a territory containing 15,250 square miles, and 700,000 inhabitants); the northern part of the peninsula in Europe, inhabited by the Greeks, a mountainous and woody region, the riches of which consisted chiefly in mines of gold and silver; the coasts, however, produced corn, wine, oil, and fruits. It was separated from Thessaly on the south by the Olympus and the Cambunian mountains (now Monte di Voluzzo); and on the west, from Epirus, by the Pindus (now Stymphe). In regard to the eastern, northern, and north-western boundaries, we must distinguish between the time before and after Philip, the father of Alexander. Before his time, all the country beyond the Strymon (Strumona), and even the Macedonian peninsula from Amphipolis to Thessalonica, belonged to Thrace; and Pæonia, likewise, on the north. On the north-west, towards Illyria, it was bounded by lake Lynchitis (Achrida). Philip conquered this peninsula, all the country to the river Nessus (Karasu) and mount Rhodope; also Pæonia and Illyria, beyond lake Lynchitis. Thus the widest limits of Macedonia were from the Ægean Sea to the Ionian, where the Drino formed its boundary. The provinces of Macedonia were, in general, known by name even before the time of Herodotus. At the time of Philip, they were nineteen. The Romans divided the country into four districts—the eastern on the Strymon and Nessus (chief city, Amphipolis); the peninsula (capital, Thessalonica); the southern, including Thessaly (capital, Pella); and the northern (chief city, Pelagonia). They made Illyria a separate country. Macedonia was inhabited by two different races—the Thracians, to whom belonged the Pæonians and Pelagonians, and the Macedonians, to whom the Macedonians are shown to have belonged by their language and customs. It speaks of 150 different tribes, who dwell here in an early period; but we have no particular accounts of them. The Macedonians were a civilized people long before the rest of the Greeks, and were, in fact, their instructors; but the Greeks regarded them as barbarians. They were divided into several different states, which were incessantly at war with the Thracians and Illyrians, till Philip and Alexander made the ascendancy to one of these states, and made it the most powerful in the world. We have no particular account of this state, but it is known to have been a limited monarchy; to have been tributary, for a long time, to the Illyrians, Thracians, and Persians, and to have been obliged to give up all its resources to the Athenians. The succession of its kings begins with the Heracleide Caranus, but first becomes important with the accession of Philip (q. v.). The prince, taking advantage of the strength of the country and the warlike disposition of its inhabitants, reduced Greece, which was distracted by intestine wars, in the battle of Chæronea, B. C. 338. His son Alexander, subdued Asia, and by an uninterrupted series of victories, for ten successive years, made Macedonia, in a short time, the mistress of the world. After his death, this immense empire was divided. Macedonia received anew its ancient limits, and, after several battles, lost its position over Greece. The alliance of Philip II. with Carthage, during the second Punic war, gave occasion to this catastrophe. The Romans delayed revenge for a season; but, Philip having laid siege to Athens, the Athenians called the Romans to assistance; the latter declared war against Macedonia; Philip was compelled to sue for peace, surrender his vessels, to reduce his army to 500 men, and defray the expenses of the war. Perseus, the successor of Philip, having taken up arms against

Rome, was totally defeated at Pydna by Paulus Æmilius, B. C. 168, and the Romans took possession of the country. Indignant at their oppressions, the Macedonian nobility and the whole nation rebelled under Andriscus. But, after a long struggle, they were overcome by Quintus Cæcilius Macedonicus, the nobility were exiled, and the country became a Roman province, B. C. 148. Macedonia now forms a part of Turkey in Europe, and is inhabited by Wallachians, Turks, Greeks, and Albanians. The south-eastern part is under the pacha of Saloniki; the northern, under beys or agas, or forms free communities. The capital, Saloniki, the ancient Thessalonica, is a commercial town, and contains 70,000 inhabitants. See the *History and Antiquities of the Doric Race*, translated from the German of C. O. Müller, (Oxford, 1830).

MACERATION (from *macero*, to soften by water) consists in the infusion of substances in cold water, in order to extract their virtues. It differs from digestion only as the latter operation admits the application of heat. Maceration is preferable in cases where heat would be injurious, as where volatile and aromatic substances are used.

MACHAON. See *Æsculapius*.

MACHINERY. The utility of machinery, in its application to manufactures, consists in the addition which it makes to human power, the economy of time, and in the conversion of substances apparently worthless into valuable products. The forces derived from wind, from water, and from steam are so many additions to human power, and the total inanimate force thus obtained in Great Britain (including the commercial and manufacturing) has been calculated, by Dupin, to be equivalent to that of 20,000,000 labourers. Experiments have shown that the force necessary to move a stone on the smoothed floor of its quarry is nearly two-thirds of its weight; on a wooden floor, three-fifths; if soaped, one-sixth; upon rollers on the quarry floor, one thirty-second; on wood, one-fortieth. At each increase of knowledge, and on the contrivance of every new tool, human labour is abridged: the man who contrived rollers quintupled his power over brute matter. The next use of machinery is the economy of time, and this is too apparent to require illustration, and may result either from the increase of force, or from the improvement in the contrivance of tools, or from both united. Instances of the production of valuable substances from worthless materials are constantly occurring in all the arts; and though this may appear to be merely the consequence of scientific knowledge, yet it is evident that science cannot exist, nor could its lessons be made productive by application, without machinery. In the history of every science, we find the improvements of its machinery, the invention of instruments, to constitute an important part. The chemist, the astronomer, the physician, the husbandman, the painter, the sculptor, is such only by the application of machinery. Applied science in all its forms, and the fine and useful arts, are the triumphs of mind, indeed, but gained through the instrumentality of machinery. The difference between a tool and a machine is not capable of very precise distinction, nor is it necessary, in a popular examination of them, to make any distinction. A tool is usually a more simple machine, and generally used by the hand; a machine is a complex tool, a collection of tools, and frequently put in action by inanimate force. All machines are intended either to produce power, or merely to transmit power and execute work. Of the class of mechanical agents by which motion is transmitted,—the lever, the pulley, the wedge,—it has been demonstrated that no power is

gained by their use, however combined. Whatever force is applied at one part, can only be exerted at some other, diminished by friction and other incidental causes; and whatever is gained in the rapidity of execution, is compensated by the necessity of exerting additional force. These two principles should be constantly borne in mind, and teach us to limit our attempts to things which are possible. See *Hydraulics, Hydrostatics, Mechanics, Steam.*

1. *Accumulating Power.* When the work to be done requires more force for its execution than can be generated in the time necessary for its completion, recourse must be had to some mechanical method of preserving and condensing a part of the power exerted previously to the commencement of the process. This is most frequently accomplished by a fly-wheel, which is a wheel having a heavy rim, so that the greater part of the weight is near the circumference. It requires great power, applied for some time, to set this in rapid motion, and, when moving with considerable velocity, if its force is concentrated on a point, its effects are exceedingly powerful. Another method of accumulating power consists in raising a weight, and then allowing it to fall. A man, with a heavy hammer, may strike repeated blows on the head of a pile without any effect; but a heavy weight, raised by machinery to a greater height, though the blow is less frequently repeated, produces the desired effect.

2. *Regulating Power.* Uniformity and steadiness in the motion of the machinery are essential both to its success and its duration. The governor, in the steam-engine, is a contrivance for this purpose. A vane or fly of little weight, but large surface, is also used. It revolves rapidly, and soon acquires a uniform rate, which it cannot much exceed; because any addition to its velocity produces a greater addition to the resistance of the air. This kind of fly is generally used in small pieces of mechanism, and, unlike the heavy fly, it serves to destroy, instead of to preserve, force.

3. *Increase of Velocity.* Operations requiring a trifling exertion of force may become fatiguing by the rapidity of motion necessary, or a degree of rapidity may be desirable beyond the power of muscular action. Whenever the work itself is light, it becomes necessary to increase the velocity in order to economize time. Thus twisting the fibres of wool by the fingers would be a most tedious operation. In the common spinning-wheel, the velocity of the foot is moderate, but, by a simple contrivance, that of the thread is most rapid. A band, passing round a large wheel, and then round a small spindle, effects this change. This contrivance is a common one in machinery.

4. *Diminution of Velocity.* This is commonly required for the purpose of overcoming great resistances with small power. Systems of pulleys afford an example of this: in the smoke-jack, a greater velocity is produced than is required, and it is therefore moderated by transmission through a number of wheels.

5. *Spreading the Action of a Force exerted for a few minutes over a large Time.* This is one of the most common and useful employments of machinery. The half minute which we spend daily in winding up our watches is an exertion of force which, by the aid of a few wheels, is spread over twenty-four hours. A great number of automata, moved by springs, may be classed under this division.

6. *Saving Time in natural Operations.* The process of tanning consists in combining the tanning principle with every particle of the skin, which, by the ordinary process of soaking it in a solution of the tanning matter, requires from six months to two

years. By enclosing the solution, with the hide in a close vessel, and exhausting the air, the power of the hide being deprived of air, exert a capillary attraction on the tan, which may be aided by pressure so that the thickest hides may be tanned in a few weeks. The operation of bleaching affords another example.

7. *Exerting Forces too large for human Power.* When the force of large bodies of men or animals is applied, it becomes difficult to concentrate it simultaneously at a given point. The power of steam, air, or water is employed to overcome resistance which would require a great expense to be mounted by animal labour. The twisting of the largest cables, the rolling, hammering, and casting of large masses of iron, the draining of mines, require enormous exertions of physical force, continued for considerable periods. Other means are used when the time required is great, and the space through which it is to act is small. The hydraulic press can, by the exertion of one man, produce a pressure of 30 atmospheres.

8. *Executing Operations too delicate for human Touch.* The same power which twists the most cable, and weaves the coarsest canvas may be employed, to more advantage than human hands, in spinning the gossamer thread of the cotton, and in twining, with fairy fingers, the meshes of the most delicate fabric.

9. *Registering Operations.* Machinery affords a sure means of remedying the inconstancy of human agents, by instruments, for instance, for counting the strokes of an engine, or the number of coils wound in a press. The tell-tale, a piece of mechanism connected with a clock in an apartment to which a watchman has not access, reveals whether he is neglected, at any hour of his watch, to put a stop in token of his vigilance.

10. *Economy of Materials.* The precision with which all operations are executed by machinery, and the exact similarity of the articles made, produce a degree of economy in the consumption of the material which is sometimes of great importance. In reducing the trunk of a tree to planks, the saw was formerly used, with the loss of at least half the material. The saw produces thin boards, with a loss of not more than an eighth of the material.

11. *The Identity of the Result.* Nothing is so remarkable than the perfect similarity of things manufactured by the same tool. If the top of a hat is to be made to fit over the lower part, it may be done by gradually advancing the tool of the sliding rest; after this adjustment, no additional care is requisite in making a thousand braces. The same result appears in all the arts of printing: the impressions from the same block, or the same copperplate, have a similarity which no labour of the hand could produce.

12. *Accuracy of the Work.* The accuracy with which machinery executes its work is, perhaps, one of its most important advantages. It would hardly be possible for a very skilful workman, such as a polishers, to form a perfect cylinder out of a piece of steel. This process, by the aid of the lathe and the sliding rest, is the every day employment of hundreds of workmen. On these two last advantages of machinery depends the system of copying, by which pictures of the original may be multiplied, and thus almost unlimited pains may be bestowed in producing the model, which shall not reflect upon the price of each individual specimen of its productions. Operations of copying take place, by printing, by casting, by moulding, by stamping, by painting, with elongation, with altered dimensions. A remarkable example of the arts of copying has before the eye of the reader in these pages. 1. They are com-

obtained by printing from stereotype plates. 2. Those plates are copies obtained (by casting) from moulds formed of plaster of Paris. 3. The moulds are copies obtained by pouring the plaster, in a liquid state, upon the moveable types. 4. The types are copies (by casting) from moulds of copper, called *matrices*.

The lower part of the matrices, bearing the impressions of the letters or characters are copies (by enching) from steel punches, on which the same characters exist in relief. 6. The cavities in these steel punches, as in the middle of the letters, *a, b, &c.*, are produced from other steel punches in which those parts are in relief. For machinery, in political economy, see *Labour-saving Machines*.

*Machinery*, in poetry. See *Poetry*.

MACK, CHARLES, baron von; an Austrian general, born in Franconia, in 1752. On leaving college, his inclination led him to enlist as a private in a regiment of dragoons, and his good conduct soon obtained him the rank of a petty officer. In the war with Turkey, he obtained a captain's commission. His spirit of enterprise procured him the favour of Napoleon, who recommended him to the emperor. On the occurrence of war with France, Mack was appointed quarter-master-general of the army of the prince of Coburg, and directed the operations of the campaign of 1793. In 1797, he succeeded the archduke Charles in the command of the army of the Rhine. The following year, he was sent to Naples, when invaded by the French; but, being beaten in the field, and suspected of treason by the Neapolitans, he fled to the French camp, and was sent as a prisoner to Dijon. He found means to justify his conduct in the opinion of the emperor, who, in 1804, constituted general Mack commander-in-chief in the role, Dalmatia, and Italy. In 1805, Napoleon ordered him to retreat beyond the Danube, and to submit to the famous capitulation of Ulm, by which 100,000 of the Austrians became prisoners. Mack was permitted to go to Vienna, where he was tried before a military tribunal, and received the sentence of death as a traitor to his country. His doom, however, was commuted by the emperor for imprisonment; and he was, after a time, released, and died in captivity, in 1828.

MACKENZIE, SIR GEORGE, a celebrated Scottish lawyer and state officer, was born at Dundee, in 1660. His father was Simon Mackenzie of Lochslin, brother of the earl of Seaforth, and his mother Elizabeth Bruce, daughter of Dr Peter Bruce, principal of Leonard's college, St Andrews. His progress in school was so rapid, that in his tenth year he was master of all the classical authors usually taught in schools. He afterwards studied Greek and philosophy in the universities of St Andrews and Aberdeen, civil law in that of Bourges in France; and, in 1687, before the termination of his twenty-first year, entered as an advocate at the Scottish

bar in 1660, he published his *Aretina*, or *Serious Romance*, in which, according to his kind biographer, *Edinburgh*, he gives "a very bright specimen of his mind and exuberant genius." His talents must have been early observed and appreciated, for in 1661, in his third year at the bar, he was selected as one of the counsel of the marquis of Argyll, then tried by a commission of parliament for high treason. On this occasion he acted with so much firmness, and evenness, as at once established his character.

His purely literary labours of this eminent person, appear to have been chiefly executed during his early years. His *Religio Stoici*, or a short Discourse upon several Divine and Moral Subjects, appeared in 1663. Two years afterwards, he published a *Moral Essay on Solitude*, preferring it to public

employment, with all its appendages, such as fame, command, riches, pleasures, conversation, &c. This production was answered by the celebrated Evelyn, in a Panegyric on Active Life. "It seems singular," says the *Edinburgh Review*, "that Mackenzie, plunged in the hardest labours of ambition, should be the advocate of retirement, and that Evelyn, comparatively a recluse, should have commended that mode of life which he did not choose." But it is probable that each could write most freshly on circumstances disconnected with the daily events of his life, while speculative ingenuity was all they cared to reach in their arguments. In 1667, Mackenzie published his *Moral Gallantry*, one of the reflective treatises of the period, intending to prove the gentleness of virtue, and the possibility of establishing all moral duties on principles of honour. To this production he added a *Consolation against Calumnies*. The fiery course of politics which he had afterwards to run, made a hiatus of considerable extent, in the elegant literary pursuits of Mackenzie; but after his retirement from public life, he wrote another work which may be classified with those just mentioned—*The Moral History of Frugality*; nor in this classification must we omit his *Essay on Reason*. During his early years at the bar, he also wrote *Celia's Country House and Closet*, a poem in English epics, and written in a manner more nearly akin to the style of Pope and his contemporaries, than that which flourished in the author's own time.

Soon after the Restoration, he was appointed a justice-depute, or assistant to the justiciar or chief justice; a situation, the duties of which were almost equivalent to that of an English puisne judge of the present day, in criminal matters. Within a few years after this period, (the time is not particularly ascertained,) he was knighted. In 1679, he represented the county of Ross, where the influence of his family was extensive, in parliament. During that year, the letter of Charles, proposing the immediate consideration of a plan for an incorporating union of the two kingdoms, was read in parliament. Sir George, an enemy to every thing which struck at the individual consequence and hereditary greatness of the country, in which he held a stake, opposed the proposition. His speech on the occasion is generally understood to be the earliest authentically reported specimen of legislative eloquence in Scotland. It is compact, clear, accurate, well composed, without flights of ardour, and, therefore, destitute of the burning impetuosity which afterwards distinguished Fletcher and Belhaven. Sir George sought distinction in his course through parliament by popular measures. In 1669, an act had been passed, compelling merchants to make oath as to their having paid duties on their merchandise. "The commissioner had that day said, that the stealing of the king's customs was a crime, which was to be provided against: whereupon, Sir George Mackenzie replied, that if it was a crime, no man could be forced to swear for it; for by no law under heaven was it ever ordained that a man should swear in what was criminal." He opposed the act of forfeiture against the western rebels, insisting that no man ought to be found or proved guilty in absence. He would have gone to the grave with the character of a patriot, had he not been placed in a position where serving a king was more beneficial than serving the people.

On the 23d of August, 1677, he was named king's advocate, on the dismissal of Sir John Nisbet. As the trial of the earl of Argyll in 1661 was the first important political case in which he had tried his powers as a defender, so was that of his son in 1681, the first in which he exercised his abilities as a state prosecutor.

In the father's case he had to resist the oppressive fictions of the crown lawyers, but all he suffered was amply repaid on the son. After this celebrated trial, he appears to have obtained, as part of the spoil, a gift of the barony of Bute, ratified by the parliament of 1681. On the recapture of the earl after his escape, Mackenzie was one of those who objected to a new trial, and he accordingly recommended his suffering on his former sentence; he is alleged to have done so from the probability, that, owing to the extreme injustice of the sentence, his heirs might probably be restored to their heritage. Meanwhile his professional ingenuity had been employed in the case of the lawburrows, by which a legal form, useful in the defence of the subject against lawless aggression, was, by adding to its natural power the weight of the royal influence, made an engine of oppression. It would be a vain task to enumerate the minor state prosecutions, which, in this eventful period, gave full employment to this active servant of government: most of them are well known, and they were at any rate numerous enough to stamp him in the minds of his opponents with a character which must live with his name—"The blood-thirsty advocate." Sir George found it necessary to attempt a vindication of his acts, under the title of *A Vindication of the Government of Charles II.* "No age," he says, "did see so many thousands pardoned, nor so many indemnities granted, as was in his time: which, as it must be principally ascribed to the extraordinary clemency of the kings he served, so it may be in some measure imputed to the bias which Sir George had to the merciful hand." Sir George leaves out of view, that it is possible for one lord advocate so far to exceed another in the number of his prosecutions, as both to acquit and sacrifice more than the whole number accused by his brethren. It was not those who were forgiven, but those who were not forgiven, that fix upon the reign of Charles II., and also upon his Scottish advocate, the indelible character of oppression and blood-thirstiness. It must, at the same time, be allowed, that the acute mind of Sir George Mackenzie was never asleep to practical improvements in jurisprudence, although the lust of power was sufficient to subdue his efforts, or turn them into another course. While he wielded the sword of persecution himself, he did much to unfit it for the use of others. He countenanced and cherished a principle, which called for the examination of all witnesses in criminal cases, in presence of the accused, instead of the secret chamber of the privy council. A frightful fiction of the law of both countries, by which no evidence could be led by a prisoner in opposition to the assertions of the libel made by the prosecutor, as representing the king, was removed by Sir George, forty years before it ceased to exist in England; and he put a stop to the system of permitting the clerk of court to be enclosed with the king, for the purpose of assisting him. In 1686, Mackenzie showed that he had a feeling of conscience, and that his religion, if entirely political, was not accurately squared to personal aggrandizement, by suffering himself to be dismissed for not agreeing to the catholic projects of James II. In 1688, however, he was restored, on the advancement of his successor, Dalrymple, to the presidency of the court of session.

The Revolution terminated his political career. At this feverish moment of struggle and disappointment, he could so far abstract his mind from politics, as to perform the greatest public service which is ever now connected with his name, by founding the *Advocates' Library*. The inaugural speech which was pronounced on the occasion, is preserved in his works. The institution has flourished, and redeems

Scotland from the imputation of not possessing an extensive public library. After the Revolution, Sir George threw himself into the arms of the university of Oxford, the fittest receptacle for a champion a vindicator of the old laws of the north. He was admitted a student on the 2d of June 1710, but he did not long live to feel the blessing of a university; he had praised, and for the first time commended. He died at St James's on the 2nd May 1714.

Sir George wrote several works of a more serious cast than those to which we have referred. His *Institute of the Law of Scotland* is well compiled, but, in comparison with the profundity of *Lawyer's*, is meagre, and its brevity makes it of little use. His *Laws and Customs in Matters Criminal*, is a store of useful information, and is the earliest attempt (though not a very clear one) of our criminal law. His *Observations on the Laws and Customs of Nations as to Precedency*, with the *Science of Heraldry* as part of the *Law of Nations*, is a volume by heralds. When *Stillingfleet* and *Lind* made their critical attacks on the *fabulous* history of Scotland, Sir George, who seemed to consider it a serious matter to deprive his majority of any supporters, wrote in 1680 *A Defence of the Royal Law of Scotland*, in which he comes forward as the most ardent advocate, and distinctly hints to the continuance of the royal line, that, had they written a history, it might have had occasion to put his authority to the test against them. These works, along with his observations on the acts of parliament, and some of his minor productions, were edited by *Rankine*, in handsome folio volumes, in 1722. His *Memories* or account of his own times, certainly the most interesting of all his works, though promised to the world, was withheld through the timidity of his friends. When long lost sight of, the greater part of it was a few years ago recovered to the world. It is full of graphic pictures of the state of the times, and from so descriptive in character as *Macaulay's* or *Scott's*, is often more lively in the detail of incidents, and more acute in perceiving the selfish motives of the actors.

MACKENZIE, HENRY, the author of the *Man of Feeling*, was born at Edinburgh, in August 1712. His father was Dr Joshua Mackenzie, an eminent physician. His mother was Margaret, eldest daughter of Mr Rose of Kilravock, a gentleman of a noble family in Nairnshire. After being educated at the high school and university of Edinburgh, Mr Mackenzie was articled to Mr Inglis of Rodent, in order to acquire a knowledge of the business of the *Exchange*. To this, though not perfectly compatible with the literary taste which he very early displayed, he applied with due diligence; and, in 1736, went to London to study the modes of English *Exchange* practice, which, as well as the customs of the court, were similar in both countries. While there, his talents induced a friend to solicit his admission in London, and qualifying himself for the *English* bar. But the anxious wishes of his family that he should reside with them, and the unambitious mind, decided his return to Edinburgh, where he became, first, partner, and afterwards successor, to Mr Inglis, in the office of *Exchange* broker.

His professional labour, however, did not prevent his attachment to literary pursuits. When in London, he sketched some part of his first and most popular work, *The Man of Feeling*, which was published in 1771, without his name, and was so much a success with the public, as to become, a few years after, the occasion of a remarkable fraud. A Mr *Smith* of Bath, observing the continued success of the work, laid claim to the work as his own.

order to support his pretensions, transcribed the whole with his own hand, with an appropriate allowance of blottings, interlineations, and corrections. It possibly was this claim put forward, and so pertinaciously was it adhered to, that Messrs Cadell and Trachan, the publishers, found it necessary to un- deceive the public by a formal contradiction. Though Mr Mackenzie preserved the anonymity of the *Man of Feeling* for some years, (probably from prudential motives with reference to his business,) he did not scruple to indulge, both before and after this period, in the literary society with which the Scottish capital abounded. He informs us in his *Life of Home*, that he was admitted in boyhood as a kind of page to the a-drinkings which then constituted the principal stive entertainment of the more polished people in Edinburgh; and his early acquaintance with Hume, Smith, Robertson, Blair, and the rest of the literary coterie, then in the ascendant, is evidenced from the same source.

Some years after the publication of the *Man of Feeling*, he published his *Man of the World*, which is intended as a counterpart to the other. In his former fiction, he imagined a hero constantly obedient to every emotion of his moral sense. In the *Man of the World*, he exhibited, on the contrary, a person rushing headlong into misery and ruin, and spreading misery all around him, by pursuing a happiness which he expected to obtain in defiance of the moral sense. His next production was *Julia de Roubigné*, a novel in a series of letters, designed, in its turn, as a counterpart to the *Man of the World*.

In 1777 or 1778, a number of young men of literary taste, chiefly connected with the Scottish bar, formed themselves into an association for the prosecution of their favourite studies, which came to bear the name of the *Mirror Club*. Of this club, Mr Mackenzie is readily acknowledged chief; and when it was resolved to issue their literary essays in a small weekly paper, resembling the *Spectator*, he was appointed to undertake the duties connected with the publication. The *Mirror* was commenced on the 1st of January, 1779, in the shape of a small folio sheet, price three halfpence, and terminated on the 1st of May, 1780; having latterly been issued twice a week. Of the one hundred and ten papers to which the *Mirror* extended, forty-two were contributed by Mr Mackenzie, including *La Roche*, and several others of the most admired of his minor pieces. The sale, during the progress of the publication, never exceeded four hundred copies; but it was more than sufficient to bring it under the notice of a wide and influential circle, and to found its reputation it has since enjoyed. When re-published in duodecimo volumes, a considerable sum was realized from the copyright, out of which the proprietors presented £100 to the Orphan Hospital, and devoted themselves to a hogshhead of claret, to be drunk at their ensuing meetings. The *Lounger*, a work of exactly the same character, was commenced by the same writers, and under the same editorship, on January 6, 1785, and continued once a week till the 6th of January, 1787; out of the hundred and ten papers to which it extended, fifty-seven are the production of Mackenzie. One of the latter papers the editor devoted to a generous and adventurous figure on the poems of Burns, which were just then published, and had not yet been approved by the public voice. As might have been expected, Mackenzie's most fondly on the *Addresses to the Mouse* and the *Mountain Daisy*, which struck a tone nearest that prevailing in his own mind.

In the institution of the Royal Society of Edinburgh, Mr Mackenzie became one of the members; among the papers with which he enriched its

transactions, are an elegant tribute to the memory of his friend lord Abercromby, and a memoir on German tragedy; the latter of which bestows high praise on the *Emelia Galotti* of Lessing, and on the *Robbers* by Schiller. For this memoir he had procured the materials through the medium of a French work; but desiring afterwards to enjoy the native beauties of German poetry, he took lessons in German from a Dr Okely, who was at that time studying medicine in Edinburgh. The fruits of his attention to German literature appeared further in the year 1791, in a small volume, containing translations of the *Set of Horses* by Lessing, and of two or three other German pieces. But the most remarkable result of his studies in this department, was certainly the effect which his memoir produced on the mind of Sir Walter Scott, then a very young man. It gave a direction to the genius of this illustrious person, at a time when it was groping about for something on which to employ itself; and harmonizing with the native legendary lore with which he was already replete, decided, perhaps, that Scott was to strike out a new path for himself, instead of following tamely on in the already beaten walks of literature.

Mr Mackenzie was also an original member of the Highland Society; and by him were published the volumes of their *Transactions*, to which he prefixed an account of the institution, and the principal proceedings of the society. In these *Transactions* is also to be found his view of the controversy respecting Ossian's Poems, and an interesting account of Gaelic poetry.

At the time of the French Revolution, he wrote various tracts, with the design of counteracting the progress of liberal principles in his own country. These services, with the friendship of lord Melville and Mr George Rose, obtained for him, in 1804, the lucrative office of comptroller of taxes for Scotland which he held till his death.

In 1793, he wrote the life of Dr Blacklock, prefixed to a quarto edition of the blind poet's works, which was published for the benefit of his widow. In 1812, he read to the Royal Society his *Life of John Home*, which was some years after prefixed to an edition of that poet's works, and was also published separately. At the time he read this paper to the Society, he laid also before them, in connexion with it, some Critical Essays, chiefly relative to dramatic poetry, which have not been published. He was himself a dramatic writer, though not a successful one. A tragedy, written by him in early life, under the name of *The Spanish Father*, was never represented; in consequence of Mr Garrick's opinion, that the catastrophe was of too shocking a kind for the modern stage; although he owned the merit of the poetry, the force of some of the scenes, and the scope for fine acting in the character of Alphonso, the leading person in the drama. In 1773, Mr Mackenzie produced a tragedy under the title of *The Prince of Tunis*, which, with Mrs Yates as its heroine, was performed with applause for six nights, at the Edinburgh theatre. Of three other dramatic pieces by Mr Mackenzie, the next was *The Shipwreck*, or *Fatal Curiosity*, which might be described as an alteration of Lilly's play under the latter of the two names. The comedies entitled *The Force of Fashion*, and *The White Hypocrite*, both of which were unsuccessful, complete the list. Mr Mackenzie's grand deficiency as a dramatic author, was his inability to draw forcible characters. His novels and tales charm by other means altogether; but in the drama, striking characters, and a skilful management of them, are indispensable.

In 1806, he published a complete edition of his works in eight volumes. From that period, and

indeed from one considerably antecedent to it, he might be said to have abandoned literature, though, to use his own affecting image, as employed at one of the meetings of the Royal Society, the old stump would still occasionally send forth a few green shoots. The patronage of the government was unfortunately extended in a somewhat improper shape, in as far as the office bestowed upon him, though lucrative, required unremitting personal labour. He was thus unable, even if he had been willing, to cultivate literature to any considerable purpose. Such leisure as he possessed, he spent chiefly in healthy recreations—in shooting, particularly, and angling, to which he was devotedly attached, and the former of which he practised in early life, on the ground now occupied by the New Town of Edinburgh. He thus protracted his days to a healthy old age, until he finally stood amidst his fellow men, like Noah amongst his descendants, a sole-surviving specimen of a race of literary men, all of whom had long been consigned to the dust. His recollections of the great men who lived in his youth, were most distinct and interesting; but it is to be regretted, that with the exception of what he has given in his *Life of Home*, he never could be prevailed upon to commit them to paper. At length, after a comparatively brief period of decline, he died January 14, 1831, in the eighty-sixth year of his age. By his wife, Miss Peniel Grant, daughter of Sir Ludovick Grant, of Grant, bart., Mr Mackenzie had eleven children, the eldest of whom is a judge of the courts of session and judiciary.

**MACKENZIE'S RIVER**; a river of North America. In the first part of its course, it flows N. E. to the Lake of the Hills, under the name *Unigah*, or *Peace river*; thence to Slave lake, it is called *Slave river*; it then takes the name of *Mackenzie's river*, and flows 780 miles N. into the Arctic sea; lon. 130° to 135° W.; lat. 69° 14' N. Its whole course is about 2000 miles.

**MACKEREL** (*scomber*). This is a tribe of migratory fishes, which annually visit the American coast, and is among the most celebrated of that class, for its numbers, and for the great use made of it in a salted state. The European mackerel (*S. scomber*) was early known as an article of food, and was held in high esteem by the ancient Romans, as forming the celebrated *sarum*, a pickle, or sauce, of which they made great use. This was prepared from several different kinds of fishes, but that from the mackerel was deemed by far the best. The mackerel is easily taken, by a variety of baits, and the capture always succeeds best during a gentle breeze of wind, which is hence termed a *mackerel breeze* by seamen. At such a time the usual bait is a bit of red cloth, a coloured feather, &c. This fish, when alive, possesses great symmetry of form and brilliancy of colours, which are much impaired by death, though not wholly obliterated. It is said, that, in the spring, their eyes are almost covered with a white film, which grows in the winter, and is regularly cast at the beginning of summer, before which they are half blind. There are several species of mackerel on the coast of the United States, the most common of which the *S. vernalis*, closely resembles the European species.

**MACKINAC**. See *Michilimackinac*.

**MACKINTOSH**, SIR JAMES, eminent as a jurist, a statesman, and a writer,—equally distinguished for his extensive learning, his large views, and his liberal principles in law, politics, and philosophy—was descended of an ancient Scottish family, and born in the parish of Dorish, county of Inverness, in 1765. After studying at the school of Fortrose, in Ross-shire, he was sent to King's college, Aberdeen, and

spent three years at Edinburgh, chiefly in medical studies. He received his medical degree in 1787, but his attention had already been turned to general literature, history, and moral, political, and speculative philosophy, and his inclination was not less to abandon his profession. In 1788, he went to London, where he published a pamphlet on the regency question, which, on account of the sudden recovery of the king, attracted little notice. He resorted to the continent, at that interesting period, to excite his sympathies for the French revolution, and published a reply to the celebrated *Letters of Burke*, under the title of *Financière* (1792), which laid the foundation of his fame, and acquired him the friendship both of Fox and his great opponent. About this time, Mr Mackintosh entered himself a student of Lincoln's Inn, was soon called to the bar by that society, and commenced the practice of law. Having obtained permission, though at great out much difficulty, to deliver a course of lectures in the hall of Lincoln's Inn, on the law of nations, he published his *Introductory Lecture*, under the title of a *Discourse on the Law of Nature and Nations*. The ability which it displayed obtained him a high opinion, including some of the most distinguished men of the country. On the trial of *Peltier* for a libel against Bonaparte (then first consul of France), in which the prosecution was conducted by Mr Perceval the attorney-general (afterwards first minister of state), and Mr Abbot (afterwards lord Treasurer), the defence was conducted by Mr Mackintosh, a sole counsel in one of the most brilliant questions made at bar or in forum, which at once established his reputation as an advocate and an orator. The recordership of Bombay, with the dignity of a high hood, was soon after conferred on him, and, under the discharge of the duties of his office, the ten years which he spent in India were marked by his exertions in the amelioration of the criminal law, the foundation of the Literary Society in Bombay, and his valuable communications in the *Asiatic Researches*. While sitting on an admiralty case, he declared that that court was bound to decide by the law of nations, and not (as had been maintained by some of the judges in England) by any direction from the king or his ministers. His return to England was hastened by a severe illness. He left Bombay in November, 1811, retiring from the recordership with a pension of £1200 per annum.

In July, 1813, he was elected, through the recommendation of lord Cawdor, as representative for the county of Nairn. In 1818, he was elected for *Knaresborough* in Yorkshire, through the influence of the duke of Devonshire, and was re-elected at the subsequent elections of 1820, 1826, 1830, and 1832. He was also elected Lord Rector of the university of Glasgow in 1822, and again in 1823. Sir James now became a person to whom a national importance and consideration were attached, one of the most distinguished and elevated characters of the country, who had acquired a conventional right from the confidence in the capacity of his judgment, and the recognition of the splendour of his abilities, to take an active and prominent part in the management of her affairs. His conviction of this truth prevailing in the quarters where it could be acted upon, he was appointed in 1828, one of his majesty's joint commissioners, and on the formation of the East India Company in 1830, he was made on the 1st December a joint commissioner for Indian affairs.

In parliament, Sir James took a prominent part in all questions connected with foreign affairs, international law; but more especially distinguished himself in the discussions on the slave trade, the

nal law, the liberty of the press, religious toleration, the slave trade, the settlement of Greece, reform in parliament, and on the right of our colonies to self-government. In politics he was a whig, and all his votes and speeches in parliament were in favour of the opinions and sentiments of that party; but he was, perhaps, one of the most moderate and tolerant politicians that ever existed, as the natural mildness and benevolence of his disposition never failed to single largely in whatever character he assumed, whether author, statesman, or judge.

In private life, he displayed all the domestic virtues, and all the better qualities of human nature. He was mild, benevolent, generous, humane, and unaffected. His conversational powers were of the first order, and never failed to delight all who had the good fortune to enjoy his society. His person is well formed, and above the middle stature. His countenance was intelligent, and exhibited a pleasing compound of grave and gay expression, indicative of readiness to sympathize with either of these feelings, as chance might direct their appeals to him. Sir James died in May, 1832, and was buried at Amplestead. As an author, his most finished production is his Dissertation on the progress of philosophy in the Encyclopedia Britannica. He also published a life of Sir Thomas More in Lardner's Encyclopedia, and two volumes of an abridged history of England. These two little volumes contain some striking passages and disquisitions; but in the opinion of Mr Campbell, they were merely the expansion of the prefatory matter which he intended for a great historical work on the affairs of England since the revolution, and which he had contemplated for several years, and in part written, but was too much impeded in his progress, both by his parliamentary duties and the infirm state of his health, to bring to conclusion. His labours were, nevertheless, given to the world in 1834, as a History of the British revolution. It was the opinion of Sir James that history ought to be written with feeling, but without passion; and to this excellent dogma he has himself firmly adhered. He also contributed various excellent articles to the Edinburgh Review.

Sir James was twice married; first in 1789, to Catharine Stewart of Gerrard Street, Soho, near to the Messieurs Stewart, formerly proprietors of the Morning Post, by whom he had issue, a son, who died in infancy, and three daughters—viz., Mary married to Claudius James Rich, Esq., of Donbary—Scotland, married to W. Erskine, Esq.—and Catharine married to Sir W. Wiseman, Bart. Mrs Macklin died in 1797.—He was afterwards married to Caroline, daughter of J. B. Allen, Esq. of Cressella, Wiltshire. By this lady, who died at Chesne, Genoa, on the 6th May, 1830, he had one son and a daughter; viz., Robert Mackintosh, Esq., a fellow of New College, Oxford; and Frances, married to H. Wedgewood, Esq. Staffordshire.

MACKLIN, CHARLES, an actor and dramatist of some celebrity, was born in Ireland, 1690, and employed in Dublin, as a bargeman, until his thirty-first year, when he went to England, and joined a company of strolling comedians. In 1716, he appeared as an actor in the theatre at Lincoln's-fields. It was not, however, until 1741, that he displayed his fame as an actor, by his admirable performance of Shylock, that being, indeed, the only actor in which he stood pre-eminent. He continued on the stage until 1789, which long interval marked by the usual vicissitudes of theatrical success rendered still greater by the temper of the individual. During the last years of his life, his standing became impaired, and in this state he died July 11, 1797, at the age of 107. His Man of

the World, a comedy, discovers a keen knowledge of life and manners, and exposes meanness, sycophancy, and political servility, with considerable skill. His Love A-la-mode also possesses kindred merit. Macklin was an entertaining companion, although dictatorial, and very irascible.

MACKNIGHT, JAMES, a learned Scottish divine, born in 1721, was educated at Glasgow and Leyden, and, on his return, was ordained minister of Maybole, where he remained sixteen years, and composed his Harmony of the Gospels, and his New Translation of the Epistles. In 1763, he published his Truth of the Gospel History. In 1772, he became one of the ministers of Edinburgh. Dr Macknight employed nearly thirty years in the execution of his last and greatest work, on the apostolical epistles—a New literal Translation from the Greek of all the Apostolical Epistles, with Commentaries and Notes, philological, critical, explanatory and practical (1793, 4 vols., 4to). He died in 1800.

MACLAURIN, COLIN; a celebrated mathematician and philosopher, born at Kilmoddan, in Scotland, in 1698. He studied at Glasgow, where he took the degree of M. A. at the age of fifteen, and defended a thesis on the Power of Gravitation. In 1717, he obtained the mathematical chair in the Marischal college at Aberdeen, and, two years after, was chosen a fellow of the royal society. In 1725, he was elected professor of mathematics at Edinburgh, where his lectures contributed much to raise the character of that university as a school of science. A controversy with bishop Berkeley led to the publication of Maclaurin's great work, his Treatise on Fluxions (Edinburgh, 1742, 2 vols., 4to). He died June 14, 1746. He was the author of a Treatise on Algebra; an Account of Sir Isaac Newton's Philosophical Discoveries; papers in the Transactions of the Royal Society; and other works.

MACPHERSON, JAMES; distinguished in literary history for his translations or imitations of Gaelic poems, said to have been composed in the third century. He was born, in Inverness-shire, in 1738, and studied at Aberdeen and Edinburgh. Having published Fragments of Ancient Poetry, translated from the Gaelic or Erse Language, a subscription was raised to enable him to collect additional specimens of national poetry. He produced, as the fruit of his researches, Fingal, an ancient Epic Poem, translated from the Gaelic (1762, 4to); Temora, and other Poems (1763, 4to); professedly translated from originals by Ossian, the son of Fingal, a Gaelic prince of the third century, and his contemporaries. (For an account of the controversy on this subject, see *Ossian*.) From the evidence of the contending parties, it may be concluded, that Macpherson's prose epics were founded on traditional narratives current among the Highlanders; but the date of the oldest of their lays is comparatively modern; and it is now difficult, if not impossible, to ascertain the precise extent of his obligations to the Gaelic bards of former ages. Mr Macpherson was afterwards agent to the nabob of Arcot, in consequence of which he had a seat in the house of commons from 1780 to 1790. He died in 1796, and was interred in Westminster abbey. He was also the author of a prose translation of Homer's Iliad, and of some other works.

MACRABIOTICS (from *μακρος*, long, and *βίος*, life); the science of prolonging life. Hufeland called his well known work *Makrabiolik*, or the Art of prolonging human Life. See *Longevity*.

MACROBIUS, AURELIUS AMBROSIIUS THEODOSIUS; a Latin author, in the reign of the emperor Theodosius, to whom he officiated as an officer of the wardrobe, and enjoyed a considerable share of

account, it should be kept in a bed of moistened earth or sand, whenever there is any delay in sowing it. A light, rich, and deep soil is the most suitable, and it should be ploughed to the depth of two feet. The time of sowing is in February, or the beginning of March, for the more northern, and September or October for the more southern regions. This kind of crop requires but little care and attention: for the first year, it is necessary only to keep it free from the weeds, and to hoe it slightly once during the summer; for the second, it requires hoeing in the spring, in the summer, and again, a little more deeply, in the latter part of the season; the same is requisite for the third year, except that the earth is heaped up about the base of the stems, in order to make it shoot with more vigour, and enlarge the roots. It is usual, before the second time of hoeing, to cut the stems for cattle, who are very fond of it; but this practice should not be repeated during the season, as recommended by some writers, or the roots will suffer. It is only at the end of the third year, that the crop is ready for harvesting; and, if it is suffered to remain in the ground beyond this period, more is lost than gained. The roots, at this time, contain the greatest quantity of colouring matter, and have attained their full size. The best method of obtaining the roots, is the following: A trench is dug along the rows, to the depth of two feet, when, by loosening the earth about the roots, they may be taken up entire. In a good soil, a single plant may yield forty pounds of the fresh roots, which diminish, in drying, six-sevenths or seven-eighths of their weight. The roots should be immediately washed, freed from all decayed parts, and dried as quick as possible, either by the sun or in a kiln. It is well observed, that madder is a hazardous crop, as, from its yielding a return only after a lapse of three years, it is often impossible to foresee what will be the state of the market at that time. Another mode of cultivation is from the roots, which are divided and set out. Twenty thousand plants may be allotted to an acre. The madder from Holland is most esteemed, and it is cultivated in that country to a very great extent. The process of pulverizing the roots, which is done by pounding or grinding, was, for a long time, kept a secret by the Dutch. In the state of a powder, it is of an orange-brown colour, and is liable to become damp, and to be spoiled, if kept in a moist place. Madder is used for dyeing woollen, silk, and also cotton goods, and the colour is very lasting, and resists the action of the air and sun. Within a few years, a method has been discovered of rendering the red exceedingly brilliant, and approaching to purple. It also forms a first tint for several other shades of colour, and besides, has, of late, been successfully used by painters, and is found to yield a fine rose colour. Madder also possesses the singular property of imparting its red colour to the bones of those animals which have used it for food, and also to the milk of cows, if they have eaten of it freely.

**Composition of Madder, and its Employment in Dyeing.** All the parts of the plant contain a yellow colouring matter, which, by absorption of oxygen, becomes red; the root is, however, most productive of this colouring matter, and is the only part employed in dyeing. It is distinguished into three parts—the bark, the middle portion, and the interior woody core. The bark contains the same colouring matter as the wood, but mixed with much brown extractive matter which degrades the hue. The bark may be separated in the milling, for it is more readily ground, and may thus be removed by the sieve. In the middle part of the root, which contains the finest colouring matter, and that in largest quantity, there may be distinguished, by the microscope, a great many

shining red particles, dispersed among the fibres. These constitute the rich dyeing material. The fibres contain a brown substance, similar to what is found in the bark. The roots occur in commerce, dried and in powder. They are also sold fresh; in which state they yield finer colours, dye more, and give up their colouring matter with one third less water. According to experiments made in England, five pounds of fresh roots go as far as four of the dry ones; and it is estimated that eight pounds of fresh roots are reduced to one in drying; hence the great advantage of using the green roots becomes apparent. The roots produced in the south of France, when sold in the fresh state, are called *alizari*. They are reddish-yellow, but, when ground, take a fine red tint. The madders of Germany and Holland are orange-yellow, passing into brown-red, having an acid and saccharine taste, and a strong smell. Jahn found, in 100 parts of madder,

Fatty matter, of a red-brown colour, resembling wax,	1.0
Red resinous matter,	3.0
Red extractive matter,	20.0
Oxidized extractive,	5.0
Brownish gum,	8.0
Ligneous fibre,	43.5
Acetate of potash and lime,	8.0
Phosphate, muriate, and sulphate of potash, about	2.0
Silica,	1.5
Oxide of iron,	0.5
	—100.0

According to other analyses, madder contains free tartaric acid. Kuhlmann finds, in the madder of Alsace, red colouring matter, dun colouring matter, ligneous fibre, vegetable acids, mucilage, vegeto-animal matters, (azotized), gum (4 per cent.), sugar (16 per cent.), bitter matter, resin, salts; the last consisting of carbonate, sulphate, and muriate of potash, carbonate, and phosphate of lime, with silica. The recent researches of M. M. Robiquet, Colin, and Kuhlmann, seem to prove that the differences in the madder dyes proceed from the relative proportions of two distinct colouring principles in madder, which they have called *alizarine* and *xanthine*. By digesting the powder of madder in water, and acting upon the jelly-like solution thus obtained, by boiling alcohol, an extract is afforded, which, at a subliming heat, yields the proper red colouring matter of madder, or *alizarine*. Or the ground madder may be treated directly with boiling alcohol; and to the alcoholic solution, dilute sulphuric acid is added, which precipitates the *alizarine* in a copious orange precipitate. *Alizarine* has a golden-yellow hue, is insoluble in water, soluble in alcohol and ether, is precipitated by acids, but not by alkalies, showing distinctly an analogy to resins. The *xanthine* was obtained from a fawn-yellow matter, soluble in alcohol and water, by precipitation with oxide of lead, washing the precipitate with alcohol, and extricating the colour by sulphuric acid. It has an orange-green tint, and a saccharine taste; alkalies cause it to pass into red, and acids to lemon-yellow. It is inferred by these chemists, that, in those fabrics which exhibit rose tints, the *xanthine* predominates; while in the violet, it is nearly wanting. From a knowledge of these facts, it becomes easy for a skilful dyer to promote the absorption, by the cloth, of one or other of these colouring principles, or to remove one of them, should both together have been attached to it. Kurrer has published, in the Polytechnic Journal of Dingler for 1827, a process, by a spirituous or vinous fermentation, and an immediate subsequent washing, which gives a perfect result with all the madders of commerce. The madder, penetrated with water, and covered over merely one inch, ferments in from thirty-six to forty-eight hours, when the whole is transferred into a tub containing a considerable quantity of cold water. Here the madder precipitates, and must be

washed with several cold waters. The ordinary madder-red dye is given in the following way:—the yarn or cloth is put into a very weak alkaline bath, at the boiling temperature; then washed, dried, and galled; or, when the calico is to be printed, for this bath may be substituted one of cow-dung, subsequent exposure to the air for a day or two, and immersion in very dilute sulphuric acid. In this way the stuff becomes opened, and takes and retains the colour better. After the galling, the goods are dried, and alumed twice; then dried, rinsed and passed through the madder bath. This is composed of three-fourths of a pound of good madder for every pound weight of the goods. The bath is slowly raised to the boiling point in the course of fifty or sixty minutes, more or less, according to the shade of colour wished for. When the boiling has continued for a few minutes, the stuff is taken out, washed slightly, dried, and treated a second time in the same manner, and with as much madder. It is then washed and dried, or passed through a hot soap bath, which carries off the taw-coloured particles. Other dyes likewise are added to the madder bath, to obtain other shades of colour; for instance, a decoction of fustic, weld, logwood, quercitron, knoppem, the mordants being modified accordingly. Hoelterhoff prescribes for *ordinary madder-red*, the following proportions:—twenty pounds of cotton yarn, fourteen pounds of Dutch madder, three pounds of gallnuts, five pounds of alum; to which are added, first, one pound and a half of acetate of lead, and, subsequently, a quarter pound of chalk. When bran is added to the madder bath, the colour becomes much lighter, and of a more agreeable tint.

*Adrianople madder-red* is given by many distinct operations. The first consists in cleansing or scouring the goods by alkaline baths, after which they are steeped in oily liquors, brought to a creamy state by a little carbonate of soda in solution. Infusion of sheep's dung is often used as an intermediate or secondary steep. The operation of oiling, with much manual labour, and then removing the superfluous or loosely adhering oil with an alkaline bath, is repeated two or three times, taking care to dry hard, after each process. Then follows the galling, aluming, maddering, and brightening, for removing the dun-coloured principle, by boiling at an elevated temperature, with alkaline liquids and soap. The whole is often concluded with a *rosing* by salt of tin.

MADIRA; an island off the western coast of Africa, belonging to Portugal; lon. 17° W.; lat. 32° 30' N.; square miles 407; population estimated at 100,000. The body of the people are of Portuguese descent, negro slavery not being permitted. The peasants are very poor, rude, and ignorant; the hardest labour is performed by females. The religion is Catholic. The island consists of a collection of mountains, the most elevated of which is 5068 feet high. The lower slopes are covered with vines, the loftier summits with forests of pine and chestnut. A great part of the sides of the hills consists of abrupt precipitous rocks, supposed to be of volcanic formation. Most of the rocks along the coast are composed of a white lava. The productions, besides wine, are wheat, rye, sugar, coffee, maize, kidney-beans, arrow-root, pine-apples, &c. The great production is wine, of well-known excellence. The quantity annually made is about 20,000 pipes, of which two-thirds are exported principally to Great Britain and the British colonies. The best vines grow on the south side of the island. There are several varieties of wines; the best is called *London particular*. The tax-gatherer takes the tenth part of the must: the rest is divided between the proprietor and the farmer. Goats abound, and still more hogs, which, being

allowed to run wild, acquire a taste of venom: the rabbit also is very common in the mountainous districts. Bees are very common, and the honey they produce is very delicate. Beggary is common among the peasants, and is considered to degrade. The Portuguese gentry live in a proud and noisy manner, associating little with strangers. It is the most opulent part of the inhabitants composed of British merchants, established there for a long trade. The commerce of the island comes almost entirely in the export of its wine. Persons stopping at Madeira, provisions and refreshments are exorbitantly dear. Adjacent to Madeira lies Santo, a small island, and the Desertas, viz. San Madeira itself, compose the group of the Azores. Funchal, the capital, with 20,000 inhabitants is lon. 17° 6' W.; lat. 32° 37' N. Porto Santo is covered by Zarco, a Portuguese navigator, in 1481 unless we may believe the romantic story of Macham, an Englishman of obscure condition, who is said to have eloped with a young lady of noble birth, and sail for France, but was driven to this region. The lady is said to have died in consequence of her sufferings, and Macham did not long survive. See the Voyage of Robert Macham in Hakluyt II. p. 14. Zarco discovered the island which he called *Ilha da Floresta*, on account of the magnitude and number of the trees that covered it, and which have now almost entirely disappeared. For the history of the recent events in Madeira, see *Portugal*. See Staunton, and Bowdich's voyages concerning information relative to this island. For information respecting the wines, see Henderson's *History of Wine*.

MADIRA; a river in South America, very abundant, and navigable; about 1100 feet long, rising in the mountains of Chuquibambilla, in the republic of Peru. It runs an easterly course to the Cruz de la Sierra, with the names of La Pinta, Chiquisqa, Cachimayo, and Guapay; and, turning to the north, enters the Amazon river, with the name of *Madeira* (Portuguese for wood), on account of the vast quantity of wood which it carries down to the current. It abounds in excellent fish.

MADNESS. See *Mental Derangement*.

MADOC; according to a Welsh tradition, a Welsh prince, who, in consequence of some domestic dissensions, went to sea with ten ships and 30 men in the twelfth century, and discovered and crossed the ocean far to the west. He made several voyages to and from this unknown land, but finally lost the knowledge of his countrymen. The story is to be found in the Welsh *Trads*, and Hakluyt gives an account of the voyages in his collection. Later travellers have imagined that they had discovered some of these early emigrants in different parts of the country, and we have had stories of white Indians and Welsh Indians, &c. See Humboldt's *Personal Narrative*, book ix., note A.

MADONNA (*Italian*); properly, any holy female. Petrarch often calls Laura *madonnina*; but the name is more particularly applied to the Virgin Mary, as she is called in other languages, *our lady*. Many excellent pictures are known under the name of *Madonna*, the famous *Madonna di Sesto* of Raphael, is the *Madonna* of Dresden.

MADRAS, PRESIDENCY OF; part of the British possessions in Hindoostan, comprehending the whole of the country south of the Krishna, excepting a narrow strip on the western coast and the Northern Circars. A considerable portion of it is governed by native princes subordinate to the British, and protected by a subsidiary force; the rest is under the immediate direction of the government and revenue. Madras, and, in 1822, was subdivided into four districts, with an area of 166,500 square miles.

and a population of 13,677,000. The commerce of this presidency is inconsiderable, compared with that of the others, in consequence of the want of a harbour, and of navigable rivers. Madras, the capital of the presidency, is the largest city on the coast of Coromandel. Lat.  $13^{\circ} 5' N$ ; lon.  $80^{\circ} 21' E$ ; 1044 miles from Calcutta, 770 from Bombay; population, by census, in 1823, 415,751. It consists of fort St George, the Native or Black town, and the European houses in the environs, surrounded by gardeus. The heavy surf which beats on the shore, and the rapid current in this part of the gulf, render the landing often dangerous and always difficult. Boats, formed of three planks sewed together, are used for crossing the surf; but in stormy weather, when no boat can venture through it, the native fishermen pass it on rafts called *alamarans*. The Black town is an irregular assemblage of brick and bamboo houses, crowded together in narrow and dirty streets, inhabited by Hindoos, Mohammedans, Armenians, Portuguese, and other Europeans engaged in the company's service. The houses of the Europeans are generally of but one story, surrounded with verandas; wet mats of rusa grass are placed before the doors and windows, in the rainy season, to perfume and cool the apartments; the heat is then excessive. Besides some literary and charitable institutions, Madras contains the government houses, and is the seat of the supreme court of the presidency.

MADRID; the capital of Spain, is situated in New Castile, and in a province of the same name, on the Manzanares, near the centre of the kingdom, about 200 miles from the sea; 650 miles S. S. W. of Paris, 350 W. by S. of Rome; lon.  $3^{\circ} 38' W$ ; lat.  $40^{\circ} 25' N$ ; population, by a census in 1825, 201,344, including strangers. It is built on several eminences, and is 2200 feet above the level of the sea, being the most elevated capital in Europe. Seen at a distance, it presents nothing that announces a great city, and the environs being destitute of wood, and even of vines, while most of the villages are in hollows, the prospect is uncommonly dreary. On drawing near, the prospect is more cheerful. The city is of an oblong form, about six miles in circuit, surrounded by a high earthen wall, but has no ditch, or any other means of defence. The old streets are narrow and crooked, but many others are wide, straight, and handsome. They are paved, kept clean, and lighted. The city has 15 gates, 42 squares, mostly small, 506 streets, 77 churches, 75 convents, 8 colleges, and 18 hospitals, 65 public edifices, 17 fountains, and several promenades, among which the Prado is the principal. The private houses are uniform, generally low, with rated windows, and have little striking in their exterior. The churches are less magnificent than in several other cities in Spain. There are two palaces on a large scale—the *Palacio Real* at the western extremity, and the *Buen Retiro* at the eastern. The *Palacio Real* is of a square form, extending each way 404 feet, 86 feet high; the enclosed court 120 feet square. It is strongly built, the exterior elegantly ornamented, and contains a collection of paintings of the best masters of Flanders, Italy, and Spain. The royal library contains about 130,000 volumes, and 2000 manuscripts. The great school of Madrid has sixteen masters, who teach the various arts and sciences. There is another seminary, on an equally extensive plan, for the sons of the nobility and gentry. There are academies for the study of the several fine arts, a botanic garden, and a variety of charitable institutions. Madrid is the *Mantua Carpetanorum* of the Romans, and the *Majoritum* of the middle ages. Philip II. first made it the capital of the kingdom, on account of its central position. It was occupied by French troops in 1808, and was the residence of

Joseph Bonaparte until 1812. It was afterwards occupied by the British. In the French expedition into Spain in 1823, it was again entered by the French, under the duke d'Angouleme. See *Spain*.

MADRIGAL; a short lyric poem adapted to express ingenious and pleasing thoughts, commonly on amatory subjects. It contains not less than four, and generally not more than sixteen, verses; and consists, commonly, of hendecasyllables, with shorter verses interspersed, or of verses of eight syllables irregularly rhymed. In the soft Provencal dialect, it was called *madrial*, because used for subjects of a *material*, that is, of a common and low character. Other derivations are given, as from *mandra*, which signifies, in Greek and Latin, a sheepfold. The earliest madrigals were those of Lemmo of Pistoia, set to music by Casella, who is mentioned by Dante. They were afterwards subjected to stricter rules in regard to the number of verses and the rhyme. In the sixteenth and seventeenth centuries, we find madrigals for the organ and other instruments. The madrigals of Tasso are among the finest specimens of Italian poetry. This form has been successfully cultivated by the Germans.

MADURA; a territory celebrated in the Hindoo mythology, now forming a part of the Madras presidency. The capital, of the same name, contains the vast palace of the ancient rajahs, now going to decay, with its lofty dome, ninety feet in diameter, and the Great Temple, one of the most remarkable monuments of Hindoo architecture, with its four gigantic porticoes, each surmounted with a pyramid of ten stories. Mahadeva, under the mystic form of the *lingam*, is the principal object of adoration. Among other remarkable places in this territory is the island of Rameswara (the Lord Rama), separated from the main land by a narrow strait, across which stretches a line of rocks called *Adam's bridge*. Rama, seized with compunction for the slaughter of the Brahmins in his wars, here set up the holy *lingam*.

MÆANDER, now MEINDER; a river of Asia Minor, which takes its rise in Phrygia, on mount Celanus: it forms the boundary between Caria and Lydia, and flows into the Ægean sea between Priene and Miletus. It was celebrated among the ancients for its winding course. The name was thence transferred to the intertwined purple borders on mantles and other dresses, as well as upon urns and vases; hence, figuratively, *meandering paths*, *meandering phrases*; that is, artificial turns and circumlocutions, &c.

MÆCENAS, C. CILNUS, the favourite of Augustus, and patron of Virgil and Horace, traced his genealogy from the ancient Etrurian kings. He has been described as a pattern of every political virtue, and a most generous patron of the sciences. He was never, in fact, however, a public minister; for even the office of prefect of Italy and Rome, which he held after the victory at Actium, was only a private trust; and the notions which are entertained of him as the protector of the learned, and which have made his name proverbial, seem to be very much exaggerated. It is true that he collected at his table poets, wits, and learned men of every description, if they were pleasant companions, sought their conversation, and sometimes recommended them to Augustus; but it was from political motives, for the purpose of gaining friends for Augustus, and extending his fame. It is true, also, that he gave Horace a farm, and obtained his pardon and freedom, and that he enabled Virgil to recover his property; but, for a man whom Augustus had made exorbitantly rich, the present to Horace was a trifle, and Virgil merely received from him what was justly his own. *Mæcenas* was

not a man of great qualities; but he well understood how to employ the favours of fortune. Without strong passions and a lofty ambition; endowed with a fine taste and a sound judgment; prudent, and cool enough to do whatever he did rightly and thoroughly, and sanguine enough not to shrink before difficulties, and always to anticipate a happy result, but too fond of ease and pleasure to love or to pursue any business, if he was not compelled by necessity; of an agreeable person, gay in conversation, affable and generous; inclined to rally others, and equally willing to receive their attacks in return; artful, and skilful in employing others for his own purposes; careful in the choice of his intimate friends, but faithful and constant after he had once chosen them; and, if necessity required, capable of any sacrifice;—these qualities gained him the confidence of Augustus, which he enjoyed undiminished till his death. Augustus used to banter him on his effeminacy, his love for curiosities, precious stones and gems, his affectation in mixing old Etrurian words with Latin, and making new words. In return, Mæcenas ventured to make use of great freedom, or rather of severity of expression, as, for instance, during the triumvirate, when Octavius was in the tribunal, passing many sentences of death, Mæcenas presented him his tablets with the words, "*Surge tandem, carnifex!*" (Rise, executioner!)—a reprimand which produced its effect; and Octavius did not take offence at it. When Augustus consulted with Agrippa and Mæcenas, whether to retain or resign the supreme power, Mæcenas, in opposition to the advice of Agrippa, urged him to retain it. Thus he proved, that he preferred the profitable to the honourable. Mæcenas appears less worthy of esteem as a private man. He had a palace, in the form of a tower, on the Esquiline hill, which was surrounded with splendid gardens. Here, at the close of the civil wars, being about forty years old, he resigned himself to indolence, luxury, and frivolous pleasures. Of all spectacles, he was most fond of the pantomimic dance, which he himself introduced into Rome. Bathyllus (q. v.), who was famous for his beauty, and his skill in this exhibition, was his favourite. He was no less fond of the pleasures of the palate. His indolence betrayed itself in his dress, in his gait, in his manners, and even in his style. He died in the year of Rome 745. His writings are mentioned by Seneca, Isidorus, and others; but none of them are extant.

MAELSTROM, or MOSKOE-STROM; a whirlpool in the North sea, near the island of Moscoe. In summer, it is but little dangerous, but is very much so in winter, especially when the north-west wind restrains the reflux of the tide. At such times, the whirlpool rages violently, so as to be heard several miles, and to engulf small vessels, and even whales, which approach it.

MENADES (from *μαιναμαι*, I am mad); a name applied to the Bacchanalians, the priestesses of Bacchus.

MEONIDES. (See *Homer*.) The Muses were likewise sometimes called *Meonides*, because Homer was viewed as their greatest favourite.

MEOTIS. *Palus Meotis* was the name given by the ancients to what is now called the Sea of Azoph. See *Azoph*.

MAESE. See *Meuse*.

MAESTRICH. See *Mastricht*.

MAESTRO; the Italian for *master*, and not unfrequently used in *maestro di capella*, chapel-master. *Maestro del sacro palazzo* is the papal censor of books and the pope's confessor, a Dominican.

MAFFEI; a celebrated Veronese family, which has produced many eminent men.

1. *Alessandro* (marquis), born 1682, served under Maximilian Emanuel, in the campaign against the Turks and the French, distinguished himself in the war of the Spanish succession, and, after the treaty of Belgrade (1717), was made field-marshal, and died at Munich, 1730. The memoirs which appeared under his name (Verona, 1737), were written by his brother, Scipio.

2. *Bernardine*, born at Rome, 1511, created a Padua, created cardinal at the age of thirty, died at the age of forty. He possessed a large number of coins, of which he made use in his artistry from Medals.

3. *Francesco Scipio* (marquis), born at Rome, 1675, studied in the Jesuits' college at Padua, and went to Rome in 1693, where he gave himself to poetry, and was received into the Acadia. He afterwards entered the military service under his brother, Alexander, in the war of the Spanish succession, and, in 1704, was present at the battle of Donauworth as a volunteer. His literary taste soon recalled him to Italy, where he wrote his *Della Scienza chiamata Ceremoniale*, a work full of learned research into the manners of the ancients in settling private quarrels, and in maintaining that duelling is contrary to reason, and the welfare of society. To improve the condition of Italian literature, the decline of which he lamented, he undertook, in connection with Zeno, and Vallisneri, the publication of a periodical, the object of which was to criticize modern works, make his countrymen acquainted with foreign literature. At the same time, he directed his attention to the Italian drama, which he enriched by his *Furberie Italiane*—a collection of the best comedies and tragedies (3 vols., 1723)—and by his original tragedy of *Merope*. (See *Italian Theatre*, in the *Encyclopædia Italica*.) This production, although only a parody essay towards uniting the Greek and French tragedy, met with the most brilliant success. His comedy *La Ceremonia* was also brought upon the stage with applause. To revive the study of the Greek language, which was much neglected by his countrymen, he invited skilful teachers to whom he supported at his own expense. The discovery of some important manuscripts in the cathedral of his native city gave his learned labours, in turn, one of the results of which was *Iconografia Italica* (1731). Maffei's reputation had now reached foreign countries, and, in 1732, he set on a visit to France, Britain, Holland, and returned by the way of Vienna, where he was received in the most flattering manner by Charles VI. He died at Verona, in 1755, and a monument is there erected to his memory. Among his numerous works, the most important, besides those already mentioned, are *Rime e Prose* (1719); *Lettere diplomatiche: Storia l'eroica*, and other writings relative to his native city. His complete works appeared at Venice 1781, 21 vols., 4to).

4. *Giovanni Pietro*, one of the most learned writers among the Jesuits, was born at Bergamo in 1641, went to Rome, where he became acquainted with Annibal Caro, and other distinguished men, and afterwards professor of rhetoric at Genoa, the secretary of the republic, and, two years later, entered the order of the Jesuits. In Rome, he published a Latin translation of Acosta's *History of India* (1570). He was invited by Henry of Portugal to Lisbon, and employed to write a general history of India; for which purpose he had access to original documents in the archives. This work (*Historiarum Indicarum Libri xvi.*) appeared at Frankfurt in 1588 (better edition, Cologne, 1805), and is characterized rather by beauty of style than by profundity.

ness of research or acuteness of judgment. He died at Tivoli, 1603.

5. *Paolo Alessandro*, born at Volterra, 1653, died in Rome, where he had chiefly resided, in 1716. By an industrious study of museums and cabinets, he acquired an extensive knowledge of ancient works of art. His principal works are *Raccolta di Statue Antiche e Moderne* (Rome, 1704), and an edition of Agostini's *Gemme Antiche*, which he enriched with valuable notes and additions; it is less prized by connoisseurs than the old and scarce edition of 1657, which is remarkable for the beauty of its engravings.

6. *Raphael*, called also *Raphael of Volterra*, born at Volterra, in the middle of the fifteenth century, died there in 1522. His chief work is *Commentarii Rerum Urbanarum Libri xxxviii.* (Rome 1506), of which the first twenty-three books contain geographical and biographical treatises: the remainder is a general view of the state of knowledge at that time.

MAFRA; a town of Portugal, province of Estremadura, six leagues north-west of Lisbon, containing a magnificent palace, erected by John V. It is constructed of marble, and is nearly a square of 728 feet. The church is placed in the centre of the fabric, having the palace on one side and the convent on the other. It was begun in 1717, and finished in 1742. A beautiful park and fine gardens are attached to it. The kings of Portugal have often resided here. The palace includes a college, which has a library of 40,000 or 50,000 volumes, and a fine mathematical apparatus. Population, 2,800. See Murphy's splendid work, published in London, in 1791, the text of which is by Luis de Sousa.

MAGADOXO, MAGADOSHO, or MAKDIHO; a kingdom of Africa, situated on the coast of the Indian sea, extending from the river Juba, near the equator, to beyond the fifth degree of north latitude. How far it extends to the westward, is not known. It has its name from its capital, situated in *large bay*, formed, as has been said, by the mouth of the river of the same name, which is called by the Arabs the *Nile of Magadoxo*, by reason of its annual overflowing. Owen's chart (1827) lays down no river between the Juba and 8° north, an extent of 30 miles. The city of Magadoxo is a place of great commerce, and vast resort from the kingdoms of Senegal, and other parts; whence their merchants bring cotton, silk, and other cloths, spices, and a variety of drugs, which they exchange with the inhabitants for gold, ivory, wax, and other commodities. It is chiefly inhabited by Mohammedans. The town is situated in lon. 45° 19' E.; lat. 2° 1' N.

MAGALHAENS, or MAGELLAN, FERNANDO; a famous Portuguese navigator, who discovered the straits at the extremity of South America, and conducted the first expedition round the world. He served under Albuquerque in the East Indies, and distinguished himself, especially at the taking of Malacca, in 1510. He afterwards entered into the service of Spain, and was intrusted, by Charles V., with the command of a fleet destined to explore a passage to the Molucca islands, by sailing westward. His voyage was commenced September 20, 1519. At the end of October, 1520, he entered the straits since called after his name, and, on the 27th November, discovered the Pacific ocean. Continuing his course, he arrived at the Ladrone Islands, and subsequently at the Philippines, on one of which he lost his life in a skirmish with the natives, in 1521.

MAGAZINES. See *Periodicals*.

MAGDALEN, or MARY OF MAGDALA, a town on the lake of Galilee, in Palestine, by an old Hebrew interpretation, is confounded with the sin-

ner mentioned in Luke vii., whose name is not given, and who, on account of her repentance and trust in Christ, was assured by him of the forgiveness of her sins. The history of her conversion from a licentious life being confounded with the story of Mary of Magdala (see *Mary*), the ideal of St Magdalen was formed, and has given occasion to some of the most celebrated productions of the pencil. Penitent females who had lived licentious lives, early banded together, and formed a religious order, under the protection of St Magdalena, which existed in Germany before 1215; and similar institutions arose about the same time in France, Italy, and Spain. In France, they termed themselves *Madelonettes*. They adopted the rules of St Augustine, and formed various congregations, distinguished by the colour of their dress (white, gray, or black), and by the different degrees of strictness in their mode of life. This order, which admitted, at first, only courtesans and females who had lost their honour, has spread into both Indies; and, although the members of it were only bound to social exercises of devotion, and did not apply themselves to useful offices, and have, moreover, departed from their ancient laws, by the reception of virtuous women, yet the institutions continue till the present day. The Catholic Magdalen establishments now remaining in Protestant countries, have been obliged to devote themselves to the care of the sick; such as that at Lauban, in Upper Lusatia.

*Magdalen Societies*, so called from the view of the character of Mary Magdalen already given, have also been established, of late years, to afford a retreat to penitent prostitutes, and enable them to pursue the work of their own reformation. Such a society was established in London, in 1758, principally by the exertions of doctor Dodd, and, since that period, between 4000 and 5000 abandoned women have enjoyed the benefits of the establishment, and have been restored to their families and society. By far the greater number of those who have been protected here have subsequently continued respectable and correct in their behaviour. No female who has conducted herself with propriety in the house, is allowed to leave it unprovided for. Similar societies also exist in some other of our principal cities.

MAGDALENA, a large river of South America, rises from lake Pampas, in the Colombian province Cundinamarca, receives many other rivers, and falls, after a course of 900 miles, by two branches, into the Caribbean sea. It contains numerous alligators. It gives name to a department of Columbia. There is another river of the same name in Texas.

MAGDALENE ISLANDS; a cluster of islands, seven in number, situated in the gulf of St Lawrence, about forty-two miles north-west from the island of Cape Breton. They are thinly inhabited by fishermen. Lon. 61° 40' W.; lat. between 47° 13' and 47° 42' N.

MAGDEBURG, one of the most important fortresses of Germany, and, from the time of Charlemagne, of considerable commercial interest, capital of the former duchy, and present Prussian government of the same name, in the province of Saxony, is situated on the left bank of the Elbe, which is crossed by a wooden bridge, about ninety-five miles from Berlin; lon. 11° 38' E.; lat. 52° 8' N.; with 36,000 inhabitants, exclusive of the garrison. Magdeburg, with her sixteen bastions, extensive outworks, &c., forms one of the strongest fortresses of Europe, and commands the middle Elbe. The Gothic cathedral is worthy of notice. Magdeburg has two excellent gymnasia, many other establishments, and considerable transit trade between the coasts and the interior of Germany, with some manufactures,

&c. In 1743, a canal was constructed uniting the Elbe and Havel, and, therefore, the Elbe and Oder. Magdeburg was the favourite residence of Otho I. The town took an active part in the reformation. It was taken by assault, May 20 (10), 1631, by the Catholic generals Tilly and Pappenheim, and was the scene of great cruelties. In 1806, it was dishonourably surrendered, by general Kleist, to Ney, after the battle of Jena. By the peace of Tilsit, it was ceded to France, which annexed it to the kingdom of Westphalia, and, by the peace of Paris, it was restored to Prussia. Carnot lived here, when in banishment as a regicide, and died here.

**MAGDEBURG, CENTURIES OF.** See *Centuries of Magdeburg*.

**MAGELLAN.** See *Magalhaens*.

**MAGELLAN, STRAITS OF;** the passage between the Atlantic and Pacific oceans, at the southern extremity of the continent of America; upwards of 300 miles in length, from cape Virgin, in the Atlantic, to cape Desire, in the Pacific ocean, in some places several leagues over, and in others not half a league. The passage through these straits is difficult and dangerous. Lon.  $70^{\circ}$  to  $77^{\circ}$  W.; lat.  $52^{\circ}$   $30'$  to  $54^{\circ}$  S.

**MAGELLANIC CLOUDS;** whitish appearances, like clouds, seen in the heavens towards the south pole, and having the same apparent motion as the stars. They are three in number, two of them near each other. The largest lies far from the south pole; but the other two are about  $11^{\circ}$  distant. They may be multitudes of stars, like the milky way.

**MAGELLONA THE BEAUTIFUL;** the name of an old French novel, reproduced in various forms, in many languages, probably composed in the eleventh or twelfth century, by a Provencal minstrel. Magellona is the daughter of the king of Naples; Peter, son of the count of Provence, is her lover. Petrarch is said to have given the present form to the novel. Its title is *L'Histoire du noble et vaillant Chevalier Pierre de Provence et aussi de la belle Maguellone, Fille du Roy de Naples* (1496, 1524, 1625). There are other editions, without year and place. The duke of Marlborough paid, in 1813, for a copy in folio, £22 1s. Lope de Vega made use of the subject in his drama, *The Three Diamonds*. See Millin's *Voyage en France*, vol. iv, p. 354; also Gorres's *Deutsche Volksbücher*.

**MAGGIORE, LAKE.** See *Lago Maggiore*.

**MAGIANS (Magi)** derive their name from *mag* or *mag*, which signifies *priest* in the Pehlvi language. (See *Indian Languages*.) They were the caste of priests with the Persians and Medians. They were in exclusive possession of scientific knowledge. As sacrifices and prayers could be offered to Ormuzd only through them; as Ormuzd revealed his will only to them, and they therefore could pry into futurity; in short, as they were considered mediators between the people and the Deity,—they necessarily possessed great authority, which they abused. Zoroaster was their reformer. He divided them into learners, teachers, and perfect teachers. For the doctrine of Zoroaster, see the article.

**MAGIC.** Men, as soon as they began to observe the phenomena around them, could not help seeing the close connexion which exists between man and external nature. When the sun sets, he wants rest, and sleep approaches with night; atmospheric changes affect his health; certain wounds become painful with the change of weather, or at certain phases of the moon; some men are painfully affected in the presence of particular animals (see *Antipathy*); certain liquids exhilarate, others destroy life. Such and similar observations, combined with many of an erroneous and exaggerated character, springing from

credulity and ignorance, soon led men to seek the mysterious connexion of man and nature, and the influence of things or causes without him, upon his mind and body, as a peculiar science, which his occupations were not yet divided, at a career devoted to the priests, whose exclusive possession of knowledge made them the guides of men in science and the arts as well as in religion. This is witnessed by some, the natural origin of supernatural magic; others, on the contrary, believe that men once actually existed a deeper knowledge of the power and influences of nature, transmitted from earlier and purer ages, but lost with increasing time and age, and others believe that men once possessed a power of producing supernatural effects with the aid of evil spirits, as those particularly gifted with a pre-eminence were able to produce supernatural effects with the assistance of God. Magic, the common name for things, is, in the Indian mythology, the power of intellectual as well as of sensual love. In Sanscrit signification, she is the muse, the goddess of prophecy and poetry, and also of deception, as a word *magic* seems to be connected with the root *ma*, so various, yet easily conjoined meanings. Thus Persia, and the neighbouring countries, famous for their knowledge of astronomy and astrology, are described as the chief seats of the ancient magic. This doctrine seems to be, in part, of great antiquity. This doctrine represented opposition or strife as a parent and original cause of all things. Also the opposition between light and darkness, Ormuzd and Ahriman, was established, the whole series of beings, the whole sensual world, proceeded from a constant struggle of light and darkness, good and evil. The change of day and night, light and darkness, the whole series of ages, time itself, are the consequence of this struggle, in which constant light, sometimes darkness, appears and disappears, and finally light shall conquer for ever. If we thus stand under the influence of preserving and destroying powers in nature, it is clear that he who can master these powers could dispose of his power of the things subject to them; and the doctrine of the Magians was, that, by prayer and a true knowledge of those laws of opposition, love and hatred, light and darkness, such power could be obtained; and that thus, also, it was possible to pry into futurity. But it was believed that as the world became with the light of the ancient doctrine of the magi so obscured, and those who bore the same doctrine, at last, only evil-disposed survivors. The magical branch of their art was, now, the essence of it by potions and enchantments. Their art consisted partly of ingredients, which were used by physicians as stimulents, partly of charms, which who had died longing for food or sex, or the other hungry dogs, and other still more disgusting instances. Magic, at this period, also occupied itself with fortune-telling, calling up the dead, travelling by the look (with the Romans and Greeks, called *phantasmagoria*—a superstition which we find existing in the present times against witches in modern times, with the preparation of amulets, the infusing of power in a glass by correspondent applications to the magic of the &c. He who wishes to become acquainted with the poetical side of magic, ought to read the *Arabian Nights*. It can hardly be doubted that the doctrine of the ancient magicians was founded, to a considerable degree, upon a superior knowledge of the phenomena of nature. The name of the magi, magus, or of *chanting stone* (according to one derivation), seems to indicate that it was not unknown to the magi, that some of their phenomena seem referable to spiritualism.—Interesting information on the subject is contained in Klecker's *Erkenntnis*, and other sources as I

*Magikon*, which contains the history of numerous secret doctrines; see also Creuzer's *Symbolik und Mythologie*; Windischmann's *Inquiries respecting Astrology, Alchemy, and Magic*, (in German, Frankfurt, 1818); also, George Conrad Horst, *On Ancient and Modern Magic, its Nature, Origin, and History* (in German), with his *Zauberbibliothek* (6 vols., Ments, 1820—25). See *Divination, Demon, Witchcraft*.

MAGINDANAO; See *Mindanao*.

MAGISTER ARTIUM. See *Master of Arts*.

MAGISTER EQUITUM. See *Master of the Horse*.

MAGISTER MATHSEOS. See *Pythagoras*.

MAGISTRATE; a public civil officer, invested with the executive government or some branch of it. Thus, in monarchical governments, a king is the highest or first magistrate. But the word is more particularly applied to subordinate officers, as governors, intendants, prefects, mayors, justices of the peace, and the like. In Athens, Sparta, and Rome, the chief magistrates were as follows: From Cecrops to Codrus, Athens had seventeen kings; from Medon to Alcmaeon, thirteen archons for life; from Charops to Eryxias, thirteen decennial, and from that time, annual archons. The democracy established by Solon was changed into a monarchy by Pisistratus, who was succeeded by his sons Hippias and Hipparchus. The ancient democracy was then restored, but was interrupted for a year, after the unhappy issue of the Peloponnesian war, by the domination of the thirty tyrants, and, for a short time, by that of the decemviri. Under the Macedonian kings, and afterwards under the Romans, except at intervals, the freedom of Athens was only a name. Antipater decreed that 9000 of the principal citizens should administer the government, and Cassander made Demetrius Phalereus prefect of the city. In Sparta, the magistrates were kings, senators, ephori, &c. Chosen by a majority of suffrages, they held their offices, some, as the kings and senators, for life, others for a limited time. Among the Romans, there were different magistrates at different times. The first rulers were elective kings. After the expulsion of Tarquin the Proud (in the year of the city 244, B. C. 510), two consuls were elected annually to administer the government. In cases of pressing danger, a dictator was appointed, with unlimited power, and, in case of a failure of all the magistrates, an interrex succeeded. This course continued, with occasional interruptions, till the year of the city 672, or B. C. 81, when Sylla assumed the supreme power, as perpetual dictator. After three years, however, he voluntarily laid aside his authority, and the consular government lasted till Julius Caesar caused himself to be declared perpetual dictator, B. C. 49. From this time, the consular power was never entirely restored. Soon after the assassination of Caesar, the triumvirs, Octavius, Lepidus, and Antony, assumed still more absolute sway; and Octavius finally became chief ruler of the Roman empire, under the title of *princeps* or *imperator*. He retained the magistrates of the republic only in name. In the beginning of the republic, the consuls seem to have been the only regular magistrates. But, on account of the constant wars, which required their presence in the army, various other magistrates were appointed, as pretors, censors, tribunes of the people, &c. Under the emperors, still different officers rose. The Roman magistrates were divided into ordinary and extraordinary, higher and lower, curule and not curule, patrician and plebeian, civic and provincial. A distinction between patrician and plebeian magistrates was first made in the year of Rome 260 (B. C. 494); that between civic and pro-

vincial, when the Romans extended their conquests beyond the limits of Italy. The ordinary magistrates were divided into higher and lower; to the former belonged the consuls, pretors, and censors; to the latter, the tribunes of the people, ediles, questors (q. v.), &c. The most important extraordinary magistrates were the dictator, with his master of horse, and the interrex. The difference between curule and not curule magistrates depended on the right of using the curule chair, which belonged only to the dictator, consuls, pretors, censors; and curule ediles. During the republic, magistrates were chosen at the *comitia*, particularly in the *centuriata* and *tributa*; in the former, the higher ordinary authorities were chosen, and in the latter, the lower ordinary authorities. Under the emperors, the mode of the election of magistrates is uncertain.

MAGLIABECCHI, ANTONIO; a learned critic, who was librarian to the duke of Tuscany, celebrated alike for the variety of his knowledge and the strength of his memory. He was born at Florence, in 1633, and, in the early part of his life, was engaged in the employment of a goldsmith, which he relinquished to devote himself to literary pursuits. He was assisted in his studies by Michael Ermini, librarian to cardinal Leopold de' Medici, and other *literati* residing at Florence. Through unremitting application, he acquired a multifarious stock of erudition, which made him the wonder of his age. Duke Cosmo III. made Magliabecchi keeper of the library which he had collected, and gave him free access to the Laurentian library, and the Oriental MSS.; of the latter collection he published a catalogue. His habits were very eccentric. His attention was wholly absorbed by his books; among which he took his rest and his meals; dividing his time between the ducal library and his private collection, interrupted only by the visits of persons of rank or learning, attracted towards him by the report of his extraordinary endowments. He left no literary work deserving of particular notice; but he freely afforded information to those authors who sought his assistance in their own undertakings. Notwithstanding his sedentary mode of life, he was eighty-one years old when he died, in July, 1714. See Spence's *Parallel between R. Hill and Magliabecchi*.

MAGNA CHARTA LIBERTATUM; the Great Charter of Liberties, extorted from king John, in 1215. (See *John*.) The barons who composed the Army of God and the Holy Church, were the whole nobility of England; their followers comprehended all the yeomanry and free peasantry, and the accession of the capital was a pledge of the adherence of the citizens and burgesses. John had been obliged to yield to this general union, and June 15, both encamped on the plain called Runnymede, on the banks of the Thames, and conferences were opened, which were concluded on the 19th. The preliminaries being agreed on, the barons presented heads of their grievances and means of redress, in the nature of the bills now offered by both houses for the royal assent. The king, according to the custom which then and long after prevailed, directed that the articles should be reduced to the form of a charter, in which state it issued as a royal grant. Copies were immediately sent to every county or diocese, two of which are yet preserved in the Cottonian library in the British museum. To secure the execution of the charter, John was compelled to surrender the city and Tower of London, to be held by the barons till August 15, or until he had completely executed the charter. A more rigorous provision for securing this object is that by which the king consented that the barons should choose twenty-five of their number, to be guardians of the liberties of the kingdom, with power,

in case of any breach of the charter, and the delay or denial of redress, to make war on the king, to seize his castles and lands, and to distress and annoy him in every possible way (saving only the persons of the royal family), till justice was done. Many parts of the charter were pointed against the abuses of the power of the king as lord paramount; the tyrannical exercise of the provisions of the forest laws was checked, and many grievances incident to feudal tenures were mitigated or abolished. But beside these provisions, it contains many for the benefit of the people at large, and a few maxims of just government, applicable to all places and times, of which it is hardly possible to overrate the importance of the first promulgation by the supreme authority. "No scutage or aid shall be raised in our kingdom (except in three given cases) but by the general council of the kingdom." This principle, that the consent of the community is essential to just taxation, has been the life of the British constitution. The thirty-ninth article contains the celebrated clause which forbids arbitrary imprisonment and punishment without lawful trial; "Let no freeman (*nullus liber homo*) be imprisoned or disseized, or outlawed, or in any manner injured or proceeded against by us, otherwise than by the legal judgment of his peers, or by the law of the land. We shall sell, delay, or deny right or justice to none." This article contains the writ of *habeas corpus* (q. v.) and the trial by jury, the most effectual securities against oppression, which the wisdom of man has devised, and the principle that justice is the debt of every government, which cannot be paid without rendering law cheap, prompt, and equal. The twentieth section is hardly less remarkable:—"A freeman shall be amerced in proportion to his offence, saving his contentment, a merchant saving his merchandise, and the villain saving his wagonage." The provision which directs that the supreme civil court shall be stationary, instead of following the king's person, is an important safeguard of the regularity, accessibility, independence, and dignity of public justice. Blackstone has given an edition of the Charter, with an introduction, in his Law Tracts. See also the histories of Hume and Mackintosh.

**MAGNÆAN INSTITUTE**; founded by professor Arnus Magnæus, for the publication of Icelandic manuscripts at Copenhagen.

**MAGNA GRÆCIA**; the southern part of Italy, which was inhabited by Greek colonists. D'Anville bounds it, on the north, by the river Silar or Selo, which empties into the gulf of Pæstum. But it seems more natural to annex Campania to it, and to take for the boundaries on the one side, the Vulturnus, where the territory of Cuma ceased, and on the other the Frento or Fortore, which forms the boundary of Apulia, and flows into the Adriatic, as the Grecian colonies reached to that point. The tribes, indeed, which had emigrated into Italy from the north, in the earliest times, spread through all Italy, but always confined by the Apennines, and in the interior of the country. Several centuries after, Greeks came hither, began to build cities on the unoccupied coasts, and intermingled by degrees with the inhabitants of the interior. The foundation of these Grecian colonies was unquestionably after the destruction of Troy. Athenians, Achæans, Eubœans, &c., with some Trojans, repaired hither. According to Dionysius of Halicarnassus, the followers of Æneas were scattered through the different parts of Italy. Some landed in Iapygia, others retired to both sides of the Apennines, and founded colonies. Subsequently the Romans sent colonies to Calabria, and partly in that way, partly by conquest, became (272 B. C.) masters of all the

Greek colonies. The Greek was no longer the sole language in Calabria; the Latin was a second, and an intermixture of the Grecian and Roman manners and usages took place, which is yet seen in Magna Græcia comprised the provinces of Calabria, Apulia, Iapygia, Lucania, and Bruttium. The celebrated republics were Tarentum, Sybaris, Crotona, Posidonia, Locris, and Rhegium.

**MAGNATES** (in low Latin, the great men) formerly in Poland, and is still in Hungary, is now applied to the noble estates, who took part in the administration of the government. In Poland they were the spiritual and temporal senators, the lords, sellors and high nobility. Among the great men reckoned the archbishop of Gnesen, and from 1596 the archbishop of Lemberg, the bishops, were the castellans, and royal officers or ministers. In Hungary, the barons of the kingdom are called *Magnates*. These are—1. the greater; 2. the lesser. The Palatine, royal and court judges, the Ban or governor of Croatia, Sclavonia, and Dalmatia, the treasurer, the highest officers of the court; 2. the counts and barons. To the prelates, nobles, and royal free towns, this denomination was also extended.

**MAGNESIA**; one of the earths, having a basis called *magnesium*. It exists in nature in various states of combination, with acids, water, &c. other earths, and is found in various rocks, springs, and the water of the ocean, mixed with sulphuric and muriatic acids. It may be obtained by pouring into a solution of its subcarbonate of subcarbonate of soda, washing the precipitate, drying it, and exposing it to a red heat. It is procured in commerce, by acting on magnesian limestone with the impure muriate of magnesia, or salt of the sea-salt manufactories. The muriate goes to the lime, forming a soluble salt, and leaves behind the magnesia of both the bittern and the limestone; or the bittern is decomposed by subcarbonate of ammonia, obtained from the solution of bones in iron cylinders. Muriate of ammonia and subcarbonate of magnesia result. The bittern is evaporated to dryness, mixed with chalk, and well limed. Subcarbonate of ammonia is then mixed with which a new quantity of bittern may be decomposed. 100 parts of crystallised Epsom salt require for complete decomposition, 56 of subcarbonate of potash, or 44 dry subcarbonate of soda, to produce of pure magnesia after calcination. Magnesia dissolves very sparingly in water, requiring 3000 of its weight of water at 60°, and 30000 at 100°. Water, for solution. The resulting liquid does not change the colour of violets; but when pure magnesia is put upon moistened turmeric paper, it gives a brown stain. It possesses the strong alkaline character of alkalinity in forming neutral salts, and acid in an eminent degree. It absorbs carbonic acid, when exposed to the atmosphere. It is infusible, except in the intense heat of a compound blow-pipe. The salts of magnesia are generally very soluble, and crystallisable, and possess of a bitter taste. The carbonate is prepared for medicinal use, by dissolving equal weights of magnesia and carbonate of potash, separated by twice their weight of water; mixing them together, and diluting with eight parts of warm water. Magnesia attracts the carbonic acid, and is precipitated, being insoluble, is precipitated, and the sulphate of potash that remains continues in solution. The mixture is made to boil for a few minutes after cooling a little, it is poured upon a filter, and clear fluid runs through, and the precipitate of carbonate of magnesia is washed with water, and is tasteless. When the process is conducted in

large scale, the bitter or liquor remaining after the crystallization of sea-salt, which is principally a solution of muriate and sulphate of magnesia, is substituted for the pure sulphate, and this is precipitated by a solution of pearlsh or of carbonate of ammonia. Carbonate of magnesia is perfectly white, friable, and nearly tasteless. It is very sparingly soluble in water, requiring at least 2000 times its weight at 60°. When acted on by water impregnated with carbonic acid, it is dissolved; and from this solution, allowed to evaporate spontaneously, the carbonate of magnesia is deposited in small prismatic crystals, which are transparent and efflorescent.

*Nitrate of magnesia* has a taste bitter and acrid. Its crystallization exhibits a mass of needle-like crystals, deliquescent, soluble in half their weight of water at 60°.

*Sulphate of magnesia*, generally known by the name of *Epsom salt*, is made directly by neutralizing dilute sulphuric acid with carbonate of magnesia; but in the large way, by the action of dilute sulphuric acid on magnesian limestone, and the native carbonate of magnesia. It is possessed of a saline, bitter, and nauseous taste. It crystallizes readily in small quadrangular prisms, which effloresce in a dry air. It is obtained also in larger six-sided prisms, terminated by six-sided pyramids. Its primary form is a right rhombic prism, the angles of which are 90° 30' and 89° 30'. It is soluble in an equal weight of water at 60°, and in three-fourths of its weight of boiling water. It undergoes the watery fusion when heated. On mixing solutions of sulphate of magnesia and sulphate of potash in atonic proportion, and evaporating, a double salt is formed, which consists of one equivalent of each of the salts, and six equivalents of water. A similar double salt (isomorphous with the preceding) is formed by spontaneous evaporation from the mixed solutions of sulphate of ammonia and sulphate of magnesia.

*Phosphate of magnesia*, formed from the combination of the acid and the earth, crystallizes in prisms, which are efflorescent, soluble in about 15 parts of cold water, and which, by heat, melt into a glass.

A *triple phosphate of magnesia and ammonia* exists, which is formed by adding phosphoric acid with ammonia, in excess, to a magnesian salt. It is insoluble, and is precipitated in a soft white powder of shining lustre. It forms one variety of urinary calculus, and its formation affords one of the best tests for the discovery of magnesia.

*Muriate of magnesia* has such an affinity to water, that it can be obtained in acicular crystals only by exposing its concentrated solution to sudden cold.

*Chloride of magnesia* may be formed in the same manner as chloride of lime. Chloride of magnesia may be obtained by heating the magnesia in chlorine gas, when the oxygen escapes, and the chlorine combines with the metal. It has the same bleaching power, and it has been proposed to apply it to the same purpose. When the chloride of lime is used, a small quantity of lime is left on the cloth: this, in the last operation of washing the cloth with water acidulated with sulphuric acid, is converted into sulphate of lime, which, being insoluble, remains, and affects the colours, when the cloth is dyed. The advantage of employing the chloride of magnesia is, that, if sulphate of magnesia is formed, it is so soluble as to be easily removed by washing. Magnesia is a very useful article of the *materia medica*. It is used as an antacid and cathartic. It is, however, nearly inoperative, unless there is acid in the stomach, or unless acid is taken after it. The carbonate and sulphate are the most frequently used of the preparations of magnesia; but the pure earth, sold under the name of *calcined magnesia*, is some-

times preferred; it is liable, however, to form large and dangerous accumulations in the bowels, of several pounds weight, when its use has long been persevered in.

*Magnesian Minerals.* Of these, the *hydrate of magnesia*, or *native magnesia*, deserves to be mentioned in the first instance. It is a rare substance, having hitherto been met with only at two localities—Swinaness in Uist, one of the Shetland Isles, and Hoboken, in New Jersey; in the latter place, occurring in thin seams, traversing serpentine. It exhibits a lamellar, or broad columnar structure; is but little above talc in hardness, or in the difficulty of its cleavage; sectile; thin laminæ flexible; specific gravity 2·350. Its colour is white, inclining to green; lustre pearly; translucent. Before the blow-pipe, it loses its transparency and weight, and becomes friable. In acids, it is dissolved without effervescence, and consists of 70 magnesia, and 30 water.

The *siliceous hydrate*, or *Deweylite*, is a compact, white, or yellowish-white mineral, found in the serpentine of Middlefield, Massachusetts, and near Baltimore, Maryland. It has a hardness between calc-spar and fluor, and is composed of silica 40, magnesia 40, and water 20. It appears to be identical with the *kerolite* of Breithaupt.

*Carbonate of magnesia*, or *magnesite*, is found crystallized in radiating and parallel fibres, reniform, tuberoso, and massive; fracture, when massive, flat conchoidal. It also occurs pulverulent; fracture flat conchoidal, sometimes earthy; dull; colour yellowish-gray, cream-yellow, yellowish and grayish-white; streak white; opaque; adheres to the tongue. Some of the compact varieties are very tough, giving fire with the steel, though too soft to impress fluor; specific gravity, 2·808. It is infusible before the blow-pipe; dissolves with a slow effervescence in the dilute nitric and sulphuric acids. It consists of magnesia 48·00, carbonic acid 49·00 and water 3·00. It is found in Stiria, Silesia, and Spain. A variety of it, possessing an earthy fracture, and containing about four per cent. of silex, is found in the islands of Samos and Negropont, in the Archipelago, and is called, by the Germans, *Meerschaum*, and by the French, *Ecume de Mer*. It is soft when first dug, and, in that state, is made into pipes, but hardens by exposure to the air. The most remarkable deposit of this mineral, however, is found at Hoboken, in New Jersey, where it occurs disseminated, in seams, through a serpentine rock; and is sometimes crystallized, at others pulverulent.

*Sulphate of magnesia* is found in crystalline fibres, parallel and divergent, and in the shape of crusts; more rarely, also, it has been found pulverulent. It is easily recognised by its bitter saline taste. Specific gravity, 1·75; colour white; lustre vitreous, translucent, or transparent. It dissolves very easily in water, deliquesces before the blow-pipe, but is difficultly fusible, if its water of crystallization has been driven off. It effloresces from several rocks, both in their original repository and in artificial walls, and then it is a product of their decomposition. It forms the principal ingredient of certain mineral waters. It occurs at Freiberg and its vicinity, efflorescing upon gneiss, also at the quicksilver mines of Idria, in Carniola, and various other places in Europe. Its most remarkable depositories, however, are the limestone caves of Kentucky, whose floors are often covered with it, in delicate crystals, to a considerable depth, intermingled with a dry earth, which has come from the decomposition or disintegration of the limestone rock: this earth is leached, in very considerable quantities, by the inhabitants of the country, who obtain from it their supply of *Epsom*

salt. For a notice of *Borate of magnesia*, see *Boracic Acid*.

**MAGNETIC NEEDLE** is a needle touched with a loadstone, and sustained on a pivot or centre, on which, playing at liberty, it directs itself to certain points in or under the horizon. See *Magnetism*, and *Compass*.

**MAGNETISM**. According to ancient tradition, a shepherd named *Magnes*, in walking up mount Ida, found that certain stones were attracted by his iron hook, and from the name of the discoverer these stones were afterwards called magnets. Others assert that these stones derived the name magnet from having been first discovered at Magnesia, a town in Heracles. It is not our business to inquire whether either of these traditions be true; it is sufficient for us to know that a peculiar species of iron ore, known to us by the names *natural magnet*, or *natural loadstone*, was known to the Greeks, and called by them magnet. More recent research has shown that the properties of the natural magnet (see *Iron, ores of*) may be communicated to other substances, or that artificial magnets may be formed, and the science which explains the laws of the action of magnets, whether natural or artificial, is called magnetism.

**History.** The property of the natural magnet of attracting iron seems to have been the amount of the knowledge of the ancients on the subject. Yet some suppose that they were also acquainted with the formation of artificial loadstones. The most important property of the magnet remained unobserved until about the middle of the thirteenth century; we allude to the property of the magnet's taking a certain direction when allowed to move freely on an axis. The discovery of the fact that a magnet when balanced upon a centre will dispose itself in a direction north and south, a discovery which has contributed more than all the inventions yet known to the extension of knowledge and the diffusion of happiness over the globe, is attributed to different individuals: the invention of the mariners' compass has by some been ascribed to Flavio, a Neapolitan; but Dr Gilbert supposes that the invention was brought to Europe from China by Paulus Venetus, an Italian. It is matter of deep regret that any uncertainty should exist respecting the name of the man who has conferred so great a benefit on the human race. From a manuscript letter of R. Asdigon, dated 1269, still preserved in the collection of the University of Leyden, it would appear that he was acquainted with the principal properties of the magnet. In this MS. we find the first notice of the declination or variation of the needle, i. e. that the suspended magnet does not always point duly north and south: this discovery has been erroneously attributed to Columbus, whose voyage was made nearly 200 years subsequent to the date of the Leyden manuscript. The next important discovery was that the needle though balanced with the utmost care before it was magnetised, departed from the level after it had received the magnetic influence. This phenomenon, commonly called the *dip* of the needle, was first observed and made known by Norman, a mathematical instrument-maker, near London, who wrote a work on *The New Attraction*. The variation of the needle was not at this time known to be changeable, but Mr Bond in 1640, who wrote fifty-nine years after Norman, clearly points it out as not only observed by himself, but also by Mair, Gunter, and Gellibrand.

No attempt was made to form a theory of magnetism before the time of Dr Gilbert, queen Elizabeth's physician, who in 1600 published his work *de Magnete*, a work that although it contains many fanciful hypotheses, contains a statement of many important

facts, and forms an important era in the history of experimental science. Halley published a theory of magnetism in 1683, and in 1698, the command of one of the ships of the royal navy was given him in order to discover the rule for the variation of the compass. An account of this voyage was published in 1701, together with a chart of the variation. The continual inverting of the needle was now regulated, although the law of the variation was not determined. More minute observations were made by Mr Graham at London, in 1722, and subsequently, showed that the variation hitherto observed was not the only change in the direction of the needle, but besides its tendency westward, it had a declination; he observed that the needle made not only an oscillation, the greatest variation taking place between ten and four o'clock in the day, and in the evening between six and seven in the evening. About the middle of the eighteenth century, experiments on the same subject were made by Wargentin, a town at also by Canton, an English philosopher, who determined that the diurnal variation was more than in summer. Mr Canton makes the daily variation for January 7° 8', and for June 13°: both observations establish the fact, but the amount of the variation suffers a change; for we find the daily variation for January 1819, to be 6° 5', and in June 11° 15'. About 1750, professor Wargentin shows that the aurora borealis had a perceptible effect on the magnetic needle, and more recently during one of Captain Cook's voyages, the iron in the ship was found to affect the direction of the magnet to a remarkable degree; so much so, indeed, as to render some remedy necessary, especially in high latitudes.

The method of magnetising steel has now become properly known till about the year 1730; the discovery being due to Dr Knight. Du Hamel, Lavoisier, and others improved upon his plan. Lambert of Berlin was the first who discovered the law of magnetic attraction, viz. the magnetic influence decreases from the magnetised object as the square of the distances increase, and Coulomb put the rest of the law beyond doubt by his experiments with the Torsion balance. Mr Peter Barlow, of the royal military academy, from a series of well conducted experiments, added much to the knowledge and success of magnetic action. He established the important law that the magnetic action increases with the surface, not with the mass, and that if we take a ball of iron, influence a compass needle, the sum of the tangents of deviation will be proportional to the cubes of the attractive forces. He also commented on the effect of the addition or abatement of heat on the magnetic power. Mr Biot followed up these results by a beautiful and extensive investigation which made its appearance in the 10th volume of the *Philosophical Magazine*. The researches of Biot, Sir H. Davy, Oersted, Mr Ampère, and more recently of Mr Faraday, have been devoted to the advancement of this highly interesting science, but the plan of this work will only admit of our entering into minor details; we shall therefore content ourselves with a brief notice of what has been done by the last mentioned philosopher.

Mr Faraday, from recent experiments, confirms magnetism common to all metals. In a paper lately delivered at the royal institution, he shows the distribution of the magnetic power at a heat of 250°; and that there was a temporary loss of its magnetic power, when the metal was brought to red heat. In order to demonstrate this, he put a magnet into an iron tube, by which means a bit of magnetic power, excepting within the tube. He then inserted it into a red hot tube, until the magnet acquired sufficient heat to deprive it of its power.

By the dispersion of the fluid equally through its surface, it attracted and repelled in the same manner, as if interrupted by a sheet of paper. Nickel, as well as iron, is influenced by the magnet; but it loses its power of being attracted or repelled at a much lower temperature; and in boiling, all its powers cease. Soft iron becomes a powerful magnet, under the influence of voltaic electricity; but retains none of the magnetic power, when the current ceases. Hardened steel acquires less power under the same treatment; but becomes a permanent magnet, when the connexion is broken. From numerous experiments, he inferred that all the metals have certain properties in common, and magnetism among the rest, which require different circumstances to develop. He infers that all the forty-two metals are susceptible of magnetism, under the influence of extreme cold: the temperature being not less than  $0^{\circ}$  below zero, Fahrenheit. Mr Faraday is still prosecuting this line of inquiry, and daily bringing forth new and interesting facts, a detail of which will be found under *Thermo-Electricity*, in this work.

**Principles.** The term *natural magnet*, is chiefly applicable to the amorphous granular varieties of iron ore. The natural magnet is of a grey colour, dull metallic lustre, becoming black when pulverized; is not malleable. Some varieties have the property of attracting iron, and others of being attracted by the magnet. The specific gravity varies from 4.24 to 4.93. Artificial magnets are commonly bars of tempered steel, to which the magnetic property has been communicated. When a piece of natural magnet is surrounded with iron filings, they will be attracted to its surface; but here will be two points of the magnet to which the filings will more particularly adhere, than to any other part. These points of greatest attraction are called the poles of the magnet.

To form an artificial magnet take a bar of tempered steel, and bring one end of it into contact with one of the poles of the natural magnet, and afterwards bring the other end of the bar into contact with the other pole; it will be found that the steel bar has acquired the same property of attracting iron, as the natural magnet has. The extremities of the steel magnet are its poles. Form another magnet, in the same way, and suspend both by silk threads from the centre, so that they shall be balanced; it will be found that they will both arrange themselves, after oscillating a little, in a direction which is nearly north and south. Mark N on the pole of one magnet which points to the north, and S on the pole which points to the south. Mark, in like manner, on the north pole of the other magnet, and s on its south pole. It will be found that both magnets incline a little from the horizontal position, the north pole being inclined downwards. This is called the *tip of the needle*. By comparing the position of the magnet with the true meridian of the place, it will be found that the north pole has either an easterly or westerly direction. This is called the *variation of the needle*. Both of these last will be more fully discussed hereafter. We shall, in the mean time, draw the attention of the reader to a few experiments with the two magnetic bars we have before spoken of.

Let that magnet marked N S be kept suspended by the silk thread, and bring the pole n of the magnet marked n s near to the N pole of the suspended magnet; it will be found that the N pole will move away from, or, in other words, be repelled by the magnet n s. Present the pole n to the pole S, and the suspended magnet will be attracted by the magnet n s. In like manner, present s to S, and

repulsion will take place; then s to N, and attraction will ensue: so that it is a general law, that poles having a like direction, repel each other; and poles having a contrary direction, attract each other. It is in magnetism then, as in electricity, poles similarly excited, will repel each other; and those oppositely excited, will attract; and, therefore, whatever it may be at or near the pole of the earth which attracts the north pole of the magnet, it must be in an opposite state of magnetism; and the same with regard to the south pole. This has led some to propose that they should call the north pole of the magnet, the south pole; and the south pole, the north. This language would tend sometimes to ambiguity, and therefore we will continue in this article to call that pole which points to the north, the north pole, and that which points to the south, the south pole.

There being two distinct kinds of action in magnetical bodies, scientific men have considered that there are two distinct species of magnetic fluid, the particles of the one fluid having the property of attracting the particles of the other; but when the particles are separate, they repel; each repels the particles of its own kind, &c. It is supposed, however, that when the particles of the same kind are combined, the action is neutralized, as is the case in simple iron and soft steel bars, which are therefore said to be passively magnetized.

Soft iron or soft steel cannot be rendered magnetic for a length of time. Hard steel can be rendered magnetic for a long time; and if sufficiently hard, the magnetic power will become permanent. The magnetic fluids do not seem to be separated in the middle of the magnetic bar, but both to exist in every particle of the bar, from one end to the other; a fact proved by the circumstance, that if you cut a bar through the middle, each piece will have its two poles, one pole at each end. From this fact it has been inferred, that in all bodies capable of being magnetized, both fluids exist, combined in each particle; but, when by any means they become separated, the body becomes actively magnetic. The cohesion of soft iron opposes little resistance to the separation of the two fluids; and, again, when the separating force is withdrawn, the tendency of the fluids to unite, receives little obstruction from the cohesion of the iron. On the other hand, the cohesion of hardened steel, opposes great resistance to the separation of the two fluids, and also great resistance to their reunion. This lays the foundation of the ordinary methods that have been devised for communicating magnetism.

When a bar of steel is chosen to be magnetized, the dimensions that ought to be preferred would seem to be, thickness 1, breadth 3, and length 30; the steel being polished, and brought to as hard a temper as possible.

Different methods have been proposed and practised for magnetizing; but we will confine ourselves to the two that have been regarded as the best. The method of Du Hamel consists in placing two steel bars parallel to each other, but an inch or inch and half asunder, being connected at both ends by two cross pieces of soft iron. Let there now be taken two bundles of previously magnetised bars. Each bundle must have all its bars, with their like poles, in one direction. Hold now one bundle with the north pole touching the middle of one of the steel bars, and the other bundle beside it, with its south pole touching the bar; and draw the two bundles along, one to one end of the bar, and the other to the other end, repeating this process until both steel bars are completely magnetized. The advantage of employing the cross pieces of iron consists in this, that

the iron becomes, as it were, a connecting link in the succession of the particles of the magnetic fluid, holding them in a developed state, while the magnetizing bars are communicating a further degree of intensity. The annexed wood-cut represents Du

Hamel's method, where A B, A' B' are the two steel bars; A B' and A' B the two cross pieces of soft iron; and a b, a' b' are the two bundles of magnetized bars. Æquius improved this method by connecting the ends of the steel bars by strong magnets, instead of soft iron rods. He likewise made the rods to move at a small distance from each other, and inclined them in a contrary direction to that of Du Hamel.

Horse shoe magnets are formed by bending straight bars somewhat in the form of horse shoes, so that the two extremities may point in one direction, and be near each other. Connect the two extremities with a piece of soft iron, after the manner of Du Hamel. The horse shoe may then be magnetized after the manner of Du Hamel or Æquius.

There are many other facts that might have been stated with regard to the magnetizing of iron, steel, nickel, cobalt, &c., but the nature of this work renders it necessary that we should confine ourselves to the more important points in this as well as the rest of the sciences.

The most simple magnetical instrument is the *horizontal needle*. This needle consists of a bar of hardened steel, magnetized. The bar is made of various forms, being commonly rectangular, but having a broad portion in the centre. There is a hole made in the middle of the broad portion, which is tapped with a screw, to receive an exterior screw turned upon a brass cap, into which is fitted a piece of agate, on which the needle is balanced upon a steel point. This form of the needle is exhibited in the accompanying wood engraving.

Another form of the horizontal needle is represented top of next column.

The needle, thus prepared, is suspended in a box made of brass or wood. Below the needle a circular card is placed, whose circumference is divided into degrees or minutes, or more commonly into thirty-two equal parts, called points. The needle passes through the centre of the card. The four cardinal points are marked as N, S, E, W, and the intermediate divisions are for the most part very nice observations, laid off in degrees and minutes; and, should great delicacy be required, a needle is made to carry a vernier. When a compass is used for land surveying or astronomical purposes, the box is furnished with sights. When the compass is used for observations at sea, it is also suspended upon a pivot, and the box in which it is contained, is hung upon gimbals, or forming a sort of universal joint, so that the needle and card may retain the horizontal position independently of the heaving of the vessel. Inside of the compass bowl or box is drawn an exception of a black line, caused the needle to be drawn parallel to the keel of the vessel, for the purpose of showing the difference between the ship's course to the magnetic meridian. There are various modifications of the sea compass, or variation compass, as it is commonly called, but on account of the superiority of the one over the other, in the excellence of the workmanship, and in any slight modifications in the form.

The *Azimuth compass*, or that intended for ascertaining the azimuth, or direction of any object compared with the magnetic meridian, differs in form from the sea compass, with this exception, it is furnished with sights, and the box in which the needle is suspended is capable of an horizontal motion round a pin in the centre of the bottom.

The *Variation compass*. A compass only intended for ascertaining small changes in the declination of the magnetic needle, either annual or diurnal, is commonly more limited in its arc of vibration, and generally longer than the needles used for the common purposes; it is also furnished with subdivisions for reading closer than the common ones, otherwise any needle so mounted and furnished, may be very sensible and capable of being read to minute divisions might be used as a variation compass.

The following cut represents the variation compass employed by Colonel Beaufoy, in making a compass

series of magnetic observations from the year 1813 to 1821; during which period the needle passed through its maximum of westerly variation in London.

The principal part of this instrument, viz., its needle, with the box and divided arc, to measure the angle of variation, is very similar to the instrument in the possession of the Royal Society; but it is greatly improved by the addition of a small transit telescope, which readily and accurately determines the true meridian, or the zero from which the degrees of the variation is to be measured. The box containing the needle is not fixed, as in many compasses, but turns horizontally on the centre, and has an index fastened to it, pointing to a divided arc on the brass frame on which it turns. The method of serving is, to move the box until a line drawn on it points exactly to the end of the needle, which being done, the angle of variation is shown by the divisions on the arc; F F is a mahogany board, which is the support of the whole instrument; it stands on the points of three screws G, H, I, by which it can be levelled. Above this is a flat plate of brass E E, attached to the board by the centre pin, and resting on three studs projecting from the board, to insure it having a perfect bearing, whilst it admits of a small horizontal motion round the centre by means of the screw W X. The plate E E has the divided arc *m*, fixed upon one end of it; and a vernier, D, reverses against the divisions; it is divided upon a projecting part of a brass plate C C, which moves on the common centre pin of the plate E, and also the needle A A. The plate C C has two segments of brass at each end of the needle, and these have the centre lines drawn upon them, which are brought to the points of the needle when the observation is made. A light brass box *d d*, with a glass cover, is placed over the plate C C, to preserve the needle from disturbance by the wind; it also supports a small double microscope M, intended to assist in examining when the index line points exactly to the end of the needle; the stem of the microscope is fixed to a dovetail groove, and can be removed to the opposite end of the box at pleasure. The centre of the plates E and C terminate in an extremely sharp point, on which the needle is suspended, having aagate cap, B, to diminish the friction as much as possible. The needle is of a cylindrical figure, about five-hundredth part of an inch in diameter, and six inches long; weighs sixty-five grains and a half, and is terminated by two conical points; the circular argument of the centre has a hole through it, for the reception of the brass socket B, which has the te cap fixed in it; the needle is, of course, provided with the usual apparatus for lifting it off the point when not in use, to avoid wearing the point of pension; *a, a*, are two arms, screwing down upon the plate, carrying the vernier D; they support a brass frame, which has the usual clamp screw L, and a gentle screw R, the former to fasten it to the arc and the latter to give a slow motion, and adjust the box for the observation. The transit telescope, being supported over the instrument by two pillars, N, fixed on the brass plate, E E, and having small boxes or boxes *f*, at the top, for the reception of the pivots of the axis Q, of the telescope are supported: this axis is conical, and is fixed exactly at right angles to the tube O P, in the same manner as other transit instruments. On the extremity of one of the pivots of the axis, a small divided level R, is fixed, and has an arm at the opposite side turning about at the centre, and provided with verniers to read the divisions of the circle; to this arm a small level S, is attached; the whole forming a circular index to set the telescope at any required angle, by setting the index at the proper division,

and then moving the telescope till the bubble of the level, S, shows the index to be horizontal; the eyepiece, A, of the telescope has a small dovetail in it to admit a dark glass for observation of the sun; *g g*, are the screws for adjusting the wires in the eyepiece as usual; there is also a detached level to adjust the instrument.

First, place the feet of the detached level upon the brass plate E E, in different directions, and bring it level by the screws H, I, G; then apply the level upon the two pivots of the transit, the covers of the boxes *f* opening with hinges for this purpose, and the bottom of the feet having notches to rest upon the pivots; if the axis does not prove level, one of the *y*'s must be elevated or depressed by a screw in the farther pillar N, until the level stands horizontally, and, reversing it, end for end, proves every thing to be correct.

Now set the vernier D, at zero, and put an additional object glass over the glass, P, of the telescope, and in this state the marks A A, against which the needle reads, can be seen through it when directed to them; this proves the zero of the division to be exactly in the plane of the telescope's motion; a small screw near Q will rectify it, if necessary, by moving the *y* a small quantity in the box *f*; the transit may be reversed in its *y*'s to rectify every thing.

The telescope is now to be adjusted to the meridian by the transit of the stars in the usual manner, the screws W, X, being used to turn the whole instrument round when requisite; but after these observations have been once made in a satisfactory manner, distant marks should be set up, both north and south, and these will give the means of adjusting it at once, and in the daytime.

The needle being suffered to settle, the box is turned about on its centre till its mark comes very near the point of the needle; the clamp screw, L, is then fastened, and the screw, R, is employed to make the coincidence exact, in which the microscope, M, greatly assists the eye. The vernier, D, now shows the angle of variation. It is proper, after the needle has been once observed, to attract it with a piece of iron, and cause it to make a slight vibration. When it settles again, it will not in all cases come to the same point, because of the friction of the suspending point; it is therefore advisable to make this trial three or four times, and take the mean of the whole.

The instrument is placed on a pillar in the open air, free from any iron, and is adjusted before every observation; the vernier is divided into half minutes, and if the meridian be not at a considerable distance, an advantage will be gained by diminishing the aperture of the object glass by a pasteboard cape. See *Variation*.

It may be worth while to remark, that this instrument will serve as a transit instrument for naval officers to examine the rate of their chronometers while on shore.

The only other form of the magnetic needle, which we shall here describe, is the *dipping needle*. This needle is so fixed, that instead of playing horizontally, its axis is parallel to the horizon; and therefore the only motion of the needle must be in a vertical direction. The extremities of the needle traverse a circular ring, divided into degrees and minutes, and adjusted by a spirit level, or otherwise, so that the zero shall stand at the end of the needle, when it is horizontal. The inventor of the dipping needle was Robert Norman, a compass-maker at Ratcliffe, about the year 1580. Some have endeavoured to find the latitude and longitude of places by means of the dipping needle.

**MAGNETISM, ANIMAL.** This name was given by Mesmer, in the latter part of the eighteenth century, to certain phenomena (not yet explained in an entirely satisfactory manner) produced by the action of one man upon another. The origin of the term was a fancied analogy between the action of the mineral magnet and that of the animal energy, or *vis vitalis*, to which these effects were attributed. Experience has shown the analogy to be unfounded. The principal means used to produce the effects of animal magnetism, are such as touching and stroking with the hands, according to rule (*manipulation*), breathing on a person, fixing the eyes upon him, &c.; the magnetized person must always be of a weaker constitution, and, if possible, of a different sex, from the magnetizer; and it is indispensable that he should be of a disposition to believe without doubting. The phenomena themselves consist partly in bodily sensations (for instance, chilliness, heaviness, flying pains, oppressions, &c.), partly in a diminished activity of the external senses, partly in fainting, convulsions, sleep, with lively dreams (magnetic sleep), in which the magnetized person is transported to higher spheres, observes the internal organization of his own body, prophesies, gives medical prescriptions, receives inspired views of heaven, hell, purgatory, &c., reads sealed letters laid on his stomach, and, when awakened, is totally unconscious of what he has experienced. At the same time, the soul becomes so elevated and refined, that the magnetized individual has an instinctive perception of the presence of the impure, and falls into fits at the approach of disbelievers in animal magnetism, and of all who investigate it by the rules of ordinary reason. Hence it is necessary to keep sceptics at a distance, when it is desired to witness the highest phenomena. The magnetized person shows a remarkable connexion with, and dependence on, the magnetizer, tasting what he eats, smelling what he holds before his nose, and no one else can bring him back from the magnetic state. In the sequel we shall give a brief exposition of the phenomena, as stated by Kluge, who appears, in his Attempt at an Exhibition of Animal Magnetism (in German), to have given the fullest account of them. A scientific investigation of the influence which we are considering is hardly consistent with the views entertained of it by its adherents, for they maintain that mere reason cannot approach, nor conceive this great mystery; it can be rightly apprehended only by a believer. Since the blow which magnetism received in 1821,\* the number of its adherents has been greatly diminished, and its pretensions have been much checked. The whole of its effects seem to be ascribable to a heated imagination, to an excitement, half spiritual, half sensual, and to a morbid sensitiveness. Animal magnetism originated thus: Anthony Mesmer (q. v.), in 1772, attempted cures with the mineral magnet, and excited some sensation in Vienna, but at length declared, that not the magnet, but a mysterious power in his own person caused the effects ascribed to the magnet, and that this power was related not only to the magnetic power, but to the attraction dispersed throughout the universe. But a fraud which he attempted (the pretended restoration of sight to a girl) having been discovered, he proceeded, in 1778, to Paris. The attention which he attracted there, and the final report of a committee of the academy on magnetism, or, as it is also called, *Mesmerism*, we shall speak of under *Mesmer*. The great supporters of animal magnetism have recently been Kieser, in Jena, and

Wolfart, in Berlin; the former explains the phenomena by the striking difference between life by day and life by night, both in the case of animals and vegetables; the latter adopts the views of Mesmer. (See *Archives of Animal Magnetism*, by Kieser, Nasse, and Nees von Eschscholtz, published since 1817, in numbers, and now with the title *Sphinx, or New Archives of Animal Magnetism*, and Wolfart's *Annals of Animal Magnetism*, ten numbers, 1815 & on, among the numerous works on the subject, in *Journal*; *Histoire critique du Magnétisme Animal*, par J. J. Ennemoser's *Der Magnetismus in seiner natürlichen Entwicklung von allen Zeiten bis zu den Völkern* (Leipzig, 1819), in the spirit of these; Wolfart; J. C. L. Ziemann's *Geschichte der Entwicklung des Thierischen Magnetismus in Europa* (Berlin, 1824), less prejudiced; *Des Magnétisme Animale*, by Bassei Florence, 1824, and his book an Inquiry into the origin, progress, and present use of Animal Magnetism. By J. C. Comenius, 2nd Edition, Edinburgh, 1836, 2 vols. 8vo. See also Russell's *Travels in Germany* (in Chambers' *Library*); Foreign Review, vol. v., where is a unfavourable historical account of the same; given; Tait's *Edinburgh Magazine* for Jan. 1840 and Chambers' *Edinburgh Journal*, No. 11.

We now proceed to an outline of the phenomena of animal magnetism, as described in the work of Mr Kluge, mentioned above. The phenomena are the case of the magnetizer and the magnetized as follows:

1. *The Magnetizer.* He is generally superior, producing a positive effect only so far as to possess a higher degree of energy and vital power than a person magnetized. The man generally does more than the woman. If the magnetizer is a weak person, there either takes place no apparent effect, or the effects are inverted, viz. the patient does appear in him, and the magnetizer is the person magnetized. If the magnetizer undertakes the manipulation of a susceptible subject, he experiences a glow, and the sensation of a grate like heat to palm, and particularly from the base of his hand. If he covers his hands with wet pieces of electric bodies, he has not this latter being, as the operation is fruitless; but horns or leather gloves do not prevent the effect. After a certain period, the magnetizer feels a general exhaustion, a weakness in the digestive system, and a partial loss of power, in proportion to the susceptibility of the magnetized subject, and the duration of the operation. If the magnetizer, during the operation, is isolated with the magnetized and electrical bodies, his loss of power is not in the effects which he produces are stronger.

2. *Phenomena in the Person magnetized.* The phenomena produced in the subject by a power of operation, are of a double kind; either they have reference to the general state of the body, or are of a periodical, but last during the whole of the operation, therefore, may be considered as the general effects of magnetism; or they have reference to the particular activities of the organization. Of the latter sort are 1. a general awakening and strengthening of the vital powers in all parts of the body, producing considerable excitement, as well as in the system of the nerves and muscles, the vascular and digestive system, as the organs of secretion; 2. a partial excitement over the whole surface of the body, to check every irregularity and local reaction, and the equilibrium restored; 3. a withdrawal of the heightened vital power from the coloring organs to others; 4. a diminution or total suppression of excitement producing the morbid action of the

\* A votary having become enceinte by a celebrated practitioner.

nerve. The magnetiser not only should have a stronger body than the person magnetised, but also a perfectly healthy one. He must have attained the maturity of his bodily powers, but must still be within the age of active life; the mind, too, must be sound and strong, in order to master the affections and passions, to have a living faith and a firm will, and thus to attain perfect control over this means of cure, as also over the patient. The phenomena of animal magnetism have been divided into six degrees. Those of the first degree are generally the following: first, the feeling of a strong current from the head to the extremities, after which a higher degree of heat follows, easily observable by the thermometer, greater redness of the skin, with increased perspiration, and a feeling of ease and comfort throughout the whole body. In the second degree, the warmth increases, and appears to the patient to diffuse itself from the stomach, as if from a central point, over the whole body. The pulse becomes generally fuller and stronger, and the breathing easier and deeper. The patient feels a heaviness in the eyelids, and an irresistible desire to close them. If he does close them, they seem to him cemented by the strongest power, and, during the remainder of the magnetic effects, it is impossible for him to open them. All the other senses, however, remain active, and their activity is often heightened. The patient knows, therefore, every thing which is done about him, though he is not always capable of speaking. At the close of the magnetic operation, he opens his eyes by himself, or with the assistance of the magnetiser, and feels generally strengthened and well. After this the patient observes, sometimes, a shining appearance before his eyes, similar to repeated lightning, a pricking in the points of the fingers and toes alternately, a heaviness and coldness in the extremities, unpleasant feelings about the region of the stomach, sickness, violent shuddering, shivering, cough, &c. The particular signs often accompanying the third degree, are, especially, swoons, convulsive tremblings, real convulsions, cataleptic and even apoplectic fits. This state generally begins with all the signs of an approaching drowsiness, repeated yawning, stretching, heaviness of the eyes, announce it. A deep sigh generally follows, after which the eyes close entirely, and a state begins similar to sleep, in which the patient seems to be deprived of all sensation and consciousness. In the fourth degree, the patient awakens, not from his sleep, but from himself, and regains his consciousness; he knows himself again, yet in a changed relation to surrounding circumstances. The external senses are either closed entirely, or their character is changed, and the internal sense only remains the same. The *somnambulist* (as he is called in this state), entirely awakened from himself, distinguishes with his eyes nothing of light and darkness, and not always even these, though, as is sometimes the case, the eyelids are open. The ball of the eye is either drawn up convulsively or stiff, the pupil widened and without sensation. Next, the sense of feeling is metamorphosed into that of seeing, so that the somnambulist can distinguish by it, not only the outlines of things, but their colours, with perfect precision. The region of the stomach becomes the central point of all sensation, and it is chiefly through this region that the sense of sight is supplied. The somnambulist, therefore, can ascertain the time perfectly well by a clock, closely held to the pit of the stomach. By repeated exercise, the patient obtains this faculty in a higher degree, and what originally appeared to him distinct becomes very clear. Persons appear to be more distinct than inanimate subjects. Hearing likewise performed in this state by the pit of the

stomach, and the sense of smell becomes sometimes so acute as to distinguish the different ingredients of compound scents. Objects which the person does not regard in a healthy and natural state, have often very sensible, and even dangerous effects on him when in a state of somnambulism. The vicinity of a living being, whom the patient perceives at a distance of ten to fifteen paces, is generally very disagreeable to him. If persons whom he dislikes touch him, paleness and coldness occur in the parts touched, and convulsions are generally the consequence. Among inanimate subjects, metals have the most unpleasant effect. To the magnet the somnambulist is still more sensitive than towards other metals. Of every thing which has occurred to the patient during this period, what he has perceived, thought, said, or done, he has, when awaking, either no recollection or a very faint one; but if he is brought again into this state, he recollects every thing very well. In the fifth degree, the patient attains, by his heightened consciousness and the increased strength of his general feelings, to that internal self-contemplation by which he is able to investigate even the minutest parts of his bodily structure. By virtue of this accurate knowledge of his internal frame, the *clairvoyant*, as he is called in this state, not only determines very distinctly the seat and quality of his disease, but at the same time an instinct develops itself in him, which makes him understand the means necessary for his cure. Besides mentioning the remedies, the *clairvoyant* also indicates the kind of magnetising necessary, and thus directs his own cure. This deep insight is not limited to the *clairvoyant's* self, but extends to persons brought into magnetic relations with him, whose sensations are always communicated to him. Between the magnetiser and the *clairvoyant* this sympathy is the strongest and most remarkable. Very often the feeling of disease in the magnetiser is not only communicated to the patient, but the disease itself, which, in some cases, has continued after the patient was awakened. Affections of the soul also pass from the magnetizer to the *clairvoyant*. Sometimes this sympathy reaches such a height, that it remains even when the parties are distant from each other. This magnetic sympathy may be still more heightened, and then the *clairvoyant* has a clear insight into the internal physical state of persons in a magnetic connexion with him, just as he has of his own; can determine their disease, its course, and future phenomena, and prescribe the means of cure accordingly. He insists that he perceives the diseased state of others precisely as his own by the stomach. His language becomes more elevated than ordinary, and is marked by fire, spirit, precision. His perception is livelier and stronger, his thinking freer, deeper, his judgment quicker and more penetrating. He not only perceives the present, and the influence of external relations, much more distinctly than before, but penetrates also into the most distant period of past time, by way of memory. There is an obvious inclination of patients for each other, if they are treated by the same magnetizer, and particularly if they are in a state of somnambulism at the same time. The patient who has attained internal clearness by the fifth degree, penetrates, in the sixth degree, the darkness of external things, and attains a higher view of the whole of nature. With uncommon clearness he often distinguishes the secrets of the past, what is distant and unknown in the present, and the events of coming time. If the patient is asked how he knows all this, he generally answers, that it is as if he were told of it by some other person, or that he feels it through the pit of the stomach. He is always fully convinced of the truth of what he thus acquires. In respect to

the choice of proper remedies, the *clairvoyant* is less limited than before. In the former degree, it was necessary to put him into connexion with another person, by intermediate bodies; but, in this degree, he can be in this relation with any distant person, if he knows him, or feels a lively interest for him, or even if the magnetizer, or any other person brought into connexion with the *clairvoyant* by actual touch, knows the distant person, and thinks intently of him. The view of the *clairvoyant* extends even into the future condition of others. In this degree, he attains to a higher, fuller life than he had before. The body seems to be intimately amalgamated with the mind, to be blended into the most harmonious union with it. The individual is removed from everything coarse and sensual, and placed in a state of serene and elevated self-contemplation. The feeling of the greatest bodily comfort and purity of soul produces a serene peace within him, which expresses itself in the nobler expression of the whole body. In this state, which, according to the *clairvoyants*, borders on heavenly felicity, they are incapable of impurity, and even the guilty obtains the feeling of virtue.

Such are the wonders of animal magnetism, of which our readers may believe much or little. The attention which the subject has attracted in Europe is our excuse for the length of this article. The footing which it has gained, and the effects which it has produced, exemplify, strikingly, the power of imagination. It would require too much space to describe all the various manipulations and other operations by which the patient is placed in the magnetic state; for information respecting these, see Kluge's work, already cited.

**MAGNIFICAT.** The words which Mary pronounced when she visited Elizabeth (contained in chap. i. of Luke, 46—55), begin, in the Vulgate, *Magnificat anima mea dominum* (My soul doth magnify the Lord). Hence the whole of her thanksgiving, on this occasion, has been called the *magnificat*. The present usage of the Roman Catholic church is, to chant or pronounce the *magnificat* every day, at vespers. It has often been set to music, and forms part of the musical cyclus of the Catholic church. The *magnificat* is also often used in Protestant church music, on the European continent.

**MAGNIFICENCE** (*highness, eminence*); a title applied to the rectors and chancellors of the German universities, and to the burgomasters of free cities. A prince who takes the office of a rector is styled *magnificentissimus*.

**MAGNIFYING GLASS.** See *Microscope*.

**MAGNISA**, or **MANIKA** (anciently *Magnesia ad Sipylum*); a town of Natolia, near the Sarabat; twenty miles N. E. of Smyrna; lon. 27° 18' E.; lat. 38° 44' N. The streets are wide, the mosques painted white, and the houses better than in most other towns in this part of Natolia. It is situated at the foot of the ancient mount Sipylum, whose top is always covered with snow. It is celebrated in history by the victory of the Romans over Antiochus the Great. Under John Ducas, it was made the capital of the Greek empire. The greatest ornament of the ancient town was a temple of Diana, called *Leucophryene*, or the *White broode*. The environs were formerly celebrated for the production of loadstone, and it is supposed the word *magnet* is derived from it.

**MAGNITUDE, APPARENT.** If straight lines be drawn from the extremities of a visible object to the centre of the pupil of the eye, the angle formed by them is called the *visual angle* or the *apparent magnitude* of the object. This angle varies with the different distances of objects, being larger when they are near, and smaller when they are remote. Hence

our idea of the magnitude of any object, depends only upon its true dimensions, but also upon the angle under which we view it; and objects of different dimensions will appear of equal magnitude if the visual angles under which they are seen are equal. Thus, for instance, the sun and moon, though their diameters are vastly different, are seen under an angle of about a degree. Besides, many perspectives and optical illusions, which we are never overcome, modify our ideas of the magnitude of objects. One of the most remarkable causes of involuntary deception, is that which occurs when experienced in looking at the moon when it is just risen, it appears larger than when it is near the zenith. In the horizon, we are apt to judge it at a greater distance from us than in the zenith, because in the former case there are intervening objects with which we can compare it, but in the latter such objects occur. If the moon is viewed through a telescope, or an open tube, so as to remove all intervening objects, it will appear of equal magnitude in both cases, and the whole illusion is immediately vanish.

**MAGNOLIA.** The magnolia tree is so admired on account of the elegance of its form and foliage. Their leaves are alternate, pointed, and, in one species, evergreen; and their flowers large, white or yellowish, solitary at the extremity of the branches, and, in some species, very large; the leaves and wood are also more or less aromatic. They are in great request in gardens. They are in general is soft, spongy, and of no great value.

The *M. tripetala*, or *umbrella tree*, is characterized by the disposition of the leaves, in a rounded manner towards the extremity of the branches, which to the whole extent of the Alleghenies, as far south as the forty-third parallel of latitude. The leaves are very large, the latter having from ten to twelve white petals, the three exterior ones being reflexed.

The *M. acuminata* inhabits the same district as the preceding. It is a lofty tree, attaining to the height of eighty feet, with a proportional trunk. Its flowers are inodorous, and have from six to ten petals of a greenish-yellow colour. The wood is pubescent beneath. The wood is soft, but strong and susceptible of a brilliant polish; it is commonly sawed into boards, and used in the interior of houses. From the shape of the fruit, which is about three inches long, it is usually called *cornucopia*.

The *M. auriculata* is readily known by its three lobes at the base of the leaves. It inhabits the south-western parts of the Alleghenies.

The *M. cordata* also inhabits the south-western parts of the Alleghenies. The leaves are pubescent beneath, and the flowers are white, attaining the height of forty or fifty feet.

The *M. macrophylla* is remarkable for the size of its leaves and flowers. The former are from two and three feet long, and the latter are from two to three feet in diameter. The petals are from nine in number, and the three exterior ones have a purple spot at the base. It inhabits the south-western parts of the Alleghenies, but seems to be confined to certain limited districts.

The *M. glauca*, or *bravea wood*, is a small, little tree, or rather shrub, with more or less flowers much smaller than in any of the preceding. It attains the height of fifteen or twenty feet. The leaves are smooth, elliptical, obtuse, and glaucous beneath. Its flowers are very elegant, and diffuse a delicate fragrance, though rather too powerful to be shut up in an apartment. The tree is said to have also a strong aromatic taste. It grows in various situations in the Atlantic states, from New York to

to Florida, and along the borders of the gulf, beyond the mouths of the Mississippi, but is not found in the upper country, nor west of the Alleghany mountains.

The *M. grandiflora*, or big laurel, is confined to the lower parts of the Southern States, from North Carolina to Florida and Louisiana. It is a lofty and magnificent tree, with large evergreen leaves, and white flowers, which are conspicuous at a great distance. Magnolias are wanting in Europe, as well as in Western Asia, but towards the south-eastern part of this latter continent, we again meet with them.

The *M. yulan* grows to the height of thirty or thirty-five feet, and the large and numerous white flowers, expanding before the development of the leaves, give it a very ornamental appearance.

The *M. purpurea* is a shrub, bearing large flowers, which are purple externally.

The *M. fuscata* is also a shrub, with small, dusky, showy, and delightfully fragrant flowers. Some magnificent species have lately been discovered on the mountains of the north of India.

MAGOG. See Gog.

MAGPIE (*corvus pica*, L.). This crafty and well known bird in its habits and manners much resembles its brethren the crows; like them, it indiscriminately feeds on both animal and vegetable food; it is peculiarly destructive to the eggs and young of the feeble tribes of birds. It is about fifteen inches in length, and weighs from eight to nine ounces. It has a black bill, wings and tail; the latter are variegated with white, green, purple, and blue, of different shades. The construction of the nests of these birds shows great art, they having a thorny cover, and the entrance being at the side. The female lays from five to seven pale-green eggs, closely spotted with black. When taken young, they readily become domesticated, and learn to repeat many words, and even sentences, as well as to imitate every noise within hearing. This faculty appears to have been known to the ancients, as Pliny relates an account of the performances of some of these birds belonging to a barber in Rome. Like the other birds of the crow kind, the magpie is a notorious thief, and will not only steal food, but will carry off any articles within its reach, particularly such as are shining, as buttons, spoons, jewelry, &c., which it carefully conceals in its nest. Its general character has been described by Goldsmith in the following terms:—"Were its other accomplishments equal to its beauty, few birds could be put in competition. Its black, its white, its green, and purple, in the rich and gilded combinations of the glosses of its tail, are as fine as any that adorn the feathered world. But it has many of the qualities of a beau, to appreciate these natural perfections: vain, restless, and quarrelsome, it is an unwelcome intruder everywhere, and never misses an opportunity, when it finds one, of doing mischief."

MAGYARS; the original name of the Hungarians, which they still use in preference to any other. They first became known about the year 626. They came from Asia, but there are different opinions as to their original residence. It is most probable that they lived in the region about the Caspian sea, between the river Kama and the Ural mountains. A similarity which has been thought to exist between their language and the Finnish, has led to the conjecture that they were of Finnish origin. After various expeditions in Asia, they entered Europe at the close of the seventh century, and settled in the vicinity of the Ingul, between the Dnieper and the Black Sea (in the present government of Ekaterinoslav). They remained more than 200 years, until they were finally forced to retire before the attacks of the Pet-

sheneges. In the last half of the ninth century, they passed over to Dacia, under their leader Arpad, settled in Pannonia in 896, and established a kingdom there. The ancient annalists sometimes call them *Turks*, but commonly *Ugner* (*Hungarians*). The country itself was called, from them, *Hungary*. (q. v.)

MAHA (in Sanscrit, *great, large*); a prefix to many names, as *Mahanoddy* (great river).

MAHABHARATA. See *Indian Literature*.

MAHE; a town and fortress of Hindoostan, on the coast of Malabar, belonging to the French; thirty-two miles N. W. of Calicut; lon. 75° 38' E.; lat. 11° 43' N.; population, about 6000. It is a neat town, and a station of the East India company's commercial agent, and carries on a trade in pepper, sandal-wood and cinnamon.

MAHMOUD, first sultan of the Gaznevide dynasty, was son of the governor of Chorasán, and sovereign of Gazna. He was sixteen years old when his father died, in 997. He drove the king of Turkestan from Chorasán, and, in 1001, invaded Hindoostan, and captured Gehal, a powerful prince. In 1002, he reduced Khalif, the revolted governor of Segestan. He repeated his invasion of India, returned, and overcame Ilek Khan, who had invaded Chorasán. He defeated him a second time, though Ilek had been joined by Kader Khan, with 50,000 horse. He now extended his conquests far and wide, and acquired immense treasures. In 1029, he conquered Persian Irak. He died in 1030, after a prosperous reign of thirty-one years. He is extolled by the Mohammedan writers, for his regard to justice, and his zeal for the propagation of his religion, which he spread in India by the extermination of a vast number of idolaters, and the demolition of their temples.

MAHMOUD II.; khan and padishah, sultan of the Ottomans, the twenty-ninth sovereign of the family of Osman, the twenty-sixth grand sultan, and twenty-first caliph, "the shadow of Allah upon earth;" an absolute prince, who, possessing by nature the disposition of a despot, has been obliged, for a great part of his reign, to contend against rebellions in the provinces, and the insubordination of the janizaries. He is the second son of Abd-ul-Hamid, who died in 1789. His life forms a brilliant chapter in modern Turkish history. He was born July 20, 1785, and was brought up in the ancient seraglio. (See *Ottoman Empire*.) Mustapha IV., the elder brother of Mahmoud, who ascended the throne in 1807, had already, according to ancient custom, ordered him to be put to death, that he might have no competitor to fear, when Ramir Effendi, paymaster of the army, at the head of 2000 Albanians, rescued the prince. The valiant Bairaktar, pacha of Ruschuk, immediately deposed Mustapha IV., and girded Mahmoud with the sword of Osman, July 28, 1808. Fourteen weeks afterwards, the janizaries, offended by the military reforms made by the grand vizier Bairaktar, took the seraglio by storm. Bairaktar immediately ordered the execution of Mustapha and his mother, and then blew himself up with his enemies. This happened Nov. 16, 1808. (See *Ottoman Empire*.) The battle between the Seyeims (infantry on the European system, in favour of whom the sultan Mahmoud had declared himself) and the janizaries was continued thirty-six hours longer in the seraglio and the capital, amidst pillage and conflagrations. The rebels gained the victory, and, for the preservation of his life, Mahmoud was compelled to send deputies to them, and to submit unconditionally to their demands. After these horrors, Mahmoud was not able to execute any plan of reform in the army, although he still persevered in his intention. At every attempt, the janiz-

aries obtained by force the discharge and execution of the commanders and ministers who undertook to establish order and discipline. Mahmoud thought only of securing himself upon the throne, stained with the blood of his uncle Selim and of his brother Mustapha. He therefore, according to Pouqueville, murdered the son of Mustapha IV., an infant three months old, and ordered four pregnant sultanas to be sewed up in sacks, and thrown into the Bosphorus. Thus he remained the last and only descendant of the family of the prophet. His will was now made known by the severest orders. Without advisers, without resources, and almost without an army, he continued the war with Russia, and against the Servians. At length, when he was totally exhausted, his divan concluded a treaty at Bucharest, with Russia, May 28, 1812. This measure was advised by Britain, but disappointed the expectations of Napoleon, who, in connexion with Austria and Prussia had pronounced the integrity of the Porte. (See *Ottoman Empire*.) Having been educated in the seraglio, where the *valide*, or sultana mother, according to ancient custom, never calls her son otherwise than, *My lion, my tiger!* the grand seignior knows no law, but some forms of custom, and has no regard for any constraints but those of necessity. The circumstances of horror, under which he ascended the throne, and the dangers which perpetually surrounded it, hardened his heart and blinded his judgment. As every sultan is directed to learn some art, he chose calligraphy. Vain of his skill, Mahmoud resolved to write with his own hand all the *kiat*-sheriffs, or orders, in his own name, and to keep a journal of his thoughts. His papers soon accumulated to such a degree upon his sofa, that he looked around for a private keeper of the archives. He found a suitable person for this office in his barber (Berber Baschi), who was doubly worthy of his confidence, because he could neither read nor write. Khalet Effendi, a courtier, who amused and ruled the sultan by his buffoonery, also occupied a high place in his favour. Berber Baschi introduced this Khalet to Mahmoud; he had once been his companion in the coffee-houses of Galata, a clerk of the corporation of butchers in Constantinople. He was afterwards, in 1806, the ambassador of Selim III. to the court of Napoleon. These men were the centre of all the intrigues which spread from the seraglio to the provinces. Khalet soon amassed great wealth by means of presents, and his influence became so important, that he completely governed the sultan and the submissive divan. But he was unable to persuade the mufti to admit him among the ulemas. (See *Ottoman Empire*, at the end of the article.) This privileged caste scorned to receive the universal favourite, because he was the son of a man who sold livers, and, moreover, a child of the world, who drank wine. Khalet punished the mufti with banishment. The new mufti, therefore, and Ali, the new grand vizier, were eager to employ every means to conciliate the favour of Berber Baschi and Khalet Effendi. The latter, however, avoided receiving any important office, lest he should be held responsible for the ill success of any measure which he advised. But he divided the spoil with the governors, who plundered the provinces, and who bribed the principal members of the divan; and was careful that no complaint should reach the sultan's ears. Pouqueville maintains, that the grand seignior himself shared with his favourite the sums extorted from the rich. Mahmoud exhibited, however, a proud and inflexible disposition towards Christian princes. The speedy execution of justice in the capital, united with the severe and bloody police, over which Mahmoud, who not unfrequently walked

about incognito, kept watch, show that he was not deficient in energy or talent. But the great and the powerful always remained at the mercy of his humour, his avarice, and his suspicion. As high officer, whether guilty or innocent, he seized his property or his life; hence the universal disposition for a revolution, and the increasing jealousy of the divan, to make the entire members of their mutual destruction, and thus to seize the treasures of both parties. The rapid succession has therefore been a continued scene of internal rebellions. The Servians surrounded a colony of the yoke of the pacha of Belgrade; Mustapha Pacha, conqueror of the Mameluke bey of the Wechabites, became almost always master of Egypt; by means of bloody insurrections from Widdin, Damascus, Trebizond, to Aleppo, Aleppo, Bagdad, Lattakin, and other places, changed their masters to bold and crafty Ali, in Janina, raised himself to the throne of Epirus. To make himself master of the treasures of this pacha, Mahmoud, by the agent Khalet Effendi, accused him of high treason. His policy involved the Porte in a civil war, which betrayed its weakness, drove the Greeks to despair and brought on their revolution. A French embassy informed the Porte of the plan of the Greeks, and Khalet Effendi resolved to escape them. In the name of Mahmoud, he gave the following commission to the secretary known as Khurschid Pacha—"Every Christian captive-bearing arms must die; the boys shall be crucified and educated in the military discipline of Europe; not to offend the ulemas, nor the styled *janizaries*."† All the decrees which manifested the fanaticism of the Mussulmans in the capital, in the provinces, the equipment of the militia for war, favourable prophecies in the name of the prophet, the proscriptions and execution of the rich, the profanation of Christian churches, &c.—all these, Pouqueville says, proceeded from the seraglio, and were the work of Mustapha and avarice led the sultan and his favourite to measures of terror, while, by letters extorted from the patriarch, and promises of assistance, made out to be violated, they strove to persuade the Greeks to lay down their arms. The grand seignior himself was present when the innocent prince Constantine Morousi was beheaded. He ordered from a hall of the seraglio the bodies of the patriarch Gregory, one of the murdered members of the Council of State, dragged by Jews, and thrown into the sea. He witnessed the execution of the princes Morousi and Chantserys, with a multitude of rich merchants and bankers of the Porte. When Mahmoud had, at last, succeeded in destroying his enemies in the capital and in the two principalities where the rebellion originated, while the dissatisfied provinces in the provinces had been subdued by sultan pachas, and the head of the formidable Ali by his feet; when he had happily concluded a treaty with Persia by the peace of 1823, brought about the mediation of Britain, and had no more to fear from the Wechabites,—then it was, after many perils, that, intoxicated with apparent success, every day grew more cruel and more oppressive. The children and grand-children of Ali, who had surrendered themselves on the faith of British promises, were put to death. Inflexible as the Porte

\* See Pouqueville's *Histoire de la Régénération de la Grèce* (History of the Regeneration of Greece), i. 131.

† After the fall of Ali Khurschid was ordered to execute the order to massacre the whole Greek population of the country, showing no compassion even to women and children, exterminate the Morousi, and to lay waste the whole of the country. Pouqueville, iii. 325.

termination which he had conceived against the Greeks, he submitted to the powers of Europe in only a few particulars relating to the restoration of the churches and of the advantages of trade, and after the intercession of the British ambassadors for three years, he consented to the evacuation of Moldavia and Walachia, June 23, 1824. When the diplomatic corps in Pera protested against the execution of the prelates, he answered—"The sultan is absolute, independent sovereign, accountable for his actions to no man." His divan, likewise, refused to send a plenipotentiary to the congress of Verona. Mahmoud trembled whenever the rage of the janizaries, whose severe generals tried in vain to dissuade them, wasted the capital with fire and sword; sacrificed every thing to calm their fury—the ablest men in the state and in the army, his nearest relatives, his most tried friends, and even Mehmet Effendi, whose services were indispensable to him. In this favourite the janizaries saw the author of the fatal Greek revolution, and of those excessive exactions which were intended to supply the extravagance of the seraglio. They commenced attacks upon him by posting up pasquinades on the walls; scurrilous songs were sung in the streets respecting Khaled Effendi and Khasnadar Usta, the favourite slave of the sultan, who, it was said, cost him more than it would to support a whole army.\* In vain did Khaled endeavour to appease the storm himself, by executing the generals, whom he charged with the misfortunes in Greece, and the Greek rebels, whom he accused of being traitors; in vain did he lavish gold, with an unsparing hand, on the rebels: the highest men of the empire themselves prepared his destruction, because he enjoyed the confidence of the grand seignior. He and his creatures, the grand vizier, Salik Pacha, and the mufti, were accused of wishing to dissolve the janizaries and substitute disciplined troops in their stead. A rebellion finally broke out in November, 1822, and the sultan banished the grand vizier, the mufti, Berberchani, and Khaled Effendi; a vast number of officers were executed or dismissed. Khasnadar Usta, the favourite slave, was committed to the chief of the police for correction, and shut up in the prison of the harem, with several Odalisks. Khaled retained his property, and retired to Iconium, the place of his birth, with a princely retinue. But his enemies soon succeeded in persuading the sultan to gratify his own vengeance, and confiscate the wealth of his favourite. This measure was immediately followed by a firman ordering Khaled to death. He was executed December 1, 1822. The age of the janizaries, though he considered himself secured by a firman under the hand of the sultan, and his friends and creatures suffered the same fate. Mahmoud complied with every wish of the janizaries, which was made to him by their representatives in the divan. When peace seemed to be restored, when Scio was destroyed, and the war with Persia brought to a close, he resolved to punish the insolence of this soldiery. The grand vizier Mehmed Ali, a friend of the janizaries, and the aga of the janizaries, both enemies of Khaled, were deposed and put to death. Great preparations for the fourth campaign against the Greeks, in 1824; the prospect of speedy reconciliation with Russia, which answered to the divan the mission of the marquis de Rivaroli, as its minister, to Constantinople; the lordship by the viceroy of Egypt against Candia and Morea; the arrival of the French ambassador, M. de Guilleminot; the friendly connexion of the sultan with Austria and Britain; the fall of Ipsara,

July 3, 1824;—in fine, every thing conspired to fill the sultan with the proudest expectations. But when the severities of his son-in-law and favourite, Hussein, aga pacha of the janizaries, and the measures of the grand vizier Ghalib, renewed the old spirit of sedition; and when news arrived from Thessaly, where the seraskier, Dervish Pacha, was defeated by the Greeks in June, 1824, and from Epirus, where Omer Vrione had effected nothing for the Porte; when the Greek fleet appeared before Ipsara and the Dardanelles, and the expedition of the capudan pacha against Samos failed,—then the rage of the janizaries in Constantinople burst forth with redoubled violence. Their hatred against Mahmoud was vented in the boldest threats, and he was accused of having represented his eldest son, Abd-ul-Hamid,† who was born March 6, 1813, as subject to epilepsy; and of having, under this pretence, withdrawn him from view, that he might poison him with impunity, if the insurgents should seek to place him upon the Ottoman throne. To avoid massacres and conflagrations, and to save himself, Mahmoud deposed Hussein Pacha and the aga of the arsenal, in August, 1824; banished them from the country, and led the prince with him into the mosque. September 14, he was obliged to appoint the pacha of Silistria, a friend to the janizaries, to succeed Ghalib as grand vizier. As the dangers thickened around him, Mahmoud grew more firm. He was gradually maturing the plan of a total reformation. He commenced with severe measures: August 12, 1825, he went so far as to forbid the Bible of the Christians to be distributed in his empire. Greater activity and important improvements in the arsenal and in the marine; at last, gave the Ottoman fleet a kind of superiority over the Grecian. The new seraskier (Redschid Pacha), and the new capudan pacha (Khosrew) were more fortunate than their predecessors. From the viceroy of Egypt the divan received the most important aid in the Morea; but they delayed from month to month the redress of the complaints of Russia. At length, when the emperor Nicholas resolved to bring the affair to a speedy termination, Mahmoud was forced to accept, May 14, the ultimatum of April 5, 1826, which was delivered to him by Minskiy. The Turkish troops now evacuated Moldavia and Walachia. The question between Russia and Turkey was also settled by the treaty of Ackerman, Oct. 6, 1826, and Mahmoud granted to Russia all her demands. The treaty here agreed upon, however, was not carried into effect until May, 1829, after which the Russian minister, M. de Ribuapierre, had an audience with the grand vizier and the grand sultan, June 7 and 14. Mahmoud was made compliant principally by the dangerous reform which he had commenced in his troops. He had long resolved to dissolve the janizaries, and the burning of the village of Galata by them (Jan. 3—5, 1826), decided him to put his plans into immediate execution. With this object, he issued (May, 29, 1826) a hatt-i-sherif on the discipline of the janizaries and the reorganization of the army. In consequence of this, a general rebellion of the janizaries in Constantinople took place (June 14); but the sultan unrolled the banner of the prophet, and after a bloody contest, repulsed the insurgents on the 15th. A fetva of the mufti, seconded by a firman of the sultan, now declared the janizaries dissolved. On this occasion, the grand seignior distinguished himself, as well for his courage as for his firmness. For many days and nights, he encamped with his ministers and generals on the

in her representation, Mahmud ordered that the villa of Scio, which supplied the harem with luxuries, should be spared.

† This prince died in 1827. The second son, Mahmud, died in 1822, and there is now living only Abd-ul-Medchid, who was born April 30, 1823, and Abd-ul-Aziz, born February 3, 1830.

Atmeidan. He used every effort for the formation of an army on the European system, and succeeded in one of the most perilous reforms ever undertaken.—For further information, see *Janizaries*; for the consequences of his refusal in regard to the Greek question, see *Greece, Revolution of*, near the end; for the late war between Russia and Turkey, declared on the part of Russia, March 14, 1828, in consequence of the breach of the treaty of Ackerman, see *Russia and Turkey*.

**MAHOGANY**; the wood of the *swietenia mahagoni*, a lofty and beautiful South American tree, allied to the *pride of India*, so commonly introduced into the southern parts of the United States, and belonging to the same family—*meliceæ*. The leaves are pinnate, composed of four pairs of oval, acuminate, entire leaflets, and destitute of a terminal one. The flowers are small, white, and are disposed in loose panicles. The fruit is a hard, woody, oval capsule, about as large as a turkey's egg. The wood is hard, compact, reddish-brown, and susceptible of a brilliant polish. It is one of the best and most ornamental woods known, forming very elegant articles of furniture. It is brought principally from Honduras and the West Indies, from which places it is exported, in vast quantities, to Great Britain, the continent of Europe, and especially to the United States, where it is so abundant and cheap as to have brought into disuse many native kinds of wood, which otherwise would be highly esteemed in cabinet-making. The tree is of rapid growth, and its trunk often has a diameter of four feet. Mahogany-cutting constitutes a principal occupation of the British settlers in Honduras. Gangs of Negroes, consisting of from ten to fifty each, are employed in this work: one of their number is styled the *hunterman*, and his duty is to traverse the woods in search of the trees. When these have been discovered, a stage is erected against each, so high that the tree may be cut down at about twelve feet from the ground. After the branches are lopped, the task commences of conveying the logs to the water's side, which is often a work of considerable difficulty. They now float down the current singly, till they are stopped by cables, which are purposely stretched across the river at some distance below. Here the different gangs select their own logs, and form them into separate rafts, preparatory to their final destination. In some instances, the profits of this business have been very great, and a single tree has sometimes been known to have produced about £1000. Mahogany now begins to be rare in St Domingo, Jamaica, and the other West India islands. It is said to have been introduced into Britain about the year 1724.

**MAHOMET**. See *Mohammed*.

**MAHON**, PORT MAHON (*Portus Magonis*); a town on the eastern coast of the island of Minorca, of which it is the capital; lat. 39° 51' N.; lon. 4° 18' E. It is the residence of a governor and the principal authorities of the island. It is built chiefly on lofty rocks, and enjoys a pure and healthy air. The houses are generally well constructed, neatly kept, and provided with cisterns. Its harbour is one of the safest and most convenient in the Mediterranean. It is capable of accommodating large fleets, but at the entrance there are some shoals. It is defended by three batteries, and eight large pieces of cannon. There are four islets near, one of which contains a spacious naval hospital for 800 patients, founded by the British in 1711; another, the quarantine buildings; a third, one of the finest lazzarettos in Europe, for 1500 inmates; a fourth, an arsenal. A natural mole runs along the harbour, and is occupied by shops with naval stores. Mahon was taken by the British in 1706; by the French in 1756; re-

stored to the former in 1783; and taken by the Spaniards, after a memorable siege, in 1798.

**MAHRATTAS**; a Hindoo nation in the west part of the Deccan. They first became known to Europeans in the beginning of the sixteenth century, and have become celebrated within the last few years. They originated from the Sappora, a warlike tribe. Being driven by the Moguls from the provinces of Hindostan, where they first dwelt to the mountains extending from west to east. The various tribes of which the nation consisted, were united into a monarchy, the founder of which, Sevajee, died in 1680. The capital is a town named Sattarah. Inured in their youth to the hardships of war, accustomed to live on horseback and armed with excellent swords, they met the Comacks, with their heavy horse, and a cavalry which was the terror of their empire, upon whom they made frequent attacks. In 1696, Aurangzeb attacked the Comacks, and the inhabitants called in the Mahrattas to assist them. The formidable conqueror found it prudent to conclude a treaty on terms very advantageous to him. After the death of Aurangzeb, the Mahrattas took advantage of the dissensions which arose in the Mogol states, to extend their own territory. Their territory amounted to about 500,000 square miles, the greatest part of which was in the Deccan. The sovereigns of this powerful monarchy, the names of Sevajee, bore the title of *mohe rajah* (great prince). They abandoned the administration of the government entirely to their ministers, who were held as prisoners. The last of the name of Ram Rajah, ascended the throne in 1714, at the age of eight years. His prime minister, the *mohe* (grand vizier) Bajeeerow, took advantage of the minority of the prince, seized the reins of government, with the aid of Rajoojee, another minister, confined Ram Rajah, (who remained a prisoner to his death in 1777, though he left him a show of dignity) Bajeeerow, with the other ministers, then partitioned the territories as independent principalities, the former assuming the western provinces, and his residence at Poona. His kingdom was the empire of the Poona Mahrattas. Bajeeerow died in 1761. The dignity of prince was hereditary in his family. His son, a minor, a government was formed in 1777, consisting of two Bramins, which left the president sitting in executive power. This division of the Mahratta states could not be effected without the consent of the principal governors of the empire, and they were gained by additions of power and money. Hence many Mahratta princes arose, some of whom were only in appearance dependent upon the sovereigns of the more extensive districts, such as the German princes, and the British.

1. The empire of the Poona Mahrattas comprehended the whole coast from Goa to Cutch, and was surrounded by Mysore, Goudah, Raichur, and the Mahratta principalities of Goudah, Raichur, and Indore. It contains the most important portions of the Bombay presidency. Bajeeerow entered the Mussulmans in 1760, and extended his empire to the banks of the Indus. This brought the Poona Mahrattas in contact with the territory under Abdallah, formerly a general of Nadir Shah. The partition having formed a plan for driving the Mahrattas out of the country, and extending the empire of the Mahrattas over all India, the whole country was divided (1759—61) into two parties. The Mahrattas adhered to Abdallah, and opposed 25,000 strong in the plains of Carnate and Panipat. He

Mahrattas, together with the Jats, were 200,000 strong. After a long and bloody battle, the latter were defeated, and lost all hopes of the supremacy over India, which had been the object of the war. Bajeerow died soon after. His son Maderow died in 1772, his grandson Narain Row was assassinated in 1773, by his uncle Ragobah. The latter could not, however, obtain quiet possession of the *peishwaship*, for a posthumous child of Narain was acknowledged for his lawful son. Ragobah offered the British the island of Salsette, on condition that they should support his claims. But the council of Bengal was unwilling to engage in a war with the Mahrattas, and, in 1776, concluded a treaty, by the terms of which Ragobah relinquished his pretensions; the British were to remain in possession of Salsette, and to receive a territory producing a yearly revenue of three lacs of rupees. Ragobah remained at Bombay; the British maintained that the district ceded to them did not yield the sum agreed upon. The Mahrattas of Ragobah had defeated the adherents of the *peishwah* at Poonah, and the government of Bombay, with the consent of the council of Bengal, sent Ragobah, in 1778, with a British army, to Poonah. The British gained many important advantages; but, on account of their war with Hyder Ali, peace was their chief object. It was concluded in 1782. They restored all the conquered countries except Salsette and the neighbouring islands. Maderow, the son of Narain Row, who had been assassinated, was born in 1774, and, in 1783, declared *peishwah*, and was, for a time, under the guardianship of one of the other Mahratta princes. Bajeerow, the *peishwah*, was established by a British force, under the command of marquis Wellesley, now duke of Wellington, and subdued several of the Mahratta bes, with the assistance of the British armies; but, in 1817, he commenced hostilities against the British. He was, however, so severely handled (November) by general Smith, that he abandoned his residence at Poonah, and fled to a mountain fortress. In 1818, he submitted to the British authority, and lived as a private individual, with a yearly pension, under the British inspection.

The state of the Berar Mahrattas was not so much involved in foreign wars, but suffered more in domestic disturbances. Berar, the chief province, is 200 miles long, and 170 broad. Rajoojee, 10 years after his expeditions with the *peishwah* into Bengal, wrested the best part of Orissa from Serdy, the usurper of Bengal. A shallow stream separated the Berar Mahrattas from Bengal, and often made incursions into the frontier provinces that beautiful region. These devastations were not checked until after Chossim Ali, nabob of Bengal, had died (1761) Burdwan and Midnapour to the British. Rajoojee, the first Berar rajah, after a long reign, left sons. The eldest succeeded his father, but died out children. The two next, Sebagee and Modagee, engaged in a war for the succession, in which the former fell, and the latter became rajah. He also led the Poonah Mahrattas in the war against the shah (in 1817), at first privately, but afterwards openly, and was obliged to submit, and to cede to the shah his fortresses. Of the remaining Mahratta states, the most important were Sindia and Holkar. The former was rajah of Oojein, and had become powerful. To limit his growing power war was declared against him by the British, in 1802, and he was defeated by the duke of Wellington (then marquis Wellesley), September 23, 1803. He was obliged to consent to a disadvantageous peace, which was afterwards often violated. He died in 1827. Holkar, rajah of Indore, whose revenue was estimated at 100,000 sterling, was alternately the friend and

enemy of the British. In the war of 1805, he was compelled to submit to disadvantageous terms. In 1817, he again took arms, but was defeated and obliged to submit, and deprived of two-thirds of his territories. He died in 1825.

The Mahrattas profess the religion of Brama; they are strong and firmly built, and vary in their complexion from black to a light brown; their manner of living is simple; they have few wants; they are educated for war; in battle, they intoxicate themselves with a sort of opium or wild hemp, which they smoke, like tobacco. In the last war, their artillery exhibited as much skill as courage. The subjugation of the Mahratta states was facilitated by the circumstance that the military caste of the rajahs was universally hated, because they treated the other castes as slaves. The property and rights of the latter found protection only under the British dominion. The caste of warriors left the British provinces in consequence, formed banditti (*pidarrees*) on the Nerbudda, and sought protection from the small Mahratta princes, who were jealous of the British. Thus arose the last general contest of the Europeans with the ancient and proud caste of warriors, which ended with the total dissolution of their order, and the overthrow of the independence of their princely families, in 1818.—See Duff's *History of the Mahrattas* (3 vols., 1826.)

MAIA; the eldest daughter of Atlas and Pleione, the mother of Mercury by an amour with Jupiter, in a grotto of the mountain Cyllene, in Arcadia. She was placed, with her six sisters, among the stars, where they have the common name of *Pleiades*. The Romans also worshipped a *Maia*, who, however, was the mother Earth (*Cybele*). The Tuscans called their principal deity *Majus*, so that here the two highest deities or principles of nature appear in a male and female form. The month of May is said to have received its name from them. See *Magic*.

MAID OF ORLEANS. See *Jeanne d'Arc*.

MAIDEN is the name of an instrument of capital punishment, formerly used at Halifax, in Yorkshire, and in Scotland, which is the prototype of the French guillotine. The maiden is a broad piece of iron, a foot square, sharp on the lower part, and loaded above with lead. At the time of execution, it was pulled up to the top of a frame ten feet high, with a groove on each side, for the maiden to slide in. The prisoner's neck being fastened to a bar underneath, on a sign given the maiden was let loose, and the head instantly severed from the body.

MAIL, COAT OF; also called *habergeon*. There are two sorts—*chain* and *plate mail*.—*Chain mail* is formed by a number of iron rings, each ring having four others inserted into it, the whole exhibiting a kind of net-work, with circular meshes, every ring separately riveted. This kind of mail answers to that worn on the ancient breastplates, whence they were denominated *lorica hammate*, from the rings being hooked together. The habergeon, or hauberk, resembled a shirt in make, and was thrown over the upper part of the body above the clothing; a collar was applied round the neck; and there was a hood, or net helmet, to cover the head. Sometimes the crown consisted of plates of iron, instead of rings; and iron plates, in like manner, were sometimes clasped around the breast and back. In addition to these parts, there were trowsers of similar construction, and it is probable, that the feet were defended by a guard of the same description.

*Plate mail* consisted of small *laminae* or plates, usually of tempered iron, laid over each other like the scales of a fish, and sewed to a strong linen or leather jacket. The plates were in general very numerous, small, and united so as to move freely

without impeding the motion of the wearer. The plate mail was much more cumbersome than the chain mail, a complete suit of ring mail, still in existence, weighing thirty-nine pounds, while one of plate weighs between seventy and eighty, and, in many cases much more. (For a more particular account of the body armour, see *Cuirass*.) The hands were defended by gauntlets, sometimes of chain mail, but more frequently of small plates of iron riveted together, so as to yield to every motion of the hand. Some gauntlets enclosed the whole hand as in a box or case; others were divided into fingers, each finger consisting of eight or ten separate pieces, the inside being gloved with buff-leather; some of these reached no higher than the wrist, others to the elbow. The thighs of the cavalry were defended by small strips of iron plate laid horizontally over each other, and riveted together, forming what were called *cuissearts*, or thigh-pieces. Of these, some entirely enclosed the thighs; others only covered the front of them, the inside, next the horse, being unarmed. They were made flexible at the knees by joints, like those in the tail of a lobster. Tassets or shirts, hooked on to the front of the cuirass, were used by the infantry. For the defence of the legs, there were a sort of iron boots, called *greaves*. Plates of iron, covering the front of the leg, were also frequently worn over the stockings of mail. The greaves commonly covered the leg all round; with these they had broad-toed iron shoes, with joints at the ankle. Boots of jack-leather, called *curbilly* (*cuir bouilli*), were also worn by horsemen. The different pieces of armour covering the body were called, collectively, a *coat of mail*. Complete coats of mail continued to be used through the seventeenth, and even in the beginning of the eighteenth century. Armour gradually continued decreasing, both from innovations and from its utility being diminished, and, in 1690, most of the defensive armour throughout Great Britain was returned to the Tower, whence it had been issued.

The subjoined cut represents a Roman coat of mail, or lorica. It was generally made of leather, covered with plates of iron in the form of scales, or iron rings twisted with in one another with chains (*Hamis concerta*).

Instead of the coat of mail, however, the most of the ancient military used only a plate of brass which covered the breast, the *thorax* or *pectore*.

The *kuwaz* of the Greeks is represented below.

MAIL, and MAIL COACHES. See *Posts*.

MAIMBOURG, LOUIS; a celebrated French ecclesiastical historian, was born at Nancy in 1620, entered into the society of Jesuits at sixteen years of age, and when he had finished the usual course of study,

became classical teacher for six years. Having written a treatise in defence of the rights of the papal church against the pretensions of the emperor at Rome, he was expelled from the society of Jesus (1682), by order of pope Innocent XI.; for which disgrace he was compensated by a pension from Louis XIV. He died in 1686. As an historian, he is partial and inexact. His complete historical works (26 vols. 12mo, 1686), contain histories of the Crusades; of the League; of the Decline of the Empire after Charlemagne; of the Pontiffs of St Gregory and St Leo; of the Schism of the Greeks; of the Grand Schism in the East; of the history of the Iconoclasts; of Lutheranism, and of Calvinism.

MAIMON, M. SES BEN, or MAIMONIDES, one of the most distinguished Jewish scholars, was born at Cordova, in Spain, in 1139. With the loss of the Arabian Thophail and Averroes in medieval philosophy, he united the study of the ancient philosophers, particularly of Aristotle, and thus rendered himself an object of suspicion to his Jewish brethren. To escape their persecutions, he went to Egypt, and became physician to the sultan Saladin, under whose protection he established a celebrated seminary at Alexandria. The intrigues of his enemies obliged him to leave that city, and he remained his life, which he closed in Cairo or in Palestine, in 1205, was passed in continual wanderings. Among his writings, the most celebrated is his *Moré Netachim* (the Teacher of the Perplexed), an attempt to reconcile the doctrines of the Old Testament with reason, or a sort of religious philosophy, which is a strong testimony to his acuteness and clear understanding. It was written originally in Arabic, translated by some Jews into Hebrew, and by Pfeffer into Latin (1629). Among his other works are: *Commentary on the Mishna*, in Hebrew and Latin (Amsterdam, 6 vols fol.); his *Jad Chochma* (Jew's Hand), an abridgment of the Talmud (Vratislavia, 4 vols fol.); his *Sepher Hamisot*, or book of precepts, Hebrew and Latin (Amsterdam, 1667), an exposition of 613 affirmative and negative precepts of the law, deserve mention. He was also the author of a book on Idolatry, translated by Vossius; and of *Christ*, translated by Gehebrand; several other works, letters and essays. The Jews call him the *doctor*, the *great eagle*, the *guide of the light of the East*, and consider him as superior to Moses. They often designate him according to their usual custom, by the four letters *M. M. M. M.* (Rabbi Moses Ben Maimon), whence the name *Rambam*.

MAIMON, SOLOMON, a distinguished Jewish philosopher, born in Lithuania, 1753, was the son of a poor rabbi, who directed his studies to the Talmud. After having lived in extreme poverty, he directed his knowledge carried him to Germany, where he became known to Mendelssohn, in Berlin, and obtained assistance from him. He pursued his studies, particularly in philosophy, with great zeal, turned his attention for some time to pharmacy, travelled to Hamburg, Amsterdam, Breslau, returned to Berlin, and died in Silesia, in 1800. He wrote the memoirs of his own life (Berlin, 1792—93, 2 vols); *Maimoniana*, illustrative of his character, published by S. J. Wolff (Berlin, 1812); he was the author of *Essays on the Transcendental Philosophy* (Berlin, 1790); *Essay toward a new logic*, or letters to *Ænesidemus* (Berlin 1794), in which he attempts to correct and define more accurately the transcendental logic; a work *On the Language of Aristotle* (1794); and *Critical Inquiry into the Human Mind* (Leipsic, 1797). In these writings he develops the doctrines of the critical philosophy with great ingenuity.

**MAINA**; a small village of the Morea, which gives its name to a district situated in a bay of the Mediterranean; lon.  $22^{\circ} 22' E.$ ; lat.  $36^{\circ} 42' N.$  The district is mountainous, the least fertile part of the peninsula comprising the south-east part of ancient Laconia, and at present is included in the provinces of Laconia and Lower Messenia. See *Mainots*.

**MAIN DE JUSTICE** (French, *hand of justice*) is a staff, at the upper end of which a raised hand is fastened. It is one of the French insignia of royalty. Napoleon had it among the imperial insignia.

**MAIN-MAST**; the chief or middle mast of a ship. It is divided into four unequal sections, viz. the *main-mast*, properly so called, which first rises from the deck; the *main-top-mast*, immediately rising from the main-mast; the *main-top-gallant-mast*, just above the main-top-mast; and the *main-royal-mast*, which crowns the whole. The form of the main-mast, like that of other masts, is taper. Each division of the mast has its particular sail, to which it gives name, viz. the *main-sail*, *main-top-sail*, &c.; and its particular yard, as the *main-yard*, *main-top-sail-yard*, *main-top-gallant sail yard*, &c.; besides its separate *head* or *top*, as the *main-top*, *main-top-mast head*, &c. The ropes, tacking, &c., of each section are named in a similar manner.

**MAINE, MAYNE, or MAIN** (anciently *Marnus*); a river of Germany, which rises on the confines of Bohemia. It is formed of two streams, the one end called the *Weisser*, or White, the other, *Rather*, or Red; both these join near Cumbach. It receives the *Regnitz*, the Franconian Saal, the Tauber, the *Kinzig*, and the *Nidda*, and flows through Bavaria, Baden, Hesse-Cassel, Hesse-Darmstadt, the territory of Frankfurt, and the duchy of Nassau, and joins the *Rhine* near Mentz. It affords a navigation as far as Bamberg. Length, about 300 miles.

**MAINE**; formerly a province of the western part of France, bounded by Normandy on the north, the *Orléanais* on the east, Anjou and Touraine on the south, and Brittany on the west. It now constitutes the departments of the Sarthe and the Mayenne. It derives its name from the *Cenomani*, an ancient Gallic people. It was part of the French dominions of Henry II. of England, and was conquered by Philip Augustus.

**MAINE ET LOIRE**, a department of France. See *Department*.

**MAINE**; one of the United States of America, bounded N. W. and N. by Lower Canada, E. by New Brunswick, S. E. and S. by the Atlantic, and W. by New Hampshire; lon.  $66^{\circ} 49'$  to  $70^{\circ} 55' W.$ ; lat.  $43^{\circ} 5'$  to  $48^{\circ} 12' N.$  Its length, on the northern frontier, is 280 miles, on the eastern, 210; greatest length from north to south, 225, and greatest breadth from east to west, 195; square miles, 32,628; population in 1790, 96,540; in 1800, 151,719; in 1810, 228,705; in 1820, 298,335; in 1830, 399,462. The principal rivers are the Penobscot, Kennebec, Androscoggin, Saco, St Croix, and St John's. The principal bays are Casco, Penobscot, Frenchman's, Englishman's, Machias, and Passamaquoddy. The chief lakes are Moosehead, Umbagog, Sebago, Schoodic, and several others farther in the interior. Maine is rather an elevated country, having generally a diversified surface. A tract commencing on the west side of the district, east of the White mountains in New Hampshire, and holding a north-east direction as far as the heads of the Aroostic, about 60 miles in length, and sixty in its greatest breadth, is mountainous. Katahdin mountain is the most elevated summit in this range. There is also a small mountainous tract in the northern extremity. The

remainder of the state may be considered, generally, as a moderately hilly country. The tract of country along the sea-coast from ten to twenty miles wide, embraces all the varieties of sandy, gravelly, clayey, and loamy soils, frequently interspersed at short distances; seldom very rich; in many places tolerably fertile, but generally poor. Of this section, Indian corn, rye, barley, grass, &c., are the principal productions. In the tract lying north of this, and extending fifty miles from the sea in the western, eighty in the central, and ninety in the eastern part, the same kinds of soil are found, but they are less frequently diversified, and generally more fertile. The surface rises into large swells of generally good soil, between which, on the margin of the streams, are frequently rich intervals, and in other places sandy or gravelly pine plains, or spruce and cedar swamps. Of this section, the principal productions are grass, Indian corn, wheat, barley, rye, flax, &c. The country beyond the limits above specified, is but little settled. It exhibits great diversities in the appearance of its soil, growth of timber, and also in climate. The land on the Kennebec, and between this river and the Penobscot, is accounted the best in the state. It is well adapted to the various purposes of agriculture, and, as a grazing country, is one of the finest in New England. Though the climate of Maine is subject to great extremes of heat and cold, yet the air, in all parts of the country, is pure and salubrious. The summers, in most parts, are favourable to the growth of all the vegetable productions of the Northern States. In some parts, however, Indian corn, and some other plants of a more tender kind, are frequently injured, and sometimes destroyed, by frosts late in the spring and early in the autumn. The cold of winter is severe, yet the serenity of the sky, and the invigorating influence of the atmosphere, during the same season, make amends, in some degree, for the severity of the weather. Maine enjoys great facilities for commerce. The coast is indented with bays, abounding in excellent harbours. All the settled parts of the country lie near a market, and the produce of the farmer is readily exchanged for money, at a good price. The principal article of export is timber. Vast quantities of boards, shingles, clapboards, masts, spars, &c. are transported to the neighbouring states, to the West Indies, and to Europe. Much of the fire-wood consumed in Boston, Salem, &c. is brought from Maine. Dried fish and pickled salmon are considerable articles of export. Beef, pork, butter, pot and pearl ashes, and some grain, are also among the exports. Great quantities of lime are annually exported from Thomastown. The value of the imports for 1829, was 742,781 dollars, or about £160,000; of the exports, 737,832 dollars, of which 729,106 was of domestic produce. The tonnage in the beginning of that year was 232,939. Cumberland and Oxford canal extends from Portland to Sebago pond. (See *Canals*.) The principal literary institutions are Bowdoin college at Brunswick (students in 1830, 112); Waterville college at Waterville; the Bangor theological seminary; the Gardiner lyceum at Gardiner, founded in 1821, for the purpose of affording a useful education to the operative and productive classes; the Wesleyan seminary at Readfield; and twenty-nine academies, with funds of the value of 170,000 dollars, or about £76,000. Each town is required by law to raise a sum equal to forty cents for each inhabitant, for the support of free schools. In 1826, there were in the state 2499 school districts, and 137,930 scholars. Some voyages of discovery were made by the British to that portion of the country since called *Maine*, as early as 1602 and 1603, and it is described under the name of *Maroo-*

*sheen*. It was visited by French navigators, as De Monts and Champlain, a few years later, but the first permanent settlements were made in 1630. The government was at first proprietary, but in 1652, the province of Massachusetts bay claimed this territory as included within the limits of their charter. In 1820, it was separated from that state, and received into the Union as an independent state. See *Massachusetts*.

MAINLAND OF SHETLAND. See *Shetland Isles*.

MAINOTS; the inhabitants of the mountainous district of the Morea, called *Maina*, is the ancient Laconia. According to Leake, *Maina* is the Italian corruption for the Greek name *Mani*, and the proper name of the people is *Maniati*. They have been supposed to be the descendants of the ancient Spartans, but probably are composed of fugitives from all parts of Greece, who found safety in this remote corner, protected by the rocks and the sea. Their number is about 60,000, of whom 15,000 are capable of bearing arms. They are Christians of the Greek church, and never submitted to the Turkish yoke. They are hardy, brave, and skilful in the use of arms, and, with the barbarous practice of robbery, unite the virtue of hospitality. Their hatred against the Turks is implacable, and they were among the first to distinguish themselves in the Greek revolution. Previous to that period, *Maina* was divided into a number of districts, each under a *capitano*, over whom was a *beg*, or head chief, residing at Kitirai. Public affairs were discussed in assemblies called *synods*, in which every Mainot had a voice. See *Greece* and *Maina*.

MAINTENANCE; an unlawful intermeddling in a suit, by assisting either party with money, or otherwise, to prosecute or defend it. This was prohibited by the Roman as well as by the English law. A man may, however, maintain the suit of his near kinsman, servant, or poor neighbour with impunity. See *Barratry*, *Common*.

MAINTENON, FRANÇOISE D'AUBIGNÉ, marchioness of, descended of a noble Protestant family, was born in 1635, in the prison of Niort, where her father was confined. In 1639, M. d'Aubigné, having been released, set sail for Martinique with his daughter. After his death, in 1645, his widow returned to France, totally destitute, and the young Frances was taken into the house of her aunt, a Calvinist, whose creed she soon after adopted. Every means was used by her mother to reclaim her, and she finally yielded to harsh treatment, and, after a long resistance, abjured that creed. The death of her mother left her solitary and dependent, and, although she was received into the house of madame de Neuillant, her god-mother, she was subjected to all kinds of humiliations, and considered herself happy in becoming the wife of the deformed, infirm, and impotent Scarron, who, touched with her situation, offered to pay the sum necessary to enable her to enter a convent, or to marry her. Scarron was not rich, but his family was respectable, and his house was frequented by the most distinguished society of the court and the city. His wife conciliated general respect and esteem and affection by her social qualities, her talents, and her modesty. On his death, in 1660, his widow, who was again left destitute, was on the point of embarking for Portugal as a governess, when madame de Montespan, the mistress of Louis XIV., procured her a pension, and afterwards had her appointed governess to the duke of Maine and the count of Toulouse, her sons by Louis. In this post, she became better known to the king, who was, at first, prejudiced against her, but who learned to esteem her for her good sense, and the care which she bestowed on the

education of the duke of Maine. He made her a present of 100,000 livres, with which, in 1670, she purchased the estate of Maintenon, and becoming fond of her society, gradually passed his evenings in love. Madame de Montespan had contributed much to the elevation of De Maintenon by her capricious and arrogant temper, and, while she withdrew the king from his connexion with her former, she supplanted her in his affection. Louis XIV. was then at an age when men wish to live in whom they may confide their joys and cares, and he longed to alleviate the weight of government by the innocent pleasures of domestic life. The ruling temper of madame de Maintenon, in her youth up, had learned to accommodate herself to the wishes of others, promised him an agreeable companion and a trusty friend. Besides this, she had a leaning towards devotion, and the king himself manifested a similar inclination. A war came on. Père Lachaise, his father confessor, advised him to sanction his wishes by a secret or formal marriage, which was solemnized in 1683. The archbishop of Paris, Harlay, married them in the presence of the confessor and two witnesses. Louis was then forty-eight, madame de Maintenon 47 years of age. At court, the marriage always appeared doubtful, although a thousand indications became it. Yet the happiness of De Maintenon was lasting: she herself says, "I was born unbecoming resisted this inclination. When the work, which no longer indulged, was fulfilled, I thought me happy; but this intoxication lasted only three weeks. After her elevation, she lived in a sort of retirement from the world. Louis XIV. visited her several times a day, and transacted business with her ministers in her apartments, while she read or otherwise employed herself. Although, in appearance, she neither knew nor wished to know any thing of the affairs, yet she often had a decisive influence on them. Chamillart was made minister, and Marsin commander of the army in Germany (1703), and Louvois and Catinat were dismissed, by her advice. The nation accused her of errors, and the course of past intentions could not always excuse her. In all other respects entirely submissive to the will of the king, she was wholly occupied with the same in rendering herself agreeable to him, and the severity of her age made her more unhappy than the power of her youth. "What a martyrdom," said the lady Bolingbroke, her niece, "to be obliged to marry a man who is incapable of being amused." The king, who sometimes teased her with his jests, endeavoured to atone for this by proofs of esteem, such as he had never shown to any other woman. But these external forms could not remove her chagrin. She did nothing for her family, because she feared to attract the notice of the court, and would receive nothing herself but the pension of Maintenon, and a pension of 48,000 livres. Among her benevolent plans, was the foundation of a school at St Cyr, for the education of poor girls of good family. Thither she retired, after the death of the king, in 1715, taking part in the amusements of the pupils, till her own death, in 1719. La Beaumelle published the *Lettres de Madame de Maintenon* (Amsterdam, 1734, 9 vols. 12mo), but with many arbitrary changes. Edition of 1812 (6 vols., 12mo) is more complete. La Beaumelle's *Mémoires sur Madame de Maintenon et le Siècle* contains many errors and much of the *vie de Madame de Maintenon*, by Carandol, contains a full account of the institution at St Cyr. The *Entretiens de Louis XIV. et de Madame de Maintenon sur leur Mariage* (Marseille, 1704), is a good book. In 1826, the *Lettres inédites de Madame de*

*Maintenon et Madame la Princesse des Ursins* (four vols.), were published at Paris.

MAIOLIKA. See *Faience*.

MAIRE, LE, STRAITS OF; a narrow channel or passage from the Atlantic to the Pacific ocean, between Terra del Fuego and Staten Land. The strait, which is bounded west by Terra del Fuego, and east by the west end of Staten Land, is about fifteen miles long and as many broad. It derives its name from Le Maire, a Dutch pilot, who discovered it in 1616.

MAISTRE, JOSEPH, count de, Sardinian minister, and member of the royal academy of sciences at Turin, born at Chamberri, 1753, of a French family, was a senator of Piedmont at the time of the French invasion (1792). He left his country in consequence of that event, and afterwards followed his king to Sardinia. In 1804, he was sent ambassador to St Petersburg, returned to Turin in 1817, and died there in 1821. De Maistre was familiar with the Greek and Latin literature. He was an enemy of liberal principles in religion, politics, and philosophy. As a diplomatist, he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his *Eloge de Victor Amadée III*; *Considérations sur la France* (1796, 3d edit., 1814, and also three editions at Paris); *Essai sur le Principe Générateur des Constitutions politiques*, in which he maintains the divine origin of sovereignty; *Soirées de St Petersburg*; *Du Pape*; and *Du Congrès de Rastadt*, the last in conjunction with the abbé de Pradt.—His brother Xavier, born at Chamberri, 1764, major-general in the Russian service, member of the Turin academy of sciences, is favourably known as a writer. The Transactions of the Turin Academy contain several chemical communications from him. He is an excellent landscape painter, and a witty poet. His *Voyage autour de ma Chambre*, distinguished for its gaiety and philosophy, has been translated into several languages. *Le Lépreux de la Cité d'Aosta* (translated into English, Philadelphia, 1825) delineates with much talent and feeling, but in sombre and mystic colours, the suffering of a man cut off from all human society. His *Œuvres*, 2d edit., Paris, 1825, 3 vols., contain also the *Expédition nocturne autour de ma Chambre*; *Les Prisonniers du Caucase*; and *La jeune Sibérienne* (a translation of the two last is called Russian Tales, Philadelphia, 1826).

MAITRE; the French for *master*; a word used in many connexions.

*Maitre d'armes* is a degree bestowed in France by the societies of teachers of fencing, on such persons as are deemed capable of instructing in this art.

*Maitre de requêtes* were officers of the parliament of Paris, before the revolution, who reported on petitions, &c. (*requêtes*). Napoleon re-established the title, and gave it to certain officers belonging to the council of state.

MAITTAIRE, MICHAEL; a learned critic and bibliographer, born in France, in 1688. His parents having fled to England, to avoid the persecutions in France, he was educated at Westminster school and Christ-church college, Oxford, where he took the degree of M.A., in 1696. The preceding year, he had been made second master of Westminster school, which office he relinquished in 1699, and, from that period, devoted his time to private tuition and the study of literature. His editions of various Greek and Latin authors are esteemed for their accuracy. His most important literary production is his *Annales typographici ab Artis Inventionem* (1719—1741, five vols., 4to, augmented by Denis and Panzer). He also wrote a *Historia Stephanorum Gr. Lingue docti*, and edited the *Marmora Oxoniensis*.

MAIZE, or INDIAN CORN (*zea mays*). The native country of this valuable grain remains still undetermined. It is usually attributed to America, where it was cultivated by the aborigines at the time of the discovery; but no botanist has hitherto found it growing wild in any part of the new continent; and most certainly it does not so exist in any portion of the territory of the United States. It is also certain that its culture did not attract notice in Europe, Asia, or the north of Africa, till after the voyage of Columbus. It was unknown to the ancient Greek and Roman writers, and is not mentioned by the earlier travellers who visited China, India, and other parts of Asia and Africa, and who were very minute in describing the productions of the countries which they visited. Notwithstanding these considerations, some authors have endeavoured to prove that it was originally from India, and thence introduced through Persia to Africa. Others, again, have attributed its origin to the western coast of Africa.

Like the other *cerealia*, it belongs to the natural family *gramineæ*, being neither more nor less than a gigantic grass. It is annual and herbaceous. The root is fibrous; the stems rise to the height of from four to ten feet, and, like other grasses, are furnished with knots at intervals. The leaves are alternate, sessile, sheathing at the base, and are slightly pubescent on their superior surfaces, and ciliate on the margin; they vary in length from one to three feet, by three or four inches in breadth. The male flowers are disposed on several spikes, which, together, form a large panicle at the summit of the stem. The female flowers are very numerous, sessile, and disposed in the axillæ of the superior leaves, upon a common axis, which is surrounded with foliaceous sheaths or husks; the styles are very numerous, six to eight inches long, and hang down like a silken tassel from the extremity of the foliaceous envelope; the seeds or grains are rounded externally, angular and compressed at the sides, and tapering towards the base, and are disposed in several longitudinal series. A great number of varieties are cultivated, differing in the size, hardness, number and colour of the grains, the form of the spikes or ears, and, what is a very important circumstance to the human family, in the time required to bring them to maturity. The grains in some varieties are violet or black; in others purple, white, or variegated; and sometimes grains of different colours are found on the same spike; but the usual colour is golden yellow. Some varieties require five months from the time of sprouting for the perfect maturity of the grains, while the period of six weeks is sufficient for others. Owing to this circumstance, this plant can be cultivated in a far wider range of climate than any other species of grain, not only throughout the tropical regions of the globe, but in the most northern parts of the United States; in fine, wherever the heat of summer is intense, though it may be of short duration. It is usually ranked the third grain, in point of utility, next after rice and wheat; but the former of these can only be cultivated in the warmer, and the latter only in the temperate parts of the earth.

Maize is now very extensively cultivated, not only in America, but throughout a great part of Asia and Africa, and also in several countries of the south of Europe, as in Spain and Italy. In many of the provinces of France, it forms almost exclusively the sustenance of the inhabitants. In some parts of America, two crops are obtained in a season, but, as it is found to exhaust the soil very soon, it is usually planted upon the same piece of ground only after an interval of five or six years. It succeeds best in a light and slightly humid soil. The usual, though not the best

mode of planting, is in little hillocks raised at intervals throughout the field, to each of which is allotted five or six grains. These last, after being dipped in water, will often sprout after a lapse of five or six days; the young plants are liable to be injured by frost. In many countries, after flowering, the tops are cut and used for fodder for cattle, and a portion of the leaves stripped also; but this last operation should be delayed till near the time of maturity, which is indicated by the drying of the leaves, and the hardness and colour of the grains. The spikes or ears are gathered by hand, and the husks, when perfectly dry, stripped off, and, together with the stalks, laid by for winter fodder, while the ears are conveyed to the granary. The green stems and leaves abound in nutritious matter for cattle, and in some countries it is cultivated solely for this purpose, especially after early crops of other vegetables; when planted for this object, it should be sowed very thickly. Corn, when well dried, will keep good for several years, and preserve its capability of germination. It is eaten in various manners in different countries, and forms a wholesome and substantial aliment. Domestic animals of every kind are also extremely fond of it. According to count Rumford, it is, next to wheat, the most nutritious grain. It is considered as too stimulating for the common food of cattle, and is found to be more stimulating than any other kind of bread used by us. Mixed with rye meal, it forms the common brown bread of New England; mixed with water alone, it makes a very palatable species of extemporaneous bread. Ground very coarse and boiled, it forms the "hominy," which is so great a favourite at the south; and the fine meal boiled thick in water, is the "mush" of Pennsylvania and the "hasty-pudding" of the Eastern States. In the form of hulled corn or *samp*, the whole grains furnish a very palatable, although rather indigestible luxury. The stems contain sugar, and attempts have been made in France to extract it, but the modes hitherto devised have proved too expensive. In more southern latitudes, the experiment would, doubtless, be attended with more success; indeed, according to Humboldt, this branch of manufacture is carried on in Mexico. The ashes contain a large proportion of potash. Of the husks, a beautiful kind of writing paper has been manufactured in Italy; and when soaked in hot water, they make excellent mattresses; a grayish paper may be made from all parts of the plant. From some information which has lately reached this country, it would seem that the native country of Indian corn has, at last, been ascertained. A variety has been obtained in Paraguay, in which each grain is surrounded by glumes, and this, according to the report of the Indians, grows wild in the woods.

MAJESTY (from the Latin *majestas*) signified, in republican Rome, the highest power and dignity—the attribute of the whole community of citizens, the *populus*. The *majestas* was also ascribed to the dictator, consul, and even senate, though, in the case of the latter, the word *auctoritas* was used in preference. The *majestas* was ascribed to persons, or bodies of persons, so far as they had legislative power, the right to declare war and peace, decide on political offences, and elect magistrates. He who violated this *majestas* (for instance, betrayed an army, caused sedition, or infringed the existing institutions or the rights of the people) made himself guilty of the *crimen majestatis*.—See Haubold *De Legibus cr. Laes. Maj.* (Leipsic, 1786, 4to.) When the republic was overthrown, the dignity, power, and name of majesty passed over to the Roman monarchs, and from them again to the emperors of Western Europe (*majestas Augusti*). At a later period, under the

Roman emperors, *majestas* was the name of the imperial dignity, whilst that of a separate one called *dignitas*. To kings the style of *majesty* was given much later. The eastern monarchs the title in France under Henry II. in 1150, and during the negotiations respecting the peace of Westphalia, we find disputes respecting its use. In the treaty of Cambrey (1529), the title of *majesty* is given to the emperor Charles V. in the treaty of Crespy (1544). Charles V. and imperial, Francis I. *royal majesty*, and the peace of Chateau-Cambresis (1558), the title of *most Christian and Catholic majesty* was used for the first time. In England, Henry VIII. assumed the title *majesty*. At present, the title of *most Christian and Catholic majesty* is called *highness*. On the continent of Europe, *majesty* is used also to denote the royal power and the privileges derived therefrom, even in the case of princes who have not personally the use. On the other hand, the title of *majesty* is sometimes applied from the legal meaning of the word, as in cases of abdicated monarchs who retain the title of *majesty and sire*; thus king Stanislaus Leszczyński of Poland. The few courtiers who survived a deposed Charles X., gave him, also the former style and the duke of Bourbonnais, as Henry V. the *royal majesty*. To this title, through its association with the awkward obsequiousness of former ages, and its indefinite conception of a religious character suited to earthly rulers, added epithets intended to elevate it still higher, as 'most gracious' is English 'most highest' (*Allerhöchster*) in Germany; into the word *majesty*, if used of the emperor of Austria the letters *K. K.* are put, which stand for *kaiserlich-königliche Majestät* (imperial-royal majesty). The pope has given the epithet of *majesty* to some monarchs, as *Catholic majesty* to the king of Spain, *Apostolic majesty* to the king of Sardinia, *Christian majesty* to the king of Prussia, and *most faithful majesty* to the king of Portugal.

The name of *Majestät's Brief*, or charter of *majesty*, was given to the act by which the emperor Rodolph II. granted (June 11, 1609) his subjects of their religion to the adherents of the Augsburg confession in Bohemia. Most of the Bohemians were Protestants. The emperor Maximilian dissolved the act in 1618, in order to punish the Bohemians for their revolt, which was occasioned by the emperor's the succession to king Ferdinand II. The abolition

\* The pedantic spirit of the Germans, which does not seem to have been given a character of formal and laborious reverence in the style of addressing princes, which, to many, and especially to the English, is little less offensive than the increase offered in the title of monarch. In the titles of the latter, there is, in all cases, poetry mixed with nonsense; but in the former, there is neither reason, nor grammar, nor poetry. In writing, a king of Germany is, at the head of the letter, addressed *der allerdurchlauchtigste, Allerhöchster, Gracmächtigste, Reich- und lehrnädigster König und Herr*—which, though it would give the following double superlatives—*the most-majestic, most-highest, most-mightiest king, most-gracious, most-learned, most-illustrious*. Besides this, the single pronouns *he, thou, you, he, she, it* are too vulgar to designate a king, and whenever they occur the prefix *most-highest* (*allerhöchster*) is added: thus *most-highest-he* (for *he*), *most-highest-thou*, *most-highest-he*, &c. A prince is addressed as *highness, highness, highness*, and a mere secretary of state as *high-ness, high-ness, high-ness*, may well exclaim, *Heigh-ho!* As *allerdurchlauchtigste* is so many, which, whether true or not, contradicts what was said. The late king of Bavaria—a man, by the way, who hated nothing more than the foppery of royal pomp—travelled through his country, and the language of a small place was, according to custom, to deliver a speech. He thought that kings were addressed *serenissimo*, as he was writing. He therefore began, "Most-gracious, most-majestic, most-mightiest," &c. Being somewhat bewildered by the presence of a king, and being accustomed to give such epithets to the Creator only, he continued, *omnipotent, most-current of his associations*.—Everlasting God and Lord, Almighty Father, Son and Holy Ghost."

was one of the principal causes of the thirty years' war, and of the intellectual debasement of that fair country. The Bohemians were converted by the sabre to the Catholic faith, and the spirit and intellect of the nation crushed, so that few beings are lower on the scale of cultivation than a Bohemian peasant.

MAJOR, in military language; the lowest of the staff-officers; a degree higher than captain. There appear to have been officers called *majors* as early as 1560, in the German and Spanish troops; they were then the assistants of the colonels. At present they are generally the commanders of battalions. The French, however, abolished this degree during the revolution; they have *chefs de bataillon*. Their *gros major* is a half-invalid officer, who commands the depot of the regiment.

MAJOR, in music, an epithet applied to that of the two modern modes in which the third is four semitones above the tonic or key-note. Those intervals which contain the greatest number of semitones under the same denomination are also called *major*; as a third, consisting of four semitones, instead of three only, is termed a *major-third*; a sixth, containing nine semitones, instead of eight, is called a *major-sixth*.

MAJOR, in logic; the first proposition of a regular syllogism containing the general premise; as, "All vicious acts are pernicious" (the *major*); "this act is vicious" (the *minor*); "therefore this act is pernicious" (conclusion).

MAJORANO GAETANO, known under the name of *Caffarelli*, a celebrated soprano, was born in the Neapolitan territory, 1703. A musician, who had remarked the excellent voice of the boy, advised his father, a peasant, to send him to school at Norcia, afterwards took him into his own house, instructed him, and presented him to Porpora at Naples, who taught him for six years. At the end of that time, Porpora told him that he could teach him nothing more, and that he was now the first singer in Italy, and in the world. In 1738, he went to England, just after Farinelli's (q. v.) departure, but was not a high favour there. After his return to Italy, he sang in several theatres with extraordinary applause, and contributed to extend the florid style of singing. In 1740, he is said to have received 700 sequins for single night at Venice. He accumulated a large fortune, and purchased the estate of Santo-Dorato, on which he took the title of *duke*. He still, however, continued to sing in the monasteries and churches, at a great price; he also visited Paris. In a sumptuous house, which he had built, was the inscription, *Amphion Thebas, Ego Domum*. At his death (1783), he left his nephew a fortune of 12,000 scudi a year, and his duchy.

MAJORAT; a term used on the European continent to denote, in its widest sense, the order of succession which is regulated by age, and the right of preference which hence belongs to the oldest. It is divided into three kinds:—1. *Primogeniture*, or the right of the first-born, by virtue of which the eldest of the eldest line always succeeds to an inheritance. His law regulates the succession to the throne in most all the European kingdoms of the present day.—2. The *majorat*, in the narrower sense of the word, gives the inheritance to the eldest of the relatives of the same rank.—3. *Seniority* always secures to the eldest in the family, without regard to the proximity of relationship.—The majorats cannot lawfully be alienated or mortgaged. The increase of majorats in a state has hitherto been regarded as a species of injustice. The more the wealth of the country is concentrated in a few hands, the more liable the bulk of the population to be reduced to poverty, and to experience the consequent evils of want,

ignorance and crime. The example of Britain may well deter other nations from that defective system of laws, of which the natural consequence is, that more than 150,000 Britons live on the continent, not to grow wealthy, but to consume their wealth. See the article *Entailments*.

MAJORCA; the largest of the Balearic islands, lying between 39° 16' and 39° 57' N. lat., and 2° 24' and 3° 31' E. lon., being about forty leagues from the Spanish, and fifty from the African coast; 1410 square miles, with a population of 181,805 inhabitants. The climate is temperate, the heat being moderated by sea-breezes. The island yields excellent grain, flax, figs, olives, grapes, almonds, oranges, melons, &c. The principal articles of manufacture are tapestry, blankets, and sashes, linen, sail-cloth, &c. The coral fishery, the making of wine and brandy, also employ the inhabitants. The administration is composed of a captain-general and a royal audience, under whom is the government of the Balearics. The capital is Palma, with 34,000 inhabitants. Alcudia, on the north-eastern coast, is the only other city.

MAJOR DOMUS (*maire du palais*); the title of the highest officer of court and state in the monarchy of the French, who was overseer of the household. The dignity of first duke (i. e. commander of the army) was soon connected with this office. The dignity became hereditary, and at length Pepin, who held this office, made himself emperor. See *Pepin*, and *France*; see also *Geschichte der Merovingischen Hausmeier* von G. H. Pertz (Hanover, 1819.)

MALABAR (from the Hindoo *Malayavar*, signifying the mountain, enclosed region) is the appropriate name of the narrow strip of land which lies between the western Ghauts and the sea, on the western coast of the peninsula of the Deccan. The whole western coast, from cape Comorin to 15° N. lat., is sometimes called the *Malabar coast*, in distinction from the Coromandel coast, on the eastern side of the peninsula. The province of Malabar is a small part of this region, containing about 7249 square miles, with a population of 907,575 persons. It was annexed to the presidency of Madras in 1808. In 1817, the revenue amounted to £225,682. The foreign trade is almost exclusively confined to Bombay, Guzerat, and the gulf of Persia. Calicut, Mahe (belonging to the French), Tellicherry are the principal cities; except on the coast, there are no towns nor villages, each land-holder living separately on his own estate. Rice, cocoa-nuts, and pepper are the principal productions. The majority of the inhabitants are Hindoos, and, on account of the remote and sheltered situation, they have preserved their manners and customs with greater purity than has been done elsewhere, the Mohammedans never having entered their territory as enemies till the irruption of Hyder Ali in 1766. There are also about 10,000 Nestorian Christians and 150,000 Roman Catholics.

MALACCA, or MALAYA; a country of India beyond the Ganges, consisting of a large peninsula, connected with Siam by the isthmus of Kraw, which is about seventy-five miles broad. In all other places, it is surrounded by the sea. It is about 775 miles long, and 120, on an average, broad. It is traversed throughout by a chain of lofty mountains, and is covered with extensive forests and marshes, so that it is difficult to penetrate into the interior. The fruits are excellent and plentiful, but grain is not produced in sufficient quantity to supply the inhabitants. Its political condition alternates between a dependence upon Siam and a division into a number of petty independent states. See *Malays*.

MALACCA; a seaport of the above country, on the western coast, and on the straits of Malacca; lon.

102° 12' E.; lat. 2° 14' N. Many of the houses are well built of stone, and there are several spacious and handsome streets. The surrounding country is fertile and pleasant. There is a good roadstead about one and a half miles distant from the town, but the entrance of the river by boats is difficult. The exports are tin, sago, pepper, canes, elephants' teeth, and gold dust. This place was once possessed by the Portuguese, afterwards by the Dutch, till 1795, when it was subjected by a British force, but restored in 1801, recaptured in 1807, and again restored in 1815. But it was finally received in exchange for the British settlements in Sumatra, and occupied by the British authorities in 1825. Population in 1823, 33,806.

**MALACCA PASSAGE**; channel of the East Indian sea, between Polo Way and the coast of Sumatra, about thirteen miles long.

**MALACCA, STRAITS OF**; a narrow sea between the island of Sumatra and the country of Malacca, extending from the equinoctial line to lat. 5° N.

**MALACHI**, the twelfth and last of the minor prophets, was the contemporary of Nehemiah, and prophesied, according to Jahn, from 412 to 408 B. C. The name signifies *angel*, or *messenger of the Lord*. Our entire ignorance of his history has given rise to numerous conjectures concerning him. His prophecy is short, his style prosaic and rough, and he denounces with vehemence the corruptions and backslidings of his countrymen. He declares that the Messiah will save the Gentiles, and announces the coming of one who shall precede and prepare the way for the Saviour. Among the principal commentators are Jerome, Pococke, Calmet, Rosenmüller, &c.

**MALACOLOGY** (from *malakos*, Greek for the *mollusca*); a term now used, particularly by the French, for that part of science which treats of the mollusca.

**MALAGA**; a maritime town of Spain, on the coast of the Mediterranean; lat. 36° 43' N.; lon. 4° 25' W.; population, 51,900. It has an excellent harbour, and is situated in the midst of a fertile country, producing great quantities of figs, almonds, oranges, lemons, olives, sumach, juniper-berries, wax, and honey, which, with dried raisins and wines from the mountains, and cork from the hills, form the foundation of the commerce of Malaga. Besides these articles, it exports a great variety of manufactured goods made here and in the neighbourhood. The port is enclosed on three sides, and is capable of accommodating 400 merchantmen and nineteen ships of war. The city presents a Moorish appearance, with high houses, and narrow, crooked, badly-paved streets. There is, however, a splendid public walk, and a rich, but unfinished cathedral. The vineyards on the neighbouring hills produce, annually, from 2000 to 3000 pipes of wine. The first vintage, in June, furnishes the Malaga raisins. The second, in September, furnishes a kind of wine resembling Sherry, but inferior to it. In October and November, the sweet Malaga wine is made.

**MALAGRIDA, GABRIEL**; an Italian ecclesiastic, notorious for his intrigues and fanaticism, was born in 1686, and, having become a member of the Jesuits' college, was despatched by that fraternity as their missionary to Lisbon. Here he acquired considerable popularity by his eloquence, and his pretensions to extraordinary sanctity. Being accused of participation in the pretended conspiracy of the duke D'Aveiro against the crown of Portugal, he was thrown into prison by the government. But, instead of being tried by the judicial tribunals, he was delivered over to the inquisition, and condemned as guilty, not of treason, but of heresy, uttering false prophecies, and seeing visions, and was sentenced to the stake, and executed September 21, 1761. See *Pombal*.

**MAL' ARIA** (Italian, *bad air*); a state of the atmosphere or soil, or both, which, in certain regions in the warm season, produces a fever more or less violent according to the nature of the exposure. The country of the *mal' aria*, in Italy, is the *Marsenne*, which extends from Leghorn to Terracina, about 920 miles, and from the sea to the Appennines, twenty-five to thirty miles. The centre of the affected district is Rome. (See *Campagna di Roma*.) We are still ignorant of the causes of this fatal miasma. It exists in the rice grounds of Lombardy, in the highlands near Padua, on the summits of the Apennines, and round the gulf of Salerno. The sky is devoted spots continues pure, the air calm, and the verdure fresh; but all this serenity and beauty of nature only forms a shocking contrast with the death-like desolation around, or with the sickly appearance of the few peasants who venture to wander in the unhealthy district. Bigelow (*Travels in Malta and Sicily*) gives a similar account of its effects in Sicily. It is found in all parts of the island, infesting not only the valleys, but the elevated situations. The city of Rome, as is well known, has been gradually invaded by it, and a large part of the city has been successively deserted by its inhabitants. In 1406, the Lateran was consecrated since 1623, the Vatican has become unhealthy, and in 1710, the Palatine, the circus Maximus, the forum, and, indeed, the whole of ancient Rome, has been deserted; even the finest parts of the modern city have become unsafe. See *Rome*.

**MALAYS**; according to Sir Thomas Stamford Raffles (*Asiatic Researches*, xii. London, 1818) a people of Asia, who have adopted the religion and language of the Arabians, and intermarried with them, so that they have become separated from their original stock, and form a distinct nation. In the thirteenth century, we find the Malays on the peninsula of Malacca, where they built a city of the same name, and founded an empire. Their settlement on Sumatra, where the nation seems to have been previously to their settling in Malacca. They afterwards possessed themselves of the rest of the archipelago, of the Philippines, the Moluccas, and some of the Australian groups, where Malay tribes are found, resembling, in their features, religion, and government, the Malays of Malacca. At that time they acted a splendid part in Asia; they carried on commerce, in part, with their own ships, and planted colonies. Great numbers of ships from China, India, China, Hindostan, and Siam filled the harbours of Malacca. They are now divided into distinct tribes, without any general head. This is partly owing to the superiority which the Europeans, particularly the Dutch, have obtained in the Indian seas, and partly to the feudal system of the Malays, by which the national power has been divided, and a common spirit prevented by the increasing power of the vassals. The superior vassals obey the will of the supreme commander only when they please, and the vassals under them have similar liberty. The great body of the nation consists of slaves; their superiors are the *orangs*, or nobility, who are independent, and sell their services to him who pays them best. The Malays are different from the Hindoos, Burmese, and Siamese. They are strong, nervous, and of a dark brown colour; their hair is long, black, and shining; the nose large and flat; their eyes brilliant and full of fire. Impetuosity, bordering on treachery, impatience of constraint, love of plunder and blood, characterize the Malays of Asia. Those in the islands of Australia are in general more gentle, kind, affable, open, and honest, and are distinguished by the finest and most symmetrical persons. The Malays of Asia, including the *Abdallah* and *Dagob*

kese, in Borneo; the Biajoos (one of the wildest tribes), and the Macassars, in Celebes; the Harafors, on the Moluccas; the Sabanos, in Magindanao; the Tagats and Pampangoes, in the Manillas; the Bisayans, in the lesser Philippines, have a remarkable resemblance in their features, in their form of government (a sort of feudal system), and in violence and cruelty. In general they profess the Mohammedan religion, are fond of navigation, war, plunder, change of place, and of all daring enterprises. Besides the Morans, the Malays have various local laws; each tribe has its own, relating chiefly to commerce. The maritime code of Malacca was collected as early as 276, and confirmed by Mohammed Shah, sultan of the country. They pay more respect to their absurd laws of honour than to justice or humanity, and we find force continually triumphing, among them, over weakness. Their treaties and their promises of friendship continue only as long as the interests which prompted them seem to demand. They are always armed, and are perpetually at war among themselves, engaged in plundering their neighbours. When they find opportunity, they will attack European and American vessels by surprise, and kill the crews, if they succeed in capturing them. No free Malay is seen without a dagger. The people, in general, are very skilful in preparing weapons, particularly daggers. Their constant use of opium contributes to infuriate them, and, when maddened by its effects, they rush out with their daggers in their hands, yelling, *Amok, amok*, (i. e. kill, kill); whence the expression, *to run a muck*. The Malays are active only in war, where they are excited by the thirst of robbery and blood. At home, they are indolent, leaving all the labour to their slaves, and despising agriculture. The Malay language is the language of commerce on all the shores of eastern India, and is very extensively used as that of literature and of correspondence. See Marsden's *History of Sumatra*, and his *Dictionary and Grammar of the Malay Language*, (1812, 4to); Crawford's *Indian Archipelago*, &c.

MALCOLM, SIR JOHN, a distinguished soldier and diplomatist, was born near Langholm, in Dumfriesshire, on the 2d of May, 1769, and entered in 1782, as cadet, the service of the East India Company. Having distinguished himself at the siege of Seringapatam in 1792, he was appointed by lord Cornwallis to the situation of Persian interpreter to a British force serving with a native prince. In 1795, on his return on a short visit to his native country, on account of his health, he performed some useful services in general Clarke's expedition at the Cape of Good Hope, for which he received the thanks of the Madras government, and was appointed secretary to the commander-in-chief. In 1797, he was made captain; and from that time to 1799, he was engaged in a variety of important services, terminating at the fall of Seringapatam, where he highly distinguished himself. He was then appointed joint secretary with captain (afterwards Sir Thomas) Munro, to the commissioners for settling the new government of Mysore. In the same year, he was selected by Lord Wellesley to proceed on a diplomatic mission to Persia, where he concluded two treaties of great importance, one political and the other commercial; returning to Bombay in May, 1801. His services were acknowledged by his being appointed private secretary to the governor-general. In January, 1802, he was raised to the rank of major; and on the occasion of the Persian ambassador being accidentally shot at Bombay, he was again entrusted with a mission to that empire, in order to make the requisite arrangements for the renewal of the embassy, which was accomplished in a manner that afforded the highest

satisfaction to the Company. In January, 1803, he was nominated to the presidency of Mysore, and to act without special instructions; and in December, 1804, he was promoted to the rank of lieutenant-colonel. In the June of the following year, he was appointed chief agent of the governor-general, and he continued to serve in that capacity until March, 1806, having successfully concluded several very important treaties during that period.

Upon the arrival in India, in April, 1808, of the new governor-general, lord Minto, colonel Malcolm was sent by his lordship to the court of Persia on a mission. He returned to Calcutta in the following August, and soon afterwards proceeded to his residence at Mysore. Early in the year 1810, he was again selected to proceed in a diplomatic capacity to the court of Persia, whence he returned upon the appointment of Sir Gore Ouseley, as ambassador.

In 1812, colonel Malcolm again visited his native shores; shortly after which he received the honour of knighthood. He returned to India in 1816, and soon became engaged in extensive political and military duties. After the termination of the war with the Mahrattas and Pindarees, to which his services had eminently contributed, he was employed by lord Hastings in visiting and settling the distracted territories of Mulhar Rao, which, and other services, he accomplished in a most satisfactory manner, gaining to British India a large accession of territory and treasure.

Sir John returned to Britain in April, 1822, with the rank of major-general, and soon after he was presented by those who had acted under him in the war of 1818 and 1819, with a superb vase of the value of £1500. During this visit to Britain, he received a proud testimony of the favour of the East India Company, and acknowledgment of the utility of his public career, in a grant, passed unanimously, by a general court of proprietors, of a thousand pounds per annum, in consideration of his distinguished merits and services.

Sir John had quitted India with the determination to spend the evening of his life in his native country; but the solicitations of the court of directors, and of his majesty's ministers for Indian affairs, induced him again to embark in the service of his country, where experience had so fully qualified him to act with advantage. In July, 1827, he was appointed to the high and responsible situation of governor of Bombay, which post he continued to fill until 1831, when he finally returned to Britain, having effected, during the few years of his governorship, incalculable benefits both for this country, our Indian territories, and every class of the inhabitants there. Shortly after his arrival in England in 1831, he was returned to parliament for the burgh of Launceston. He frequently addressed the house at length; and his speeches were characterized by an intimate knowledge of the history and constitution of his country, by a happy arrangement, and much elegance of expression. His last public address was at a meeting in the Thatched House Tavern, for the purpose of forming a subscription to buy up the mansion of Sir Walter Scott for his family; and on that occasion, his concluding sentiment was "that when he was gone, his son might be proud to say, that his father had been among the contributors to that shrine of genius." On the day following he was struck with paralysis, the disorder which had just carried off the illustrious person on whose account this address had been made. His death took place in Prince's Street, Hanover Square, London, on the 31st of May, 1833. As an author, his principal works are—A Sketch of the Sikhs, a singular nation in the province of the Penjamb, in India; The History of Persia, from the

earliest period to the present time; Sketches of Persia; A Memoir of Central India; and his treatise on the Administration of British India, which was published only a few weeks before his death. Sir John had also been engaged for some time before his death in writing a life of Lord Clive, which has since appeared.

**MAL DE NAPLES**; an early name for syphilis, because the disease was spread among the besiegers of Naples, and from them rapidly communicated to others.

**MALDIVE ISLANDS**; a cluster of islands in the Indian sea, situated about 270 miles south-west of Cape Comorin. The number is said to amount to 1000 or more, but they are for the most part small, and uninhabited. The greatest breadth of the chain is from twenty to twenty-four leagues. The inhabitants appear to be a mixture of Arabs and Indians of Malabar. They supply vessels with sails and cordage, cocoa nuts, oil and honey, dry fish, tortoise-shell, and, especially, cowries. They are divided into seventeen *attollons*, or provinces, and are governed by one king; but each *attollon* has its particular governor, who rules with great oppression. The subjects are miserably poor; and none dare wear any clothing above the waist, except a turban, without a particular license. They have only four ports, in which their few articles of commerce are collected. The Maldivian islands lie in lon. 73° 30' to 75° 45' E.; and lat. 3° 30' to 7° 5' N. No European settlements have been made in them.

**MALEA, CAPE.** See *Matapan*.

**MALEBRANCHE, NICHOLAS**, a French priest of the congregation of the oratory, and a celebrated philosopher, was born at Paris, in 1638. His health being delicate, he was classically instructed by a domestic tutor, but afterwards went through courses of philosophy and divinity at the colleges of La Marche and of the Sorbonne. At the age of twenty-two, he determined to embrace the monastic life, and was admitted into the congregation of the oratory. He applied himself first to ecclesiastical history, and afterwards to Oriental learning and biblical criticism; but, having accidentally met with Descartes's treatise *On Man*, he determined to make himself master of that author's system of philosophy. The result of this study was his famous treatise *On the Search after Truth*, first printed in 1673, but of which the best edition is that published by himself in 1712, in 2 vols. 4to., and 4 vols., 12mo. The doctrines of this celebrated work, which contains fine thoughts and uncommon reflections, rendered still more striking by his elegant manner of conveying them, are founded upon Cartesian principles, and are, in some particulars, Platonic. It is principally distinguished by the maintenance of a mysterious union between God and the soul of man, and the doctrine that the human mind immediately perceives God, "and sees all things in him." His next publication was *Christian Conversations* (1676). This was followed (in 1680) by a *Treatise on Nature and Grace*, which led to several controversial pieces between him and Arnauld. Father Malebranche also wrote several works on physical subjects, and several papers for the academy of sciences, of which he was admitted an honorary member in 1699. Malebranche was highly venerated for his elevated genius, and nothing could be more amiable and simple than his conversation and manners. As a philosopher, although he agreed with those who preceded him, in conceiving ideas to be the immediate objects of perception, he distinguished, more than any previous metaphysician, the object from the sensation which it creates, and thereby led the way to a

right understanding, both of our external senses and mental powers.

**MALESHERBES, CHRISTIAN WILLIAM DE LA MOIGNON DE**, an eminent French statesman, descended from a family of distinguished worth and talents. He was the son of William de La Moignon, chancellor of France, and was born at Paris in 1721. After studying at the Jesuits' college, he qualified himself for the legal profession, and became a member of the parliament of Paris. In 1750, he succeeded to father as president of the court of aids, and he soon made superintendent of the press, in both which offices he displayed a liberal and enlightened policy, highly honourable to his talents and character. In the banishment of the parliaments, and the suppression of the court of aids in 1771, Malesherbes was exiled to his country seat, where he devoted his leisure to the study of statistics and agriculture, to the improvement of his estate and of the country around it. After the accession of Louis XVI. he resumed his presidency over the revived *parlement*, and, in 1775, was appointed minister of justice. Finding his plans for the benefit of the nation counteracted by the influence of others, he resigned his post in May, 1776, and went to reside in his country land. He was recalled to the king's councils in 1780, when he drew up two memoirs, *On the Advantages of France*, and the *Means of repairing them*; but his advice was rejected, and he thereupon took his final leave of the court. Returning to the country, he continued his patriotic labours, and in 1789 published an *Essay on the Means of accelerating the Progress of Rural Economy in France*. He took a part in the proceedings which led to the overthrow of the monarchical government; but on the opening of the national convention for the trial of the king, he emerged from his retreat to become the warm advocate of his unfortunate sovereign. His warm attachment to his fallen master excited the jealousy of the French rulers, and caused his detention. Shortly after his return home, his daughter, Madame De Rosambo, and her husband, were arrested and conducted to Paris; and his own arrest, and that of his grandchildren, soon followed. Almost to their family were exterminated by the merciless persecutions of his persecutors. Malesherbes was beheaded Jan. 22, 1794, and he bore his sufferings with a cool worthy of his life. Louis XVIII. ordered a monument to be erected to him in the great hall of the Palais de Justice. It was completed in 1821, and the inscription by the king—*Servans, super his regi suo, in solis veridatem, procerum in omni attulit*.

**MALET, CHARLES FRANCIS**, a French legislator-general, was born at Dole, in 1754. Having served the military service, he embraced the cause of the revolution with ardour, and rose rapidly to the wars of the republic. At the time of Napoleon's assumption of the imperial dignity, he openly avowed his republican opinions, and was, in consequence, left without employment. His connections with individuals known to be hostile to the imperial government, rendered him an object of suspicion, and a proof of his guilt could be obtained, he was detained in prison for several years. During his confinement, he became acquainted with Lamour, formerly attached to Moreau's staff, and General Gudin, who had both been in prison several years. In October, 1812, Malet formed the daring plan of overthrowing a prince then at the summit of his power in Paris. For this purpose, he engaged the co-operation of his fellow prisoners, and, having obtained permission to be carried to an hospital, he escaped during the night of October 23, and, presenting himself to the colonel of a regiment of the Paris garrison, in per-

sounded him that the emperor was dead, and that an opportunity was now offered to restore the republic. He also showed him a decree of the conservative senate, abolishing the imperial government, and constituting general Malet commander of Paris. He next hastened to the barracks of the tenth cohort, under the command of Soullier, who had either been previously gained, or was easily made to believe what he desired—the emperor's death and a change of government. Soullier took possession of the Hotel de-ville at eight o'clock in the morning, and Prochot, the prefect of Paris, who arrived soon after, was also brought to believe that the emperor had been killed. Measures were taken for establishing a provisional government, and a detachment under general Guidal hastened to the Hotel of the Police, seized general Savary, the minister, conducted him to the prison La Force, and installed Lahorie in his place. Malet next proceeded with some soldiers to the quarters of general Hullin, but could not convince him that the story of the emperor's death was true, nor that the pretended decree was genuine. After some altercation, Malet discharged a pistol at him, and wounded him in the jaw, but was immediately seized from behind, and thrown to the ground, by general Abordie, adjutant of the post, who, on hearing of the military movements, had hastened to general Hullin's quarters, and had been admitted without opposition by Malet's soldiers. The latter, who appeared to have been ignorant of Malet's designs, consented to conduct him to prison. His accomplices were soon after arrested, and were examined, with him, before a court-martial, the next day. The examination continued two days and three nights. During the whole time Malet displayed the most unperturbable coolness, avowed his designs, and declared himself ready to die. He was shot, with the other conspirators, October 27, in the plain of Grenelle.

MALHERBE, FRANCIS DE, a celebrated French poet, was born in 1555, at Caen, of an ancient but decayed family. His father was a Calvinist, but, having adopted as a principle, that a gentleman could be of the religion of his prince, he himself adhered to the church of Rome. He entered into the service of Henry d'Angoulême, natural son of Henry II., and married the widow of a counsellor, to whom he had several children. He did not visit Paris until his fiftieth year, when Henry IV. received him into his service, and gave him a liberal pension, chiefly in consequence of the recommendation of Adrien du Perron, who mentioned him as one who surpassed all the French poets who had preceded him. He died at Paris, in 1627. Although the recorded incidents of his life be few, numerous testimonies abound of his caustic wit, greediness of presents, and morose temper; he being generally at war with his wife or another of his relations. He was also lax and entious in respect both to morals and religion. Such was his zeal for the purity of the French language, that, when near expiring, he reproved his nurse for using a word not duly authorized. He may be termed the father of cultivated French poetry, being not only an excellent versifier, but possessed of many of the qualities of a poet; not indeed of the highest class, but he was ingenious, harmonious, elegant, and sometimes even elevated. His poetry consists of odes, stanzas, sonnets, epigrams, and other short pieces, with a few of a devotional cast. He also published translations of Seneca *De Beneficiis*, and of Ovid of *Livy*, with some letters. The best editions of his works are those of Paris, 1722, 3 vols., 8vo., and 1757, 8vo.

MALL, or PALL-MALL, was a game formerly much played in England, in which a box ball was

struck through a ring. The *mall* (French *mail*) was properly the stick (*mallet*) used for striking; but the French *mail* also signified the game itself, more commonly called, by the English, *pall mall* or *pall-mail*, and the ground or alley on which it was played, which was often planted with trees. The site of the street now called *Pall-Mall* (pronounced *pell-mell*) was originally appropriated to playing this game, and derives its name from that circumstance. The walk called the *mall*, in St James's park, also received its name from having been the royal play-ground in the time of Charles II., when mall was a fashionable amusement.

MALLEABILITY; a property of metals, whereby they are capable of being extended under the hammer. (See *Ductility*, and *Metal*.) This word has of late been used by some philologists, to indicate the power of certain languages to form words from given roots by adding prefixes and affixes, and thus to express many different shades of the original idea.

MALLET, DAVID, a miscellaneous writer, was born at Crief, in the county of Perth, about 1700, and, in 1720, was a tutor in the family of Mr Home of Edinburgh. In 1723, he accompanied the two younger sons of the duke of Montrose to Winchester school, and, in the same year, published his admired ballad of William and Margaret. He subsequently made the tour of Europe with his pupils, on his return settled in London, and dropped the name of *Malloch* for *Mallet*. In 1728, he published a poem, entitled the *Excursion*, and, in 1731, a tragedy, called *Eurydice*, which met with temporary success. A poem on Verbal Criticism followed in 1733, and he was soon after made under-secretary to Frederic, prince of Wales. His tragedy of *Mustapha* was produced with success in 1739, and, the following year, his life of lord Bacon appeared, prefixed to a new edition of the works of that great man. In 1747, he published his largest poem, entitled *Amyntor and Theodora*. On the death of Pope, Mallet lent himself to the resentment of lord Bolingbroke against the deceased poet, for having clandestinely printed his *Idea of a Patriot King*. For this service, he was rewarded by Bolingbroke with a bequest of his works, the publication of which produced a prosecution. The duchess of Marlborough having left £1000 between him and Glover, to write the life of her husband, the latter declined the task, and it was undertaken by Mallet alone, who received more or less of the recompense, without leaving on his death, a line towards the work. On the prosecution of admiral Byng, he was employed, by the ministry, to assist in making that unfortunate officer their scapegoat, and was rewarded by a considerable pension. On the accession of lord Bute to the premiership, he wrote his *Truth in Rhyme*, and tragedy of *Elvira*, to which a political tendency was given, to serve the politics of that nobleman, and he obtained a place in the customs for his recompense. He died in 1705. The religious scepticism which he avowed, may have assisted to darken the portraits usually given of Mallet; but it is obvious that no partiality could have rendered it amiable.

MALLET; a weapon. See *Mace*.

MALLEUS, in anatomy; a bone of the ear, so called from its resemblance to a mallet, and in which is observed the head, the neck, and handle, which joins the membrane of the tympanum. See *Ear*.

MALLICOLO, or MANICOLO; an island in the South Pacific ocean, which, according to captain Dillon, should be considered as forming one of the group called Queen Charlotte's islands; lat. 11° 41' S.; lon. 167° 5' E. It has acquired an interest from having been the place where Laperouse was cast away, as appears from the results of the expedi-

tion of captain Dillon, who went on a voyage of investigation, in 1827 (Narrative, &c., 2 vols., 8vo, London, 1829). The relics which he obtained from the island, were identified by Lesseps, who had left Lapérouse in Kamtschatka, and by Betham, as having the armorial bearings of Colignon, botanist on board the frigate. According to the information obtained by captain Dillon, two ships had been thrown ashore; the crew of one perished; the people of the other built a small vessel, and went to sea; what became of them is not known; of two Frenchmen who had remained on the island, one died about three years before the arrival of captain Dillon; the other had followed the fortunes of a defeated chief to some other island. Lesseps has published (Paris, 1831) the *Voyage de Lapérouse*, with all the documents and results of the researches since made to discover his fate. This island must not be confounded with Malicolo, one of the New Hebrides, in lat. 16° 30' S., lon. 167° 50' E.

**MALLOUINES**, or **MALOUINES**. See *Falkland Islands*.

**MALMAISON**; a chateau, two and a half leagues from Paris, and one and a half from Versailles, in one of the most charming situations in the vicinity of the great metropolis. It was the residence of Joséphine, who died there in 1814, and whose grave is indicated by a simple monument. In its beautiful walks, Napoleon loved to find recreation from the cares of state. It received its name (*malus domus*) from its having been erected on the spot where the Normans landed on one of their incursions in the ninth century.

**MALMESBURY**, **WILLIAM OF**, an ancient English historian of the twelfth century, was born in Somersetshire, on which account he was sometimes called *Somersetanus*. He relates that, when he was a child, he had a great inclination for learning, which was encouraged by his parents, and it is supposed that he was educated at Oxford. He became a monk of Malmesbury, and was elected librarian of the monastery. He studied all the sciences of his time, but attached himself particularly to history, and finding that a satisfactory account of his own country was wanting, he determined to write one, "not," as he himself says, "to display his learning, which is no great matter, but to bring to light things that are covered with the rubbish of antiquity." His *De Regibus Anglorum* is a general history of England, in five books, from the arrival of the Saxons, in 449, to the twenty-sixth Henry I., in 1126; a modern history, in two books, from that year to the escape of the empress Maud from Oxford, in 1143; with a church history of England, in four books, published in Sir H. Savile's collection (1596). He discovers great diligence, good sense, and modesty. His *Antiquities of Glastonbury* was printed by Gale, and his *Life of St Aldhelm*, by Wharton. He died in 1148.

**MALMSEY WINE** is a sweet wine, made from a grape originally brought from Monembasia, a small town on the south-east coast of the Morea. The English call the place by its Italian name, *Malvasia*, and the French, *Malvoisie*; hence the name of the wine, *Malmsey* (*vin de Malvoisie*). Much of the Malmsey now used is made from a grape grown on rocky ground, in Madeira, exposed to the full influence of the sun. It is left to hang about a month later than the grapes used for the dry wines, and is not gathered until partially withered. See Henderson, *Hist. of Wines*, 250.

**MALÔES**, **St** (properly, *St Malo*); a seaport on the western coast of France; lat. 48° 39' N.; lon. 2° 1' W.; population, 9860. It is situated on a peninsula, which is connected with the main land by a

narrow causey (the *Sillon*). The harbor is deep and commodious, but difficult of access. The fisheries are extensive and strong. The fisheries are active, hardy, intelligent, zealous, and are occupied in the cod and whale fisheries, as the last fish and colonial trade. Wine, brandy, wheat, and provisions, hemp and tar, are the principal articles of trade. In 1622, this place fitted out two-hundred privateers; in 1711, it gave 30,000,000 *livres* Louis XIV. It is the native city of Mauguet, Deshay-Trouin, and Cartier, the discoverer of Canada.

**MALONE**, **EDMUND**, a commentator on the works of Shakspeare, was born at Dublin, in 1717, after completing his studies at Trinity college. He resided at the Inner Temple, London, and was called to the bar in 1767. Possessing a competent fortune he gave up his profession, and employed himself in literary pursuits. After having been the confidant of Steevens, in his edition of Shakspeare's poems, Malone quarrelled with that gentleman, and published an edition of his own, in 11 vols., 8vo, 1793. He also published an Inquiry into certain facts attributed to Shakspeare (see *Ireland*); biographical memoirs of Sir Joshua Reynolds, Dryden, &c. Hamilton, &c. He died May 25, 1812.

**MALPIGHI**, **MARCELLO**; an eminent Italian physician and anatomist of the seventeenth century; he was born in 1628, near Bologna, and studied at the university of that city. He was admitted M.D. in 1653, and, three years after, was appointed to a medical chair. The grand duke of Tuscany called him to become professor of medicine at Pisa, where he held three years, and, in 1660, returned to occupy his former office at Bologna. He was tempted by a high stipend to accept the professorship of medicine at Messina, in Sicily; but the jealousy of his colleagues rendered him uneasy, and he again returned to Bologna, in 1666. He was elected a member of the royal society of London in 1669, and communicated to that association various anatomical discoveries relative to the minute structure of animal bodies, the results of microscopical observations. Pope Innocent XII., in 1691, called him to Rome, and appointed him his physician, chamberlain, and domestic prelate, which posts he held till he died in 1694. His works, relating to anatomy, physiology, and vegetable anatomy, comprise much new and important information on the brain, the spleen, the uterus, &c.; also on the formation of the fetus in the egg, on plants, &c. His anatomy of vegetables, &c. His complete works have been often published (London, 1687, &c.). His posthumous works were published at London (1687, folio), and republished at Venice and Leyden. Garparini published his *Consult. Med. Cruræ* at Rome (1713). Although Malpighi is not free from error, yet he contributed much to the progress of anatomy, and deserves a distinguished place among discoverers.

**MALPLAQUET**, **BATTLE OF** (Sept. 11, 1793) the bloodiest in the war of the Spanish succession, gained by Marlborough and Eugene, the commanders of the allies, against the French under Tilly. After the capture of Tournay, the allies went to invest Mons, the capital of Hainaut. To prevent this, Villars marched against them: an elderly, noble and valiant Bouders, served under him as a volunteer. The French army was 70,000 strong, with eighty pieces of cannon. The allies, who numbered about 80,000 men, with 140 pieces of cannon, commenced the attack, near the wood in the neighbourhood of the villages of Blangies and Malplaquet. Marlborough commanded the British troops, and the German troops in the British pay, on the right wing. Eugene led the centre; Tilly and a small

Nassau, the left wing, where the Dutch were stationed. Villars commanded the right wing of the French forces; Bouffers, the left. The left wing of the allies was put to flight, and Marlborough had to struggle against the most furious attacks upon the right. The Pretender, son of James II., chevalier St George, charged twelve times, at the head of the French cavalry. Villars then weakened his centre, by despatching reinforcements for the left wing. At his crisis, Eugene advanced, stormed the intrenchments which covered the enemy's centre, and drove back the guards. The marshal hastened thither on the left wing, but too late; he was wounded himself; his centre was broken through, and the wings separated. The battle was lost. The field was covered with about 30,000 dead and dying. The French lost hardly 10,000; the allies, more than 30,000. The conquerors took no prisoners nor cannon. Bouffers conducted the retreat in good order, between Le Quesnoy and Valenciennes. The allies immediately laid siege to Mons, which fell into their hands.

MALT is the preparation of barley, from which ale, beer, and porter are brewed, all which are generally denominated *malt liquors*. For this purpose, the barley is steeped in water for three or four days. It is then taken out and suffered to lie until it begins to sprout or germinate. As soon as this process has advanced sufficiently, its further progress is prevented by drying it in a kiln, heated by coal or coke, for which purpose the anthracite coal is found to answer admirably well. The grain is now become mellow and sweet, and after having been crushed in a kind of mill, contrived for the purpose, its saccharine and uclaginous portions are extracted by boiling water. The liquor thus produced has the name of *wort*, which, having undergone the process of fermentation, and having been flavoured by the addition of hops, &c., constitutes ale or beer. What remains of the malt after brewing, is called the *grains*, which are used for feeding horses and cows. Besides the use of barley for malt, it is also extensively used for soup, broth, bread, &c., in all the countries of Europe. See *Fermentation and Brewing*.

MALTA (anciently, *Melita*); an island in the Mediterranean, possessed, through several centuries, a degree of celebrity and power greater than has ever been attached to any other territory of so little extent; lat. 35° 53' N.; lon. 14° 30' E. (of the observatory of the grand master); sixty miles from Sicily; 200 from Calipia, the nearest point of Africa; separated from the small island of Gozo by a strait five miles wide, comprising, with Gozo and the rock of S. Geminio, which lies between, about 170 square miles. The population of the group was, at one time, 4,000; at present, 94,000; of which 14,000 belong to Gozo. Besides the natives, there are British, Turks, Egyptians, Italians, French, and Dutch. The Maltese, English, and Italian are the predominant languages. The soil consists of a thin covering of earth, on a soft, calcareous rock, and is increased by taking up the surface of the stone into a sort of gravel, and mixing it through the earth. To the north-west, the land rises precipitously more than 100 feet; to the north-east, it is low. There is but one small stream in the island, which is conducted, by an aqueduct of several thousand arches, and eight miles long, to Valetta; a supply of water is obtained from cisterns, in which the rain water is collected. The southern shore is rocky, and without any harbour; that of Marsa, on the east, forming the port of Valetta, is one of the best in the Mediterranean, being completely land-locked, and capable of containing 500 vessels. The climate is hot, but the

heat is mitigated by a sea breeze, which always sets in at night. The principal production is cotton. Melons and oranges, of an excellent quality, are abundant. Corn is raised in small quantities. Figs are cultivated with great care, the process of caprifigging (see *Figs*) being practised. The Maltese are of African origin; with a swarthy skin, hair inclined to frizzle, and nose somewhat flattened. They are industrious, frugal, and excellent seamen; but poor, ignorant, superstitious, vindictive, and dishonest. The upper class speak Italian, but the language of the common people is a *patois*, compounded of Arabic (which is the fundamental and principal part), German, Greek, Italian, and other languages. The Arabic so far predominates, that the peasants of Malta and Barbary can understand each other. They have no alphabet, and, according to the fancy of individuals, adopt those of other tongues. The capital is Valetta, founded in 1566, by Lavelette (q. v.), grand master of the knights of Malta, with a population of 40,000. It is remarkable for the magnificence of its buildings, and the position and strength of its fortifications. The church of St John, the patron of the order, is a noble building, 240 feet long and sixty wide, which contained great riches, until they were seized by the French. The hotels of the knights, corresponding to the eight languages into which the order was divided (see *John, St, Knights of*) are now occupied by the British officers. The palace of the grand master is an extensive pile, and contains a magnificent armoury of ancient and modern weapons. The great hospital afforded accommodations for 2000 patients, who were attended by the knights. The vessels used in the hospital service were of solid silver. Immense granaries, cut out of the rock, were stored with corn, sufficient to maintain the garrison twenty years. They were hermetically closed, and the grain has been preserved in them, so as to be fit for use after a hundred years. The fortifications are the strongest in the world. Besides five forts, commanding the most important points, there are lines of vast strength, enclosing the various quarters, and forming works of such extent as to require 25,000 men to man them, and 100,000 to invest the place completely. Valetta is protected on three sides by the water, and on the fourth, by five lines of fortifications. The ditches are, in some places, ninety feet deep, hewn out of the rock, and the ramparts are mostly formed in the same manner. 1000 pieces of cannon are mounted on the works.

Malta was early in the hands of the Carthaginians, who were dispossessed by the Romans. (On the antiquities, inscriptions, vases, coins, &c., consult the *Malta antica illustrata*, by Bress, Rome, 1816, 4to.) It was occupied, in the middle ages, by the Saracens and Normans, and, in 1530, was conferred, by Charles V., on the knights of St John, who had been expelled from Rhodes by the Turks. It was soon fortified by the knights, and underwent several memorable sieges. In 1798, general Bonaparte took possession of it, on his expedition to Egypt; and, in 1800, the French garrison was obliged, by famine, to capitulate to a British force. In 1814, the possession of it was confirmed to Great Britain, by the treaty of Paris.—See Boisgelin, *Ancient and Modern Malta* (London, 1805, 2 vols., 4to); Brydson's *Tour through Sicily and Malta*; and Bigelow's interesting *Travels in Malta and Sicily* (Boston, 1831); Vassalli's *Grammatica della Lingua Maltese* (Malta, 2d ed., 1827.)

MALVASIA; a district in the Morea. The chief place, called *Malvasia di Romania*, is situated on an island, and connected with the continent by a bridge. It is a fortress; has a bishop, and 2000

inhabitants. Since the late division of Greece, Malvasia forms a province of the department Laconia. The well-known cape Malea belongs to Malvasia. The famous Malmsey wine is made here (also on some other Greek islands). A similar kind of wine is also made in Sicily, Sardinia, in Provence, and Spain. Among the Sardinian wines of this sort, the *Malvasia di Sorso* is particularly distinguished. The Spanish sort comes mostly from Catalonia and Teneriffe. There are both red and white kinds. See *Malmsey Wine*.

MAMELUKES, MAMLOUKS, or MAMALUKES (from the Arabic *memalik*, a slave); slaves from the Caucasian countries, who, from menial offices, were advanced to dignities of state. They did not, however, form a separate body, but when Gengis-Khan made himself master of the greatest part of Asia, in the thirteenth century, and carried vast numbers of the inhabitants into slavery, Nedjmeddin (Malek Salah), sultan of Egypt, bought 12,000 of them, including natives of Mingrelia and Circassia, but chiefly Turks from Capchak (Kiptak), had them instructed in the military exercises, and formed

a regular corps of them. They soon exhibited a spirit of insubordination and rebellion. Under his successor, they interfered in the government, assassinated the sultan, Turan Shah, and, in 1254, appointed Ibehg, one of their own number, sultan of Egypt. The dominion of the Mamelukes in Egypt continued 263 years. The command was usually held by the bravest of their number. During this period, they made some important conquests, and, in 1291, they drove the Franks entirely out of the East. Selim I. put an end to this kingdom, after having taken Cairo the capital, by storm, in 1517. He placed a Turkish pacha as governor over Egypt, but appears to have been compelled, by circumstances, to leave the twenty-four beys, who governed the different provinces, in possession of their power. This state of things continued more than 200 years. But, from the middle of the last century, the number and wealth of the Mamelukes gave them such a superiority over the Turks in Egypt, that the pacha appointed by the Porte was obliged to conform entirely to their wishes. This superiority was owing principally to Ali Bey, who ruled with unlimited power, from 1766 to 1773, when he was assassinated. The Mameluke beys, especially Murad Bey, played an important part at the time of the French invasion. The Mamelukes, who were scattered throughout Egypt, and estimated at 10 or 12,000 men, maintained their numbers, principally by slaves brought to Cairo from the regions lying between the Black and Caspian seas. These were compelled to embrace the Mohammedan faith, and were all educated as soldiers. After a time they obtained a share in the

government, and some of them even became bey for none but Mamelukes were capable of holding an office. They formed a fine body of men, and attacked the French, when they invaded Egypt, with the greatest fury; but they were soon vanquished by the European artillery, and many of them were killed by the French. The present pacha of Egypt, Mohammed Ali, destroyed the beys, in 1811, by massacre.

MAMMALIA. This class consists of animals which are provided with mammae, by means of which they suckle their young. The term is derived from *mamma*, breasts.

The first writers on this branch of natural history were Aristotle and Pliny, and some time afterwards they were followed by Elian, who wrote not only of the nature of animals, and Oppian, in a poem on hunting, describes, at some length, the various animals which were known at his time. In the writings of Hippocrates, Cato, Columella, and Varro, we have occasional observations on the uses of various animals, and, also, on their ferocity, most of which are now considerably mixed up with fable.

In 1551, after the revival of letters in Europe, Gesner published a history of quadrupeds, which was placed in alphabetical order; but some of the most striking genera, such as horses, deer, apes, and men, were arranged in groups. But it was John Ray, a native of Britain, who formed the first chronological arrangement of quadrupeds, which was published in the year 1683, under the title of *Synopse Biblica Animalium Quadrupedum*. There he divided them into two classes; first those with hoofs, and next those provided with nails.

Successing writers continued to improve upon the superstructure of Ray; but it was reserved for the great Linnaeus to lay the first foundation of a more extensive and distinct classification. To us generally, we are indebted for a more perfect method of definition. He attempted what never had been done before, in his *Systema Naturae*, which appeared in 1735, by bringing under review the whole animal, vegetable, and mineral kingdoms, classes as described and named every natural object which had been discovered up to his time, and arranged them in his writings a language fitted to supply all the wants of the age. This celebrated work was ever sought after, and, in a short time, passed through twelve editions; and not long after his death, was edited a new edition of the *Systema Naturae*, with additions, up to the date of its publication in 1760. After his time many distinguished men attempted to improve the arrangement of Linnaeus, the most successful of which was Blumenbach.

A new era commenced in the study of natural history in France. Cuvier, Lamarck, and Latreille laid the foundation of a school which classified animals from their organization. Their great mistake so far adopted the Linnaean method, but their investigations being more precise, and the arrangement of objects being almost daily augmented, they found it necessary to institute many new genera, in our department of zoology. They were fond of the study of internal comparative anatomy was indispensably necessary to a true knowledge of nature, and by their vigorous and patient investigations, they showed the world that this was the only certain method of ascertaining the distinctions between nearly allied groups and species. Thus, with the aid of external characters, has brought the comparative anatomy to its present advanced condition.

Cuvier has shown that there are - *unmistakably prescribed to living beings*, which he thus defines: "Every organized being forms a whole and entire system, of which all the parts mutually co-operate and co-operate to produce the same definite ends."

by a reciprocal re-action; none of these parts can change, without a change of the others also. Thus, if the intestines of an animal are organized in a manner only to digest fresh flesh, it is necessary that his jaws should be constructed to devour the prey, his claws to seize and tear it, his teeth to divide the flesh, and the whole system of his organs of motion to follow and overtake it, and of his organs of sense to perceive it at a distance. It is necessary, also, that he should have seated in his brain the instinct to hide himself and spread snares for his victim; such are the general conditions of a carnivorous regimen; they must infallibly be united in every carnivorous animal—without them the species could not subsist. But under these general conditions, there are particular ones with respect to the size of the species, and the abode of the prey for which each animal is disposed."

Of all the departments of zoology, the Mammalia of Cuvier is his most perfect work, and we have, in a great measure, followed him in the following article, to which we have added a few new genera, established by other naturalists, and we have otherwise slightly altered the arrangement, to bring it nearer to the present state of zoological knowledge.

Cuvier places the class mammalia at the head of organized beings, because the animals which it embraces are the most perfect in their structure, and hence their most varied powers of motion, sensation, and intelligence.

Most mammiferous animals are formed for walking; a few, however, can sustain themselves in the air; while a limited number are destined to live in the water. Bats suckle their young, and are otherwise constructed like quadrupeds; and whales and other cetaceous animals, although inhabitants of the waters, are strictly mammiferous animals, and also suckle their young.

From man, who, from his most perfect organization, stands at the head of the system, to whales and their congeners, which are classed at the end of the mammalia, the skeleton is formed upon the same general principles, and its parts are only altered and modified to suit the station which the animal is destined to fill.

Fig. 1. Is the human skeleton: *a a* the os humeri, *b* the radius, *A A* the ulna, *c* the bones of the carpus, *i* the pelvis, *d d* the os femoris, *e e* the fibula, *f f* the tibia, *g g* the bones of the tarsus, *m* the projection of the os calcis.

Fig. 2. Is the skeleton of a bird: all the bones which correspond with those of the human skeleton, are marked by similar letters. The same apply to the following skeletons. Fig. 3 is that of a frog, and fig. 4 that of a fish.

By those unacquainted with comparative anatomy it will be imagined, on contrasting the skeleton of the human subject with those of the bird and the frog, that these two have more bones in the leg than man, which is not the case, as the bones marked *g* in the latter skeletons are merely one of the tarsal bones more developed than in man, and that bone, reaching from the toes to the first joint in birds, is called the tarsus. We have illustrated the bones by skeletons of the monkey and horse, which will convey a pretty correct idea of those throughout mammiferous animals.

#### SKELETON OF A MONKEY. Plate 52, fig. 13.

##### Bones of the Trunk.

- a*. The Sternum, or breast bone.
- BBB. The seventh or last true rib.
- c*. The cartilage of the ribs.
- d*. The twelfth, or false rib.
- unE. The lumbar vertebrae, with their intervertebral cartilages and transverse processes.
- f*. The os sacrum.
- G. The os innominatum, composed of the os ilium, os pubis X, and the os ischium *a*.

##### Bones of the Superior Extremity.

- H. The clavicle fixed before to the first piece of the sternum, and outwards to the acromion of the scapula I.
- C. The scapula: above it is the cervix of the scapula, and below the outward extremity of the clavicle, the superior costa, and coracoid process are seen.
- k. The os humeri.
- G. The head, or ball of the os humeri: on each side are seen the internal and external tubercles of the os humeri, and farther out, the groove for lodging the tendon of the long head of the biceps muscle.
- 8. The inner condyle of the os humeri.
- 9. The outer do.
- LL. The radius, at the end of which is its head.
- MM. The ulna, at the upper end of which is the coronoid process.
- QQQ. Bones of the carpus, eight in number.
- NN. The metacarpal bone of the thumbs.
- PPP. The metacarpal bones of the fingers.
- qaa. The two bones of the thumb.
- RRR. The three phalanges of the fingers.

##### Bones of the Inferior Extremity.

- S. The os femoris, the ball or head of the bone is lodged in the acetabulum.
- 13. The cervix of the bone.
- 14. The large trochanter.
- 15. The small trochanter.
- 16. The inner condyle.
- T. The patella, placed upon the trochlea of the os femoris.
- U. The tibia.
- 17. The head of the tibia.
- 18. The tubercle of the tibia.
- 19. The malleolus internus.
- V. The fibula, the upper end of which is connected with the tibia.
- 20. The malleolus externus.
- WW. The bones of the tarsus.

21. The projection of the os calcis.  
 XX. The metatarsal bones of the four toes.  
 YYYYY. The phalanges of the toes, or of the lower hands in monkeys and other quadrumanous animals.  
 22. 23. The pelvis.  
 23. The vertebrae of the tail, or caudal vertebrae. This organ in man consists but of a single bone rising out of the lower part of the pelvis, and is termed the os coccygis.

*Bones of the Head and Neck.*

23. The os frontis joined to its fellow by the sagittal suture.  
 24. The parietal bone.  
 25. The temporal process of the sphenoid bone.  
 26. The lower jaw.  
 O. The malar, or cheek bone.  
 The superior maxillary bone, fig. 1. a.  
 The nasal bone, do. b.

**SKELETON OF A HORSE.** p. 52. f. 23.

- a. The posterior maxillary, or jawbone.  
 b. The superior maxillary, or upper jaw.  
 c. The orbit or cavity in which the eye is contained.  
 d. The nasal bones, or bones of the nose.  
 e. The suture, dividing the parietal bones below, from the occipital bones above.  
 f. The inferior maxillary bone, containing the upper incisors or cutting teeth.  
 B. The seven cervical vertebrae, or bones of the neck.  
 C. The eighteen dorsal vertebrae, or bones of the back.  
 D. The six lumbar vertebrae, or bones of the loins.  
 E. The five sacral vertebrae, or bones of the paunch.  
 F. The caudal vertebrae, or bones of the tail.  
 G. The scapula, or shoulder blade.  
 H. The sternum, fore-part of the chest or breast bone.  
 I. The costae, or ribs, seven or eight of which, articulating with the sternum, are called the *true ribs*, and the remaining ten or eleven, which are united by a cartilage, are called the *false ribs*.  
 K. The radius, or bone of the fore-arm.  
 L. The ulna, or elbow, with its process, the olecranon.  
 MM. The carpus, or knee, consisting of seven bones.  
 NN. The metacarpal, or shank bone; the large metacarpal, or cannon, or shank in front, and the smaller metacarpal, or splint bone behind. g. The fore-pastern and foot, consisting of the os sufraginis, or upper and longer pastern bone, with the sesamoid bones behind, articulating with the common and greater pastern; the os coronae, or lesser pastern, the os pedis, or coffin bone, and the os navicular, or shuttle bone, not seen, and articulating with the smaller pastern and coffin bones; A. the corresponding bones of the hind feet.  
 OO. The small metacarpal, or splint bones.  
 P. The pelvis, or haunch, consisting of three portions; the ilium, the ischium, and the pubis.  
 QQ. The femur, or thigh bones.  
 RR. The patella, placed on the stifle joint.  
 SS. The tibia, and fibula (the latter is a small bone behind) are also called the ham bones.  
 TT. The bones of the tarsus, or hock, six in number.  
 UU. The metatarsals of the hind leg, called shank or common bones.  
 WW. The os calcis, or point of the hock.  
 XX. The sesamoid, or fetlock bones.

The upper jaw of the whole mammalia is fixed immovably to the cranium; the lower jaw consists of two pieces, uniting in the centre of the chin, and articulated by a projecting condyle to a fixed temporal bone. The neck is composed of seven vertebrae, and in one species it consists of nine. The anterior ribs are attached to a sternum, formed of several vertical pieces. The anterior extremities or arms commence at the scapula, or shoulder-blade. This bone is not articulated to any other, but simply suspended in the muscles, by thin attachments, and frequently resting on the sternum by the clavicle or collar bone, which holds an intermediate situation; this is prolonged into an arm, fore-arm, and terminated by a hand, consisting of two rows of small bones, denominated the carpus, another row called the metacarpus, and finally the fingers, each composed of two or three bones, called phalanges.

The whole class, with the exception of the Cetacea, have the posterior extremity fixed to the spine, where it spreads out into a pelvis. In young animals, this part is divided into three pairs of bones; the *ilium*, or that part attached to the spine; the *pubis*, which forms the anterior portion of the pelvis, and the *ischium*, which forms the posterior part. At the place where these bones unite, there is a cavity into which the thigh bone is articulated,

to which is attached the leg, composed of two bones, the *tibia* and *fibula*. The leg is terminated by a foot, composed of parts analogous to those of the hand, and are termed the *tarsus*, *metatarsus*, and *toes*. The termination of the lower extremities of the animals, comprising the order *quadrumanus*, cannot be termed a foot, as it is in every respect analogous to the hands of the upper extremities, as hence the name of the order, *four-handed*, &c. is readily seen, by comparing the hands of the upper and lower extremities of the *Chimpanzee* (*Troglodytes niger*) plate 52, figures 23 and 24. The *toes* are both formed for grasping. Fig. 23 is the end of the upper extremity or arm, and fig. 24 is the end of the lower extremity or leg; a hand bone is the *Aye-aye*, (*Chiromys Madagascariensis*), as is presented at fig. 45.

The CRANIUM in the mammalia is always separated by two condyles upon the sides from the vertebra of the neck. The cranium is divided into three compartments; the fore part is formed by two frontal bones and the ethmoid; the intermediate, by the parietal bones and the sphenoid; the posterior by the occipital. Between the occipital bones and the sphenoid, are inserted the temporal bones, a part of which properly belongs to the ear.

In the foetus the occipital bone is divided into two parts; the body of the sphenoid into two, and those of its pairs of alae are separate. The temporal bone consists of three divisions, one of which serves to complete the cranium, another to close the bottom of the ear, and the third to form the sides of the skull. These parts of the bones of the cranium unite more or less quickly, and are perfectly united in the adult.

The face is formed by two maxillary bones, between which the nasal canal passes; they form the two intermaxillary bones in front, and the palatine behind; between these descends the maxillary lamina of the ethmoid bone, called the *Floor*. At the entrance of the nasal canal, are the bones proper to the nose. The jugal, or cheek bone of each side, unites the maxillary bone to the temporal, and also to the frontal bones; and finally, the zygomatic occupies the internal angle of the orbit, and sometimes a part of the cheek.

The BRAIN is composed of two hemispheres, united by a medullary lamina, called the *corpus callosum*, and contains two ventricles, enclosing two pairs of tubercles, which are termed *corpora callosa*, the *thalami optici*, *nates* and *testes*. Between the *thalami optici* is a third ventricle, which communicates with a fourth, situated under the cerebellum. The *crura* of the cerebellum form always under the *medulla oblongata* a transverse process, called *pons Varioli*.

The EYE is always situated in the orbit, &c. protected by two eyelids, and the rudiments of a third. The crystalline lens is fixed by the ciliary process and its cellular sclerotic coat.

The EAR has universally a cavity called the *tympanium* or drum, which is closed from without by the *membrana tympani*; it has also four bones, called the *incus*, *malleus*, *stapes*, and *os orbicularis* at its entrance of which is placed the *stapes*, which communicates with these circular canals; finally, a canal called the *cochlea*, which terminates by one of its canals in the tympanal cavity, and by the other in the vestibule.

The TONGUE is always fleshy, and attached to the hyoid bone, suspended by ligaments on the sides.

The organ of VOICE is always placed at the superior extremity of the *trachea*; and a fleshy communication, denominated the *Falx palati*, or soft palate, establishes a distinct communication between the larynx and back part of the nostrils.

**TOUCH** is always more perfect in animals whose fingers are more numerously developed, and which are least covered at their tips; such as those possessing only a single nail protecting their upper extremities, as in man, apes, and lemurs; sensation in the toes of such as are covered with hoofs, on the contrary, is extremely blunted.

**CLOTHING.** Animals are provided by nature with a covering adapted to the situation in which they are placed. Living for the most part on the earth's surface, the mammalia are exposed to the transitions of heat and cold; the bodies of most of them are covered with a coating of hair, varying in thickness. As their habitation approaches the northern regions, it is more dense, and thinner towards the equator. The cetaceous animals which inhabit the sea, are totally divested of hair.

The essential characters of the mammalia are taken from the number and structure of their teeth, and the construction of their hands and feet. On the perfection of the organs of touch, the expertness of the animal depends; and from their dentary formula may, in a great measure, be deduced the nature of their food and digestive functions.

Animals which feed on flesh have three kinds of teeth; incisors, or cutting teeth, pl. 52, f. 48, *a*; canine, or tearing teeth, *b*; and molars, or grinding teeth, *c*. Those which subsist entirely on animal food, have all their teeth more acute than those which live partly on other substances. Man is an omnivorous animal, and with the structure of his teeth we shall contrast those of the lion. Plate 52, fig. 7, represents an incisory tooth of man; fig. 10, the incisor of a lion; fig. 8, canine of man; 11, that of a lion; fig. 9, the molar of man, and 12, that of a lion. Fig. 16, represents the molar of the Mastodon of America. Fig. 15, are the molars of the lower jaw of the Neotoma Floridana, an animal which exists exclusively on grain and other vegetable substances; which is indicated from the construction of these. If these are contrasted with those of a highly carnivorous quadruped, the *Viverra gracilis*, a striking difference will be observed, for, in place of the flattened surface of those of the Neotoma, the latter exhibit a sharp and irregular surface: fig. 25, represents the second molar of the upper jaw of *Viverra gracilis*; 26, second molar of the under jaw, and 27, the molars of the under jaw. The front view of the teeth of the *Viverra* or *Musanga* are given at 28, which show the strongly developed canines.

Animals of the Rodent order, have but two kinds of teeth, and they live chiefly on grain, nuts, and the bark of trees. Their cutting teeth or incisors, are formed very differently from those of most other animals. Plate 52, fig. 18, is an incisory tooth of the upper jaw of the *Isodon pilorides*, viewed exteriorly; fig. 20, an interior view of the same, and 21 an anterior view. The entire construction of the jaws of these are very different from those which live upon flesh, and other food, as will be seen by comparing the jaws, figs. 14 and 17, with fig. 21, which is the jaw of the *Mangusta Javanica*, an animal which is highly carnivorous, and represented at plate 52, fig. 21.

The method of Cuvier is adhered to, in the generic characters which we have given in the following classification of the mammalia, wherein the dental formula, and construction of the extremities form the principal generic distinction. The arrangement of the figures is intended to represent the upper and under jaw. For instance, in man, the incisory or cutting teeth, are placed in the centre of each jaw, one above and four below, and are marked 1; the canines, or sharp-pointed teeth, are next to these, placed further back, that is, one on each side of the

incisory teeth above and below, and are marked 2—2; beyond these, and further in the mouth, are the molars or grinding teeth, five on each side or the canines above and below, marked 3—3, making a total of thirty-two teeth. The Chimpanzee, an animal which stands next to man in point of organization, has a similar arrangement in the number and kinds of teeth.

Cuvier divides his class Mammalia into the following orders:—

I. **BIMANA**; with two hands, of which Man is the only species. He has three kinds of teeth.

II. **QUADRUANA**; animals with four hands, and having three kinds of teeth. Monkeys, &c.

III. **CARNASSIERS**. These have three kinds of teeth, which are more or less of a carnivorous character. Thumb of the anterior extremities never opposable to the other fingers or toes. It is divided into four families—*Cheiroptera*, or bats; *Insectivora*, or such animals as feed much on insects, as the Hedgehog, &c.; *Carnivora*, animals which subsist on flesh; Cats, &c.; *Marsupialia*, animals provided with a pouch for the protection of their young after birth, as the Kangaroo, &c.

IV. **RODENTIA**, or Gnawers; animals with two large incisors in each jaw, separated from the molars by a void space. The molars in most genera with flat or rigged crowns, and in others blunt tubercles; Hares, Squirrels, &c.

V. **EDENTATA**; generally destitute of teeth; some genera with molars only; their toes varying in number, and provided with large hoof-like nails. Ant-eaters, &c.

VI. **PACHYDERMATA**, or thick-skinned animals; it includes all the hoofed quadrupeds, except the ruminants. Horses, &c.

VII. **RUMINANTIA**; animals which ruminate or chew the cud, with cloven feet, and provided with four stomachs. Deer, &c.

VIII. **CETACEA**; whales.

Latreille and other naturalists have separated the *Cheiroptera* from the order Carnassiers; and even Cuvier himself proposed that the Marsupial animals should be formed into a distinct order.

The following arrangement has been adopted by us:—Order I. *Bimana*, II. *Quadrumania*, III. *Cheiroptera*, IV. *Feræ*, V. *Marsupialia*, VI. *Glires*, VII. *Edentata*, VIII. *Pachydermata*, IX. *Ruminantia*, X. *Cetacea*.

Cuvier and Latreille have placed the genus *Ornithorynchus* in the order *Edentata*, but this animal possesses characters which will not apply to any of the Cuvierian orders, and would properly make an order of itself, consisting of one genus.

The mouth of the *Ornithorynchus* is formed like the bill of a duck, resembling that of a shoveler or other broad-billed species; pl. 52, fig. 49. The internal edges of the under mandible, (which is narrower than the upper), are serrated or channelled with numerous striae, as in a duck's bill. The nostrils are small and round, and are situated about a quarter of an inch from the tip of the bill, and are about an eighth of an inch distant from each other. The fore feet, fig. 47, have five straight, strong, and sharp-pointed toes, the two exterior ones somewhat shorter than the middle three, a broad, fan-shaped web extends considerably beyond the claws. The hind feet, fig. 31, are provided with five other claws longer and more curved than those of the fore feet; the exterior toe and claw are considerably shorter than the other four. The males have a long sharp spur, situated considerably above the toes, through a small perforation of which they eject a poisonous liquor. See *Ornithorynchus*.

## ORDER I. BIMANA.

THIS order consists but of one species, MAN, who is placed at the head of the animal kingdom. He has three kinds of teeth; hands on the anterior extremities and feet on the posterior extremities, fitted for progressive motion in an upright posture; hands and feet, furnished with five fingers and five toes, on each of which are flat nails; two mammae or breasts.

*Homo Sapiens*. Man, "knowing himself." Incisive teeth 2; canines 1; molars 1; total 32. Facial angle differing in different nations. Cuvier considers that there are but three distinct varieties of the human race, viz. the Caucasian, Mongolian and Negro; while Blumenbach, divides them into five, the Caucasian, Mongolian, Ethiopian, American, and Malayan; the chief difference of each variety depending on the development of the skull, and on the facial angle, and general shape. See Article MAN.

*Variety I. The Caucasian*, pl. 52. f. 1., f. 2. coronal surface of the skull. Face oval; facial angle 85 degrees; forehead high, expanded; space between the eyes wide, cheeks coloured with red, hair long, usually of a brown colour. This form predominates in Europe. To which also belong the ancient Greeks; as exhibited in the skull pl. 52 f. 6, where the forehead rises to a great height.

*Variety II. The Mongolian*, pl. 52. f. 3. Face flat, broad, copper coloured, with lateral projections of the cheek bones; facial angle 75 degrees; space between the eyes narrow, eyes placed somewhat obliquely; hair straight, hard; lips thick; nose somewhat depressed; beard thin. This race is spread over Asia, Finland, European Lapland, and includes the Esquimaux hordes.

*Variety III. The Ethiopian*, pl. 52. f. 4. Face round, the upper and lower jaw projecting forward considerably; nose flat, broad; lips very thick; facial angle 70 degrees, skin brownish-black, of different degrees of intensity; hair woolly, frizzled and black. This race inhabits the middle parts of Africa. Fig. 5 represents the coronal surface of the skull.

*Variety IV. The American*, pl. 52. f. 32. Forehead short; cheek bones prominent; nose flattish; facial angle 73 degrees; skin mostly tan, varying to reddish copper-colour; hair straight and coarse, beard thin. This variety comprises the whole aborigines of America, with the exception of the Esquimaux. This skull is that of a North American Indian. Fig. 46 is the skull of a Charib, it represents the most preponderating of the lower lateral and posterior portions of the brain, of any variety of skull known to exist.

*Variety V. The Malayan*, pl. 52. f. 33. Face of an obtuse oval; nose broad; mouth wide; facial angle 73 degrees; skin varying in colour from mahogany to chestnut and clove brown. This race inhabits India, near the Ganges, with the Islands of the Indian ocean and Polynesia. The skull is that of a Siamese.

## ORDER II. QUADRUMANA.

QUADRUMANOUS animals have three kinds of teeth; incisors, canines, and molars; all the four extremities are provided with hands, which fit them in an especial manner for climbing trees. The thumb, however, differs from that of man, being not opposable; pectoral mammae two or four. Their food consists of fruits, roots and insects.

## FAMILY I. SIMIÆ.

Form approaching that of man; 2 pectoral mammae,

*Troglodytes niger*. Chimpanzee, pl. 53. f. 1. Facial angle 50°; destitute of cheek pouches, and tail at the base of the spine; arms moderately short; head round, muzzle projecting a little; canines project slightly, destitute of callosities on the hinder parts.

*Pithecius satyrus*. Orang-outang, pl. 53. f. 2. Facial angle 65° without cheek pouches, tail, or callosity at the termination of the spine; arms long.

*Hylobates syndactylus*. Siamang, pl. 53. f. 9. Facial angle 60°; arms very long, reaching nearly to the ground, destitute of cheek pouches and tail; some species without callosities.

*Presbytis mitrula*. Capped Monkey. Facial angle 60°;

destitute of cheek pouches; distinct callosities; arms reaching to the knees; tail long.

*Colobus polycomus*. Full bottomed Monkey, pl. 52. f. 8. Muzzle short, facial angle from 40 to 45°; arms naked, provided with cheek pouches; nostrils approximated, tail longer than the body; body and arms slender, as thumbs on the fore-arms: having callosities.

*Nasalis larvatus*. Proboscis Monkey, pl. 52. f. 64. Facial angle 50°; muzzle short; having two pouches; nose greatly produced; body robust; thumbs of fore-arms slender; tail longer than body; having mammae.

*Lasiopyga nemca*. Douc, pl. 52. f. 34. Facial angle varying from 50 to 60°; muzzle but slightly elongated, face naked; hands longer than the fore-arms, moderate and slender; cheek pouches, but no callosities, as in *Colobus*.

*Semnopithecus entellus*. Entellus Monkey, pl. 52. f. 6. Facial angle 45°; head round; nose depressed; cheek pouches; thumbs very short, remote from fingers and callosities.

*Cercopithecus mona*. Varied Monkey, pl. 52. f. 11. Facial angle varying from 45 to 50°; head round, nose distinct, approximating the fingers; cheek pouches a length of body at least; callosities, except in one species.

*Cercocebus fuliginosus*. White-eyed Monkey, pl. 52. f. 6. Facial angle 45°; cheek pouches and mammae rather large; fingers long and slender, tail short, tapering and longer than the body.

*Macacus niger*. Black Ape, pl. 53. f. 7. Facial angle from 40 to 45°; muzzle elongated; canine teeth long and long; tail not quite a third the length of the body, as robust.

*Cynocephalus niger*. Black Baboon, pl. 52. f. 14. Facial angle from 30 to 35°; head and muzzle greatly elongated; nostrils placed on the extremity of the superciliary and occipital ridges much developed, as wrinkled with obliquely longitudinal ridges or scars, as cheek pouches; limbs of nearly equal length, strong; claws large.

*Papio mormon*. Rib-nose Baboon, pl. 52. f. 15. Facial angle from 30 to 35°; muzzle long, truncated, as strong; cheek pouches; callosities; tail short.

## AMERICAN MONKEYS.

*Ateles paniscus*. The Coati, pl. 54. f. 38. Facial angle 60°; head round, limbs slender; anterior limbs without thumbs; tail very long, powerfully prehensile, as naked.

*Lagothrix Humboldtii*. Capybara, pl. 54. f. 2. Facial angle 60°; muzzle projecting; tail long, strong; prehensile callosities beneath near its point.

*Myecetes urinus*. Araguato, pl. 54. f. 35. Facial angle 30°; strong canine teeth; tail long, prehensile, as the under side at the extremity, as *Myecetes*.

*Cebus fatuellus*. Horned Sapsucker, pl. 53. f. 14. Facial angle 60°; head round, muzzle short; as thumbs small, thumb long and well formed; tail long, prehensile.

*Callithrix sciureus*. Siamiri, pl. 54. f. 30. Facial angle 60° head round, muzzle short; tail long, hairy, as prehensile; nails straight.

*Aotus trivirgatus*. Douroucoul, pl. 53. f. 11. Facial angle 60°; head round and large; muzzle short, stronger than the body, not prehensile; nails flat.

*Pithecia melanocephala*. Cacajao, pl. 53. f. 12. Facial angle 60°; head round; muzzle short; as mammae as canines very strong; tail shorter than body, hairy, as claw-like and bent.

## FAMILY—OCEINIÆ.

*Jacchus vulgaris*. Striated monkey, pl. 53. f. 5. Head round, muzzle short; occiput prominent, as more than the body, quite covered with hair; ears not as arched and pointed.

*Midas rosalia*. Silky Tamarina, pl. 52. f. 6. Facial angle 50°; head round; muzzle short; as thumbs small, ears large; tail much lengthened, hairy.

## FAMILY II. LEMNÆ.

Form approaching quadrupeds; incisors both upper in form and number; nostrils placed at the corners of the muzzle; first finger of the lower extremities set as thumb, with a sharp turned up nail.

*Lichonotus nigerr.* Short-tailed Indris, pl. 54. f. 42. Incisor tooth 1; canines 1; molars 1; 1. Tail very short, or none.

*Orobates Senegalensis*, pl. 52. f. 53. Incisors 1; 1 lower horizontal; canines 1; molars 1; ears very large; tail very long.

*Indris laniger.* Fleury Indris, pl. 52. f. 40. Incisors 1; molars 1; 1; tail very long.

*Prosimia macaco.* Huffed Lemur, pl. 53. f. 13. Incisors 1; lower ones horizontal; molars 1; 1; tail very long.

*Simia gracilis.* Slender Lorin, pl. 53. f. 14. Incisors 1; lower ones horizontal; canines 1; 1; molars 1; 1; limbs slender; tailless.

*Nycticebus Bengalensis.* Slow Lemur, pl. 54. f. 43. Incisors 1; 1; canines 1; 1; molars 1; 1; tail variable in length.

*Leontide Senegalensis.* Senegal Golego, pl. 53. f. 15. Incisors 1; 1; lower ones horizontal; canines 1; 1; molars 1; 1; ears very large; hind legs and tail very long.

*Chiroglossus.* Dentary formula, unknown; ears short and oval; whiskers very long; tail long and tufted, cylindrical, re-curve.

*Tarsius Bancanus.* Banca Tardus, pl. 54. f. 45. Incisors 1; unequal; canines 1; small; molars 1; 1; ears large and naked; hind legs, tarsal and tail long.

*Chiroglossus Malaccensis.* Aya-Aya, pl. 54. f. 41. Incisors 2, strong; no canines, but a blank space for them; molars 1; 1; fore legs short, middle finger long and slender; hind legs and tail long, tufted.

### ORDER III. CARNASSIERS.

Three kinds of teeth, the molars formed for cutting; jaw capable of a vertical motion only; thumb of the anterior foot, never opposable to the fingers.

#### FAMILY I. CHEIROPTERA.

Fingers connected by a membrane, extending from the anterior to the posterior hands, answering the purpose of wings. Incisors varying in number; canines rather strong; molars with acute crowns.

##### TRIBE I. GALBOPITHECI.

Nails of fingers long and greatly hooked; skin of the membranes hairy on both sides.

*Galbopithecus rufus.* Otolgo, pl. 53. f. 16. Incisors 1; canines 1; 1; molars 1; 1; ears small and rounded; tail variable in length; membrane enveloping the neck, and both extremities; fingers of anterior extremities short, nails bent, slender.

The following arrangement of the Bats is proposed by Mr J. E. Gray.

##### TRIBE II. VESPERTILIONA.

###### Sub-Family. Rhinophorina.

Nasal appendages membranous, complicated; index finger consisting of one joint.

*Nyctophilus.* Incisors 1; canines 1; 1; molars 1; 1; upper canines short and conical, the under equal; first molar in upper jaw acute, with one tubercle; second and third with four tubercles; and the fourth with three.

*Myotis spuma.* Incisors 1; canines 1; 1; molars 1; 1; ears extended and united at their base; three nasal appendages; no tail; third finger of hand without the last phalanx.

*Rhinophorus.* Larvatus, pl. 54. f. 47. Incisors 1; canines 1; 1; molars 1; 1; ears long and distinct; tail long, free.

*Nycterus.* Incisors 1; canines 1; 1; molars 1; 1; forehead with a deep groove; mouth provided with a pouch on each side.

###### Sub-Family. Phyllostomina.

Nasal appendage simple, fleshy, entire or double; index finger formed of two phalanges.

*Phyllostomus hastatus.* Javilla Bat. Incisors 1; canines 1; 1; molars 1; 1; nasal appendage double, one piece heart-shaped, the other lyre-shaped; ears large, naked and separated; tongue bristly.

*Abdomus.* Incisors 1; canines 1; 1; molars 1; 1; ears

large, furnished with auricles; nasal appendage single; index finger two-jointed; extremity of tail naked.

*Pampyrus.* Incisors 1; canines 1; 1; molars 1; 1; tail short, involved in the membrane.

*Glossophaga.* Incisors 1; canines 1; 1; molars 1; 1; tongue long, extensible and suctorial; intermoral membrane, usually obsolete.

*Myotis.* Incisors 1; canines 1; 1; molars 1; 1; two nasal appendages; no tail.

*Rhinopoma.* Incisors 1; canines 1; 1; molars 1; 1; nose elongated, ears large, united, one nasal appendage; tail long.

*Artibeus.* Incisors 1; no canines; molars 1; 1; two nasal appendages.

*Diphylla.* Incisors 1; canines 1; 1; molars 1; 1; or 1; 1; Two short nasal appendages.

*Neophyllus.* Incisors 1; canines 1; 1; molars 1; 1.

###### Sub-Family. Pteropina.

Molars obtusely tubercular; wings conical; intermoral membrane and tail usually wanting; index finger with three joints; head elongated, hairy.

*Pteropus Javanicus.* pl. 54. f. 46. Incisors 1; canines 1; 1; molars 1; 1; nose simple, tail short, or none; index finger with a third phalanx and a nail; tongue papillary.

*Cephalotus.* Incisors 1; canines 1; 1; molars 1; 1; according to Geoffroy; but according to F. Cuvier 1; 1; tail very short.

*Cynopterus.* Incisors 1; canines 1; 1; molars 1; 1; two of which are false in each jaw; tail very short.

###### Sub-Family. Noctilionina.

Molars acutely tuberculated; wings long, narrow; index finger two-jointed; head short, obtuse; lips very large; tail incurved.

*Molossus amplexicaudatus.* Incisors 1; upper ones cleft; canines 1; 1; molars 1; 1; large, with numerous points; nose simple; tail long.

*Sturnoderma.* Incisors 1; according to Geoffroy, but F. Cuvier says they are 1; molars 1; 1; nose simple; tail none.

*Celano.* Incisors 1, the upper sharp and simple, lower formed, as it were, of four columns; no canines; molars 1.

*Aillo.* Incisors 1; no canines; molars 1.

*Neotophilus.* Incisors 1; no canines; molars 1, provided with acuminate processes.

*Proboocides.* Incisors 1; canines 1; 1; molars 1; 1; the front one small, the rest tuberculated.

*Chiromela.* Incisors 1; canines 1; 1; molars 1; 1.

*Noctilio Brasilensis.* pl. 53. f. 17. Incisors 1; canines 1; very strong; molars 1; 1; ears small lateral, remote.

###### Sub-Family. Vespertilionina.

Molar teeth acutely tubular; wings large, broad; index finger of only one joint; head long, hairy; lips simple; tongue short; tail long.

*Vespertilio murinus.* Common bat, pl. 53. f. 18. Incisors 1; upper set in pairs, lower close; canines 1; 1; 1; 1; or 1; 1; anterior molars simple conic.

*Plecotus.* Incisors 1; canines 1; 1; molars 1; 1; ears larger than the head, united at their base.

*Thyroptera.* Dentary formula unknown; body slender; nose small and wings narrow; tail long, exerted; extremities formed for walking; three kinds of teeth; mammae abdominal.

### ORDER IV.

#### FAMILY I. INSECTIVORA.

Molars having various sharp points; in some species the canines are very long, and in others short; tentacles ventral, sometimes both ventral and pectoral; legs short, always formed for plantigrade loco-motion.

*Kriacus Europæus.* Common hedge-hog, pl. 53. f. 19. Incisors 1; canines 1; 1, shorter than the grinders; grinders 1; 1, upper parts protected by prickles, under parts by coarse hair; tail short or none; six pectoral and four ventral teeth.

*Sorex araneus*. Shrew mouse, pl. 53. f. 20. Incisors ; upper ones indented at their base into the lower; canines  $\frac{1}{2}$  ; molars  $\frac{1}{2}$  ; muzzle greatly elongated; ears and eyes small; six or eight teeth both ventral and pectoral.

*Mygale Pyrenaica*. Pyrenees desmarty, pl. 53. f. 21. Incisors  $\frac{1}{2}$ ; two upper large, strong; false canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; tail long, scaly, compressed laterally; toes palmated.

*Tupaia tana*. Tana Tupaia, pl. 54. f. 29. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; body elongated, head attenuated and blunt; eyes and ears large; tail long; 4 ventral teats.

*Scalops Canadensis*. Canadian scalops, pl. 53. f. 24. Incisors  $\frac{1}{2}$ , upper very large; with 3 lateral false incisors and then a void; true molars  $\frac{1}{2}$ ; destitute of external ears; anterior toes large, united to the third phalanx; nails strong and flat.

*Chrysochloris Asiaticus*. Indian chrysochloris, pl. 53. f. 22. Incisors  $\frac{1}{2}$ , strong and flat in the upper jaw, lower very small; false incisors  $\frac{1}{2}$  small; true molars  $\frac{1}{2}$ ; anterior feet three-toed with strong nails; hinder feet with five toes; eyes minute; no external ear; muzzle cartilaginous.

*Talpa Europæa*. Common mole, pl. 53. f. 23. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ , triangular; molars  $\frac{1}{2}$ ; head elongated; eyes excessively minute; destitute of external ears; fore feet large, somewhat hand-shaped; nails slightly arched; hind feet slender.

*Centetes celosus*. Tenree, pl. 53. f. 25. Incisors  $\frac{1}{2}$  or  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ , shaped like the grinders; molars  $\frac{1}{2}$ ; ears very small; legs short, five toes, no tail.

*Condylura macroura*. Radiated condylura, pl. 54. f. 18. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; muzzle long, ciliated at the point; no ears; eyes very small; fore feet formed for digging.

## FAMILY II. CARNIVORA.

Each jaw provided with 6 incisors; molars devoid of sharp points; canines long and strong.

### TRIBE I. PLANTIGRADES.

Predatory animals; their whole foot from toe to heel placed on the ground while walking.

*Ursus ferox*. North American bear, pl. 53. f. 26. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; toes five, provided with strong claws formed for digging; tail short; 2 pectoral and 4 ventral mammae.

*Procyon lotor*. Raccoon, pl. 53. f. 27. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ , large and compressed; molars  $\frac{1}{2}$ ; muzzle acute; body slender; ears small; tail long; teats 6, ventral.

*Nasua fusca*. Brown coati, pl. 53. f. 28. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; body thin; elongated; snout long and mobile; feet semi-palmated, armed with strong crooked nails; tail long; six ventral teats.

*Cercopithecus caudicolatus*. Potto, pl. 53. f. 29. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; body thin; head round; ears oval; toes with strong crooked nails; tail long and prehensile.

*Meles Labradorica*. American badger, pl. 53. f. 30. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; body thick; legs short; ears short, round; eyes small; tail short, under which is a pouch containing a fetid fluid.

*Mydaus meliceps*. Teledu, pl. 54. f. 48. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; two false molars above and three below; snout pointed like that of a hog; ears nearly concealed; tail very short; two anal glands.

*Gulo Arcticus*. Wolverine, pl. 53. f. 31. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; head slightly elongated; legs, tail, and ears short; toes with crooked nails.

*Rattellus mellivorus*. Ratel, pl. 53. f. 3. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; body thick and depressed; legs strong, short; nails slightly arched and retractile; no external ears.

### TRIBE II. DIGITIGRADES.

Predatory animals, which walk on their toes only.

1st Sub-division.—With tuberculous tooth behind the great carnivorous tooth of the upper jaw.

*Mustela Canadensis*. Canada martin, pl. 53. f. 32.

Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$  or  $\frac{1}{2}$ ; body long, slender; legs short; claws sharp, crooked; a sebaceous gland.

*Myphetes Americanus*. American otter, pl. 52. f. 2. Variety of ditto the Chinese, pl. 53. f. 34. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; the great canine with a tubercle on the inner side; posterior incisors, as long and villous.

*Lutra nair*. Pondicherry otter, pl. 52. f. 3. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$  or  $\frac{1}{2}$ ; head long, slender; ears short; feet webbed.

*Enhydra Marina*. Sea otter, pl. 52. f. 4. Incisors  $\frac{1}{2}$ ; cheek teeth  $\frac{1}{2}$ ; false molars  $\frac{1}{2}$ ; head up as in short; body long.

2nd Sub-division.—Having two tubercles behind the great canine one in the upper jaw.

*Canis familiaris*. English pointer, pl. 54. f. 5. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; the three last in upper jaw, and the four in the lower jaw cutting, and of a small size. Muzzle more or less gated, depending on variety; ears in wild species dependent in domestic varieties; fore feet five-toed, hind feet with six toes.

#### 1. Pupils of the eyes circular.

Section I. Head elongated; parietal bones considerably shelving towards each other; condyles of the lower jaw parallel with the upper molars. *Ancaster* & greyhound, &c.

Section II. Head moderately elongated; parietal bones approaching each other from their inner ends, but afterwards divergent. *Spaniel*, shepherd's dog, &c.

Section III. Muzzle more or less truncated, canine considerably elevated; condyles of the lower jaw above the line of the upper molars. *Butcher's dog*, wolf, &c.

#### 2. Pupils of the eyes long; tail long and bushy.

*Fulpes fulvus*. Fulvous fox, pl. 54. f. 23. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; throat and abdomen white; chest part of legs and feet black. North America.

*Lycan picta*. Hyena dog, pl. 52. f. 38. Incisors not forming a regular series, the central ones long and below situated more internally than the rest; short; shoulders higher than the flanks like a dog.

*Megalotis Smithii*. Smith's fennec, pl. 52. f. 39. Incisors, supposed the same as in *Canis* and *Lynx*, but long and acute; ears disproportionately large, tubercles.

*Piterra civetta*. Civet, pl. 53. f. 36. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; head long; nostrils placed on its sides; pupils of the eyes small of being contracted to the breadth of a single hair; scapulae; claws semi-retractile; provided with a pouch.

*Paradoxurus typus*. Type paradoxurus, pl. 52. f. 37. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; head long and depressed; tail very long and depressed when at rest.

*Cynictis Steedmanni*. Steedmann's cynictis, head canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; anterior feet with five toes, posterior feet with four; body long, slender; head as in short and oval; legs long; tail long and bushy.

*Herpestes griseus*. Gray ichneumon, pl. 52. f. 38. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; and part of large, the vent of which is placed below; feet four-toed.

*Suricata Capensis*. Cape Suricate, pl. 53. f. 39. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; grinders  $\frac{1}{2}$ ; body long and three-toed; nails strong; tail long, slender; with a sebaceous gland beneath.

3rd Sub-division.—Of Digitigrades destitute of a tubercular tooth behind the large canine one in the upper jaw.

*Hyena Capensis*. Spotted Hyena, pl. 54. f. 6. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ , very strong; molars  $\frac{1}{2}$ ; the last molars; tongue scapulae; ears large; feet five-toed; nails not retractile; provided with a glandular pouch; teats four.

*Felis nebulosus*. Clouded Tiger, pl. 54. f. 7. Incisors  $\frac{1}{2}$ ; canines  $\frac{1}{2}$ ; molars  $\frac{1}{2}$  or  $\frac{1}{2}$ ; head round; jaws short; ears short, triangular; tongue scapulae.

supra circular in some, in others vertically oval; fore feet with five toes, hind feet with four; nails retractile.

### FAMILY III. AMPHIBIA.

Feet enveloped in the skin, short, fine shaped, and adapted for swimming, hind feet placed horizontally; incisors generally : : 1.

*Phoca pallasiata*. Common Seal, pl. 54. f. 63. Teeth variable. Incisors 1, or 1; or 1; canines 1; molars 1; or 1; or 1; nostrils susceptible of being closed with; eyes large; no ears, or only rudimentary; five-toed; the anterior extremities with hands, and the posterior with feet; fingers enveloped in the skin; tail short, thick; four abdominal teats.

*Monachus monachus*. Proboscis Seal. Incisors 1, or 1; canines 1; molars short, broad and flat; no external ears, none elongated.

*Otaria leonina*. Sea Bear, pl. 54. f. 65. Incisors 1; canines 1; large; molars 1; with distinct external ears.

*Lach. rosmarus*. Walrus, pl. 54. f. 64. Incisors 1; canines 1; much elongated, longer than the head; molars 1; body elongated, conical; head round, muzzle large; no external ears; tail short; fore feet shaped like soldiers, with five short claws; hind feet with five toes united in the skin, and placed horizontally.

### ORDER V. MARSUPIALIA.

Teeth of the various sub-divisions differing considerably; young produced in an imperfect state, and are nursed in an external pouch, which is supported by two marsupial bones; thumbs of hind extremities, mostly distinct and opposable to the fingers, in most species.

1st Sub-division. — With canines and insectivorous cheek teeth.

*Didelphis virginiana*. Virginian Opossum, pl. 53. f. 39. Incisors 1; canines 1; strong, compressed, and projecting slightly; molars 1; or 1; head long, conical, with a pointed muzzle; ears large and round, nearly destitute of hair; tongue articulated; five toes, nails long and bent; hind feet with long thumbs, opposable to the fingers; tail long, half covered with hairs.

*Chaeractes pallasiata*. Yapock, pl. 54. f. 55. Incisors 1; canines 1; grinders pointed and cutting; feet palmated; no thumb nails; tail long, naked and prehensile.

*Dasyurus macrurus*. Spotted Dasyurus, pl. 54. f. 56. Incisors 1; canines 1; grinders 1; head conical; fore feet, five-toed, nails crooked; thumbs of hind feet destitute of nails; tail long, hairy.

*Lepus rufescens*. Raffles' Gymnura, pl. 54. f. 20. Incisors 1; canines 1; molars 1; head elongated, laterally compressed; upper jaw considerably longer than the under one; ears round, naked; tail long, naked and only; feet pentadactyle, nails long, hooked and retractile; hind legs very long.

*Peromyscus nasuta*. Long Nosed Peromyscus, pl. 54. f. 54. Incisors 1; or 1; canines 1; or 1; head much elongated; fore feet with five toes; hind feet four-toed, the two internal enveloped in the skin, showing the main only; tail long, acute.

2nd Sub-division. — Incisors 1, lower ones very long; canines in lower jaw, very small or none.

*Phalangeria Cookii*. Cook's Phalanger, pl. 54. f. 21. Incisors 1; canines 1; or none; false molars 1; or 1; true molars 1; or 1; head elongated; feet with five toes; tail destitute of hair in some species.

*Petaurista lagotis*. Flying Petaurista, pl. 55. f. 25. Incisors 1; canines 1; or 1; molars 1; or 1; head elongated; eyes small; feet short, five-toed; united by a common skin; claws arched and compressed; skin of elbow extended, and uniting the limbs, so as to form a parachute; tail long.

3rd Sub-division. — Incisors 1; the lower ones very long and shearing; canines 1.

*Potorus murinus*. Kangaroo Rat, pl. 54. f. 23. In-

cisors 1; canines 1; molars 1; head long, acute; ears large; upper lip slit; fore legs short.

*Anturus Labialis*. Large Kangaroo, pl. 53. f. 40. Incisors 1; no canines; molars 1; head lengthened; ears and eyes large; fore legs very short, five toes, with strong nails; hind legs very strong, four-toed; tail long, very strong, assists the animal in leaping.

*Phascogalea fuscus*. Koala, pl. 53. f. 41. Incisors 1; false molars 1; true molars 1; ears large; toes parted into two groups, the thumbs and index finger being on one side, the three others on the opposite; hind feet with a clawless thumb.

4th Sub-division. — Incisors 1; no canines.

*Phascogalea Wombat*. Wombat, pl. 53. f. 42. Incisors 1; no canines; molars 1; body thick; head large, depressed; ears short; tail very short.

5th Sub-division. — Not marsupial.

*Arctictes albafrons*. White-faced Arctictes, pl. 52. f. 31. Head short; muzzle abruptly pointed; ears small, tufted with long bristly hairs; tail long, very hairy, and prehensile.

### ORDER VI. RODENTIA.

Each jaw provided with two large incisors, separated from the molars by an open space; destitute of canine teeth; lower jaw articulated by a longitudinal condyle; orbits not separated from the temporal fossae; the Zygomatic arches small; toes varying in number.

#### Section 1. Provided with Clavicles.

*Castor fiber*. Beaver, pl. 53. f. 43. Incisors 1; no canines; molars 1; incisor teeth strong; eyes small; ears short and rounded; feet five-toed, the posterior ones palmated; tail large, depressed, and covered with scales; males provided with a pouch which secretes an unctuous matter.

*Fiber Zibethicus*. Ondatra, pl. 54. f. 25. Incisors 1; canines 1; molars 1; fore feet with four toes; hind feet with five, which have stiff hairs on their edges, adapting them for swimming; tail long and laterally compressed; both sexes with an unguent pouch.

*Arvicola amphibius*. Water Campagnol, pl. 53. f. 49. Incisors 1; no canines; grinders 1; flat on the crowns; tail round and hairy.

*Onychomys leucogaster*. Hairy Sigmodon, pl. 52. f. 17. Incisors 1; destitute of canines; grinders 1; with flat crowns divided into radicles; fore feet, with four toes, and a small tubercle instead of a thumb; hind feet also four-toed, and rest equally on the sole in walking.

*Neotoma Drummondii*. Drummond's Neotoma, pl. 54. f. 26. Incisors 1; no canines; molars 1; with five triangles, one of which is anterior, two exterior and two interior; fore feet four-toed, with a rudiment of a fifth; hind feet with five toes.

*Neotoma floridana*. Florida Neotoma, pl. 54. f. 6. Fur very fine, lead-coloured and mixed with yellow above; abdomen and throat buff.

*Sigmodon hispidus*. Prickly Sigmodon, pl. 52. f. 14. Incisors 1; no canines; molars 1; fore feet with four toes and the rudiment of a fifth provided with a nail; hind feet with five toes; tail hairy.

*Lemmus Norvegicus*. Lapland Lemming, pl. 54. f. 27. Incisors 1; destitute of canines; grinders 1; with flat crowns and angular pieces of enamel; ears very short; in some species the fore feet are five-toed, and in others four; hind feet five-toed, the nails on all of them formed for digging.

*Echymus hispidus*. Rough-haired Echymys, pl. 54. f. 12. Incisors 1; no canines; grinders 1; head long; eyes large; ears somewhat short; fore feet with four toes, and the rudiment of a fifth; hind feet with five toes; tail long, usually wavy; back covered with short spines.

*Myurus arvensis*. Common Dormouse, pl. 54. f. 13. Incisors 1; no canines; molars 1; divided by transverse bands; eyes large, prominent; ears large, round; fore feet four-toed, with a rudimental thumb; hind feet with five toes; tail long, hairy, and tufted in some species.

*Hydromys Coypus*. Coypus, pl. 54. f. 9. Incisors  $\frac{1}{1}$ ; no canines; grinders  $\frac{1}{1}$ ; flattened on the crowns, with enamelled ridges in the form of the figure 8; all the feet provided with five toes; thumb of fore feet very small; hind feet palmated; toes united by a membrane; tail cylindrical, length of the body, and acutely tapering.

1st Sub-division. *Spineless rats of the old Continent.*

*Mus Sylvaticus*. Field Mouse, pl. 54. f. 40. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ , tubercular; ears oblong or rounded, almost destitute of hairs; fore feet four-toed, and a wart for a thumb, covered with an obtuse nail; hind feet five-toed; tail long, without hair, and somewhat scaly.

2nd Sub-division. *Destitute of spines. American Rats.*

*Mus rufus*. Red Rat. Fur yellowish red; darker on the head and back; abdomen yellowish, 6 inches long. Inhabits Paraguay.

3rd Sub-division. *Spinous Rats.*

*Mus Perchal*. Perchal Rat, pl. 54. f. 10. Fur reddish brown above, with spiny hairs intermixed; gray underneath; body 13 inches long; inhabits Pondicherry, in India.

*Cricetus vulgaris*. Common Hamster, pl. 53. f. 43. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; provided with cheek pouches; head thick; ears rounded and oval; fore feet with four toes, and the thumb represented by a nail; hind feet with five toes.

*Geomys Douglasii*. Douglas's Geomys, pl. 52. f. 44. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; head large, depressed; nose short; nostrils are small, round openings, facing downwards somewhat laterally; mouth small; with large and pendulous cheek pouches; eyes small, far apart; body cylindrical; legs short with five toes in each foot.

*Diplostoma Douglasii*. Douglas's Camas Rat, pl. 54. f. 29. Incisors  $\frac{1}{1}$ , furrowed; no canines; molars  $\frac{1}{1}$ ; cheek pouches very large, with exterior openings.

*Dipus gerboa*. Jerboa, pl. 54. f. 22. Incisors  $\frac{1}{1}$ , lower ones acute; no canines; molars  $\frac{1}{1}$  or  $\frac{1}{2}$ ; eyes large; ears long, pointed; fore feet four-toed, and nailed tubercles representing a thumb; hind legs five or six times the length of the fore ones, with from three to five toes.

*Gerbillus Canadensis*. Labrador Sweeping Mouse, pl. 54. f. 25. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; ears moderately short; fore legs short; four-toed; hind legs being long; feet with five toes, each provided with a nail; tail long, hairy.

*Aspalax Typhlus*. The Spalax, pl. 54. f. 4. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; with tubercular crowns; eyes extremely small; no external ears; feet short; with five toes; tail naked; fur soft and short.

*Bathyergus maritimus*. Coast Bathyergus, pl. 54. f. 1. Incisors  $\frac{1}{1}$ , very large and long; no canine teeth; molars  $\frac{1}{1}$  or  $\frac{1}{2}$ ; body thick, cylindrical; head thick; muzzle truncated; eyes small; no external ear; feet and tail short.

*Pedetes Capensis*. Cape pedetes, pl. 54. f. 3. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; lower incisors cut obliquely; molars consisting of two elliptical parts; head short, large, and depressed; muzzle obtuse; ears long, narrow; eyes large; all the feet four-toed. Females provided with an abdominal pouch.

*Arctomys marmotta*. Alpine Marmot, pl. 54. f. 7. Incisors  $\frac{1}{1}$ , very strong; no canines; molars  $\frac{1}{1}$ ; upper surface ridged and tubercular; body thick; head and eyes large; ears short; no cheek pouches; fore feet four-toed; hind feet five-toed; tail very short. Habits social.

*Spermophilus Franklinii*. Franklin's marmot, pl. 53. f. 46. Incisors  $\frac{1}{1}$ , strong; no canines; molars  $\frac{1}{1}$ ; head somewhat large, with large cheek pouches; tail long in most of the species; habits solitary.

*Capromys Fournieri*. Fournier's Capromys, pl. 54. f. 8. Incisors  $\frac{1}{1}$ , very strong, transversely truncated; no canines; molars  $\frac{1}{1}$ ; body bulky; fore legs short, with four toes and a rudimentary thumb; hind feet with five toes; tail long, thick at the base, scaly.

*Sciurus Hudsonius*. Chickasaw squirrel, pl. 53. f. 46. Incisors  $\frac{1}{1}$ , flat in front; no canines; molars  $\frac{1}{1}$ , tubercular; head small; eyes large; ears erect; fore feet four-

toed; hind feet five-toed; nails long and curved; tail long, with long bushy hair.

*Pteromys volucella*. Lesser American Flying Squirrel, pl. 55. f. 10. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; ears and eyes round; eyes large; skin on the side of the head dilated, and extending from the fore to the hind legs, forming a kind of parachute; tail long and thin.

Section II. *With imperfect chawm = can*

*Hystrix cristata*. Crested Porcupine, pl. 54. f. 19. Incisors  $\frac{1}{1}$ ; canines none; molars  $\frac{1}{1}$ ; head not too short; tongue with spiny scales; body covered with long and strong moveable spines, intermixed with or not short; fore feet with four toes; hind feet with two.

*Atherura fasciculata*. Fasciculated Porcupine, pl. 54. f. 13. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; head not too forehead depressed; ears short, rounded; fore feet with four toes, and a rudimentary thumb; hind feet with five toes; tail one-third the length of the body; provided with a tuft of bristles; body covered with spines from the head to the root of the tail.

*Chinchilla lanigera*. Chinchilla, pl. 54. f. 11. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; head round; ears very large; fore feet four-toed, and a rudimentary thumb; hind feet four-toed, external toe short, not so far behind; tail half the length of the body.

*Lepus capensis*. Rabbit, pl. 54. f. 15. Incisors  $\frac{1}{1}$ , upper in pairs; no canines; molars  $\frac{1}{1}$ ; ears not so large; anterior feet with five toes; posterior feet not covered with hair beneath; tail short, erect.

*Lagomys Alpina*. Pika, pl. 54. f. 14. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; ears moderate; no tail. Skulls nearly perfect; feet same as the rabbit.

*Hydrochærus capybara*. Capybara, pl. 53. f. 6. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; muzzle somewhat eyes large; ears moderate, and rounded; fore feet four-toed and palmated; hind feet three-toed; no tail.

*Cavia Culeya*. Guinea Pig, pl. 54. f. 18. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; body thick; muzzle short, depressed; eyes large; ears rounded; legs very short; fore feet four-toed; hind feet with three; no tail.

*Dasyprocta Acuti*. Agouti, pl. 54. f. 17. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; head elongated; slender the muzzle flat; eyes large; fore feet four-toed, and so do the hind feet; hind feet three-toed; nails long and strong.

*Celeoglossus subeiger*. Brown Fox, pl. 54. f. 20. Incisors  $\frac{1}{1}$ ; no canines; molars  $\frac{1}{1}$ ; head short, broad pouches; five toes on all the feet, all the teeth too small.

ORDER VII. EDENTATA

Destitute of incisors in either jaw; sometimes have molars only; some species are without teeth; the variable in number, protected by strong nails.

Tribe I. *Tardigrada.*

Face short, with canines and molars, or with the latter only; nails long, bent.

*Bradypus tridactylus*. Three-toed Sloth, pl. 54. f. 2. No incisors; canines  $\frac{1}{1}$ ; molars  $\frac{1}{1}$ ; canines larger than the grinders; head small; muzzle truncated, not longer than the hind, having three toes, armed with long nails; fur thick, harsh, and long.

*Megatherium Cuvieri*. Cuvier's Megatherium, pl. 54. f. 1. No incisors or canines; molars  $\frac{1}{1}$ ; with numerous furrows on their crowns; body twelve feet long. Found in a fossil state only, in Paraguay, South America.

Tribe II. *Edentata, or digging Edentata.*

Muzzle generally elongated; with neither teeth or sometimes none.

*Dasyprocta novaeboracensis*. Nine-banded Armadillo, pl. 55. f. 7. No incisors, or sometimes  $\frac{1}{1}$  or canines; teeth subject to great variety, varying in number from 24 to 60; head long, pointed; muzzle small; tongue extensible; body wholly covered by scales; fore feet five-toed; hind feet with five toes; nails long, stout & digging; tail long.

*Oryzomys Capensis*. Cape Ant-Kater, pl. 54. f. 31. No incisors or canines; molars 11, separate; head elongated; fore feet four-toed; nails strong; hind feet three-toed, plantigrade; nails strong, hoof-shaped.

*Myrmecophaga jubata*. Great Ant-Kater, pl. 55. f. 6. Institute of teeth; head greatly elongated, muzzle tapering to a point; tongue long, protractile; toes united to the base of the nail; fore feet four-toed, hind five-toed; incisors species two before and four behind; nails strong, fitted for digging; tail long, sometimes prehensile.

*Marmota flaviventris*. Indian Marmot, pl. 54. f. 28. No teeth; muzzle acute; tongue protractile; body elongated, covered with coriaceous imbricated scales; feet five-toed; nails strong, fitted for digging; tail long, covered with scales.

*Chlamyphorus truncatus*. Truncated Chlamyphorus, pl. 54. f. 2. Neither incisors nor canines; molars 11; head pointed, broad above; body covered with a coriaceous shell, composed of transverse plates; under parts with a coating of fine silky hairs; tail rigid; claws very strong.

*Phalanger hystrix*. Spiny Echidna, pl. 54. f. 31. Dentition of teeth, the palate arched; muzzle flat, narrow and small; tongue protractile; eyes small; no external ears; feet with five toes; hind legs with a pointed spur, through which an acrid secretion is ejected; tail short, with a covering of stiff spines.

*Ornithorhynchus anatinus*. Duck-billed Platypus, pl. 54. f. 31. Dentition of incisors and canines; molars 11, which are fixed only in the gums; muzzle horny, elongated and depressed, resembling the bill of a duck; five toes on each foot, united by a membrane; male with a spur in the hind leg; tail flattened. The bill is represented at 52. f. 40; a fore foot, f. 47, and a hind foot, f. 31.

## ORDER VIII. PACHYDERMATA.

Thick skinned animals, with three kinds of teeth, feet provided with toes, variable in number, and terminated with strong nails or hoofs, destitute of clavicles.

### FAMILY I. PAHOECIDÆ.

Upper incisors in the form of tusks; molars compound, one in number; five toes on all the feet; provided with protuberances.

*Elephas indicus*. Indian Elephant, pl. 55. f. 1. Incisors 1, in the form of enormous tusks; molars 11; nose elongated into a cylindrical tapering proboscis, movable in all directions, with a finger-like process at its tip, and with which it has the power of grasping; head very large, ears large, flat; neck short; tail of medium length, provided with a tuft of hair.

*Elephas africanus*. African Elephant, pl. 55. f. 2. External structure same as the above; ears very large; tail long; proboscis very thick at the base; fore feet with five toes, and four on the hind, which have but three hoofs.

*Mastodon giganteus*. Mammoth, pl. 52. f. 42. Incisors 1, no canines; molars 11; triangular without cartilaginous covering; crowns with points disposed in pairs; tusks the fore legs; bright of animal to the withers elevated. Found fossil only, in North America.

### FAMILY II. TRU PACHYDERMATA.

Mostly with three kinds of teeth, two at least, in others not with four or two toes.

*Hippopotamus amphibius*. Hippopotamus, pl. 53. f. 4. Incisors 1; canines 1; molars 11; head thick and square; eyes and ears very small; legs short; feet with nearly equal toes, provided with small hoofs; body large and heavy; skin destitute of hair.

*Dasypus*. Armadillo, pl. 54. f. 34. Incisors 1; canines 1; molars 11; nose elongated, cartilaginous and provided with a bone to the snout, feet four-toed, the two middle ones only touching the ground, provided with strong hoofs; body covered with brios.

*Phacochærus africanus*. Ethiopian Hog, pl. 54. f. 25. Incisors 1; canines 1, forming large rounded canines, directed upwards from the sides of the jaws; molars 11, composed of cylinders, united by a coriaceous

head large, cheeks with large fleshy lobes, feet cleft like the hog.

*Dicotyles subniger*. Collared Pecary, pl. 55. f. 3. Incisors 1; canines 1; grinders 11; canines not projecting beyond the mouth; four toes on the fore feet, and three on the hind; joins with a glandulous opening, secreting a foetid humour; a tubercle in place of a tail.

*Anoplotherium vulgare*. Greater Anoplotherium, pl. 52. f. 43. and skeleton, pl. 65. f. 2. Incisors 1; canines 1; molars 11, all the teeth in one line; general form supposed to be between that of the horse and rhinoceros, feet with two toes. Found in a fossil state only.

*Rhinoceros indicus*. Indian Rhinoceros, pl. 55. f. 5. Teeth varying with the species, the incisors either 1 or 1; no canines; molars 11, or 11; nose with one or two horns; feet three-toed; tail short, compressed at the tip; skin very thick, naked and rugose.

*Hyrax Capensis*. Cape Hyrax, pl. 55. f. 4. Incisors 1, the upper very strong, curved inwards, and detached from the molars; molars 11; anterior feet, with three or four toes, posterior with four, the inner one provided with a crooked nail.

*Palaotherium sinense*, the little Palaotherium, pl. 65. f. 4. Incisors 1; canines 1; molars 11; incisors wedge-shaped and parallel; canines conical, crossing each other; molars square, with four roots, ridged with enamel, separated from the canines by a vacant space; general form of the skull like that of the tapir.

*Tapirus Americanus*. American Tapir, pl. 55. f. 16. Incisors 1, intermediate, shorter than the exterior; canines 1, moderate, detached; molars 11; their crowns forming two transverse ridges; fore feet four-toed; hind feet three-toed; nose capable of being elongated into a short trunk.

### FAMILY III. SOLIDUNGULA.

With three kinds of teeth; only one visible toe, and a strong hoof on each foot.

*Lepus Arvensis*. Am. pl. 54. f. 32. Incisors 1; the crown hollow when young; canines 1; molars 11; eyes large; ears full, pointed, and erect; upper lip capable of considerable motion; feet with a single visible toe, covered with strong hoofs; tail with long hairs, in some species with a tuft at the extremity.

## ORDER IX. RUMINANTIA.

With three kinds of teeth, but destitute of incisors in the upper jaw; without clavicles; feet with two-hoofed toes; metatarsal and metatarsal bones united; organs of digestion calculated for ruminating, and consisting of four stomachs; they feed on vegetables; and embrace a wide geographical range.

### TRIBE I. CAMELIDÆ.

Feet with horny soles; canines in both sexes; no horns.

*Camelus bactrianus*. Bactrian Camel, pl. 53. f. 32. Incisors 1; canines 1, conical, straight, and strong; false grinders 11, detached; true molars 11; head long, nostrils slit obliquely, upper lip cleft, eyes large, ears small; feet with only two free toes, ending in crooked nails, tail medium length; four ventral mammae; back with one or two protuberances.

*Lachama glama*. The Lama, pl. 54. f. 51. Incisors 1; canines 1, strong, straight, and conical; false molars 11; true molars 11; ears long and pointed; tail short; two ventral mammae; no protuberance on the back.

### TRIBE II. CERVIDÆ.

Feet bisulcated; no horns; males with canines in the upper jaw.

*Monachus monachus*. Thibet Monk, pl. 55. f. 12. Incisors 1; canines 1; molars 11; the canines of the male are long, and project out of the mouth; hind quarters higher than the fore; feet with cleft hoofs;

tail very short; two inguinal mammae; destitute of horns.

*Cervus Wallichi*. Nepal stag, pl. 55. f. 11. Incisors : canines ; in the male, none in the female; molars : ; head long, terminated by a muzzle; eyes large, pupil transversely elongated; most species with a lachrymal sinus; ears long; horns solid, deciduous, palmated, branched or simple, in the male only; mammae four, inguinal.

*Mos. Elk*. No canines; horns united into one palm, more or less indented; no muzzle; tail very short. American Elk.

*Capreolus*. Roeback. Destitute of canine teeth and lachrymal sinuses; horns nearly allied to the elk's; a small antler to the front, high over the beam, and the superior part being turned backwards forms a fork.

*Sabulo*. Brocket. Muzzle widened to a glandular termination near the nostrils; lachrymal sinus small; horns simple, without branches or processes. Pitta Brocket.

*Sylcorrus*. Muntjak. Canine teeth, (mostly found in the males) long; muzzle small; suborbital sinus deep; horns small, with one anterior process only, standing upon elevated pedicles. Philippine Muntjak.

### TRIBE III. GIRAFIDÆ.

Frontal process prolonged in the form of horns, covered with a hairy skin in both sexes.

*Camelopardalis Girafa*. Giraffe, pl. 55. f. 9. Incisors : ; no canines; molars : ; head long; upper lip entire; no lachrymal sinuses; neck extremely long, with a short thin mane; legs slender, the hindmost shortest.

### TRIBE IV. CAPRIDÆ.

Horns persistent, sheathing upon an osseous nucleus, nearly solid, receiving its increase by annual rings at the base.

*Antelope rupicapra*. Chamois, pl. 55. f. 15. Incisors : ; no canines; molars : ; horns common to both sexes, or in the male only; variously inflected, generally annulated, or projecting in spiral ridges, bifurcated in some; with a muzzle, half muzzle, or simple nostrils; most species with a lachrymal sinus; eyes large; ears long and pointed; legs slender; teats four or two.

The following subgenera are proposed by Major Hamilton Smith.

*Dicranoceros furcifer*. Prong-horned Antelope. Horns much compressed, rough with an anterior process and the points bending backwards, placed upon the orbits and impending over the eyes; facial line convex; tail very short.

*Aigoceros leucophus*. Blue Antelope. Horns very large, pointed, simply bent back, annulated, placed above the orbits; tail as long as the thigh; mane reversed; throat and under-jaw bearded; destitute of suborbital sinuses and inguinal pores. Large.

*Orys leucoryx*. White Oryx. Horns very long and slender, acute, annulate, with a slight spiral twist; ears long; mane reversed; tail length of the thigh; tip tufted; knees smooth, large.

*Gazella Pygarga*. White-faced Gazelle. Horns incurved, or turned outwards and again inwards, constituting a lyrate form, black, annulate, and striate; lachrymal sinus small; eyes very large; knees usually tufted; tail short and tufted.

### DIVISION II.

Horns in the male only.

*Antelope cervicapra*. Common Antelope. Horns never truly lyrate, placed below the frontal crest, and sometimes more or less spiral; suborbital sinuses devel-

oped; inguinal pores distinct; a small hair spot representing the muzzle; knees frequently tufted, papulous.

*Redunca Jacobsoni*. Crowned antelope. Horns situated behind the orbits, black, smooth, the tips bending forwards, annulated below down above, short and slender; ears long; muzzle smooth; knees smooth; tail rather short.

*Tragulus sepius*. Deerhound. Horns smooth, slightly inclined, round, and shorter than the ear, more or less smooth; ears long; tail very short; knees smooth.

*Raphicerus acuticornis*. Sharp-horned antelope. Horns without wrinkles striated, short or long, very sharp, and vertical; sinuses of ears, or on head narrow.

*Tetracerus quadricornis*. Four-horned antelope. Horns (in the male only) four; the two upper a pair erect, smooth, pointed, and rising on the frontal crest, or horns much shorter, conical, and situated below the orbits; tail short. This genus was mentioned by J. L. Leach. Horns in the male only.

*Cephalophus quadricornis*. Four-tufted antelope. Horns small, straight, reclining, placed high on the frontal crest, annulated; muzzle small, black; hair of the horns long and tufted; knees smooth; tail short, erect and solitary.

*Neotragus moschus*. Sisk's antelope. Horns brown, very small, sub-annulate, black, acute; no sinuses on head round; nose pointed; muzzle small; in ant. size very diminutive.

*Tragelaphus scriptus*. Horned antelope. Horns unguinated, somewhat spiral, ridged, placed high on the frontal crest and reclining; muzzle very small; no sinuses; mammae four.

*Neomelotus Dumerilii*. Devant's antelope. Structure assuming the goat form; horns short, erect, no lack, and annulated at their base; maxillary bone a terminal bone in general provided with a process, or coarse, loose; legs strong.

*Rupicapra maxima*. Ovine antelope. Horns in both sexes slender, vertical, and attenuated, sinuses small at their extremities, a few wrinkles at the base on the glandular apertures behind; horns approaching to the limbs strong; hair long, with a small patch on the beneath. The chamois is of this sub-genus.

*Apleoceros leucurus*. Wool-bearing antelope. Horns simple, sub-recumbent, conical, with small sinuses, points smooth and bent back, deciduous of sinuses and lachrymal sinuses; tail short; horns approaching to the shape of a sheep.

*Amas depressicornis*. Amas. Horns point on the edge of the frontal crest, on the same plane with the face, very strong, slightly depressed, straight, not straight, wrinkled, and acute; facial line straight, suborbital opening.

*Capra hircus*. Domestic goat, pl. 55. f. 14. Horns : ; no canines; molars : ; horns annulated at the base either vertical or inclined, nodose, and more or less angular; chin bearded; forehead concave; tail short, naked at the base.

*Ovis aries*. African sheep, pl. 55. f. 15. Horns : destitute of canines; molars : ; horns annulated common to both sexes; large, spirals, more or less equal, forehead arched; hair of the horns, one hard as the other woolly.

*Dicotyles*. Incisors : ; no canines; molars : ; horns common to both sexes, or in one sex small at the frontal crest, variously twisted; horns large and heavy; legs strong; neck short; generally annulated with a mane and beard; higher behind than before.

The four following are sub-genera, according to Major Hamilton Smith :—

*Acronotus bubalis*. Bubalis. Horns in both sexes with double flexures, more or less developed, approximating and annular at their base, smooth and bent to the tips; head narrow, long; lachrymal sinus small with inguinal pores; knees smooth; sinuses small, tail moderate, tufted.

*Bacelaphus oryx*. Impressa. Horns in both sexes heavy, strong, placed on the summit of the frontal crest, straight, but twisted, and with a slight ridge, not furnished with a mane; sinuses with an orbit of the mammae.

*Stenopercus rosadens*. Kooden. Horns (in the male only) placed on the frontals, smooth, forming regular spiral curves; muzzle broad; mane long; chin bearded; shoulders elevated; tail covered with long hair; stature large.

*Perdas raris*. Neel Ghas. Horns (in the male only) placed on the sides of the frontal crest, short, strong, subangular, and destitute of annulations; shoulders elevated; neck with a mane; throat hairy; dewlap small.

### TRIBE V. BOVIDÆ

Horns (in both sexes) persistent, round, smooth, never straight, and invariably placed upon the sides of the frontals; muzzle broad; females with an udder; stature large; gregarious.

*Capreolus gnu*. Gnu. Incisors 2; no canines; molars 4; horns curved backwards, base broad, approximating, tips turned down, points uncinate upwards; cheeks provided with a glandular excrescence; neck and throat with a mane; tail hairy, as in the horse.

*Oryx capensis*. Much ox, pl. 54. f. 33. Horns in sheaths on the summit of the head, where they are flat and broad, beyond which they bend down against the cheeks, with their points turned up; ears short; eyes small; tail short.

*Bos americanus*. American bison, pl. 55. f. 17. Head large, skull strong; dense about the frontals, which are convex; muzzle broad, naked; eyes large; ears funnel-shaped; dewlap on the neck; tail various omphs, tufted.

Major Smith gives the following as sub-genera. *Bubalus*, Cape ox; *Rumin*; The bison; *Taurus* Urus; *Antelope* cornutus.

### ORDER X.

#### Cetacea.

Body formed like a fish, terminated by a cartilaginous ventral appendage flared horizontally; two anterior extremities forward like fins. Teeth conical, or none; skin smooth, entirely destitute of hair.

#### FAMILY I. SIRENIA.

##### Herbivorous Cetacea.

*Manatus senegalensis*. Senegal Manatus, pl. 55. f. 21. Incisors 2; no canines; molars 4. Incisors small, existing in the fetus only. While young they lose four teeth. Head not distinct from the body; mustachies formed by a bundle of stiff hairs directed downwards; no external ears; tongue oval; on the margins of the dorsal fins are small nubs.

*Halosæ Indica*. Dugong, pl. 55. f. 19. Incisors 2 in adult; when young; no canines; molars 4; in the fetus, and 2; in the young; body fish-shaped, terminated by a horizontal two-lobed fin, muzzle truncated and subacute; fins short; no distinct fingers or nails.

*Stelleria borealis*. Northern Stelleria. Destitute of canines and canines; molars 4 consisting of a plate on each side of the jaws, not attached by roots, but by number of small vessels and nerves; no external ears; lips double; eyes covered by a cartilaginous membrane.

#### FAMILY II. CETACEA.

Teeth random, or none; nostrils assuming the form of spiracles; skin smooth, shining, and destitute of hairs on every part; mammae placed near the anal opening.

*Delphinus phœnus*. Porpoise. Pl. 55. f. 27. Teeth few, few shaped, compressed, and notched on their outer edge, varying in number from 20 to none; jaws more or less provided with in form of a hook; aperture of spiracles 2; on all parts of the body with sometimes a long dorsal fold of skin; tail horizontally flattened and rounded.

*Momonodon monoceros*. Narwal. Pl. 55. f. 20. Incisors

1; destitute of canines and molars; one or two large, straight, very long and pointed tusks inserted in the upper jaw; shaped like the dolphin's; orifice of spiracle, united at the top of the head; with a longitudinal dorsal projection.

### TRIBE II. LARGE-HEADED CETACEA.

*Physeter macrocephalus*. Great-headed cachalot, pl. 55. f. 28. Under jaw elongated, with from 18 to 25 thick conical teeth on each side; upper jaw broad, elevated, with bony laminae, or with short and undeveloped teeth; orifices of spiracles united at the upper end of the snout; some species with a dorsal fin.

*Balaena mysticetus*. Common whale, pl. 55. f. 23. Destitute of teeth; upper jaw keel-shaped, furnished on each side with bony laminae or whalebone; orifices of spiracles separated, placed near the centre of the upper portion of the head; some species with a dorsal fin, and others with nodules on the back.

**MAMMEE-TREE, or WEST INDIA APRICOT** (*mammee Americana*); a large and beautiful tree, native of tropical America, and interesting from the qualities of the fruit, which is highly esteemed. This fruit is large, roundish, and contains a bright yellow, firm pulp, which is enveloped with a thick, leathery rind; within this outer rind is a second very delicate one, closely adhering to the pulp, which should be cautiously removed, otherwise it leaves a bitter taste in the mouth, not very strong at first, but gradually increasing, and continuing for two or three days. The taste is peculiar, sweet, and very agreeable, and is accompanied with an aromatic, pleasant odour. The tree belongs to the *guttiferae*, the same family with the *mangosteen*, and attains the height of sixty or seventy feet. The leaves are oval, obtuse, very entire, smooth, and six or eight inches in length. The flowers are white, an inch and a half in diameter, and diffuse a delightful perfume.

**MAMMON**; the Syrian god of riches, mentioned in the teachings of Jesus, as a personification of worldliness. Spenser has personified Mammon in his noblest manner (book ii., canto 7), where are represented the secret treasures of the "god of the world and worklings."

"An uncount, salvage, and uncivil wight,  
Of greedy hue and foul ill-favour'd sight,  
His face with smoke was tann'd, and eyes were blear'd,  
His hair and beard with soot were ill beclard,  
His coal-black hands did seem to have been rear'd  
In smith's fire-spitting forge, and nails like claws appear'd.

"His iron coat all overgrown with rust,  
Was underneath enveloped with gold,  
Whose glistering gloss darken'd with filthy dust,  
Well yet appeared to have been of old,  
A work of rich entail and curious mold,  
Woven with anties and wild imagery;  
And in his lap a mass of coin he told,  
And turned upside-down, to feed his eye,  
And covetous Desire, with his huge treasury.

"And round about him lay on every side  
Great heaps of gold that never could be spent;  
Of which some were rude ore not purified,  
Of Mulibar's devouring element:  
Some others were new driven, and distant  
Into great ingots, and to wedges square;  
Some in round plates withouten monument;  
But most were stamp'd, and in their metal bare  
The antique shapes of kings and heroes strange and rare."

**MAMMOTH** (Russian *momo*); a species of extinct elephant, found in a fossil state, entirely distinct from the existing species of Asia and Africa. (See *Elephant*.) It has left proofs of its existence in Europe, in Northern Asia, and in America. A

great quantity of fossil ivory is obtained from Siberia, and it is visible, almost everywhere, on the banks of rivers, which undermine the soil. Whole carcasses, covered with flesh and skin, preserved by the eternal frost of those regions, have even been found in the northern parts of Siberia. The bones have been occasionally found in all parts of Europe, and have given rise to stories of giants. They have been found in Kentucky, South Carolina, and other parts of the United States, and Humboldt discovered them on the elevated plain of Quito. A mammoth, in complete preservation, was seen by Adams, a traveller in Siberia, who found the skeleton to be nine feet and a half high, and fourteen long, from the tip of the nose to the *coccyx*. The tusks were nine feet long. The scientific name of this animal is *elephas primigenius* (Blumenb.), or *éléphant fossil* (Cuv.). It is not to be confounded with the mastodon, a gigantic fossil animal of North America. See *Mastodon*, and *Organic Remains*.

**MAMMOTH CAVE**; a stupendous cave in Kentucky, near Green river, 130 miles south-south-west of Lexington. It has been penetrated nine or ten miles, and has many windings that have not been explored. The depth is sixty or seventy feet. It contains figures, some of which are of immense size and fantastic form; but is more remarkable for its extent than the variety or beauty of its productions, having none of the beautiful stalactites found in many other caves. The earth is strongly impregnated with saltpetre, and large quantities of it are manufactured.

**MAN**, in natural history, according to some naturalists, although, it must be confessed, rather from motives of pride than from anatomical considerations, forms the order *bimana*, in the class *mammalia*; according to others, and more scientifically, is included in the family *bimana*, in the order *anthropomorpha*, which contains, also, the two families of *quadrumana*, or proper monkeys, and *lemura*. The family *bimana*, according to this classification, contains three genera,—*man*, the *orang-outang*, and the *gibbon*. Linnæus, was the first who ventured to class man (*homo*, *homo sapiens*) in a scientific system with other animals; and he did not escape the censure of some, as degrading the dignity of the human race by such an approximation; but classification is a mere statement of a fact in anatomy, and the philosopher, who observes and interprets nature, is not surely to blame. Man, then, whether considered as the head of the animal creation, and a part of it; or as a sole genus and sole species, distinct from others, and lord of all; whether defined to be a biped without feathers, or a quadruped without hoofs, a monkey with a voice, or a monkey without a tail—if viewed solely in a physical light, and setting aside his divine reason, and his immortal nature,—is a being provided with two hands, designed for prehension, and having fingers protected by flat nails, and two feet, with single soles, destined for walking; with a single stomach, and with three kinds of teeth.—incisive, canine, and molar. His position is upright, his food both vegetable and animal, his body naked. It has been made a subject of dispute, whether there is more than one species in the human race; but it is merely a dispute of words; and if the term *species* is used in its common scientific sense, it cannot be denied that there is but one species. There are, however, certain and constant differences of stature, physiognomy, colour, nature of the hair, or form of the skull, which have given rise to subdivisions of this species. Blumenbach reduces these varieties to five:—

1. The first variety occupies the central parts of the old continent, namely, Western Asia, Eastern and

Northern Africa, Hindoostan and Japan. Its features are the colour of the skin, more or less brown; the cheeks tinged with red or yellow; either brown or fair; the head less than the face oval and narrow; the forehead narrow marked, the nose slightly arched; the front teeth placed perpendicular to the chin full and round. The features of such a countenance, which is the European, causes it to be generally mistaken for them at least) as the most agreeable. The Abyssinians, the Berbers, or inhabitants of Atlas, have features not essentially differing from those of the Europeans, except in the colour of the skin, and which, among the Hindoos and some mountaineers, is quite fair. Blumenbach divides the Caucasian, from its superiority to the Caucasus. In plate LVI. representations of the various tribes who belong to this variety, 1, is a Georgian; fig. 2, an Armenian; fig. 3, a Tschirkesian; fig. 4, a Circassian; fig. 5, a hardiner; fig. 6, a Tschetchevian; fig. 7, a Turk; fig. 8, a Comar; fig. 9, an Esthonian; fig. 10, a Magyar; fig. 11, a Finn; fig. 12, an Armenian; fig. 13, a Laplander; fig. 14 and 15, Mamelukes; fig. 16, a Tartar.

2. The second variety has been called the *negro* variety. The colour in this race is a deep black, stiff, straight, and rather thin; the nose square; the face large, flat, and depressed; the features indistinctly marked; the ears small; the cheeks round and prominent; the eyes small. This variety comprises all the nations to the east of the Ganges and of most beyond, except the Malays. Representations of this variety will be found in plates LVI. and LVII. Part 1, fig. 17, is a Turk; fig. 18, an Egyptian; fig. 19, a Persian; fig. 20, a Hindoo. Plate LVII. fig. 1, a Yakoute; fig. 2, an Ostiak; fig. 3, a Kamtchatka; fig. 4, a Kirghise; fig. 5, a Kalmuck; fig. 6, a Mongol; fig. 7, a Tunk-Tatar; fig. 8, 9, and 10, Chinese; figs. 11 and 12, Japanese; figs. 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

3. The American variety resembles the first, ascribed in several points. Its principal characters are the copper-colour; stiff, thin, erect hair; low forehead; eyes sunk; the nose straight projecting; cheek-bones prominent; the ears small. This variety comprises all the American races, except the Esquimaux. There are several branches, however, which differ considerably. The following are representations of this variety: fig. 13, presents Maxima, leader of one of the tribes on the frontiers of Peru. Fig. 14, presents Tajadamerca, general of the Matabos. Plate LVIII. fig. 1 is represented a Sumatran; fig. 2, 3, 4, and 5, Brazilian Botokas; fig. 6, a Camakian; fig. 7, a Brazilian Peru; and fig. 8, Brazilian Fatchos.

4. The fourth variety of Blumenbach is called the *Malay*, and described as of a very dark colour; the hair black, soft, thick, and curled; the nose a little projecting; the nose thick, waxen, and flattened; the mouth large; the upper jaw prominent. This variety comprehends the inhabitants of the Malay ocean. Representations of the Malay variety may be found in plate LIX. Fig. 1, a Malay; fig. 2, a Malay; fig. 3, a Malay; fig. 4, a Malay; fig. 5, a Malay; fig. 6, a Malay; fig. 7, a Malay; fig. 8, a Malay; fig. 9, a Malay; fig. 10, a Malay; fig. 11, a Malay; fig. 12, a Malay; fig. 13, a Malay; fig. 14, a Malay; fig. 15, a Malay; fig. 16, a Malay; fig. 17, a Malay; fig. 18, a Malay; fig. 19, a Malay; fig. 20, a Malay; fig. 21, a Malay; fig. 22, a Malay; fig. 23, a Malay; fig. 24, a Malay; fig. 25, a Malay; fig. 26, a Malay; fig. 27, a Malay; fig. 28, a Malay; fig. 29, a Malay; fig. 30, a Malay; fig. 31, a Malay; fig. 32, a Malay; fig. 33, a Malay; fig. 34, a Malay; fig. 35, a Malay; fig. 36, a Malay; fig. 37, a Malay; fig. 38, a Malay; fig. 39, a Malay; fig. 40, a Malay; fig. 41, a Malay; fig. 42, a Malay; fig. 43, a Malay; fig. 44, a Malay; fig. 45, a Malay; fig. 46, a Malay; fig. 47, a Malay; fig. 48, a Malay; fig. 49, a Malay; fig. 50, a Malay; fig. 51, a Malay; fig. 52, a Malay; fig. 53, a Malay; fig. 54, a Malay; fig. 55, a Malay; fig. 56, a Malay; fig. 57, a Malay; fig. 58, a Malay; fig. 59, a Malay; fig. 60, a Malay; fig. 61, a Malay; fig. 62, a Malay; fig. 63, a Malay; fig. 64, a Malay; fig. 65, a Malay; fig. 66, a Malay; fig. 67, a Malay; fig. 68, a Malay; fig. 69, a Malay; fig. 70, a Malay; fig. 71, a Malay; fig. 72, a Malay; fig. 73, a Malay; fig. 74, a Malay; fig. 75, a Malay; fig. 76, a Malay; fig. 77, a Malay; fig. 78, a Malay; fig. 79, a Malay; fig. 80, a Malay; fig. 81, a Malay; fig. 82, a Malay; fig. 83, a Malay; fig. 84, a Malay; fig. 85, a Malay; fig. 86, a Malay; fig. 87, a Malay; fig. 88, a Malay; fig. 89, a Malay; fig. 90, a Malay; fig. 91, a Malay; fig. 92, a Malay; fig. 93, a Malay; fig. 94, a Malay; fig. 95, a Malay; fig. 96, a Malay; fig. 97, a Malay; fig. 98, a Malay; fig. 99, a Malay; fig. 100, a Malay.

of the Sandwich islands; fig. 18, Naba-Seta, prince of the Timor island; fig. 16, an Otahetian.

5. The remaining variety is the Negro. Its characters are, colour black; hair black and woolly; head narrow; forehead convex and arched; cheek-bones projecting; nose large, and almost confounded with the upper jaw; the upper front teeth obliquely placed; the lips thick; the chin drawn in; the legs crooked. This race is found in Western and Southern Africa, and the great islands of the Pacific, generally in the interior. There are very great differences in the tribes included in this variety: the Negro, with the complexion of jet, and wool; the Caffre, with a copper complexion, and long hair; the sutoy Papous, or New Guineaman; the native of Van Diemen's Land; the Harafora, who are found in Borneo, and the Hottentots, hardly differ more in situation than in features. Representations of this variety will be found in plates LVIII. and LIX. Figs. 1, 2, 3, and 4, in plate LIX., represent the Negro Proper. Figs. 9, 10, and 11, in plate LVIII., represent Hottentots. Figs. 12, 13, 14, 15, same plate, represent Bushmen, male and female. Figs. 16, same plate, a, b, c, represent Papous of Van Diemen's Land; a, named Grou-Agrou; b, Ara-Menda; and c, Parahiri. See the article *Mammalia* for a more particular description of the above varieties. Also see Blumhach, *De Ferretate nativa Generis Humani*.

Hary de St Vincent, in his *Essays Zoologues sur l'Homme*, divides the human race into fifteen species, and numerous varieties.

Man, considered in his nobler character of a social, moral, religious, and political being, will be more appropriately considered under other heads. See *Language, Philology, Political Institutions, Religion*.

MAN, falls or (the *Menads* of Ptolemy); an island belonging to Great Britain, in the Irish sea, nearly equidistant from the coasts of England, Scotland, and Ireland; thirty miles long, and twelve, here widest, broad; seventy in circumference; seven miles, 230; population, in 1831, 40,986; chief towns, Castletown (the capital), Douglas, Peel, and Ramsey; lon. 4° 30' W.; lat. 54° 15' N. The interior is mountainous. Snowfield, or Seafield, the highest summit, is about 3000 feet above the sea. The soil, not naturally very productive, is greatly enriched by the abundance of seaweed cast upon the shore. Agriculture, of late, has made great advances. The productions are barley, wheat, oats, turnips, potatoes, flax, cattle, sheep, poultry, &c. The island contains seventeen parishes, under the jurisdiction of a bishop, styled bishop of Sodor and Man, who is vicar-general of the island. The Manx language, a kind of Gaelic, prevails in the interior, but English is spoken in the towns. On the south is a small sound, called the *Calf of Man*, which is separated by a narrow channel.

In 1606, the island was granted to lord Stanley, and, in 1735, became vested in the duke of Athol. In 1764, it was sold to Great Britain for £70,000, with all its rights of sovereignty.

MAN-OF-WAR; a ship of war: an armed ship.

MAN-OF-WAR BIRD. See *Albatross*.

MANAKIN (*pyra*, Lin.). This is a small genus of birds peculiar to South America, having a common beak, thicker than broad, grooved; small and large. Their tail and feet are short. In their vocal form and proportions, they are not very unlike the tanager. They are generally small, and inhabit the depths of forests, being seldom seen in situations bold. The largest of three birds, the *P. ultramarina*, is distinguished by a beautiful crest of red feathers upon its head. Its back is of a fine blue, and the rest of the plumage of a deep black.

Closely allied to these birds is one of the most extraordinary of the feathered tribe,—the cock of the rock (*rupicola*). This bird is as large as a pigeon, is of a bright orange colour, and is furnished with a double crest of feathers on its head, placed in the form of a fan. They live on fruits, scratch the earth like the common fowl, and form their nest of dry wood, in deep holes in the rocks. The female lays two eggs.

MANASAROWARA, a lake of Thibet, among the Himalaya mountains, is one of the most venerated of all the places of pilgrimage resorted to by the Hindoos, who visit it in great numbers, in spite of all the difficulties of the journey. The Thibetians also hold it in great reverence, and come from great distances to throw into it the ashes of their friends. It is about fifteen miles long and eleven broad, and, with its borders of lofty crags, and its towering barrier of snow-capped mountains, forms a magnificent scene. Its shores are covered with monastic houses.

MANASSEH; eldest son of Joseph, born in Egypt. When brought with Ephraim to receive the blessing of his grandfather Jacob, the old man placed his right hand upon the head of the younger, and his left upon that of Manasseh, thus depriving the latter of the precedence due to his priority of birth. The descendants of Manasseh formed a tribe, which, in the promised land, was settled half beyond the Jordan, and half in the territory of Samaria, Sichen, and Bethany. See *Hebrews*.

MANCANDO (abbreviated *meno*, Italian) is used in music to denote that the time of a piece must become slower and slower, and the tone by degrees vanish.

MANCHA, LA; a province of Spain in New Castile, almost every way surrounded by mountains, forming an immense plain, intersected by ridges of low hills and rocks; not an enclosure of any kind, except mud walls, about the villages; not a tree to be seen, except a few dwarfish evergreen oaks and olive plants, scarce deserving the name. All this vast tract of open country is cultivated in corn and vines. A traveller says, "There is no labourer nor young female peasant, who is not well acquainted with Don Quixote and Sancho." This is the most cheerful country of Spain; the inhabitants are affable, and great lovers of music and dancing; population, 214,087; square miles, 8000; chief towns, Ciudad-Real and Osona.

MANCHE, DEPARTMENT OF LA; in the north-western part of France, on the British channel, called in French *La Manche*. See *Department*, and *Channel*.

MANCHESTER, the most important manufacturing town in England, is situated at the south-eastern extremity of the county palatine of Lancaster, 186 miles N. W. from London, thirty-six miles by the high road, thirty by the railway, E. by N. from Liverpool, and eighty-two N. from Birmingham. It stands on the eastern bank of the river Irwell, near its junction with the two tributary streams of the Irk and the Medlock. On the opposite bank has been built the town of Salford, which, though under a different jurisdiction, is yet so closely connected with Manchester as to form a part of it, and is therefore comprehended in the same statistical report. The communication is kept up by means of several bridges.

*History.* Manchester is of very high antiquity. In the time of Julius Agricola, the Roman governor of Britain, it was a Roman station, and called *Mancunium*, which, says Mr Whitaker, signifies the Place of Tents. Other antiquaries tell us that the origin of the name is to be found in Saxon etymology, it being frequently spelled *Manigester* in ancient

records. Another opinion is, that during the possession of Britain by the Romans, the military post stationed here, in order to distinguish it from the great camp at Chester, was called *Monacastra*, (afterwards corrupted to *Mancestre*.) the single camp, much on the same principle that Anglesea and Man, solitary islands, acquired the appellation of Mona. The town, which had gradually accumulated round the ancient fortress, was ruined during the early incursions of the Danes, and subsequently restored by Edward the Elder, about 920. On the Norman Conquest, Albert de Greley, one of the adventurers attached to the standard of William I., obtained possession of this place, and made it his seat of residence; and his son Robert de Greley, in 1134, after returning from an expedition into Normandy, whither he had attended his sovereign Henry I., obtained from that prince as the reward for his services a grant of a fair to be held in his lordship of Manchester, annually on St Matthew's Day, and the days before and after it; and this fair, which still subsists, under the appellation of Ackers Fair, now takes place on the first of October. Thomas de Greley, lord of the manor in 1301, gave the burgesses of the town a charter of the customs of the manor, by which Manchester was constituted a free burgh. From the Greley family this lordship was transferred to Robert de la Warre, whose descendant, Thomas de la Warre, in the reign of Henry V., founded that noble establishment the collegiate church. In 1579, the manorial rights and immunities were sold for £3000 to John Lacy, who, in 1596, resold them for £3,500 to Sir Nicholas Mosley, in whose family the manor, now immensely increased in value, has ever since continued. Manchester is mentioned by Camden, in the reign of Elizabeth, as a place of importance for its population, manufactures, and commerce; and during the government of Cromwell this town twice returned members to the house of commons. On the commencement of the civil war between Charles I. and the parliament, possession was taken of Manchester, in behalf of the latter, by the country militia, who being joined by the people of the town and neighbourhood, the streets were slightly barricaded; and the earl of Derby, who in September, 1642, at the head of a large body of royalist forces assaulted the town, was repulsed, and forced to retreat. The next year the town was strongly garrisoned, and remained in the hands of parliament till the war was terminated. When the insurrection against government took place in 1745, under prince Charles Edward Stuart, Manchester became for a short time the quarters of the insurgents. On the 29th of November the main body of their forces entered this town, on their march from Scotland; and the young adventurer took up his quarters at a house in Market Street Lane, called from that circumstance the Palace, and since converted into an inn, which still retains that appellation. The rebel army remained here till the 1st of December, and then proceeded southwards, but was soon after obliged to retreat. The inactivity of the local authorities at Manchester on the arrival of the Scottish troops, was construed into disaffection to the existing government, and at the assizes at Lancaster, in 1747, the constables, or presiding officers of the town, were arraigned on the charge of high treason, but the prosecution ended in a verdict of honourable acquittal. In 1768, Manchester was visited by Christiern VII., king of Denmark, who came to this part of the country to see the works for the improvement of inland navigation, then in progress, under the duke of Bridgewater. In 1817, during a period of great manufacturing depression, a number of distressed persons agreed to

assemble and march to London, in order to lay their grievances before the throne. Each individual was provided with a blanket shag on his shoulder, hence they were called Blanketers. Many went on their journey, but their perseverance was few; way, and none proceeded further than Manchester. A more remarkable event took place on the 13th Aug. 1819, when a vast concourse of people assembled on a piece of vacant ground near St Peter's church, for the purpose of petitioning for a reform in government. This assemblage was illegally dissolved by a detachment of yeomanry, under the direction of the magistrates; and the chairman of the meeting, Henry Hunt, with several of the leaders, were captured and sent to prison. The yeomanry displayed much unnecessary severity on the occasion; several lives were lost; and about 500 persons of both sexes suffered injury. This transaction, popularly called the Manchester massacre, excited a great indignation throughout the country, as being an outrage both on humanity and the constitutional rights of the people.

*Description.* Manchester is about two miles in length, and one and a half in breadth, containing about 600 streets, which are in general well paved and lighted with gas, and the inhabitants are conveniently supplied with water. The buildings display considerable variety, but among the modern erection there are some handsome ones. Within the last twenty years, several extensive improvements have been carried into execution in different quarters of the town. In 1802 an act of parliament was procured for making alterations in Market street and its vicinity, and for the erection of a new bridge across the Irwell, from Waterloo to Salford; the narrow avenues at the bottom of King street, connecting it with Deansgate have been widened; as also have those at the lower end of Cannon street, leading to Hanging ditch. In 1803, the carriage way has been widened to the edge. Market street, formerly called Market lane, has been rebuilt on such a scale of magnificence as to entitle it to the appellation of the largest street of Manchester. The carriage-way is generally paved with Macadamized; and the footways are occasionally widened, and otherwise improved. Works, for lighting the streets of Manchester, were established in 1817, and others for lighting houses in 1820; besides which, a portable gas engine has been formed, to supply gas for lighting counting-houses or other buildings. The Manchester and Salford waterworks were established in 1820. Besides the bridges over the Irwell, there are six which cross the Irk, nine the Medlock, and several others over the canals. Among the public edifices appropriated for the purposes of commerce is the Manchester exchange, built by subscription and opened to the public in January, 1804. In 1804 Buildings, and Chapel Street, Salford, are the cotton halls, or public marts, for the sale of Yorkshire cloth; and in Hanging Ditch is the Corn Exchange for the accommodation of corn-dealers and bakers. The public markets are numerous, but not so generally distinguished for extent or convenience of arrangement. Provisions of all kinds are exposed for sale every day in the week, except Sunday, the regular market-days, however, being only four. The public places are the New Shambles, at the end of Bridge Street, for butchers' meat, with a pork-market adjacent; the fruit-markets are at Long Millgate and Shude Hill; Smithfield Market, Shude Hill, is for various commodities and provisions, except on Wednesdays, when the sale of cattle takes place there. On the London Road are shambles, and a market for

fruit and vegetables; there is a market in Brown Street, opened in November, 1827, on the removal of the old shambles, in Market Street; the poultry and butter market takes place on Saturdays, in Smithy Door; and in Salford is a new market-house, with a stone front, and commodious arrangements for the sale of butchers' meat, fruit, and vegetables, opened in May, 1827. The municipal buildings include some handsome structures, particularly the town-hall of Manchester, in King Street, a noble edifice, recently erected, designed for the transaction of business, connected with the police of the town and the administration of justice, as well as for public meetings. The town-hall of Salford is in Chapel Street. The New Bailey Prison, or Penitentiary, in Stanley Street, Salford, completed and opened for the reception of prisoners in 1790, consists of an extensive building, in the centre of a large rea, enclosed by very high walls: it is three stories in height, and arranged in the form of a cross; and in front, over the entrance, is the court-room, where the sessions are held, and adjoining are commodious apartments for the magistrates, jurors, and others. Hulme are cavalry barracks; and in the Regent's Road, barracks for infantry. The churches in Manchester are numerous, and many of them elegant. The oldest is the venerable collegiate church, originally founded by Thomas Lord de la Warre, in the reign of Henry V., and rebuilt in the reign of Henry II. There are about fifty places of worship for members of various religious denominations. Among the most important of the charitable foundations in Manchester is the Blue Coat School, established through the munificent bequest of Humphrey Cheetham, Esq. To the same gentleman, the town is indebted for the foundation of a valuable public library. There is a free grammar-school in Long Millgate, which was founded in 1513, by Hugh Olden, bishop of Exeter, and which is a seminary of considerable importance and great reputation. The other establishments for gratuitous education include

Collegiate Church School, Fennel Street; the Free and Dumb School, Stanley Street, Salford; St. Mary's School, Gartside Street; the Catholic Free-school, Lloyd Street; the New Jerusalem School, Pell Street, Salford; the Ladies' Jubilee School, Newbays Park; the National School, Granby Row; the National School, Bolton Street, Salford; the Lancastrian School, Marshall Street; and the Free School, Saville Street, Chorlton Row. There are also a considerable number of Sunday-schools. The establishments for ameliorating the condition of the sick poor are in extent commensurate with population and casualties incident to the working of a great manufacturing town: the Royal General Manchester Infirmary and Dispensary, which in consequence, was built in 1755; it is now built with stone. The Lunatic Asylum, which was established in 1765, is also cased with stone, and the fine sheet of water extending along the fore-ground of the edifices, presents an appearance of very considerable beauty. The House of Mercy, or Fever Hospital, has existed since 1796; the Lying-in Hospital was instituted in 1790; the Mechanics' Friend Society, in 1791; an Institution for the Cure of Diseases of the Eye, in 1815; the Infirmary, in 1819; and the Female Penitentiary, in 1822. The school for the Deaf and Dumb, was established in 1825. There are generally about 100 children of both sexes receiving instruction in this institution. Dispensaries for the relief of the sick, are established in the several adjacent parishes. Manchester and Salford are rich in charities: the annual income of the boroughs and charities is £2,392, 18s. 1d.; and other

charities, distributed by various trustees, amount to £1,631, 13s. 4d. One of the effects of these charities is to diminish the pressure of the poor rates upon the inhabitants. The institutions for the promotion of literature, science, and the fine arts, are the Literary and Philosophical Society of Manchester; the Society for the Promotion of Natural History, with a museum of considerable value; an Agricultural Society; the Floral and Horticultural Society; the Royal Botanical Gardens, in the Stretford road, which present attractions of the most superior order to the scientific and public generally; and the Royal Manchester Institution, a superb building, in Mosley Street. The last named was erected from a design by Mr Barry, of London, in the Grecian style of architecture. The libraries in Manchester are exceedingly well furnished with works of ancient and modern literature, periodicals, &c.: the principal of these establishments, after the College library, is the Portico, (in Mosley Street, with a news-room.)—a spacious and elegant edifice, of the Ionic order, completed in 1805. The Mechanics' Institute, in Cooper Street, is very flourishing, and, since its commencement in 1826, has been progressively increasing its members. The New Mechanics' Institute, or Hall of Science, in Pool Street, is an establishment that promises to rival its sister institution.

The principal places of public amusement consist of the Theatre, in Fountain Street, called the Theatre-Royal, erected in 1806; the Queen's Theatre, in Spring Gardens, originally built in 1753; the Assembly and Billiard Rooms, in Mosley Street, in 1792; and the New Concert Hall, in St Peter's Square. The public baths, at the Infirmary and Lying-in Hospital, at once afford relaxation, and conduce to health. The Races, which were established in 1730, and held on Kersal Moor, continue for three days, in Whitsun-week: at these periods immense numbers are collected together, and a great portion of the population of Manchester and the surrounding country may be said to be assembled at one place during this annual carnival.

*Trade and Manufactures.* About the year 1352, the manufacture of a kind of woollen cloth, made from the fleece in an unprepared state, was introduced into Manchester, and from that period till the introduction of cotton, the town distinguished itself by its woollen and linen fabrics. It was not till about 1750, that the cotton trade assumed any very high degree of importance. In 1760 manufactured goods, which had, until then, been made only for home consumption, found a market on the continents of Europe and America; and shortly after the *picking peg* was invented by Mr John Kay. In 1806 the *power-loom* (originally invented by the Rev. Mr Cartwright), first introduced into Manchester by Mr Grimshaw, was again tried with ultimate success. In 1781, two years before Arkwright's machinery for carding and spinning cotton by steam was introduced here, the quantity of cotton wool imported amounted only to 5,198,778 lbs.; but the successive inventions of Higs, Hargrave, Arkwright, Crompton and Watt, so astonishingly facilitated the manufacture, that its extent has been increased more than thirty-fold. In 1800 the quantity of cotton wool imported into this country was 56,010,732 lbs.; in 1810 it amounted to 132,488,935 lbs.; in 1820 the weight was 144,818,100 lbs.; in 1823 it had increased to 169,773,600 lbs.: in 1824 the quantity was 136,735,566 lbs.; in 1832, 283,000,000 lbs.; and the duty in the same year £690,000. The total quantity of cotton yarn spun in England, in the year 1832, was 222,596,907 lbs. About four fifths of the whole amount of the cotton trade of the kingdom centres in Lancashire; and it is calculated that the

known deity, Pachakamak, i. e. the soul or support of the world; externally, however, and as an inferior and visible deity, the sun, his parent; and ordered sacrifices to be offered to the latter, as a benefactor of men. Perhaps some stranger from civilized land, appeared in Peru, and employed religion, to procure an ascendancy which enabled him to form a regular government. Manco Capac after a long and prosperous reign, and as far as tradition may be relied upon, seems justly to have been entitled to rank among the benefactors of mankind by the benevolence of his institutions. See Rottsch's *History of America*.

**MANDAMUS.** A writ of *mandamus* (we command) is, in general, a command issuing from some superior court, directed to some inferior court, or some person or corporation, requiring them to do a particular thing, which such superior court has previously determined it to be their duty to do, or, at least, supposes to be consonant to right and justice. Issues where a party has a right to have a thing done, and has no other remedy and in some cases where he has another, but a tedious and inadequate one.

It is either in the alternative, ordering the court, corporation, or party, to which or whom it is directed, to do the thing specified, or to appear and show cause why it should not be done; or absolute, mandating the thing specified to be done without condition or alternative. The writ is usually first issued in the alternative, directing the party commanded to appear, and show cause against its being issued absolutely, and in case of there being no cause shown, an absolute *mandamus* is issued. The writ is enumerated for the issuing of this writ, by Sir William Blackstone, are—to compel the party directed to be restored to some office or franchise of public nature, whether temporal or spiritual; to cademical degree; to the use of a meeting-house, &c.: it lies for the production, inspection or return of public books and papers; for the surrender of the *regalia* of a corporation; to oblige a corporation to affix their common seal; or to compel the holding of a court. It may be directed to an inferior court, ordering it to proceed in the hearing of a cause, or to enter up a judgment. It is sometimes directed to a corporation, directing them to remove officers. The statute of 2 Geo. II. c. 4, makes for its being issued to command an election mayor or other chief magistrate of a city, town, or parish; and so, where one is elected to any office, or clerk, or is legally elected member of any body, as one of the aldermen of a city, and is refused admission or recognition as such, this writ is issued in his behalf.

**MANDAN**; a fort and Indian village on the Mississippi, 1600 miles from the Mississippi, by the course of the river; lon. 100° 50' W.; lat. 47° 20' N. The place is remarkable for the encampment of Lewis and Clarke, during the winter of 1804, 5, on their expedition up the Missouri. They arrived at the place on the 17th December, the thermometer stood at 45° below 0. The Mandan Indians are in the majority.

**MANDANE**; the mother of Cyrus. See *Cyrus*, *mythes*.

**MANDARINS**; the official nobility in China. See *Mandarin*.

**MANDATE**; an order in Germany, used for a decision of a court of justice, by which, on the application of a party, something is ordered or prohibited to the party. The process is unconditional (*sine die*) if no legal opposition can be anticipated, or conditional (*sub conditione*) if the other party is at liberty to make remonstrances.

*Mandate* was also the name given to a certain kind of paper-money in the French revolution. After the *assignats*, which had been kept in circulation by the violence of Robespierre, had lost all credit, a new money was created—the *mandates*,—founded, like the *assignats*, on the credit derived from the confiscated property, but with the essential difference, that specific pieces of property, enumerated in a table, were pledged for the redemption of the bills, whilst the *assignats* furnished only a *general* claim. The *mandates* could be realized at any moment, as the owner was authorized to take any portion of the property enumerated on the table, as soon as he made his intention known, and paid the quarter part of its assigned value without any further formality. First 600,000,000 of *mandates* were created, but soon after (March 18, 1796), 2,400,000,000. A forced circulation was given to them, by which the government was enabled to defray the expenses of the approaching campaign. This was hardly done, when they also sank to nothing; they were, therefore, in part redeemed, while the rest disappeared of themselves. Instead of sinking under this burden, France owed her deliverance to this measure. The evil carried along with its excess its cure.

**MANDEVILLE**, SIR JOHN, a celebrated English traveller of the fourteenth century, was born at St Alban's. He was of a respectable family, and bred a physician; but a desire to visit foreign countries induced him, in 1332, to set out upon a course of travels, in which he is said to have spent thirty-four years. During this period, according to his own account, he visited the greater part of Asia, Egypt, and Libya, making himself acquainted with many languages, and collecting a great mass of information, true and false, which he committed to writing in Latin, French, and English. He died at Liege, in 1372, where a monument is erected to his memory, the inscription on which denominates him *John de Mandeville, alias De Barba, Lord of Campoli*. The only genuine edition of his travels, entitled the *Voiage and Travaile of Sir John Maundeville, Knight*, was printed from an original manuscript in the Cotton library (1727, 8vo). His extreme credulity in the collection of absurd and fabulous stories is only surpassed by his unblushing indulgence in the most extravagant fictions.

**MANDEVILLE**, BERNARD, a writer and physician of considerable temporary celebrity, was born in Holland about 1670. He was probably of English extraction, as he fixed his residence in England, and wrote his works in the English language. His most celebrated production is the *Fable of the Bees*, or *Private Vices made Public Benefits*, first printed in 1723. The reasoning in this piece is founded on the sophism, that the luxury and superfluity which mark the advanced stages of society, and the vices which they engender, are often the causes of national prosperity, and hence the necessary prevalence of vicious principles in human nature. Consistently with this doctrine, his general views of mankind are of the most disparaging tendency; and he declares against all attempts to exalt the humble classes by education. Many answers appeared, among which was one by bishop Berkeley, to whom he replied in 1723, in his *Letter to Dion*. His *Free Thoughts on Religion* (1720), was deemed deistical. He also wrote several other works. He died in 1733.

**MANDINGOES**; a nation of negroes found in different parts of Western Africa, in Senegambia and Guinea. They are of the Mohammedan religion, and their language is, in some measure, the commercial language of Western Africa. They are superior to most of the African tribes in civilization. The following cut represents their costume;

**MANDOLA**, or **MANDOLINE**; an instrument, the name of which is much more musical than its tones. The Italian name is *mandola*, *mandora*. It has four strings, belongs to the lute and guitar species, and is played with a quill as well as with the finger. There are also instruments of this kind with six or more strings, which, therefore, approach nearer to the nature of the lute. It is chiefly in use in Italy, and is pleasing when it accompanies the easy song of the country people. The strings are of steel or brass.

**MANDRAGORA** and **MANDRAKE**; a name given by the ancients to a root which grew cleft into two parts, and resembled the human form. Hence miraculous powers were attributed to it, and the herb it produced was called *circæum*. According to Josephus (*Antiquit.*, book viii. chap. 2), Solomon had such a plant, which drove away demons. Pliny, in his *Natural History* (lib. 25. cap. 13) directs how it should be dug up; and Josephus, who called it *bararas*, states something similar. This root was supposed to have a double sex, and to make prolific; hence commentators on the Bible have conjectured that it was the fruit which Rachel desired of Leah, according to Genesis xxx. 14.

**MANDSHURES**, or **MANTCHOOS**. Two nations, the Mandshures and Tunguses, whose common origin is proved by their traditions, their language, and their physical conformation, belong to the Mandshure race, which wanders over the vast deserts in the east of Siberia and north of Mongolia. They were known in the earliest times under the name of the *Kins*, or *Niutshes*. From A. D. 926 they were tributary to the Khitans, and dwelt to the north of Corea, in Eastern Tartary, as far as to the Eastern sea, and the Amour. In 1114, they revolted under Okota, against the Khitans, and, in 1118, established the kingdom of Kin, in China, which was called from the founder of the dynasty. In 1125, Tai-tsung overthrew the kingdom of the Khitans, in the north of China; he then attacked the Song, who had called him in to their assistance, compelled Wey-tsung to cede to him a part of China, and deprived his successor of the remainder of northern China, leaving him only the southern part of the country. The Mongols, hitherto vassals of the Kins, revolted under the successor of Tai-tsung, and compelled the latter to cede to them a part of their territory. In 1208, Genghis-Khan refused the payment of tribute; in 1212 and 1213, entirely defeated the Kins, threw off the yoke, and made the Kins themselves his tributaries. In 1215, Ning-tsung, sovereign of China, of the dynasty of Song, refused to pay the tribute. In 1221,

the Kins were deprived of part of their territory, by Genghis-Khan. In 1230, Okai continued the war, and reduced the kingdom under Gai-tsung. After the expulsion of the Kins from China, they first appeared in 1556 under the name of the *Mantchoos*. They found reception in Lea-Tung, between Shensi-Mongolia and Corea; but, in 1616, they invaded China under Tienming, and made extensive conquests. To increase the confusion, he rebelled Li excited an insurrection, attacked the emperor Wey-tsung, in 1643, and defeated him. The emperor hanged himself, and thus put an end to the dynasty of Ming, the last family of native princes in China. A reconciliation was now effected with the Mantchoos. Tsonte drove Li out of Peking, he fell in the midst of his conquests, which were continued by his son, in 1644, since which period the Mantchoos have been the sovereigns of China. There is at present no Mantchoos within the Russian territory, a part of them, when the Russians came to Siberia, left their possessions in East Siberia, extending from lake Baikal to the Mongolian mountains, and along the river Amour, and withdrew to the coast of China; those who remained, and submitted to the Russian government, fell under the jurisdiction of China, by the treaty of Nerchinsk, by which they gave up all the Amour and the Mantchoos were its subjects. The Stanovoiyskiy mountain now form the boundary of the country inhabited by the Tunguses, part of whom are tributary to China, part to Russia, and part are independent.

**MANE**. See *Hair*.

**MANEGE**, or **MANAGE**, is used to denote the art of breaking and riding horses, or the place apart for equestrian exercises. It is borrowed from the French, who derive it from the Italian *maneggio*. Some writers derive it from the Latin *manus agendo*. Most horses are, by nature, extremely docile, and, when proper means are used with them, they are very well disposed to obey their masters. These ought, therefore, to endeavour, from the commencement, to acquire the confidence of the animal, by kind and gentle treatment, and by avoiding all unnecessary severity. Some horses, indeed, are naturally vicious or obstinate, and must be occasionally punished; but the chastisement should be inflicted with judgment and discrimination. A horse has been sometimes mistaken for vicious, and some horses, not naturally vicious, have been made so by severity and injudicious treatment. A horse's education may commence between the age of two and three years, and will greatly facilitate his operations, if he has been handled during the same. About this age, a halter or cavesson is used, and should be put upon the foal, that is as long as he is familiar with it. The groom, too, who is to manage the animal, should lift each of his feet, and hold them gently with a piece of wood or a halter, and which he will readily submit to be shod with iron shoes. Next, before feeding, the groom should sit on the saddle on the back of the foal, and move it gently with great caution. After a while, the foal should be bound over the saddle, and the halter should be bound over the saddle, and the foal should be fed. Every thing should be taught gently, and gently, to avoid the danger of making the animal timid or vicious. The horse should be made to run at the end of a long rein, and a hand, a noose-band being put on his nose, and following him, if necessary, with a long stick. Exercise should be performed with great caution, and but little at a time, that the horse may not be fatigued, stupefied, or discouraged. The horse should acquire a firm, regular, and determined gait, and may be mounted. Only a trench or saddle-cavesson should be used at first. The Mantchoos

should not be introduced till the horse has been taught to carry his head high, and is free in his motions. A fine carriage is to be given to the horse bringing his head in such a position as to form a perpendicular line from his forehead to his nose, at which his head should be brought a little more forwards by pulling the inward rein gently and by greens, and crossing the outward rein a little over, whereby he acquires the most beautiful position, and better able to go through his exercises. The usual paces of a horse are a walk, a trot, and a lop, to which some horses, of themselves, add an amble. In a walk, a horse lifts two legs on a side, after the other, beginning with the hind leg first; in an amble, two legs on a side at the same time; in a trot, two at the same time, and keeps two on the ground crosswise. In galloping straight forward, the horse may lead with either fore leg, but unless the hind leg on the same side follows it, the legs are said to be disunited; in this pace, all four legs are off the ground at the same time. In galloping in a circle, the innermost fore leg should lead, or he is said to gallop false. The canter or hand gallop is considered as a natural pace: it is an easier gallop, in which the hand presses on the bridle, to train the speed. When the horse has learned to go forward freely, he should be exercised for some time in the manner above pointed out, first at a walk, and then at a trot. The trot is to render him supple in his shoulders, and to make him go with a free, light, and determined action, for which no pace is so well adapted. A horse light in hand should be taught the extended trot. When he goes freely, he should be brought together by degrees, until he is united in his legs, and goes unitedly and equally. If he is kept together, he slackens his pace, push him forward, still keeping him gently in hand. If he is very in hand, he must be thrown back on his heels, to shorten his steps and collect his girth. He must not be suffered to sink his neck, or poke out his nose. When he has been wrought into a proper position, he should be made still more supple in the shoulders, by the lesson of the *épaule en dedans*, which is, perhaps, the most important lesson of any. For this purpose, the bend of the neck must be procured in the manner formerly described. When he has been ridden in this position till he goes with perfect steadiness and freedom, the rider should walk him forwards to the right, and then backwards, almost imperceptibly, to place him so that the hinder feet keep the straight line of a wall, the fore feet come out about a foot and a half to the left, towards the centre. This must be effected by crossing the outward rein, in the right hand, to the left, a little backwards, which compels the horse to bring the right shoulder forwards, and to cross the inward leg over the outward. The rider should also press his right leg to the horse's side, which brings in his shoulders. The same crossing of the legs afterwards be effected in the hinder legs, by crossing in the fore legs, &c. In every exercise, the rider should avoid all unsettled motion, and keep the horse going with the legs. Every thing should be effected by the hands only, and the legs should be used only in case of necessity. After the horse has been taught to go freely on this lesson to the right, the rider may change to the left. The horse should be ridden in the same manner across the course, and should be used alternately to the right and left, until he is perfectly supple in his legs with perfect facility. He may now, and should, be taught to back. Whenever the rider wishes to back a few paces, and then put the horse forwards by little at a time. In backing, if he begins to rear, push him out immediately into a full gallop. When the horse has been sufficiently practised

in the *épaule en dedans*, he should be made to traverse a passage with his head to the wall and with his croup to the wall. The motion of his legs in passing to the right, is the same with that of the *épaule en dedans* to the left, and so *vice versa*, but the head is always bent and turned differently. In the *épaule en dedans*, the horse looks the contrary way to that which he goes; in passing, he looks the same way as he is going. The directions for executing this lesson are similar to those of the *épaule en dedans*. The equilibrium of the rider's body is particularly necessary. Bits should not be used until the previous lessons have been well practised with the trench or snaffle. Horses should be taught to leap by degrees, beginning with small leaps. The rider must keep his body back, raise his hand a little, to help up the fore parts of the horse, and be very attentive to his balance, without raising himself in the saddle, or moving his arms. Horses should first leap standing, then walking, then trotting, then galloping. A low bar, covered with furze, is best to begin with, as it pricks the legs of the horse if he does not raise himself sufficiently, and prevents him from acquiring the dangerous habit of touching. In order to teach horses to stand fire, and to bear the sound of drums and other noises, they should be first accustomed to them in the stable at feeding time. All other things necessary to make a horse steady may be easily taught by good judgment, patience, and gentleness. Of all bad tempers and qualities in horses, those which are occasioned by ignorant riders and harsh treatment, are the most common and the worst. For mounting, &c. see *Horsemanship*.

MANELLI, PIETRO; a comic singer, who, about the year 1750, went at the head of a company of Italian singers to Paris, and gained the public favour by his comic talent. A warm dispute arose between the favourers of the modern Italian music and the old French style. The parties were called *buffonists* and *antibuffonists*. The chiefs of the parties were Grimm and Rousseau. The Italian music was victorious.

MANES, among the Romans; the souls of the dead. The good spirits were also called *lares*, and the evil *larvæ*. Some regarded them as the good and evil genii, which attend men through life. The manes were reckoned among the infernal gods; but a belief was prevalent, that they sometimes appeared upon the earth in the form of ghosts, particularly on the 30th of August, 4th of October, and 7th of November; whence the Romans considered these unlucky days. The superstitious notion that the spirits of the departed had an important influence on the good or bad fortune of the living, especially of those with whom they had been formerly connected, produced a general fear of them, and made people very cautious of offending them. As they were supposed to persecute those who disturbed their remains, tombs were held sacred, and victims (*inferiæ*) and libations offered to the manes. When it was not known whether a corpse had been buried or not, a cenotaph was erected, and the manes were solemnly invited to rest there, from fear that otherwise they would wander about the world, terrifying the living, and seeking the body which they had once inhabited. It was also supposed that they delighted in blood; various animals were, therefore, slain upon the funeral piles,—particularly those of which the deceased had been fond during his life,—and burned with the body.

MANES; founder of the sect of Manichæans. See *Manichees*.

MANESSE, RUDIGER VON; a native of Zurich, who, in 1336, when the aristocrats of his city, expelled by the burgomaster Bruns, threatened to return with the support of Austria, received the chief command from his fellow-citizens, was victorious, and saved the

liberty of Zurich. After the death of Bruns, he was chosen burgomaster. He was a lover of poetry, and formed a collection of 140 love-songs, called after him the *Manesse collection*. It remained until the beginning of the seventeenth century in Switzerland, but was carried off, and, during the thirty years' war, found its way to Paris, where it was discovered, in 1726, by Ch. von Bartenstein. Part of the manuscript was published in 1748 (2 vols., Zurich); in 1758, and 1759, complete, by Bodmer and Breitinger. It is important in the history of German literature.

MANETHO; an ancient Egyptian historian, who was high priest of Heliopolis, in the reign of Ptolemy Philadelphus, about 304 B. C. He wrote in Greek a history of Egypt, from the earliest times to the last years of Nectanebis, and pretended that he had taken it from the sacred pillars of the first Hermes Trismegistus; the inscriptions on which, after the flood, were translated into Greek, but written in the sacred characters, and deposited in the sacred recesses of Egypt. The manifest absurdity of this pretension induces several writers to think, that some mistake or corruption has taken place in the passage of Eusebius which relates it. The work of Manetho, which is lost, consisted of three parts, the first of which contained the history of the gods or heroes, and the second and third that of twenty dynasties of kings, which, having been epitomized by Julius Africanus, are recorded by Eusebius. Several fragments of Manetho are preserved by Josephus, in his work against Apion. See *Scyffarth* and *Hieroglyphics*.

MANFREDI, EUSTACHIO; an eminent mathematician and astronomer, born in 1674, at Bologna, in Italy. He applied himself to the cultivation of mathematical science, and, in 1698, was appointed professor of mathematics in the university of Bologna. In conjunction with Victor Stancari, he commenced a series of astronomical observations, of which he afterwards published an account in his *Schedæ Mathematicæ*. In 1703 appeared his treatise on the Solar Macule; and the following year he was chosen regent of the college of Montalto, and also surveyor-general of the rivers and waters of the Bolognese territories. In 1705, he published a work on the Reformation of the Calendar; and he afterwards began the composition of his *Ephemerides Motuum celestium*, which he carried on from 1715 to 1725. On the foundation of the institute of Bologna, in 1712, Manfredi was appointed astronomer to that establishment. He was admitted an associate of the royal academy of sciences at Paris, and, in 1729, a foreign member of the royal society of London. He died in 1739. Besides the works already noticed, he was the author of other mathematical and astronomical productions; and after his death, appeared a volume of his poems.

MANGANESE, in the condition of an ore, had been used in certain arts, before its nature, as a distinct metal, was known. Scheele and Bergman, from an examination of this ore, inferred that it chiefly consisted of the oxide of a metal. To obtain the metal, the mineral is dissolved in muriatic acid, the oxide of iron in the solution precipitated by ammonia, and the solution itself evaporated to dryness; the residuum, after heating to expel the muriate of ammonia, is pure oxide of manganese, which is made into a paste, with a small quantity of oil and charcoal, and exposed, in a crucible, to the most intense heat of a powerful wind-furnace; the result of the process is the manganese in the metallic form. Hydrogen gas, passed over the heated oxide, will also reduce it. The metal is of a white colour, with a shade of gray, having a moderate lustre, which tarnishes, however, on exposure to the air. Its texture is granular; it is brittle and hard; specific gravity, 8; heated in oxygen or chlorine, it takes fire, and forms an oxide or chloride.

The oxides of manganese have attracted the attention of many chemists, and are hardly yet determined from controversy. Three, most probably four, well defined oxides may be obtained; and some intermediate oxides, compounded of these, exist in nature. The protoxide is best obtained by transmitting hydrogen gas over the deutoxide, peroxide, or carbonate of manganese, ignited by a spirit-lamp, or a gas tube. It is permanent in the air, but, when heated to 647 Fahr., it absorbs oxygen very rapidly, and at a red heat, it passes from its green color almost instantaneously, into black. Its composition is manganese 76.82, and oxygen 23.18. It is the base of the proper salts of manganese, which, the protoxide is colourless. The deutoxide is prepared by exposing the nitrate or peroxide of manganese to considerable time, to dull ignition. It is a base, and the prismatoidal manganese ore (gray oxide of manganese), and consists of 70 metal and 30 oxygen. When heated with sulphuric acid, oxygen is extricated with effervescence, and a protoxide results. The peroxide exists native and crystalline in perfect purity. It may be artificially prepared by heating the dry proto-nitrate till a white mass has been formed, which must be pushed over, while hot with strong nitric acid, and again calcined with constant stirring. It contains not much oxygen as the protoxide. The sesquioxide is formed by exposing the nitrate, or peroxide of manganese, to a white heat, out of the influence of water vapours. It has a brownish-red color when cold, and is nearly black while warm. It contains not proportional of the protoxide, and contains the sesquioxide. It dissolves, in small quantity, in dilute sulphuric acid, without disengagement of oxygen, forming an amethyst-red liquid. On heating in solution, or dilute sulphuric acid, or the red oxide, oxygen is evolved, the colour disappears, and a persulphate remains. Strong muriatic acid dissolves the red oxide into a coloured solution, which, on adding chlorine, and gradually passes into a permanent purple. A compound, possessing very singular properties, as respects the colour to which it gives rise when in solution, and which from its resemblance, has received the fanciful name of the *chameleon*, is formed by fusing together the black oxide of manganese and potash, or to carbonate, which, on being dissolved in water, communicates to it a greenish-blue colour. The solution, standing a little time exposed to the air, or to an oxide of iron which it contains, and the color becomes blue; and, on the addition of water, or an acid, the solution assumes a violet color, which it soon passes to red, brown, black, and becomes colourless. When the colour of the solution is bluish-green, the manganese is believed to be united with the alkali, in the condition of manganous acid; and when it is red, the manganese is supposed to be in the state of manganese and the manganous acid is, according to this view, very easy of decomposition. When combined with potash it forms a submanganite; and whenever the potash is saturated, or its action weakened, the manganous acid is decomposed into deutoxide of manganese and manganic acid; hence the changes of the solution. According to the experiments of Berzelius, the manganic acid has a dark carmine-red color, tastes sweetish at first, but afterwards bitter and astringent, and is destitute of smell. When heated with care, it volatilizes. It is decomposed by treatment with hydrogen gas, the hydrogène acid, carbonated sulphur, the metals, and all organic substances. The salts of manganese are usually prepared from the black oxide. The acids, which have a strong affinity to the protoxide, expel the excess of oxygen, equally

if their action is aided by heat; with other acids, it is necessary to add a little carbonaceous matter, as sugar, to abstract a portion of oxygen from the peroxide. The principal salt is the *sulphate of manganese*, which may be thus prepared: the acid acts very slowly on the metal itself; if diluted, however, it acts more quickly, hydrogen gas being disengaged of a fetid smell. The solution, when concentrated, is of a rose colour; when obtained neutral, it affords on evaporation, granular crystals of a reddish colour, transparent and soluble. Its taste is styptic and bitter, and it is very soluble in hot water. *Nitrate of manganese* may be formed from the carbonate. It is very soluble, and difficult to crystallize. It may also be formed by making the acid act on a mixture of peroxide of manganese and sugar or gum; the vegetable substance serving to reduce the manganese to a minimum of oxidation, while much carbonic acid is evolved. The muriatic acid is equally incapable of combining directly with the black oxide, but according to the usual law, it de-oxidizes it: one part of the muriatic acid is decomposed; its hydrogen combines with the excess of oxygen of the black oxide, to form water; the chlorine, the other element of this portion of the acid, is evolved; and the rest of the muriatic acid unites with the protoxide of manganese, to form the *muriate*. The solution of *muriate of manganese* is of a rose colour when concentrated, and affords, by evaporation, small crystals of a pale rose colour, which are four-sided tables; they are deliquescent, very soluble in water, and, by a red-heat, are converted into a red chloride. *Carbonate and phosphate of manganese* may be formed by double decomposition, being thrown down in the state of insoluble precipitates. The salts of manganese suffer decomposition from the alkalis, which precipitate the oxide: they are not decomposed, however, by the inflammables, or the other metals, which is a proof of the affinity of manganese to oxygen. Oxide of manganese combines with those earths capable of vitrification, and with their compounds, and communicates to the glasses which they form a violet tinge; it imparts the same colour, also, to borax, and other vitrifiable salts. When heated with these fluxes, by the blow-pipe, the colour soon disappears in the interior flame, from de-oxidation, but appears again if a little nitre be added. *Sulphuret of manganese* was obtained by Berthier, by heating the sulphate in a charcoal crucible; it was of a gray colour and crystalline appearance. Manganese, from its infusibility, does not combine readily with many of the metals. It shows, however, considerable affinity to iron, occurring frequently combined with it in nature. It is contained, also, in those ores of iron which are best adapted to the fabrication of steel, and is supposed to improve the quality of steel. Gold and iron are rendered more fusible by a due addition of manganese; and the latter metal is rendered more ductile. Copper becomes less fusible, and is rendered whiter, but of a colour subject to tarnish. Manganese is applied to no use in its metallic form. The black oxide is employed by the chemist in preparing oxygen and chlorine gases. It has long been used in the art of glass-making, to counteract the green tinge communicated by the iron contained in the materials—an effect which it produces by yielding oxygen to the oxide of iron, and bringing it to a high degree of oxidation; in a larger quantity added to glass, it gives a purple colour. It is also used to give a black colour to earthenware.

**Ores of Manganese.** 1. *Gray manganese ore* is found in prismatic crystals, whose primary form may be considered as a right rhombic prism of  $100^\circ$  and  $90^\circ$ . It also cleaves parallel with both the diagonals of this prism. The crystals are usually slender and

much striated, longitudinally. Fracture uneven; lustre metallic; colour dark steel-gray to iron-black; streak brownish-black; opaque; brittle; hardness about that of limestone; specific gravity, 4.626; it also occurs in twin crystals, in reniform, botryoidal, and other imitative shapes, with a surface generally rough and drusy; composition columnar, of various sizes of individuals, often forming a second granular composition. In the massive varieties, the granular or columnar composition often becomes impalpable, in which cases the fracture is earthy. Gray manganese ore has been divided into several sub-species, chiefly in consequence of its mechanical composition. *Radiated gray manganese* ore comprises long acicular or reed-like prisms, and such massive varieties as consist of columnar particles of composition, while the *foliated* one refers to short prisms and granular compositions. *Compact gray manganese* ore contains varieties composed of impalpable granular individuals, and *earthy gray manganese* ore, such as have lost their coherence, and appear in the state of an earthy powder. The composition of some varieties belonging to this species, has been found by Klaproth to be—

Black oxide of manganese,	90.50	89.90
Oxygen,	2.25	10.25
Water,	7.00	.50

It is infusible before the blow-pipe, and colours glass of borax violet blue. It is insoluble in nitric acid. In heated sulphuric acid, it disengages oxygen; and chlorine is evolved, if it is brought into contact with muriatic acid; also, before the blow-pipe, or alone in a strong heat, it gives out oxygen. The gray manganese ore frequently accompanies the hematitic iron ores; and sometimes its earthy and compact varieties constitute beds by themselves. It also occurs in veins, particularly in porphyry, along with sulphate of barytes. Its most celebrated localities are Ilfeld in the Hartz, and Ehrenstock in Thuringia. It has numerous localities also in Saxony, Bohemia, Hungary, France, and Britain. It has been observed in many of the American states; but occurs most abundantly in Vermont, at Bennington and Monkton, accompanied with hematite and uncleavable manganese ore. The uses of this species of manganese ore, wherever it occurs in quantity, are very important for various chemical operations, and for none more so than the manufacture of chloride of lime, the ordinary bleaching powder. Its use in the manufacture of glass, is also very considerable. *Black wad* deserves to be mentioned under this species, as a very remarkable substance among those which contain manganese. It occurs in reniform, botryoidal, fruticose, and arborescent shapes, in froth-like coatings, on other minerals, or massive. Its composition is generally impalpable, and the fracture even or earthy. Colour brown, of various shades; opaque; very sectile; soils and writes; hardness below that of talc; specific gravity, 3.7; the varieties are very light, when dry; yet, as they imbibe water with violence, when immersed into it, they sink immediately. Mixed with linseed oil, it undergoes a spontaneous combustion. It consists of—

Oxide of manganese,	68
iron,	6.50
Water,	17.50
Carbon,	1.00
Baryta and silica,	9.00

It has been found in the Hartz, in Devonshire, and Cornwall, in England, also at one locality in the United States, in Connecticut. The black wad is conceived to be the colouring matter in the dendritic delineations upon steatite, limestone, and other substances.

2. *Pyramidal manganese ore* is a rare mineral,

occurring crystallised in octahedrons, with a square base, whose pyramids are inclined to each other, at an angle of  $117^{\circ} 30'$ . Fracture uneven; lustre imperfect metallic; colour brownish-black; streak dark-reddish or chestnut-brown; opaque; hardness equal to that of apatite; specific gravity, 4.72. It also occurs massive, possessed of a granular composition. It is probable that the variety from Piedmont, analysed by Berzelius, belonged to this species; if so, its composition would be, oxide of manganese, 75.80; silica, 13.17; oxide of iron, 4.14; and alumine, 2.80. In the oxidating heat of the blow-pipe, it yields a fine amethyst-coloured glass. It is soluble in heated sulphuric acid. It has been found in veins, in porphyry, along with other ores of manganese, at Oehrenstock, near Ilmenau in Thuringia, and at Ilsefeld in the Harz.

3. *Compact manganese ore, or uncleavable manganese ore*, occurs in reniform, botryoidal, and fruticose shapes, having a columnar or granular composition, sometimes impalpable. Fracture flat conchoidal, or even; lustre imperfect metallic; colour bluish-black, passing into dark steel-gray; streak brownish-black; shining; opaque; brittle; hardness nearly equal to that of feldspar; specific gravity, 4.14. It occurs sometimes accompanied by hematite, but generally along with other ores of manganese, in veins, in the older rocks. It is found at numerous places in Europe, and in the United States.

4. *Manganese blende, or sulphuret of manganese*, is one of the rarest ores of this metal, and has hitherto only been found at Nagyag in Transylvania, and in Cornwall. It is rarely crystallised, generally occurring massive, in distinct concretions. Colour iron-black; lustre imperfect metallic; streak dark green; opaque; rather sectile; hardness but little superior to that of calcareous spar; specific gravity, 4.014. It consists of protoxide of manganese, 85.00, and sulphur, 15.00. Before the blow-pipe, it is melted with difficulty. If reduced to powder, and thrown into nitric, muriatic, or dilute sulphuric acid, it emits sulphuretted hydrogen, and is dissolved.

5. *Phosphate of Manganese* occurs massive, with a cleavage in three directions, perpendicular to each other, one of which is more distinct than the rest. Fracture small conchoidal; lustre resinous; colour blackish-brown; streak yellowish or reddish-grey; opaque; brittle; hardness above that of apatite; specific gravity, 3.43. Before the blow-pipe, it melts easily into a black scoria; is readily dissolved in nitric acid, without effervescence, and consists of oxide of iron, 31.00; oxide of manganese, 42.00; and phosphoric acid, 27.00. It has hitherto been found only at Limoges in France, and at Washington in Connecticut.

6. *Carbonate of Manganese* is found crystallised in rhomboids of  $106^{\circ} 51'$ , and massive. Fracture uneven, imperfectly conchoidal; lustre vitreous, inclining to pearly; colour various shades of rose-red, partly inclining to brown; brittle; hardness but little above that of calcareous spar; specific gravity, 3.59; the massive varieties present globular and botryoidal shapes; composition granular, sometimes small, and even impalpable; it consists of oxide of manganese, 54.60; carbonic acid, 33.75; oxide of iron, 1.87; silica, 4.37; lime, 2.50. It effervesces rather briskly in nitric acid; before the blow-pipe, its colour is changed into grey, brown, and black, and it decrepitates strongly, but is infusible without addition. It is found in the Saxon mines in the neighbourhood of Freiberg; also at Nagyag in Transylvania. For an account of the red and reddish-brown silicious ores of manganese, see *Silicate of Manganese*.

MANGEL-WURZEL; a kind of beet, which does not afford fodder of as good quality, nor in such

abundance, as was supposed at the time of its introduction; but it is valuable from its size and hardy nature. The leaves may be eaten as a substitute to spinach, and continue in season long after that plant has withered. In some parts of Germany, the farmers prefer it, for their cattle, to turn-seedling, and, besides, it can be obtained at the same part of the season, when green fodder is much wanted.

MANGO; a celebrated fruit, now raised in most of the tropical parts of the globe. It is native of India, and was introduced into Jamaica in the year 1782. The taste is delicious, agreeable, and yields only to the mangosteen. The tree is one of the sumach, and belongs to the same order, *Umbelliferae*. It attains the height of thirty or forty feet, has a rapid growth, and is very productive. The leaves are simple, alternate, lanceolate, smooth, and entire. The flowers are numerous, reddish, and disposed in large terminal panicles. The fruit is kidney-shaped, subject, however, to a good deal of variation in size, form, and colour, and contains a large, flattened stone. Many fine varieties of mango are cultivated, some of which are very beautiful, and diffuse a delightful perfume.

MANGOSTEEN. This far-famed tree is a product of a middling-sized and beautiful tree, *Garcinia mangostana* of botanists, and was originally brought from the Molucca islands, but is now cultivated in many parts of the East Indies. The leaves are large, opposite, smooth, coriaceous, and evergreen; the flowers are terminal and solitary, and of a covered colour: the fruit is shaped like, and about as large as an orange, divided internally into seven cells, each containing a single seed. It belongs to the *Guttifera*, a natural family, which is not now beyond the tropics. It is, on all hands, admitted to be the most delicious, as well as the most valuable of all known fruits. We have not heard of its introduction into any part of inter-tropical America, although great pains have been taken to transport thither so many of the productions of the East.

MANGROVE (*Rhizophora*); a genus of plants, consisting of trees or shrubs, which grow in swampy countries, along the borders of the sea, in a soil which are liable to be overflowed by the sea water even as far as low water mark. Their branches are long, hang down towards the earth, and when they have reached it, take root, and produce new roots. In this manner, immense and almost impenetrable forests are formed, which are filled with vast numbers of crabs, aquatic birds, mosquitoes, and also others, which attach themselves to the branches. The leaves are simple, opposite, and entire. The most remarkable for throwing out roots, which support the branches of the trees, while yet adhering to the foot-stalk. The *R. mangro* is found in Florida nearly as far north as the 30th parallel of latitude. This genus, and an allied one, form a natural tree by themselves.

MANHEIM; a city of Baden, capital of the archbishopric of the Neckar, at the conflux of the Neckar with the Rhine; thirty-four miles N. of Carlsruhe; lon.  $9^{\circ} 28' E$ ; lat.  $49^{\circ} 29' N$ ; population, 21,500. It was chosen by the elector palatine for the site of a town, being, before, a petty village, with a castle. In 1719, it became the residence of the elector of the Palatinate and his court, and so continued till 1777. In 1802, it was annexed to Baden. It contains a very large palace, is the second residence of the grand duke, and the seat of the supreme court of appeal for the grand duchy. Mannheim presents a fine view from a distance. It is divided into two quarters, and is of an oval form. It is built with the greatest regularity; the streets are wide, straight, well paved, the houses uniform and elegant.

public buildings large and handsome; and it is one of the finest towns in Germany. It contains Lutheran, Reformed, and Catholic churches, a synagogue, and three hospitals. The palace contains a gallery of paintings, cabinet of antiquities, and a library of 60,000 volumes. The observatory is a noble building, with a curious tower 106 feet high. The lyceum, or gymnasium, for the education of the upper classes, is superintended by able instructors.

**MANIA**; a Roman spectre, the mother of the Manes, to whom, in the most ancient times, human sacrifices, particularly of children, were offered. This took place as late as the time of Tarquinius Superbus. In subsequent times, onions and poppy-heads were sacrificed instead of children. Little figures, stuffed with wool, were hung outside the house, to appease the Mania; also clews of yarn, equal in number to the slaves, to protect them.

**MANIA**. See *Mental Derangement*.

**MANICHEES**, or **MANICHÆANS**. Of the founder of this sect—whom the Orientals called *Mani*, the fathers of the church, *Manes*, terming likewise his adherents *Manichees*—history contains two different accounts. The older account, contained in the historians of the Christian church, seems far more credible than the Arabic version of the tenth century, which makes him an accomplished magician, a skilful painter, and a Christian priest; but says nothing particularly new respecting him. According to the first account, he became, when a boy, a slave, under the name of *Cubricus*, to a wealthy widow in Persia, at whose house he met with the four books of Cythianus, an Egyptian enthusiast, of whom nothing more is known, which had been left her by his scholar Terebinthus, or Buddas, entitled *Mysteries, Chapters, Gospel (Artzeng) and Treasury*. By the perusal of these books, he was led to his doctrine of the world and of spirits, framed from the dualistic ideas of the Chaldeans, together with the systems of the Gnostics. (See *Gnostics*.) Being left the heir of his mistress at her death, he assumed the name of *Mani*, and sought to rear, like Mohammed, on the foundation of these books, a new religious philosophy, for which he acquired disciples. The reputation of his wisdom caused him to be invited to the court of Sapor, king of Persia, where he was imprisoned, because the sick son of this king had died under his care. His scholars brought him information of the obstacles which Christianity had thrown in the way of his doctrines. The reading of the Holy Scriptures of the Christians now suggested to him the idea that he was called to the purification of Christianity from Jewish and hierarchical deformities, and to the diffusion of a mysterious doctrine, unrevealed by the apostles—nay, that he was the Comforter promised in the New Testament. Having escaped from prison, and collected new disciples at Arabion, a fortress on the frontiers of Mesopotamia, he sought, under the name of an apostle of Christ, and, according to the Arabic narrative, favoured by Sapor's successor, Hormizdas (Hormuz), A. D. 272, to convert the Christians in those regions to his doctrines. While engaged in these endeavours, he is said to have been twice overcome by Archelaus, a Christian bishop at Askar (Charræ) in Mesopotamia, in two disputations; to have incurred again the suspicion of the Persian court, and, in the year 277, to have been executed (according to the Christian account, flayed alive), at the command of king Varaces (Vaharem). Proceeding on the ground of an eternal opposition of good and evil, mingling the philosophy of Zerdusht (Zoroaster) with his arbitrary versions of biblical doctrines, his system possesses but little in common with Christianity, except the language. He assumes two principles, independent of each other; one of

good—the God, without form, in the kingdom of light; and one of evil—the hyle, or devil, of colossal stature and human shape, in the darkness of matter; the former strengthened by two emanations, created in the beginning, the Son and the Spirit, and superior to the latter, both surrounded by innumerable similar aëons, or elementary natures, proceeding from them, which dwell in the five elements, or spheres, that rise one over the other in the kingdom of good, viz. light, clear water, clear air, genial fire, and pure ether; and, in the kingdom of evil, darkness, or earth, troubled water, stormy air, consuming fire and smoke, from each of which proceed congenial creatures. During an internal war of the always discordant powers of darkness, the defeated party discovered, from the high mountains on the frontiers, the kingdom of light, hitherto unknown to the devil. In order to conquer it, the devil made peace with his species. The good God endeavoured to subdue his enemies by means of artifice and love. The prince of darkness, having eventually been defeated in the contest, produced the first parents of the human race. The beings engendered from this original stock consist of a body formed out of the corrupt matter of the kingdom of darkness, and of two souls, one of which is sensual and lustful, and owes its existence to the evil spirit; the other, rational and immortal, a particle of the divine light, which had been carried away in the contest, by the army of darkness, and immersed into the mass of malignant matter. The earth was created by God out of this corrupt mass of matter, in order to be a dwelling for the human race, that their captive souls might, by degrees, be delivered from their corporeal prisons, and their celestial elements extracted from the gross substance in which they were involved. With this view, God produced two beings from his own substance, Christ and the Holy Ghost; for the Manichæans held a consubstantial Trinity. Christ, or the glorious intelligence, called by the Persians *Mithras*, subsisting in and by himself, and residing in the sun, appeared in due time among the Jews clothed with the shadowy form of a human body, to disengage the rational soul from the corrupt body, and to conquer the violence of malignant matter, and he demonstrated his divine mission by stupendous miracles. This Saviour was not man: all that the New Testament relates respecting the humanity of Jesus was merely appearance, even his death and resurrection; but his sufferings are emblems of the purification by self-denial, death and new life, necessary for corrupted men. His crucifixion, in particular, is an allegory of the torments of the soul, which is fastened to matter as to a cross. When the purposes of Christ were accomplished, he returned to his throne in the sun, appointing apostles to propagate his religion, and leaving his followers the promise of the Paraclete, or Comforter, who is Mani the Persian. Those souls who believe Jesus Christ to be the Son of God, renounce the worship of the God of the Jews, who is the prince of darkness, and obey the laws delivered by Christ, and illustrated by Mani, the Comforter, are gradually purified from the contagion of matter; and, their purification being completed, after having passed through two states of trial, by water and fire, first in the moon and then in the sun, their bodies return to their original mass (for the Manichæans derided the doctrine of the resurrection of bodies), and their souls ascend to the regions of light. But the souls of those who have neglected the salutary work of purification, pass, after death, into the bodies of other animals, or natures, where they remain till they have accomplished their probation. Some, however, more perverse and obstinate, are consigned to a severer

course of trial, being delivered over, for a time, to the power of malignant aerial spirits, who torment them in various ways. After this, a fire shall break forth and consume the world, and the prince and powers of darkness shall return to their primitive seats of misery, in which they shall dwell for ever. Between these seats and the kingdom of light the souls of those not wholly purified keep eternal watch, that both may remain as they were from the beginning.

With this system of religion, which was contained in the books of Scythianus and Mani's own treatises, letters and apocryphal writings; but, at present, exists only in the fragments found in the ancient authors, especially in St Augustine against the Manichees, the moral system of this sect corresponds. It divides the Manichees into two classes: the *elect* are to abstain from wine, flesh, and all animal food, marriage and sexual indulgences, from music, the possession of earthly goods, and all luxury, as well as from war, labour, and doing injury to the vegetable world, and even from plucking fruits; are to kill no animals but vermin, and devote their life to pious contemplation. More was allowed the *auditors*, or more imperfect. By their labour, they had to support themselves and the elect; in marriage, must abstain from the procreation of children, and place their happiness in poverty. The head of all was Mani, with twelve disciples, among whom Thomas, Buddas, and Acuas, from whom the Manichees were also called *Acuanites*, deserve mention. The Manichean congregations were superintended by bishops, of whom Mani ordained seventy-two; by elders and deacons, all from the class of the elect, in which there were also sainted virgins. These ecclesiastics had, however, merely the authority of teachers, the church government being democratically administered by the congregations. Temples, altars, images, victims, and other sensible aids of divine worship, were not allowed: their worship consisted of singing, prayers, the reading of their sacred books, and lecturing. The supper they celebrated without wine, and, like the primitive Christians, often delayed baptism to a mature age. Of the fasts and festivals of the Christians, they observed only that which commemorated the death of Jesus, and Sunday; the latter, with strict fasting. In March they celebrated the anniversary of the death of Mani (Bema), on which day a splendid pulpit, five steps in elevation, was erected in their simple halls of assembly for Mani, present in the spirit. They claimed the title of Christians; but, notwithstanding the reputation of extraordinary purity of morals, conceded them even by their enemies, they had to suffer, after the fourth century, more cruel persecutions than other heretics. Till this time, they had spread with great rapidity from Persia, where they had their origin, through Syria and Asia Minor, to Northern Africa, and even as far as Italy. In Northern Africa, where they had many, though not numerous congregations, with separate bishops, they were exterminated, in the fifth century, by the Vandals; in the Roman empire, especially in Italy (whither numbers of them had fled from Africa), by the persecutions of Christian emperors and episcopal excommunications. Being finally suppressed in Persia also, they took refuge, after the beginning of the sixth century, partly in the heathen regions of Eastern Asia, where they seem to have had an influence on the formation of Lamaism, partly in the obscurity of secret brotherhoods, and appeared, in subsequent centuries, under different names. The Priscillianists, Paulicians, and Catharists (q. v.) had much in common with the Manichees: their name, was, however, given to heretical sects and societies in the middle ages, as to the Canonici, burnt at Orleans in 1022, frequently

without reason, and merely to excite the people's hatred.

MANIFEST is a regular list of a ship's cargo, containing the mark and number of each separate package, the names of the persons to whom the different parcels of goods are shipped, and also of the persons to whom they are consigned, a specification of the quality of the goods contained in each package, as rum, sugar, tea, coffee, &c. and also an account of the freight that the captain is to receive from the consignee of such goods, as is usual, corresponding with the bills of lading which he has already signed. The manifest is usually sent to the ship-broker, who clears the vessel at a custom-house, and by the captain, and serves as a voucher for the latter, whereby to settle his account with his owners, &c.

MANIFESTO; a declaration publicly made of the commencement of a war, by the commanding powers, to show the causes which justify such a measure. The name is taken from the word *manifestum est*, &c. (it is manifest), the beginning of these declarations, as they were anciently written in Latin. Manifestoes are in the form of printed letters: they commence with a short address to the public in general, and are signed with the name of the sovereign who issues them. Manifestoes in this continent, are usually written in French. They have been in use among all nations, till our own day. In France, where so many old forms have been set aside, the place of manifestoes, during the revolution, was supplied by messages from the emperor to the senate, proclamations to the army, and decrees of the *Moniteur*.

MANILIUS, MARCUS; a Roman poet who lived, probably, in the Augustan age. The circumstances of his life are unknown. He is less remarkable as a poet than as being the Roman who, in imitation of Aratus, undertook a didactic poem on astronomy. In this poem, we have but five books. It is called *Astronomica*. It is valuable chiefly as a work of erudition; it contains, however, a few beautiful and appropriate passages, particularly in the introduction. The best editions are by Bentley (London, 1726, 8vo), Stober (Strasburg, 1767), and Pagny (Paris, 1788, 2 vols.)

MANILLA; capital of Luzon, and of all the Spanish possessions in the Philippines; lat. 14° 30' N.; lon. 116° 16' E.; population, including the suburbs, about 60,000, of which 3000 are Spaniards, 7000 Metis, 4000 Chinese, and the rest natives. (See *Malaya*.) Manilla is beautifully situated at the bottom of a bay, on the west side of the island and is well fortified. The streets are wide, paved, and lighted; the houses generally consist of a basement story of stone, and an upper story of wood, covered with balconies, and windows of mother of pearl, or some other transparent substance. The principal buildings are the churches and monasteries. The chief manufactures are cigars, and a sort of transparent stuff, which the natives use for clothing. The commerce is very considerable since the port has been opened to foreigners. The chief articles of export are sugar, indigo, cotton, tobacco, rice, pepper, pearls, &c.; wine, brandy, cotton, silk, and various manufactured articles, cutlery, &c., form the principal imports. In 1818, nine Spanish, five French, one American, four Portuguese, seventeen British ships, and thirteen Chinese junks, sailed from the port. Provisions are abundant and cheap. The climate is hot and damp. Manilla has repeatedly suffered from earthquakes. Those of 1643, 1794, and 1804, were very destructive. A hurricane, in 1804, destroyed most of the houses left standing. In 1792, it was

taken by the British, and ransomed for a million sterling. See *Philippines*.

MANIOC, MANDIOCA, or CASSAVA (*gatro-pas manihot*); a tortuous shrub, allied to the castor-oil plant, and interesting from the nutritious qualities of the roots. It is indigenous to tropical America, and is now cultivated from Florida to Magellan, and in several countries of Asia and Africa. The stem is smooth, branching six or seven feet high; the leaves are alternate, deeply divided into from three to seven lobes, which are lanceolate, acute, and entire; the flowers are disposed in loose compound racemes, and the calyx is reddish or pale-yellow; the fruit is almost globular, and is composed of three cells, each containing a shining seed about as large as those of the castor-oil plant. It is easily cultivated, grows rapidly, and produces abundantly. It is much less subject to the ravages of animals, or to the variations of the atmosphere, than most crops, and, besides, accommodates itself to almost every kind of soil. The roots attain the size of the thigh, and require at least a year to bring them to perfection; neither can they be kept in the ground for a longer period than two years. The cultivated varieties are very numerous. It is said that an acre of manioc will nourish more persons than six acres of wheat. Every part of the plant is filled with a milky juice, which is a very violent and dangerous poison, bringing on death in a few minutes when swallowed; and it may well excite surprise that human ingenuity should have converted the roots into an article of food. For this purpose the roots were formerly rasped with rough pieces of stone; but they are now ground in wooden mills, and the paste is put into sacks which are exposed for several hours to the action of a very heavy press. By this means it is deprived of all the poisonous juice, and the residue is called *cassava*. Cassava flour, when kept free from moisture, continues good for fifteen or twenty years. It is very nutritious, half a pound a day being sufficient for any one. The Creole women prefer the cassava to wheat bread, but, to a European, the taste is rather insipid. It is also the basis of several different beverages, some of which are acid, agreeable, and even nutritive. The substance called *tapioca*, which is frequently imported into Europe and the United States, and is used for jelly, puddings, and other culinary purposes, is separated from the fibrous parts of the roots by taking a small quantity of the pulp, after the juice is extracted, and working it by hand till a thick white cream appears on the surface. This, being scraped off and washed in water, gradually subsides to the bottom. After the water is poured off, the remaining moisture is dissipated by a slow fire, and the substance being constantly stirred, gradually forms into grains about as large as those of sago. This is the purest and most wholesome part of the manioc.

MANIPULATION (from the Latin); work done with the hands. The word is used in pharmacy for the preparation of drugs; in chemistry, for the preparation of substances for experiments; in animal magnetism, for the motion of the hands, by which a person is magnetised. See *Magnetism, Animal*.

MANIPULUS. See *Legion*.

MANITOU, among some tribes of the North American Indians, is the name for a magical preparation, whose virtues are somewhat like those of an amulet. A figure of an animal, a feather, a horn, a bird's beak, or some other object, is consecrated, with various charms, by the sorcerer, or doctor of the tribe or village, and worn by the individual for whom it is intended as his *manitou*, or medicine. It seems to be not unlike the *fetich* (q. v.) of most barbarous people.

MANLIUS, MARCUS CAPITOLINUS; a brave, ambitious, and artful patrician and consul of Rome. The Gauls, under Brennus, had captured Rome (B. C. 390), and were besieging the capitol. On a dark night, they determined to surprise the citadel. They had already reached the foot of the walls; the sentinels, thinking them secure, had fallen asleep, and the enemy had already discovered a vulnerable point, when the garrison was awakened by the cackling of some geese, which were dedicated to Juno. All rushed to their arms; Manlius was the first who reached the place of danger. Two of the Gauls had gained the summit; one of them fell under his sword; and the other he thrust over with his shield. His example animated the rest. The capitol was saved, and Manlius received the surname *Capitolinus*. Having afterwards proposed a law to free the people from taxes, the senate was excited against him, and he was arrested and imprisoned as a disturber of the peace. But the people looked up to him as their greatest benefactor, and with one voice demanded his liberation. It was granted; but his restless spirit led him to new enterprises; he even aimed at the sovereignty, and the tribunes of the people became his accusers. He was condemned to death, and thrown from the Tarpeian rock (B. C. 383).

MANLIUS, TITUS TORQUATUS; a Roman consul and general, son of Manlius Imperiosus. On account of a defect in his speech, his father was unwilling to carry him into the city, and kept him in the country among the slaves. This conduct appeared so unjust to the tribune Marcus Pomponius, that he summoned the father before him to answer for himself. The son, indignant that his father should be persecuted on his account, immediately hastened to the house of the tribune with a dagger in his hand, and forced him to swear that he would proceed no further. This filial piety made such an impression on the people, that they chose Manlius military tribune for the next year. He marched with the army against the Gauls; one of whom challenged the bravest Roman to single contest. Manlius accepted the challenge, conquered his adversary, and encircled his own neck with the collar (*torquis*) of the Gaul, in consequence of which he received the surname of *Torquatus*, which he transmitted to his posterity. Some years after, he was appointed dictator. He was the first Roman who ever held this office without having been consul. He was afterwards consul, and held the consulship in the Latin war (B. C. 340). Contrary to his express orders, that no Roman should engage in combat without command, out of the ranks, his son, remembering his father's victory, accepted a challenge to single contest from one of the chiefs of the enemy. He came off victorious, and laid the spoils of the enemy at his father's feet. He turned reluctantly from his son, gave him the crown of victory, and immediately ordered the lictor to execute upon him the punishment of his disobedience. This instance of severity secured to Manlius the most implicit obedience. A few days after, he defeated the enemy. In the battle, his colleague, Decius Mus, devoted his life to his country. The senate voted to him the honour of a triumph. He then retired to private life. *Manliana edicta* became a proverbial expression for commands of severe justice.

MANNA. This substance, which is so frequently employed in the *materia medica*, and which forms a considerable article of commerce, exudes naturally or from incisions made in the trunk and branches of a species of ash (*ornus rotundifolia*). It first appears as a whitish juice, thickens on being exposed to the air, and, when dried, forms a whitish or red-

dish granular substance, which is the manna of commerce. The tree is a native of Italy, and is cultivated extensively in Sicily. June and July are the two months in which the manna is collected. It is detached from the trees with wooden knives, and is afterwards exposed to the sun for drying. A little rain, or even a thick fog, will often occasion the loss of the collections of a whole day. The taste of manna is sweet, and slightly nauseous. It is a mild purgative, and is principally administered to children. The *fraxinus virgata* also yields manna, but it cannot be obtained from any other species of *ornus*.

MANNER, in the fine arts, is used in two different meanings: First, it signifies the habitual style of an artist or a school of artists. (See *Style*.) Secondly, *manner* (also *mannerism*) is used as a term of reproach, and designates those qualities of a work of art which do not proceed naturally from the subject treated, but from the individual character of the artist, or the false taste of an age. Such are the studied yet untrue performances of certain actors, the phraseology or conceptions of certain poets, the colouring or composition of certain painters, &c. The two senses of the word are not to be confounded. A history of mannerism in the fine arts would be both interesting and instructive, a correct view of the aberrations of the human mind in any important particular furnishing a valuable warning for the future.

MANNERT, CONRAD, a distinguished German scholar, was born at Altdorf in 1752. He was first teacher at the St Sebaldus-school in Nuremberg, and, in 1788, at the Ægidian gymnasium there. In 1797, he was made *professor ordinarius* of philosophy at Altdorf; in 1808, of history at Landshut; and, in 1826, of geography and statistics at Munich. His principal works are, *Geographie der Griechen und Römer* (10 vols., Nuremberg, 1788—1825; 2d edit., from vol. i. to vol. iv., 1799—1820); *Compendium der Deutschen Reichs-Geschichte* (ib. 1803; 3d edit., 1819); *Statistik des Deutschen Reichs* (Bamberg, 1806); *Die älteste Geschichte Bojariens und seiner Bewohner* (Nuremberg, 1807); *Kaiser Ludwig II. oder der Baier, eine gekrönte Preisschrift* (Landshut, 1812); *Handbuch der alten Geschichte* (Berlin, 1818); *Die Geschichte Baierns* (2 vols., Leipsic, 1826); *Geschichte der alten Deutschen, besonders der Franken* (1829).

MANNUS; a hero of the ancient German mythology, the son of Thuisikon, revered, like Hercules, after his death. From him comes the German word *Mann*, signifying a male endowed with power and courage.

MANOEL, DON FRANCESCO, the most celebrated lyric poet of modern Portuguese literature, born at Lisbon, 1734, died at Paris, 1819. His talent was first known to foreigners, whom he attended as a *Cicerone*, after the earthquake of Lisbon in 1755. His poems are also popular among his countrymen. That on Virtue has been generally admired. His enemies, jealous of his reputation, endeavoured to render his opinions suspicious, for which they found means in his expressions concerning toleration and monks, and in his translation of the *Tartuffe* of Molière. Cited before the inquisition, he disarmed (July 4, 1778) the agent of the holy office, and fled to Paris, where he ever after continued to reside. He translated Wieland's *Oberon*. His poems, under the title of *Versos de Filinto Elysio*, fill several volumes. His odes and his translation of Lafontaine's Fables are particularly esteemed.

MANŒUVRE, in military art; a movement given to a body of troops, according to the rules of tactics, by which it is intended to gain a decisive advantage over an enemy, or to regain advantages which the

enemy has already won. A *manœuvre* may be executed by large or small masses, according to a preconcerted plan, or upon the sudden impulse of genius seizing upon a favourable moment: in general it may be said, that manœuvres have become more practicable in proportion as armies have grown larger and discipline stricter. In an ancient battle, where the combat was well kindled, the commander, to a great degree, the direction of his troops: in modern battles, he is enabled by manœuvres to exert a more controlling influence, though there are still moments when he is obliged to let the battle go. (See *Battle*.) To execute effective manœuvres, a great heat of battle, requires great coolness and insightfulness in the commander, and thorough trust in the troops. A manœuvre generally is a mark of the excellence of the officers of all degrees.

One of the most important manœuvres is that of outflanking an enemy, in which the general moves back part of his line (*refuses*), whilst the other strives to turn the wing of the enemy, or to meet: with the assistance of a division particularly appointed to get round it, and thus to throw the enemy into confusion. The invention of this manœuvre is ascribed to Epaminondas; he owed to it his victory at Leuctra and Mantinea. Philip, Alexander, Caesar at Pharsalia, Banier at Wittstock, Torstenson at Liskowitz, Frederic the Great at Hohenfriedberg, Leuthen, Napoleon, and other generals, owe their most brilliant successes to this manœuvre. In executing it, the attacking army always moves in an oblique direction, and the attack is sometimes made *en échelon* (q. v.), as at Leuthen. The breaking through the enemy's line (see *Line*)—a chief manœuvre in naval warfare—is, in land-battles, one of the boldest and most dangerous. The retreat *en échelon* (chess-board) is one of the most advantageous, and most fitted to preserve calmness and order among the troops. The change of front during the combat is very dangerous, and rarely succeeds. The main of a battle, where the other circumstances are nearly equal, depends upon the capacity of the troops for manœuvring; hence manœuvring in peace with large bodies is very necessary, in which the chief movements of both parties must be laid down beforehand; but the details ought to be left to the moment, so that the judgment of the officers shall be exercised. In the provinces of Prussia, large bodies of troops are annually assembled for this purpose. In 1823, from September 5 to September 20, 40,000 troops were collected for this object near Berlin. Generals Adolphus and Charles XII. exercised their troops so well that they were allowed to be the best in Europe; but Frederic the Great conceived the whole art of war from a new point of view, and from Potsdam, where he superintended the reviews and manœuvres of his guards, and the garrison of Berlin, it may be said he proceeded the new art of war. There he perfected the movements which were afterwards introduced into the army at large; and generals from all Europe were sent to study his manœuvres. But, as it often happens with the creations of genius, the application of his plans by inferior men was attended with a pedantic minuteness of detail with which the sons of Europe were embarrassed when the war of the French revolution took place. The genius of the French generals now reformed the art of war and manœuvring on a great scale was invented by them. Napoleon developed it still farther, and the rest of Europe learned it from him.

MANOMETER (Gr. *manō*, rare, and *metron*, measure); an instrument to measure or show the alterations in the rarity or density of the air.

MANOR (*manerium*, from *manere*, to remain, because the usual residence of the owner) seems to have

been a piece of territory held by a lord or great personage, who occupied a part of it, as much as was necessary for the use of his own immediate family, and granted or leased the remainder to tenants for stipulated rents or services. This was the origin of *copyhold* estates, viz. those held by copy of the roll of the court of the manor. No manors, with all their incidents and franchises, have been granted in England since the reign of Edward III. One of the most important incidents to these ancient manors, was the right to hold a court, called a *court-baron*, which was held within the manor, and had jurisdiction of misdemeanours and nuisances within the manor, and disputes about property between the tenants. (See *Courts*.) Another branch of the jurisdiction, and entirely distinct from the preceding, was, the receiving of the surrender of the estate of any tenant, and admitting his grantee or successor in his place, and transacting other matters relating to the *tenure* or *tenancies*, for which purposes the court was held by the steward of the manor. The steward was also the registrar or clerk, in the other branch of the jurisdiction, for the prosecution of suits; but the freeholders of the manor were in effect the judges in these.

MANSFELD; one of the most ancient families of German counts, taking their name from the castle of Mansfeld in the former circle of Upper Saxony.—*Peter Ernst von Mansfeld* was the natural son of Peter Ernst, count of Mansfeld, governor of Luxembourg and Brussels. The archduke Ernst of Austria, godfather to the young Peter, educated him in the Catholic religion. He was of service to the king of Spain in the Netherlands, and to the emperor in Hungary, in consequence of which the emperor Rodolphus II. legitimated him. But when he was denied the dignity and estates which his father had possessed in the Netherlands, and which had been promised to him, he, in 1610, embraced the Calvinistic doctrines, and, joining the Protestant princes, became one of the most formidable enemies of the house of Austria. In 1618, he led troops to the assistance of the revolted Bohemians, fought a long time for the elector Frederic of the Palatinate, devastated the territories of the spiritual princes, was several times beaten, but always contrived to make head anew. In 1625, he collected an army by the aid of English and French money, and intended to penetrate into the Austrian hereditary states. April 25, 1626, he was beaten by Wallenstein near Dessau, yet continued his march to Hungary, to join Bethlem Gabor, prince of Siebenbürgen (Transylvania); but, the latter having changed his views, Mansfeld disbanded his troops, intending to go to Britain by way of Venice. But not far from Zara he fell sick, and died in 1626, in his fortieth year. He was buried at Spalatro. At the approach of death, he ordered his armour to be put on, and stood up, leaning on two of his aids, to await the last enemy. Mansfeld was one of the greatest generals of his time. He rose more formidable from every defeat. With great understanding, which he showed in his diplomatic transactions, he united overpowering eloquence and inexhaustible cunning. He maintained his troops by plunder, and was compared to Attila. The Lutheran line of the house of Mansfeld became extinct in 1710; in 1780, the last male of the Catholic line died. His only daughter brought all the allodial estates of the family, by marriage, to the rich Bohemian house of Colloredo, which has ever since borne the name of *Colloredo-Mansfeld*. The former county of Mansfeld was, in 1814, added to the Prussian government of Merseburg. This county is interesting to Germans, as Eisleben and Mansfeld are situated in it. In the former Luther was born, in the latter he went to school.

MANSFIELD MOUNTAIN is the highest sum-

mit of the Green mountains, and the most elevated mountain in Vermont. The elevation of the north peak, called the *Chin*, above the state-house at Montpelier, is 4051 feet; above the ocean, 4279; elevation of the south peak, called the *Nose*, above the state-house, 3755; above the ocean, 3983. The mountain is situated in Mansfield and Sterling, about twenty-five miles from Burlington.

MANSFIELD, WILLIAM MURRAY, earl of, the fourth son of David, lord Stormont, was born at Perth, in Scotland, March 2, 1705. He received his education at Westminster school, and Christchurch, Oxford. He then made the grand tour, and, on his return, became a student at Lincoln's Inn, and, after the usual term of probation, was called to the bar. He gradually made his way to eminence in his profession, and, in 1742, was appointed solicitor-general, about which time he also obtained a seat in parliament. After distinguishing himself as an advocate at Edinburgh, in 1743, and as one of the managers of the impeachment of lord Lovat, in 1747, he succeeded Sir Dudley Ryder as attorney-general in 1754, and as chief-justice of the king's bench in 1756; soon after which he was created baron Murray, of Mansfield. For a few months, in 1757, he held the office of chancellor of the exchequer. During that interval, he effected a coalition of parties, which led to the administration of Pitt, afterwards lord Chatham. The same year, he declined the offer of the great seal, as he did twice afterwards. A change of parties in the cabinet, in 1765, which introduced into office the marquis of Rockingham and his friends, for a while threw lord Mansfield into the ranks of the opposition. The year 1770 was memorable for attacks on his character in a judicial capacity, in both houses of parliament, which, however, led to no serious result. On the trial of Woodfall, for publishing Junius's Letters, and on some other occasions, he showed himself the zealous supporter of government. In October, 1776, he was advanced to the dignity of an earl of Great Britain. During the riots in London, June, 1780, his house was attacked by the Anti-Catholic mob, and his valuable collection of books and manuscripts fell a sacrifice to the fury of the multitude, by whom the mansion was burned to the ground. He continued for some years longer to exercise his judicial functions. In 1788, he resigned his office of chief-justice; and the remainder of his life was spent in retirement, principally at his seat at Caen-wood, near Hampstead. He died March 20, 1793. As a politician, lord Mansfield was a favourer of high maxims of government in general; and in the law of libel, he supported the opinion, that the jury is the judge of the fact only, and not of the law. He was, however, an enemy to violent exertion of power, as well as a friend to religious toleration. On various occasions, he opposed vexatious prosecutions, under intolerant laws, and voted in favour of the bill for the relief of the Roman Catholics. His ideas of legislation were, on many points, liberal. As an orator, he displayed more of persuasive elegance than of boldness and force; but he might fairly have contested the palm of eloquence with any of his contemporaries, except lord Chatham. In argument he was acute. Lord Ashburton used to say, that when he was wrong, the faults of his reasoning were not easily detected; and when he was right, he was irresistible. His fame rests chiefly on his conduct as a judge. He would not accept of the legal compensation to which he was entitled for the destruction of his property in 1780. There is a life of him by Holliday (4to, 1797), and by Th. Roscoe, in Lardner's Cabinet Cyclopædia.

MANSLAUGHTER. See *Homicide*.

MANSO, JOHN CASPAR FREDERIC, born in the

duchy of Gotha, May 26, 1759, and died June 6, 1826, in Breslau, where he had been, since 1790, pro-rector, and since 1793, rector of the Mary Magdalen gymnasium. He wrote a good deal in prose and poetry, but his most important works are, History of the Prussian State since the Peace of Hubersburg (Frankfort on the Maine, 1819 et seq., 3 vols.), and a History of the Ostrogothic Empire in Italy (Breslau, 1824), both in German.

**MANTCHOOS, or MANTCHEWS.** See *Mandchures*.

**MANTEGNA, ANDREW**, one of the most celebrated of the early painters, was born at Padua, in 1431. His master, Squarcione, was induced by the talents which he displayed to adopt him as a son. The youth employed himself principally in drawing from antiques, and, at the age of sixteen, painted a picture for the grand altar in the church of St Sophia, at Padua. Mantegna soon after entered the service of Lodovico Gonzaga, at Mantua, where he opened a school. Here he painted his great picture, the Triumph of Julius Cæsar, for the exhibition of which a palace was erected in Mantua. It consists of several pictures, which have since been transferred to Hampton court. Gonzaga conferred on him the honour of knighthood in reward for his merit. Innocent VIII. invited the artist to Rome, to paint in the Belvedere, and he afterwards executed a number of capital works. One of the latest and best was the *Madonna della Vittoria*, now in the Louvre at Paris, in which Giovanni Francesco Gonzaga is seen returning thanks for the victory gained by him over the forces of Charles VIII. (1496). There are several other of his works in the Louvre, and an Annunciation in the Dresden gallery. He died at Mantua in 1506. Mantegna excelled in perspective, which was then a rare merit. His manner was stiff and dry, and his imitation of the ancient is everywhere manifest. His son, Francesco, was also a painter.

**MANTELETS**, in the art of war; a kind of movable parapets, made of planks about three inches thick, nailed one over another, to the height of almost six feet, generally cased with tin, and set upon little wheels, so that in a siege they may be driven before the pioneers, and serve as blinds to shelter them from the enemy's small shot.

**MANTINEA**; one of the most ancient, and, with Tegea, most important cities of Arcadia, on the frontier of Argolis, on the little river Ophis. The modern Tripolizza (q. v.) is built on the ruins of the ancient cities of Megalopolis, Tegea, Mantinea, and Pallantium. Mantinea was known for its wealth, and famous for the battles fought near it, one B.C. 418, in the fourteenth year of the Peloponnesian war, the result of which battle was, that Argos seceded from Athens, and joined Sparta; the other, fought B.C. 363, by Epaminondas, against the Peloponnesians. Epaminondas (q. v.) was victorious, but fell. A third battle was fought near Mantinea, B.C. 206, between Machanides, tyrant of Lacedæmon and Philipomen, general of the Achæan league. The latter was victorious, and slew the tyrant with his own hand.

**MANTIS.** Few of the insect tribe have attracted more attention than these curious productions of nature, from their singular forms, and still more singular habits. From the manner in which they stretch out their fore legs, they have acquired the reputation of diviners, and because they often rest on their hind legs, folding the anterior pair over their breast, the superstitious have supposed them in the act of prayer; hence they are called, in Languedoc, where they are common, by the name of *prie-dieu*. The genus *mantis* has been separated, by

modern entomologists, into several distinct genera, viz. *mantis*, *spectrum*, *phasma*, and *phyllo*. The first of these contains the celebrated *mantis* (*M. religiosa*), which, as has been said, is highly considered as possessing miraculous power. The superstition appears to extend to almost every part of the world in which these insects are found. The Arabs regard them as under the especial patronage of Allah, and the Hottentots pay divine honours to them. The dry leaf mantis (*phyllo*) resembles in its shape and colour, is remarkable, even in its manner of resting, for its extreme dryness, suggesting the idea of a dry and withered leaf. The manners, also, in addition to their structure, are the delusion. They often remain on trees, without motion; then, suddenly springing into the air, appear to be blown about like dry leaves. The Indians of South America, where these insects are very common, believe that they really are attached to the tree at first, and that when they have arrived at maturity, they loosen themselves, and carry away. In some parts of the East Indies, a species of mantis is kept, like game cocks, for the purpose of fighting, which they do with great ferocity.

**MANTISSA.** See *Logarithms*.

**MANTUA**; a delegation of Austrian Italy, in the government of Milan, lying on the north of the duchies of Modena and Parma; population, 220,000 square miles, 8° 8'. The Po passes through it, and it is also watered by the Oglio, Mincio, Secchia, &c. The surface is very level; the soil of great fertility; the principal product grain; others rice, hemp, flax, fruit, and vines. The late duchy of Mantua, or the Mantuan, was of larger extent than the present province. It was annexed to the Cisalpine republic (q. v.) in 1797, and formed a department of the kingdom of Italy until 1814, when it was ceded to Austria, as a part of the Lombardo-Venetian kingdom. See *Lombardy*.

**MANTUA** (Italian, *Manfua*); a city of Austria, Italy, an episcopal see, and capital of a department, formerly a duchy of the same name; seventy miles S.W. of Venice, seventy S.E. of Milan, on 10° 46' E; lat. 45° 9' N.; population, 25,000, many of which are about 2000 Jews. It is situated on two islands formed by the expansion of the waters of the Mincio, one about a mile square, the other a little more than half that size: on this is the most recently built part of the city. The extensive suburb of Ceresè is on the mainland. Mantua is well fortified, and is, by nature and art, one of the strongest places in Europe. Most of the streets are broad, regular, and well paved; the houses of stone, and generally well built; and the public squares spacious and elegant. It contains a magnificent cathedral, numerous churches, convents, and hospitals, a public library, an academy of arts and sciences, a gallery of antiquities, and several valuable collections of paintings. Other public objects of interest are the palace of justice, of Gonzaga, and of T., so called from its form; the church of St Andrew; the Ceresè, with its halls; the famous bust of Virgil; and the buildings of the university, which was founded here in 1482. The silk manufactures were formerly flourishing, and are still considerable; those of leather and woollen are also important. In the summer and autumn, the city is unhealthy, on account of its marshes in its neighbourhood. (See *Italy*.) It is a place of great antiquity, said to be older than Rome, and, a century ago, contained about 30,000 inhabitants. Virgil was born at Andes (now Mantua) in the vicinity.

**MANUEL, JACQUES ANTOINE**, one of the most eloquent and intrepid defenders of French liberty, was born in 1775, at Barcelonnette, in the department of the Lower Alps, and was educated at the

colleage of Nîmes. He entered as a volunteer in one of the battalions of the requisition in 1793, and rose to the rank of captain. After the peace of Campo Formio, he quitted the army, studied law, was admitted to the bar at Aix, and soon acquired a high reputation for talent. In 1815, he was elected to be chamber of deputies which was convoked by Napoleon, and after the abdication of that monarch, Manuel strenuously contended for the rights of the young Napoleon. He also moved a spirited motion against the force which was used by the allies to bring about the restoration of the Bourbons. This was, of course, an unpardonable crime, and an opportunity was found to display, at least, the disposition for punishing him. In 1815, he settled at Paris, and, in the following year, applied for admission to the Paris bar, that he might be entitled to lead in the courts. The council of discipline, as it is called, consulted the members of the bar at Aix as to their opinion of his character, in the hope of finding something against him; but, though their answer was favourable, the council refused to comply with his request. This refusal was repeated in 1816. In 1818, he was elected a member of the chamber of deputies by three departments, and became one of the most formidable opponents of the ministers, speaking extemporaneously with great facility—talent possessed by few of the French deputies. On the opening of the budget in 1819, he delivered a speech which produced a very lively sensation, and was printed by order of the chamber. "Our political organization," said he, "is at once deficient in its municipal system, which is its natural basis; in the national guard, which must be our protection in peace, our defence in war; in the jury, without which the liberty of the press is an empty shadow; and in the responsibility of officers, which is the safeguard of all rights." In the ensuing sessions, he continued, in a series of bold and eloquent speeches, to oppose the arbitrary measures which then characterized the policy of the French government. On the exclusion of Grégoire (q. v.), on the bills for suspending the liberty of person and of the press, on the laws of election, on the reform of the jury, the organization of the council of state, colonial legislation, public instruction, &c., he maintained the rights of the nation, and defended the charter in spite of the menaces, murmurs, interruptions, and calumnies of the royalist faction. Calm and immovable, yet fervid and ardent, his courage and eloquence were always victorious over the violence of his enemies. During the new elections, in 1823, the greatest efforts were made to prevent his being chosen, and after the election a plan was formed for excluding him, as unworthy of a seat. This being found impracticable, his enemies determined to effect his expulsion, and a pretext was found in his first speech of the session, on the question of the Spanish war. In the outset he was called to order; the president pronounced him in order; he was again interrupted by loud cries; he was accused of defending regicide; his expulsion was demanded; he was prevented from explaining or proceeding, and the president, unable to restore order, was obliged to adjourn the chamber. The next day, Labourdonnaye moved his expulsion; Manuel defended himself, in an eloquent speech, from the charge brought against him. The motion was sustained and referred to March 3; on that day, Manuel protested against the power of the chamber to expel a representative of the nation, but his expulsion was voted by a majority. On the next day, he again took his seat, and, being required by the president to withdraw, replied that he should yield only to force. The session was then suspended for an hour, the members of the left side remaining in their seats.

In this interval the *Huissier* (sergeant at arms) read to him an order of the president requiring him to leave the hall; but his reply was as before, "I shall yield only to force." The *huissier* called in a detachment of the national guard, which refused to act; and a body of the *gendarmes* was introduced. On being directed by the commanding officer to retire, he refused, and the order was issued to the *gendarmes* to arrest him. As they approached, he rose and expressed himself ready to follow them, the members present accompanying him. Manuel was again chosen to the chamber in 1824. He died in 1827, and was buried in the *Père Lachaise*, some obstacles which were interposed to the solemnisation of his obsequies being surmounted by the firmness and prudence of his friends.

MANUMISSION, among the Romans; the solemn ceremony by which a slave was emancipated. (See *Freedman*.) Constantine the Great, after his conversion, transferred to the Christian church all such solemn ceremonies of the heathen. Thus he allowed the Christian masters to emancipate their slaves before the altar on festival days, and especially at Easter, by placing the deed of emancipation on the head of the freedman in the presence of the congregation.

MANURES; vegetable, animal, and mineral matters, introduced into the soil, to accelerate vegetation and increase the production of crops. If the soil to be improved be too stiff, from excess of clay, it will require sand; if too loose, from excess of sand, it will be benefited by clay; but, when sand is mixed with argillaceous soil, the latter must be broken and pulverized, which may be effected by exposing it to the frost, and afterwards drying it. *Marl* is a natural compound earth, used with great success in the melioration of soils. It consists of a mixture of clay and lime, sometimes containing a little silica and bitumen. Those varieties of it which contain more clay than lime, are advantageous for a dry, sandy soil; while calcareous marl, or that in which the lime predominates, is suited to an argillaceous soil. The great advantage of marl is, that it dilates, cracks, and is reduced to powder, by exposure to moisture and air. Marl in masses would be totally useless on the ground; yet it is necessary to begin by laying it on the ground in heaps; for the more it is heaped, the more it dilates, splits, and crumbles to dust; in which state it is fit to spread upon the ground. Marl is sometimes formed into a compost with common manure, before it is laid on the soil; in this state, however, it should be applied sparingly at a time, and renewed frequently. It operates by subdividing the soil, and hastening decomposition; its calcareous particles disorganizing all animal or vegetable bodies, by resolving them into their simple elements, in which state they combine with oxygen, and facilitating this union. The best time for marling is the autumn. *Quick-lime*, and especially that derived from fossil, or living shells, is another excellent means of amending soils. It is particularly adapted to cold, marshy soils, abounding in organic matters, as it assists powerfully in the conversion of animal and vegetable substances into nourishment for plants. *Ashes* are very beneficial to the soil, by attracting moisture from the atmosphere, in consequence of the alkali they contain, and thus accelerating vegetation. *Gypsum* is, however, the most universal mineral manure; but chemists are not agreed as to the manner in which it acts on vegetation. It is strewed, in the state of fine powder, over crops, when the leaves are in full vigour towards the latter end of April, or the beginning of May.

*Common manure* consists of the remains of organized bodies, of every description, whether animal or vegetable, in a state of decomposition (i. e. resolving

itself into those primitive elements which can re-enter into the vegetable system). The principal result of this decomposition is carbonic acid, which, becoming dissolved in water, finds its entrance into the plant by the pores in the fibres of the roots, and, being everywhere distributed through the vegetable tissue, deposits its carbon for the growth of the plant, while its oxygen escapes into the atmosphere, through the pores of the leaves. Manure which has not completely undergone the process of fermentation, so that the straw is not yet wholly decomposed, is best adapted to strong, compact soils; the tubular remnants of straw answer the purpose of so many little props to support the earth, and afford a passage for the air, thus rendering the soil lighter; besides, the completion of the fermentation taking place after the manure is buried in the soil, has the advantage of raising the temperature. Those bodies which are subject to the most rapid decomposition, are most employed for manure. Of this description are animal manures in general, which require no chemical preparation to fit them for the soil. The great object of the farmer is to blend them with the earthy constituents, in a proper state of division, and to prevent their too rapid fermentation. In maritime districts, *fish*, when sufficiently abundant, are sometimes used to manure the land. They afford a powerful manure, and cannot be ploughed in too fresh, though the quantity should be limited. Mr Young records an experiment, in which herrings, spread over a field, and ploughed in for wheat, produced so rank a crop, that it was entirely laid before harvest. During the putrefaction of *urine*, the greatest part of the soluble animal matter that it contains is destroyed; it should, consequently, be used as fresh as possible; but if not mixed with solid matter, it should be diluted with water, as, when pure, it contains too large a quantity of animal matter to form a proper fluid nourishment for absorption by the roots of plants. Amongst excrementitious solid substances, one of the most powerful is the *dung of birds* that feed on animal food, particularly the dung of sea-birds. The *guano*, which is used to a great extent in South America, and which is the manure that fertilises the sterile plains of Peru, is a production of this kind. It contains a fourth part of its weight of uric acid, partly saturated with ammonia, and partly with potash; some phosphoric acid, combined with the bases, and likewise with lime; small quantities of sulphate and muriate of potash; a little fatty matter; and some quartzose sand. *Night-soil*, it is well known, is a very powerful manure, and very liable to decompose. Its disagreeable smell may be destroyed by mixing with quick-lime, after which, if exposed to the atmosphere in thin layers, in fine weather, it speedily dries, is easily pulverized, and, in this state, may be used in the same manner as rape-cake, and delivered into the furrow with the seed. The Chinese, who have more practical knowledge of the use and application of manure than any other people existing, mix their night-soil with one third of its weight of a fat marl, make it into cakes, and dry it by exposure to the sun. In this state it is free from any disagreeable smell, and forms a common article of commerce of the empire. After night-soil, *pigeon's dung* comes next in order as to fertilizing power. If the pure *dung of cattle* is to be used as manure, like the other species of dung which have been mentioned, there seems no reason why it should be made to ferment, except in the soil; or if suffered to ferment, it should be only in a very slight degree. A slight, incipient fermentation is, undoubtedly, of use in the dunghills; for, by means of it, a disposition is brought on, in the woody fibre, to decay and dissolve, when it is carried to the land, or ploughed into the soil; and

woody fibre is always in great excess in the refuse of the farm. Too great a degree of fermentation is, however, very prejudicial; and it is better that there should be no fermentation at all before the manure is used, than that it should be carried on far. In cases where farm-yard dung cannot be immediately applied to crops, the destructive fermentation of it should be prevented, very carefully, by defending it against the action of it, as much as possible, from the rays of the atmosphere; a compact marl, or a tannin cap, offers the best protection against the air. As when the dung is covered over, or, as it were, even up, it should be dried as much as possible. If it is found to heat at any time, it should be turned over and cooled by exposure to air. When a thermometer plunged into it, does not rise above 100° Fahrenheit is little danger of much aeriform matter being formed if the temperature is above that point, the dung requires to be immediately spread open. A thin piece of paper, moistened in marine acid, and laid over the steams arising from a dunghill, gives off white fumes, it is a certain test that the decomposition is going too far; for this indicates that the alkali is disengaged. The situation in which the dung is kept by farmers is often very injudicious. It is frequently being exposed to the direct influence of the sun; whereas it should always be kept under sheds, or, at least, on the north side of a wall. In perishable substances, of animal origin, are sometimes used as manure, such as *horns, hair, hoofs, and bones*; but, owing to their dry nature, they require a longer period for their decomposition. They are not calculated for annual harvest, but to fructify the soil for a produce of much longer duration, such as that of olive trees and of *carrots*. Vegetable manure does not undergo fermentation previous to being buried in the soil. Of this kind are *manure, green crops*, such as clover, lupines, and buckwheat, which are ploughed into the soil, as is best, since they contain a considerable quantity of water, and, when buried, serve to lighten the soil previous to decomposition. It is especially adapted to hot climates. *Rape-cake*, which is used with great success as a manure, contains a large quantity of mucilage, some albuminous matter, and a small quantity of oil. It should be used recent, and as dry as possible, before it is applied. It forms an excellent dressing for turnip crops, and is most economically applied by being thrown into the soil at the same time with the seed. *Sea-weeds*, consisting of different species of *fuci, algae*, and *confervae*, are much used as a manure, on the sea coast. The manure is more transient in its effects, and does not last for more than a single crop, which is easily accounted for, from the large quantity of water of the elements of water, which it contains. It does not without producing heat, when exposed to the atmosphere, and seems, as it were, to melt down, and dissolve away. It should be used as fresh as it can be procured, and not suffered to lie in heaps, exposed to the air, for six months or a whole year, as it is often allowed to do. *Soot*, which is principally formed from the combustion of wood and peat, contains, likewise, substances derived from animal matters, and is a very powerful manure. It requires no preparation, but is thrown into the ground with the seed.

The foregoing species of manure have, for the sake of convenience, been described separately, though they are very rarely employed separately by the farmer; on the contrary, the most common manure consists of a mixture of animal, vegetable, and mineral substances, such as farm-yard litter, night-soil, mud from the streets, dung from the roads, or earth from the bottom of ponds

and rivers, abounding with organic remains of fish, shells, and rotten plants. Before being laid upon land, it usually requires being well turned up and exposed to the air for some time; but as soon as it is spread, it should be ploughed in, to prevent loss by evaporation. As to the depth below the surface of the ground, to which it should be deposited, it may be remarked, that this should never be below the reach of the roots of the plants it is intended to nourish; for, in proportion as it is dissolved and liquefied, it will naturally descend. And it is better to manure lands in the spring than in autumn, lest the winter rains should dissolve it too much, and endanger its sinking below the roots of the crop. With regard to the quantity of manure, it is a commodity so scarce, that it is not likely to be employed in excess. This occurs, however, sometimes in garden culture, and it produces a strong and disagreeable flavour in the vegetables. But the stock of manure is generally so limited, that it has been the study of agriculturists to discover some means of compensation for a deficiency, rather than to apprehend danger from excess. This compensation has been found in a judicious system of crops. See *Rotation of Crops*.

MANUSCRIPTS are a principal subject of diplomatics. All the existing ancient manuscripts are written on parchment or on paper. The paper is sometimes Egyptian (prepared from the real papyrus shrub), sometimes cotton or silk paper (*charta bombycina*), which was invented in the East, about the year 706, and used till the introduction of linen paper, and in common with this till the middle of the fourteenth century; sometimes linen paper, the late of the invention of which, though ascribed to the first half of the thirteenth century, on the authority of a document of the year 1243, written on such paper, is, nevertheless, exceedingly doubtful. The earliest mention of pens is found in the seventh century. The most common ink is the black, which is very old: the oldest, however, was not mixed with vitriol, like ours, but generally consisted of soot, lamp-black, burnt ivory, pulverized charcoal, &c. Red ink is also found, in ancient times, in manuscripts, of a dazzling beauty. With it were written the initial letters, the first lines, and the titles, which were thence called *rubrics*, and the writer *rubricator*. More rarely, but still quite frequently, blue ink is found in ancient manuscripts; yet more rarely green and yellow. Gold and silver were also used for writing either whole manuscripts (which, from their costliness, are great rarities), or for adorning the initial letters of books. With respect to external form, manuscripts are divided into rolls (*volumina*, the most ancient way, in which the Troubadours in France wrote their poems at a much later period), and into stitched books, or volumes (properly *codices*). Among the ancients, the writers of manuscripts were mainly freedmen or slaves (*scribæ librarii*). Subsequently, the monks, among whom the Benedictines, in particular, were bound to this employment, by the rules of their order. Manuscripts were afterwards approved and embellished by correctors and rubricators. But of much greater importance, for estimating the age, value, &c., of a manuscript, than these external circumstances and marks, are the internal, particularly the character of the writing and of the letters. It is more difficult to form a correct judgment respecting the age of Greek manuscripts from the character of the writing than it is respecting that of Latin manuscripts. In general, it is to be remarked, that, in a Greek manuscript, the strokes are lighter, easier, and more flowing, the older it is; and that they become stiffer in the progress of time. The absence or presence of the Greek accents is in

no respect decisive. Moreover, few Greek manuscripts are found of an earlier date than the seventh, or, at most, the sixth century. The characters in Latin manuscripts have been classified partly according to their size (*majuscula*, *minuscula*), partly according to the various shapes and characters which they assumed among different nations, or in various periods (*scriptura Romana antiqua*, *Merovingica*, *Longobardica*, *Carolingica*, &c.; to which has been added, since the twelfth century, the *Gothic*, so called, which is an artificially pointed and angular character); and for all of those species of writing, particular rules have been established, affording the means of estimating the age of a manuscript. Before the eighth century, interpunctuations rarely occur: even after the introduction of punctuation, manuscripts may be met with destitute of interpunctuations, but with the words separate. Manuscripts which have no capital or other divisions, are always old. The *catch-word*, as it is termed, or the repetition of the first word of the following page at the end of the preceding, belongs to the twelfth or subsequent centuries. The fewer and easier the abbreviations of a manuscript are, the older it is. Finally, in the oldest manuscripts, the words commonly join each other without break or separation. The division of words first became general in the ninth century. The form of the Arabic ciphers, which are seldom found in manuscripts earlier than the first half of the thirteenth century, also assists in deciding the age of a manuscript. Some manuscripts have at the end a statement when, and, commonly, also, by whom, they were written (*dated codices*). But this signature often denotes merely the time when the book was composed, or refers merely to a part of the manuscript, or is entirely spurious. Since we have had the evidence of the Herculanean manuscripts, we can determine with certainty that none of our manuscripts are older than the Christian era. In 1825, a fragment of the Iliad, written on papyrus, was discovered on the Island of Elephantina, in Upper Egypt, by a French gentleman, travelling in the employment of Mr Banks. It contains from 800 to 900 verses, beginning at the 160th, and is handsomely written in capital letters, and is in a good state of preservation, unquestionably the oldest of all classical manuscripts, and probably of the times of the Ptolemies.—It was the custom, in the middle ages, wholly to obliterate and erase writings on parchment, for the purpose of writing on the materials anew. These *codices rescripti*, *rasi*, are thought great curiosities. This custom ceased in the fourteenth century, probably because paper came then more into use. See *Codex*.

MANUSCRIPTS, ILLUMINATED; those manuscripts which are adorned with paintings illustrating the text, or in which the initial letters were decorated with flourishes or gilding. This kind of bibliographical luxury was not unknown to the ancients, and the art of illumination was much practised by the monks. Their vignettes are, in some instances, of considerable historical importance. The specimens from the period between the fifth and tenth centuries are superior to those produced during the succeeding centuries. The term *illuminated* is derived from the use of *minium*, for a red colour, by the artists; hence called *miniatores*, or *illuminatores*. An example of Anglo-Saxon illumination of the eighth century is preserved in the British museum (Cottonian MSS.), which employed the skill of four distinguished theologians of the day. Eadfrid, bishop of Durham, wrote the text (the four Gospels); Ethelwold, his successor, illuminated the volume; Bilfrid, the anachoret, covered it richly with gold and silver plates, and precious stones; and Aldred added

glosses. Many MSS. are found with the initial letters omitted, the writer or copyist and illuminator being distinct persons. We still see traces of this practice in the ornamenting of initial letters in some printed books. See Mabillon, *De Re diplomatica*.

MANUTIUS, ALDUS, or ALDO MANUZIO; an Italian printer of the fifteenth and sixteenth centuries, celebrated as an artist and a man of letters. He was born at Bassano, in the Roman territory, about 1447, and was educated at Rome and at Ferrara, where he learned Greek under Baptista Guarino. He became tutor to Alberto Pio, prince of Carpi; and, in 1482, quitted Ferrara, to reside with John Pico, prince of Mirandola. In 1488, he established himself as a printer at Venice, but the first work which he finished was not published till 1494. In the course of the ensuing twenty years, he printed the works of the most ancient Latin and Greek authors extant, as well as many productions of his contemporaries, and some treatises of his own composition. Among the latter are a Latin Grammar; a Greek Grammar; a tract on the Metres of Horace, and a Greek Dictionary. He was the inventor of the italic, or cursive character, hence called *Aldine*, for the exclusive use of which, for a term of years, he obtained a patent from the pope and the senate of Venice. He established a kind of academy at his own house, and delivered lectures on classical literature, to the general study and improvement of which he greatly contributed. He died in April, 1515, leaving four children by his wife, who was the daughter of Andrea d'Asola, a Venetian, in partnership with whom he carried on his business.

*Manuzio, Paolo*, son of the foregoing, was distinguished as a classic scholar, no less than as a printer. He was born at Venice, in 1512, and was brought up under the care of his maternal grandfather. He received a learned education, and, in 1533, re-opened the printing-office, which had for some time been closed, but did not carry on the establishment entirely on his own account, till 1540. He opened an academy for the instruction of young persons in polite literature; and afterwards made a tour through the cities of Italy, for the purpose of examining the various libraries. After refusing several offers of professorships at Bologna and elsewhere, he was appointed to superintend the printing-office attached to a newly-founded academy at Venice, where he continued till 1561, when he settled at Rome, on the invitation of pope Pius IV. He was employed to conduct a press for printing the works of the fathers, and other ecclesiastical authors; and at the same time, kept up his establishment at Venice, whither he returned in 1570. Pope Gregory XIII. induced him, by means of a pension, to take up his abode again at Rome, where he died, in April, 1574. He was the author of Commentaries on the Writings of Cicero; a treatise *De Curia Romana*; Proverbs; Letters, &c.

*Manuzio, Aldo*, the younger, the son of the preceding, was also a printer. He was born in 1547, and was educated by his father, under whom he made an extraordinary progress in literature. In his eleventh year, he produced a Collection of elegant Phrases in the Tuscan and Latin Languages; and other juvenile publications attest his classical acquirements. On his father's removal to Rome, he carried on the printing establishment at Venice, where, in 1577, he was appointed professor of belles-lettres at the school of the Venetian chancery. In 1585, he succeeded Sigonius in the chair of rhetoric at Bologna; whence he removed to Pisa, to become professor of polite literature, in 1597; and, during his stay there, he received the diploma of doctor of laws,

and was admitted a member of the Florentine academy. In 1588, he went to Rome, and accepted a professorship, which had been held by Manuzio. He was much favoured by pope Sixtus V., and Clement VIII. bestowed on him the office of secretary of the Vatican press. He died in October, 1607, and with him expired the glory of the Aldine press; the valuable library, collected by him and his predecessors, was sold to liquidate his estate; he was the author of many works, including commentaries on Cicero, and Familiar Letters. See *Aldi Editions*.

MANZONI, ALESSANDRO, an Italian name of lyric poet, of noble birth and elevated genius, was born in Milan, and distinguished, even early, by his *scavi sociali* on the death of Immanuel, and a later period, created a new kind of prose called *Novi*. As a tragic writer, he surpassed all other Italian poets. His tragedies are *Il Conte Cenci* (Milan, 1820), and *Adelchi* (1822). In both of them, he introduces the chorus. The subject of the first is from Italian wars of the fifteenth century; it has received great applause in Germany, France, and England, as well as in his own country. His work is his *Betrothed—I Promessi Sposi*. Since the historical romance into Italy. His other comprising his poems, tragedies, commentaries, and miscellaneous prose writings, have been printed (in 6 vols., 1839).

MAP; a projection, on a plane surface, of the whole or a part of the spherical surface of the earth. The earth being a spheroid, its surface cannot be made to coincide rigorously with a plane; and therefore becomes necessary to have recourse to a projection, that is, a plan on a plane surface, and indicates the relative positions, dimensions, &c. of the different parts of a spherical surface. (See *Projection*.) The three principal modes of projection are the orthographic, the stereographic, and the conic, distinguished by the different points of view at which the observer is supposed to be placed. In the orthographic projection, the surface of the globe is represented by a plane, which cuts it through the middle, the eye being placed vertically at an infinite distance from the two hemispheres. In the stereographic projection, the spherical surface is represented on the plane of one of its great circles, the eye being supposed at the pole of that circle. The conic projection supposes the point of view at the circumference of the sphere, and the surface is then projected on a cone tangent to it. Each of these kinds of projection is susceptible of different modifications. None of the planispheres traced by the three modes exactly indicated gives a perfect representation of the globe; they alter the figures of countries, either in the centre or on the borders; they present equal spaces with unequal dimensions, &c. To obviate these difficulties, the conic and cylindrical projections are commonly used; the cone and cylinder being curved surfaces which are capable of being perfectly developed on a plane, and, at the same time, approximating to the nature of a spherical surface. These projections have also been subjected to a great variety of modifications which we cannot here explain. Other forms of being maps, which have not the development of a sphere for their basis, have been recommended; such as the proportional projection, in which the principal modification is to represent, by equal spaces, regions of equal extent. (See *Mayer's Introduction to the Art of tracing Maps*, in German; *Poisson's Traité de Topographie*.) In the choice of details to be inserted into a map, the author must be guided by the purpose of his delineations, and needs to be directed by experience, learning, and judgment. One map is designed

to show the limits of states, the positions of towns and cities, the subdivisions of the country into provinces, departments, counties, &c.; another may be devoted more particularly to delineating the natural features of the region, its mountains, rivers, &c.; and details are selected accordingly. A military map should indicate every pass, ford, obstruction, &c., which may affect a march, facilitate or obstruct a manoeuvre. A nautical map, or chart, should indicate every reef, sand-bank, or rock, delineating, as far as possible, not only the irregularities of the bottom, but the direction, &c., of the shores. To the seamen, the nature of the bottom of the sea is interesting only within soundings; but to the physical geographer, it is also important, as illustrative of the whole system of mountain and geological formations on the globe. There are also historical, botanical, mineralogical, &c., maps, designed to illustrate some particular point. Elementary maps for instruction are not intended to advance the science by the publication of new details, but should be adapted to convey the current truths of the science in a simple form; and, for this purpose, a numerous series of small maps is better than a few, constructed on a large scale, with minute exactness. In collecting and combining details, astronomical observations and geodesical measurements must be employed, when possible, at least at the prominent points, and, where the author is assisted by these, the accounts of intelligent travellers, of former geographers, &c., must supply the deficiencies.—Maps are engraved on tin, copper, and other metals; also, sometimes, in wood, and, of late, are been lithographed with much success for certain purposes. Soon after the invention of the art of printing, an attempt was made to print maps like usual matter, by Sweynheum; later by Buechink, in 1518; in 1777, by Breitkopf, in Leipzig. Hans, at last, produced pretty good specimens (see his *Carte de Portugal de Pologne* in 1778, 1793, et 1795); and, quite recently, the same has been attempted in colour; but the main object of cheap maps thus made, chiefly for children,—an impressive and clear view,—seems not entirely attained. If we consider a drawing of the country ordered by Joshua (*Josh. xiv. 9*) as a map, then the origin of geographical projection is very old. We find traces of maps with the Egyptians, in the times of Senosiris (q. v.), who used his hereditary dominions and his conquests to be represented on tablets for his people. Scylax, anathemones (370 B. C.) and Hipparchus (130 B. C.) copied him. Certain traces of maps are found in the times of Aristagoras of Miletus, and Socrates, too, by way of a reproach to the pride of Alcibiades, used him to search for his own estates on a map. The Romans, at their triumphs, had pictures of the conquered countries carried before them, and had a knowledge of their territories in their archives, as *tabulae*. Caesar himself took part in the surveying of different countries. There is a map extant, of the times of the Macedonians, certainly not later than Theodotus, a military map, for the use of the Roman army, called the *Prutinger table*, from having belonged to a learned scholar of this name. (See *Prutinger*.) Ptolemy drew maps according to the conographic projection. Agathodemon, an artist Alexandria, drew twenty-six maps for the geography of Ptolemy, and with him the first period of the history of maps is generally closed. They were drawn on the accounts of travellers without well settled principles. The second period, which extends to the beginning of the sixteenth century, the time of the master Hesham (q. v.), can show metal globes, plane tables and maps. Nicolaus Dons corrected the globe of Ptolemy, had them cut in wood, and added new ones. Sebastian Munster followed in his

steps. In the third period, maps became more and more perfect. Particular credit is due to those of Abraham Ortelius, Gerhard Mercator (born 1512, died 1594), William and John Blau (who produced 616 maps), Sanson, Schenk, Vlaschen, De Witt, Hondius. After them, John Baptist Homann became famous, who consulted the most distinguished astronomers and mathematicians, and prepared 200 new maps. In regard to the character of the early maps, and early geography in general, the chapter on the progress of geographical science in Lardner's *Maritime and Inland Discovery* contains valuable information. The following facts are taken from that source. The most eminent geographers of the sixteenth and seventeenth centuries were men of learning, who, in the spirit of that age, adopted with aul and obstinacy all the mistakes committed by the writers of antiquity, which thereby acquired an authority that was very difficult to be overthrown. The first requisite, in a correct system of geography, is to determine accurately the relative position of places; but, in this, the ancients were guilty of gross errors. The method which they employed to determine the latitude of places admitted of but little precision, and their determination of longitudes was still more erroneous. The countries with which the Greek and Roman writers were best acquainted were those on the Mediterranean, yet Constantinople is placed by Ptolemy two degrees north of its true position. The Arab writers increased this error to four degrees. The breadth of the Mediterranean was also increased far beyond the truth. Carthage is made 4° 38' south of its true place. The errors in longitudes were far greater, the length of the Mediterranean being made 68° instead of 41° 28': in other words, it was made 1400 English miles longer than the reality. This enormous error continued in the maps of Europe, with little variation, till the beginning of the last century. The difference in the estimated longitudes of Rome and Nuremberg, two of the best known places in Europe, varied above 800 miles, from the fifteenth to the seventeenth century. The error is still more remarkable, as existing in the longitude of places which are nearly in the same latitude. Cadix and Ferrara, for instance, were placed nearly 600 miles too far asunder; and this error continued till the close of the seventeenth century. Errors of a wider kind, originating in credulity rather than in inaccurate observation, found a place in the maps of the middle ages, and were slowly banished at a recent date by the improvements of astronomy and navigation. In a map of the world, published at Venice, in 1546, by Giacomo, Asia and America are united in lat. 38°. Tibet is placed at the junction of the two continents. In another Venetian map, by Traversari, dated 1654, the distance from Quinai, in China, to the gulf of California, in America, is only 31°, the two continents being unduly stretched some thousand miles respectively to the east and the west. The best maps were long deficient in correct distances, particularly in longitude. South America is represented by Fischer as 62°, or above 4300 miles across, while North America, on the same map, extends from the mouth of the St. Lawrence on the east, to New Albion on the west, through a space of 180°, or above 9000 miles. Hondius, in 1630, ventured, indeed, to abridge Asia of the undue dimensions given it by Ptolemy, and to reduce its extension towards the east to 165°. But his example was not followed; and many instances might be adduced, in which the authority of Ptolemy, who was but slightly acquainted with one half of the globe, was blindly submitted to in an age when Europeans wandered over its whole surface. A great step was made

towards the attainment of accuracy, in regard to longitudes, when Galileo discovered, in 1610, the eclipses of Jupiter's satellites. Until, however, Cassini published his tables, in 1668, nothing accurate was known respecting their eclipses and revolutions. Cassini laboured indefatigably to improve geography, by allying it strictly with astronomy, and loudly complained that it needed a total reform. Delisle, his friend, set seriously about the task of reconstructing the geographical edifice. In the year 1700, he published his map of the world, as well as separate maps of Europe, Asia, and Africa, boldly departing from the examples of his predecessors, and making free use of the materials which the improvements in astronomy had placed within his reach; so that he may be considered the creator of modern geography. He died in 1726. His distinguished disciple, D'Anville, appointed geographer of the king of France at the age of twenty-two was remarkable for correctness of judgment and fineness of penetration. Though he proceeded much on conjecture, he rarely erred. He completed what Delisle had begun. For further information on the subject of geography and geographical works, see *Geography*, and *Gazetteer*; see, also, *Degrees*, *Measurement* of.

The whole number of maps which have been published may amount to from 23,000 to 24,000, of which, however, hardly 4600 are original. The first maps engraved on metal were made by Bueckink and Schweynheim, in 1478; the first cut in wood, by L. Holl, in 1482. (See Hauber's *Essay towards a circumstantial History of Maps* (in German, Ulm, 1724); Hubner's (q. v.) *Museum Geographicum*.) Among the maps prepared of late years in Great Britain, those of Arrowsmith are distinguished.

MAPLE (*acer*); a genus of plants, peculiar to the northern and temperate parts of the globe, consisting of trees or arborescent shrubs, having opposite and more or less lobed leaves, and small flowers, which are either axillary or disposed in racemes. The fruit consists of two capsules united at base, each containing a single seed, and terminated by a wing-like membrane. In one instance, the leaves are compound and pinnated. Twenty-seven species are known, of which six are found in Europe, twelve are found in North America, six very beautiful ones in the islands of Japan, and the remainder in different parts of Asia.

The red maple (*A. rubrum*), is one of the most common and most extensively diffused of American trees. It grows in moist situations, from lat. 49° to the gulf of Mexico, both in the Atlantic and Western States. The bright red blossoms, appearing at a time when there is no vestige of a leaf in the forest, render this tree very conspicuous at the opening of spring; and again, at the close of the season, it is not less conspicuous, from the scarlet colour which the leaves assume when they have been touched by the frost. The leaves are cordate at base, unequally toothed, five-lobed, and glaucous beneath. It attains the height of seventy feet, with a diameter of three or four at the base. The wood is easily turned, and when polished acquires a silken lustre; it is hard and fine-grained, and is employed chiefly for the lower parts of Windsor chairs, sometimes for saddle trees, wooden dishes, and similar purposes.

The variety called *curled maple*, from the accidental undulation of the fibres, is one of the most ornamental woods known, and bedsteads made of it exceed in richness and lustre the finest mahogany. It is sometimes employed for inlaying, but its most constant use is for the stocks of rifles and fowling pieces. The white maple is chiefly remarkable for

the beauty of its foliage, the leaves being larger and much more deeply lobed than those of the preceding, and glaucous beneath. The twigs are more conspicuous and greenish yellow, and the tree is larger than in any other of the species. It is found as far south as the preceding, and is not abundant west of the mountains; its range extending toward the sources of the Mississippi, and west to base of the Arkansaw. It attains large dimensions, being a trunk five, and sometimes eight feet in diameter. The wood is little used, but the bark is preferred by hatters in some places.

The sugar maple (*A. saccharinum*) is a taller tree. Besides the sugar which is obtained from the sap, the wood affords excellent fuel; and from its ashes is procured potash. The sugar is superior in quality to the common brown sugar of the West Indies, and when refined, equals the finest. The sap of all the maples contains a certain quantity of sugar, but in none, that we know of, does it contain so great a proportion as in this and the following species. A single tree of this species will yield two or six pounds of sugar. The leaves are much as five-lobed, with the lobes minutely denticulate. It grows in cold and moist situations, between the forty-second and forty-eighth parallels of latitude, as on the Alleghenies to their south-western termination, extending westward beyond Lake Superior, as is abundant in the northern parts of Pennsylvania, the western portion of New York, Upper and New Brunswick, Nova Scotia, and in the northern parts of New England. The potash is obtained from the two principal northern parts, New York and Boston. To the latter place the wood is brought in great quantities from Maine for fuel, and is considered hardly inferior to hickory.

A variety, with undulations, like the curled maple, and containing besides small spots, is called *half-eye maple*, and forms exceedingly beautiful seats of furniture. The charcoal has the preference in the forges of Vermont and Maine.

The black sugar maple (*A. nigra*) is a more southern tree than the preceding, and is everywhere abundant on the Ohio and the other great rivers of the West. It has not been observed north of latitude 44°, and does not extend into the western part of the more southern states. The leaves resemble in form, those of the sugar maple, but may be distinguished by the pubescence of the inferior surface. It attains very lofty dimensions. The wood is little used, but is preferred for the frames of Windsor chairs, and furnishes the best fuel, after the hickories. The sap yields abundance of sugar, which is manufactured in America to a vast amount.

The ash-leaved maple, or box elder (*A. asplenifolia*) abounds chiefly west of the Alleghenies, where it has a very wide range, extending from lat. 37° to the gulf of Mexico, and also within the chains of the Rocky Mountains. It is easily known by its large, five-lobed leaves, and becomes a large tree. The wood is fine-grained, but is little used.

The striped maple, or moose-wood (*A. striatum*) is a large shrub, chiefly remarkable from the white lines on the bark, which give it an elegant appearance. It is a northern plant, and its leaves are turned loose into the woods to be eaten by the young shoots at the beginning of spring. The wood has been sometimes employed for making mahogany, but it is of inferior quality.

The wood of the common European maple is much used by turners, and on account of its softness is frequently employed for musical instruments, particularly for violins.

MAPPE-MONDES; the French name for map of the world. See *Maps*.

**MARA**, GERTRUDE ELIZABETH, daughter of a Mr Schmähling (born, according to some, in 1750, in Cassel; others say in 1743, at Eischbach, in the territory of Eisenach; others say in 1749), was one of the greatest singers of her time. Her father, city musician in Cassel, instructed her in music. When she was seven years old, she played the violin admirably. In her tenth year, she performed before the queen, in London, whither she had accompanied her father, and where she remained two or three years. In her fourteenth year, she appeared as a singer at court. In 1766, she went with her father to Leipsic, and received an appointment there. Frederic the Great, though much prejudiced against German performers, was induced to invite her, in 1770, to Potsdam, his residence, showed great admiration of her powers, and gave her an appointment immediately, with 3000 Prussian dollars salary (about £450). In 1774, she married a violoncello player named Mara, a man of careless habits, who involved her in many difficulties, and she was dismissed by the king, in 1780. In 1782, she went to Vienna and Paris, where she received the title of a first concert singer of the queen. In 1784, she went to London, where she was received with the greatest enthusiasm. For thirteen evenings' performance at the Pantheon concert, she received 1000 guineas. In 1785 and 1786, she was engaged for the London opera, and appeared at one of the annual concerts in honour of Handel, as first singer, and, in the winter of 1785 and 1786, was established at the London opera. But her obstinacy offended as much as her powers delighted. In 1802, she went to Paris, and, in 1803, to Germany. At a later period, she went to Petersburg, and, in 1808, she was at Moscow, where she is said to have married her companion Florio, after the death of Mara, from whom she had been separated long before. By the burning of Moscow, she lost her house and fortune; and she therefore went to Revel, and gave lessons in music. In 1819, she came through Berlin to Britain, and, in 1821, returned to Esthonia. The latest accounts of her were, that she celebrated her birth-day at Revel, February 23, 1831, having completed her eighty-third year, on which occasion Goethe offered her a poetical tribute. The fame of this singer was founded not only on the strength and fullness of her tone, and the extraordinary compass of her voice, which extended from *c* to the triple-marked *f* (nearly three staves), but also on the admirable ease, quickness, and spirit, with which she sung the most difficult passages, and her simple and enchanting expression in the *adagio*. Her singing of Handel's airs—for instance, "I know that my Redeemer liveth"—in the *Messiah*, was particularly celebrated.

**MARABOOTIS**; among the Berbers (q. v.) of northern Africa, a sort of saints, or sorcerers, who are held in high estimation, and who exercise, in the villages, a despotic authority. They distribute oracles, affect to work miracles, and are thought to exercise the gift of prophecy. The rich presents which they receive from a superstitious people, enable them to live with a good deal of pomp, often keeping an armed force, and maintaining a numerous number of wives and concubines. They make, indeed, pretensions to abstinence or self-denial.

**MARACAYBO**; a town of Colombia, capital of the department of Zulia (see *Colombia*), formerly capital of the province of Maracaybo, in Venezuela; *lon.* 71° 17' W.; *lat.* 10° 13' N. It is situated on the western side of the lake Maracaybo, about twenty miles from the sea. Most of the houses are covered with reeds; but the town is fortified, and the number of the inhabitants, in 1801, amounted to 22,000; which number was afterwards increased to 24,000

by an accession of refugees from St Domingo. Here is a large parochial church, an hospital, and four convents. Large vessels cannot come up to the town, on account of the bar at the mouth of the harbour.

**MARACAYBO**, a lake, or rather gulf, of South America, about 200 miles long, and seventy broad, running from S. to N., empties itself into the North sea; the entrance is defended by strong forts. As the tide flows into this lake, its water is somewhat brackish, notwithstanding the many rivers it receives. It abounds with fish. The lake becomes narrower towards the middle, where the town is erected.

**MARANHAM**, or **MARANHAO**; a province of Brazil, between 1° 20' and 10° 50' S. latitude, and 45° 10' and 53° 20' W. longitude. It takes its name from an island situated at the mouth of three rivers, about forty-two miles in circumference, which is fertile and well inhabited. The island itself is very difficult of access, by reason of the rapidity of the three rivers which form it; so that vessels must wait for proper winds and seasons to visit it. The natives have about twenty-seven hamlets called *oc*, or *tace*, each consisting of only four large huts, forming a square in the middle; but from 300 to 500 paces in length, and about twenty or thirty feet in depth; all being built of large timber, and covered from top to bottom with leaves, so that each may contain 200 or 300 inhabitants. The air is serene, seldom incommoded with storms, excessive drought, or moisture, except in the time of the periodical rains, which last from February to June. The soil of the province is very fertile, producing maize, cotton, sugar, rice, cocoa, pimento, ginger, &c. Population, 183,000, exclusive of the savages. The number of negroes is very great. The capital is Maranhao, or St Luiz, with 12,000 inhabitants; *lat.* 2° 29' S.; *lon.* 48° 45' W.

**MARANON**. See *Amazon*.

**MARAT**, JEAN PAUL, whose name is odiously notorious in the most hateful times of the French revolution, was born at Boudry, in Neuchâtel, in 1741, and studied medicine at Paris, where he practised his profession at the beginning of the revolutionary movements. Previous to 1789, he had published several works on medical and scientific subjects, which display considerable acuteness and learning. Of a small and even diminutive stature, with the most hideous features, in which some traits of insanity were perceptible, his whole appearance was calculated to excite at once terror, pity, ridicule, and disgust. The first breath of the revolution converted the industrious and obscure doctor into an audacious demagogue, if not into a ferocious maniac. He began by haranguing the populace of one of the sections, but was treated with ridicule, and hustled by the crowd, who amused themselves with treading on his toes. Still he persisted, and finally succeeded, by his violence and energy, in commanding attention. Danton had just instituted the club of the Cordeliers, and collected around him all the fiercest spirits, and Marat among the number, who became the editor of the *Ami du Peuple*, a journal which was the organ of that society, and soon became the oracle of the mob. As early as August 1789, he declared it necessary to hang up 800 of the deputies, with Mirabeau at their head, in the garden of the Tuileries, and, though he was denounced to the constitutional assembly, and proceeded against by the municipal authority of Paris, he contrived to escape, with the assistance of Danton, Legendre, and others, and by concealing himself in the most obscure corner of the city. His journal, meanwhile, continued to appear regularly, was openly hawked about the streets, and assumed a more furious and atrocious tone, as he was inflamed

by the prosecutions of the authorities, and encouraged by the increasing strength of his party. During the existence of the legislative assembly, he continued his outrages, figured among the actors of the 10th of August (see *France*), and in the assassinations of September (1792). He was a member of the terrible committee of public safety, then formed, although without any official capacity, and signed the circular to the departments, recommending a similar massacre in each. Marat was chosen a member of the convention; and in spite of the contempt and abhorrence with which he was received in that body, particularly by the Girondists, who endeavoured, at first, to prevent his taking his seat, and, afterwards, to effect his expulsion, soon found encouragement to proceed with his sanguinary denunciations. The ministers, general Dumouries, and the Girondists, whom he contemptuously called *hommes d'état*, were the objects of his attack. Being charged, in the convention, with demanding in his journal 270,000 heads, he openly avowed and boasted of that demand, and declared that he should call for many more if those were not yielded to him. During the long struggle of the Mountain party and the Girondists, his conduct was that of a maniac. The establishment of the revolutionary tribunal, and of the committee for arresting the suspected, was adopted on his motions. On the approach of May 31 (see *Jacobins*), as president of the Jacobin club, he signed an address instigating the people to an insurrection, and to massacre all traitors. Even the Mountain party denounced this measure, and Marat was delivered over to the revolutionary tribunal, which acquitted him; the people received him in triumph, covered him with civic wreaths, and conducted him to the hall of the convention. July 13, 1793, his bloody career was closed by assassination. (See *Corday, Charlotte*.) Proclaimed the martyr of liberty, he received the honours of an apotheosis, and his remains were placed in the Pantheon. It was not till some time after the dispersion of the Jacobins, that the busts of this monstrous divinity were broken, and his ashes removed, and then it was as a royalist that he suffered this disgrace.

**MARATHON**; a village of Greece, in Attica, about fifteen miles N. E. of Athens, celebrated by the victory gained over the Persians by Miltiades, 490 B. C. See *Miltiades*.

**MARATTAS**. See *Mahrattas*.

**MARATTI, CARLO**, painter and engraver, was born at Camerino, in the marquisate of Ancona, in 1696, and while a child, amused himself with painting all sorts of figures drawn by himself on the walls of his father's house. In his eleventh year, he went to Rome, studied the works of Raphael, of the Caracci, and of Guido Reni, in the school of Sacchi, and formed himself on their manner. His *Madonnas* were particularly admired. Louis XIV. employed him to paint his celebrated picture of Daphne. Clement IX., whose portrait he painted, appointed him overseer of the Vatican gallery. He died at Rome in 1713. We are much indebted to him for the preservation of the works of Raphael, in the Vatican, and of the Caracci in the Farnese palace. He also erected monuments to those masters in the church *della Rotonda*. As an artist, Maratti deserves the title given him by Richardson, of the last painter of the Roman school. His design was correct, and although he was not a creative genius, he showed himself a successful imitator of his great predecessors. His composition was good, his expression pleasing, his touch judicious, and his colouring agreeable. He was acquainted with history, architecture, and perspective, and used his knowledge skilfully in his pictures. The good taste which prevails in all his works is remarkable. His chief works are in Rome.

He also etched successfully, among other things, the life of Mary, in ten parts. *Chant. Sermon*, in Passeri, were his pupils.

**MARBLE**, in common language is so applied to all sorts of polished stone, because of the decoration of monuments and palaces in the construction of private houses is made the materials thus made use of. It is so very distinguished the true marbles from those which have no just title to such a designation. It has a short but universal character of marble. It is said, that it effervesces with dilute acids, and is capable of being scratched with flint. It is marked gypsum. These properties are not to be said, once, from the granites, porphyries, and pudding-stones, with which it has been confounded on one side, and from the gypsaceous substances on the other. From the hard rocks having been included under the marbles, comes the name of as marble." Marbles have been divided into various divisions, by different writers. The most frequent division has been that of two great orders—primitive marbles, which have a true crystalline fracture, and secondary marbles, or those which possessed of a dull fracture. This classification is grown out of the idea that the former are more anciently created—an opinion which is a fiction of geology, for the most part, whether a firm, though occasionally we find a marble of compact and close texture, in old rocks, and on the other hand, those which are highly crystalline, very recent formations. DeCuvillier has based his classification of marbles upon the colour which is present; those of a uniform colour forming one class, those with two colours, another; those with three shades, a third; and so on. The best classification of these substances, however, is that of Vauquelin, which divides all marbles into seven or eight classes, viz. 1. marbles of a uniform colour, including solely those which are either white or red; 2. variegated marbles, or those in which the veins and colours are interlaced and disposed with regularity; occasionally, this variety contains some of organic remains; when these are disposed in like masses, they are sometimes called *marble à la Turque*; 3. shell marbles, or those which consist of the remains of shells; 4. *Ammonite* marbles, or those which are, apparently, wholly formed of the remains of shells; 5. *cipolin* marbles, or those which are composed of green talc; 6. *breccia* marbles, or those which are formed of angular fragments of different marbles united by a cement of some different colour; 7. *porphyry* marbles, or those which are formed of angular fragments, like the *breccia* marbles, except the difference of having the pebbles of a different place of being angular. By ancient *marble*, is understood those kinds made use of by the ancients, the quarries of which are now almost all exhausted or unknown. Of these we mention the following:—

**Parian marble**. Its colour is snow-white, and tinged to yellowish-white; it is fine, granular, and polished, has somewhat of a waxy appearance, hardens by exposure to the air, which enables it to resist decomposition for ages. Diphilus, Isidore Malas, and Mitichides, employed the marble, or were imitated by their successors. It contains, with accuracy, the most delicate texture of the stone and retains for ages, with all the softness of wax, a mild lustre even of the original polish. The best Grecian sculpture which has been preserved to the present time, is generally of Parian marble. In the Medicean Venus, the Diana of Verone, the *Minerva* (called *Patrona of Fribourg*), *Arcadia* (or *Cleopatra*), and *Juno* (called *Capitoline*). It is so

Parian marble on which the celebrated tables at Oxford are inscribed.

*Pentelican marble*, from mount Pentelicus, near Athens, resembles, very closely, the preceding, but is more compact and finer granular. At a very early period, when the arts had attained their full splendour, in the age of Pericles, the preference was given, by the Greeks, not to the marble of Paros, but to that of mount Pentelicus, because it was whiter, and also, perhaps, because it was found in the vicinity of Athens. The Parthenon was constructed entirely of Pentelican marble. Among the statues of this marble in the royal museum at Paris, are the Torso, a Bacchus in repose, a Paris, the throne of Saturn, and the tripod of Apollo.

*Carrara marble* is of a beautiful white colour, but is often traversed by gray veins, so that it is difficult to procure large blocks wholly free from them. It is not subject to turn yellow, as the Parian. This marble, which is almost the only one used by modern sculptors, was also quarried and wrought by the ancients. Its quarries are said to have been opened in the time of Julius Cæsar.

*Red antique marble (rosso antico* of the Italians; *Ægyptium* of the ancients). This marble, according to antiquaries, is of a deep blood-red colour, here and there traversed by veins of white, and, if closely inspected, appears to be sprinkled over with minute white dots, as if it were strewed with sand. Another variety of this marble is of a very deep red, without veins, of which a specimen may be seen in the Indian Bacchus, in the royal museum of Paris.

*Green antique marble (verde antico* of the Italians), is an indeterminate mixture of white marble and green serpentine. It was known to the ancients under the name *marmor Spartanum*, or *Lacedæmonium*.

*African breccia marble (antique African breccia)*. It has a black ground, in which are imbedded fragments or portions of a grayish-white, of a deep red, or of a purple wine colour. This is said to be one of the most beautiful marbles hitherto found, and has a superb effect when accompanied with gilt ornaments. Its native place is not known with certainty; it is conjectured to be Africa. The pedestal of Venus leaving the bath, and a large column, both in the royal museum in Paris, are of this marble.

**MARBOD**, or **MAROBODUUS**. See *Marcomanni*, and *Arminius*.

**MARBURG**; capital of Upper Hesse, in Hesse-Cassel, situated on the Lahn, with a population of 6700 inhabitants, a castle, and a university. It is built on the declivity of a hill, on the summit of which is the castle. It has five Catholic, Lutheran, and Calvinist churches. The university was founded in 1527, and has an excellent library of above 100,000 volumes, a valuable botanical garden, an anatomical theatre, and other institutions connected with it. In 1829, the number of students was 347. It is remarkable as being the first Protestant university founded in Germany.

**MARCELLINUS AMMIANUS**. See *Ammianus Marcellinus*.

**MARCELLO**, **BENEDETTO**; a noble Venetian, youngest son of the senator Agostino Marcello. He was born in 1686; and, while a youth, became a great proficient in the science of music, in consequence, it is said, of a reflection thrown upon his deficiency in that respect, at a concert given by his brother Alessandro, which hurt his pride, and stimulated him to exertion. He afterwards studied under Gasparini, and, receiving a liberal education, distinguished himself as a poet, as well as a musician. In 1716, a *serenata* of his composition was performed at the celebration of the birth of the first son of the emperor Charles VI., and excited great applause.

Eight years after appeared the first four volumes of his adaptation to music of Giustiniani's Paraphrase of the Psalms, which he afterwards completed in eight more, the whole being published in 1726. Garth, of Durham, has adapted suitable words, from the English translation of the Psalms, to Marcello's music, with a view to their being performed as anthems in the cathedrals, with great success. This elaborate work was printed by subscription, in eight folio volumes. Marcello was successively a member of the council of forty, *provveditore* of Pola, and chamberlain of Brescia, in which city he died in 1739.

**MARCELLUS**, **M. CLAUDIUS**; the first Roman general who successfully encountered Hannibal, in the second Punic war. During his consulship (B. C. 223) he had given the greatest proofs of his valour, in a single combat with Viridomarus, a Gallic chief, whom he slew; the Gauls, discouraged by the loss of their leader, fled before an inferior Roman force. The result of this victory was the complete conquest of Upper Italy. Marcellus received the honour of a triumph, as the decree of the senate expressed it, for his victory over the Insubri and Germans. This is the first time that the Germans are mentioned in the Roman history, and the last mention we have of a personal contest between generals. Soon after this, the second Punic war broke out, and, after the fatal battle of Cannæ, he was sent against Hannibal; and, as prætor, took the command of the troops remaining at Canusium, in the room of Terentius Varro. On receiving information of Hannibal's march to Nola, he hastened to anticipate him, threw himself into the city, and forced the Carthaginians to retreat, with a loss. Hannibal made a second attack upon Nola, and, as the place was untenable, Marcellus resolved to risk a general engagement on the open plain. His army was inferior in point of numbers, but had the advantage of longer spears. After a hard-fought battle, Hannibal was driven to his camp. Marcellus was now chosen consul, with the celebrated Fabius Maximus Cunctator for his colleague. He frustrated a third attempt of Hannibal to regain the city of Nola, and again offered him battle, which the latter declined. His activity was interrupted for a time by disease. He afterwards went to his province of Sicily, where the siege of Syracuse was his most remarkable achievement. After having used every means (B. C. 214) to capture by force that city, which was defended by the mechanical ingenuity of Archimedes, he limited himself to a blockade, and frustrated all the efforts of the Carthaginians to relieve it, and succeeded, partly by artifice, and partly by force, in making himself master of the place (B. C. 212). The city was surrendered unconditionally, and he was unable to save it from pillage, but he gave orders that no Syracusan should be put to death. Many of the inhabitants, however, and among them Archimedes, were killed in the heat of victory. Marcellus was filled with regret on account of the death of Archimedes, granted many privileges to his connexions, and caused him to be buried with much pomp. After having reduced the greater part of the island, and gained a complete victory over the Carthaginians, he returned to Rome, and received the honour of an ovation. He was again made consul (B. C. 211), with M. Valerius Lavinius, and again received the command in Sicily. But the Syracusans sent ambassadors to Rome to complain of his cruelty, and pray for another general. Marcellus was acquitted, but he voluntarily exchanged provinces and remained in Italy. The Syracusans afterwards repented of their conduct, and entreated his forgiveness. He pardoned them, and procured them the restoration of their former privileges, and the honour of

being considered as allies of Rome. As a mark of gratitude, they declared themselves the clients of the Marcellian family. In the mean time, Marcellus carried on the war against Hannibal in Italy, and fought an undecisive battle at Numistrum. In the succeeding year, he was defeated by Hannibal at Canusium; but, having rallied the fugitives, and inspired them with fresh courage, he renewed the contest on the following day, and gained the victory, though with a heavy loss. B. C. 209, he was chosen consul the fifth time, with T. Quintius Crispinus. The two consuls united their forces on the Liris, but Hannibal avoided giving battle. The Romans, preparing to encamp upon a neighbouring hill, were suddenly surrounded; they would, however, have been able to cut their way through, had not the Etrurians, who composed the largest part of the cavalry, immediately surrendered. Marcellus himself fell; his son and the other consul escaped. Thus died this great general, who made himself formidable to Hannibal himself. He was called the *sword*, as Fabius was the *shield*, of Rome. Hannibal took the ring from his finger, and caused the body to be burnt with the most distinguished honours, and sent the ashes to his son, in a costly urn. His family continued to flourish, and furnished many consuls, until it became extinct with the son of Octavia, the sister of Augustus, whom Virgil has immortalised.

**MARCH** (Latin *Mars*); originally the first month of the Roman year; so named, according to tradition, by Romulus in honour of his father, Mars. Till the adoption of the new style in Britain (1752), the 25th of March was new year's day; hence January, February, and the first twenty-four days of March have frequently two years appended, as January 1, 1704, or 1701—2. See *Calendar*.

**MARCH**; a movement by regular steps in the manner of soldiers; also a journey performed by a body of soldiers either on foot or on horseback. Soldiers on a march are subject to certain rules very necessary to keep them in good order, and fit to meet the enemy. The march in the first sense of regular step differs on different occasions. In the parade-march, from seventy-five to ninety-five steps, differing in different armies, are made in a minute; in the quick-march, from 108 to 115 steps; and in the storming-march, 120 steps.

*March* further signifies the music composed for such movements; it is composed in  $\frac{3}{4}$  or  $\frac{2}{4}$  time for the parade-march, and in  $\frac{1}{4}$  for quick-time. There are many sorts of such marches for festivals, funerals, &c., varying according to their different purposes.

**MARCHE**; one of the ancient provinces of France, bounded north by Berry, and the Bourbonnais, east by Auvergne, and south by Guienne and Limousin. Its name is derived from its having been on the frontier of these provinces, and it was often called *Marche de Limousin*. In the middle ages, it had, for some time, its own sovereign counts. Philippe le Bel acquired it by confiscation. It afterwards belonged to the house of Armagnac, and that of Bourbon-Montpensier. Francis finally united it with the crown domains. See *Department*.

**MARCHES** (from the Middle Latin, *marca*, *marca*, a boundary); the frontiers of a state. Thus in English history, we read of the lords of the Welsh marches, that is, of the frontiers of England and Wales; the marches of Scotland were divided into west and middle marches. The office of the lords marchers was originally to guard the frontiers. (See *Marquess*.) The corresponding word in French is *marche* (see *Marche*), in German *mark*, in Italian *marca*. In the estates of the church was a province called *Marca*, divided into the march or marquise

of Ancona, and that of Fermo. In the Venetian territory was the *Marca Trevizana*. In Germany, the mark of Brandenburg or the *vicinani mark* (so mark), was divided into the *Mecklenburg*, *Vormark*, *Altmark*, *Vormark*, and *Uckermark*. The *Marquisat* (marquise of Stiria), *Danemark* (Danish: *den Margrave*).

**MARCHESI**, LUIGI, called also *Marconi*, a celebrated singer, born at Milan, 1824. While a youth, having attracted the notice of some *cognoscenti*, he was encouraged to leave and quit his father's house privately, went to Bologna, there subjected himself to the necessary study. After completing his studies at the *Conservatorio*, he returned to his native country, where he was received with the greatest admiration and enthusiasm. The academy at Pisa caused a medal to be struck in his honour; he afterwards sang at Rome, Vienna, Petersburg, Berlin, and in 1788 went to London, where the directors of the Italian opera gave him £1500 for one winter, with a benefit and expenses. Marchesi was not less remarkable for the beauty of his person, and his grace and proper gesture, than for his voice. He sang in Vienna 1801. The time of his death is unknown.

**MARCHFELD**; the Austrian circle under the Mannhartsberg, in the country below the *Leitha* (so called); particularly the fertile plain between the rivers March and Danube, about twenty-three English miles long and fourteen wide, the position of which has made it at several epochs the field of decisive battles, and which is one of great interest for the military student. Here of Bohemia, defeated here, in 1290, King Ottokar of Hungary, and conquered Stiria, which he then remained united to Germany. In another battle fought here August 26, 1278, between Charles and Rodolph of Hapsburg, Ottokar fell. This was the foundation of the house of Hapsburg, which is still seated on the throne of Austria. The first battle on this bloody plain was that of Aspern, May 21 and 22, 1809; and the fourth, the battle of Wagram, July 5 and 6, 1809.

**MARCION, MARCIONITES**. See *Gentiles*.

**MARCOMANNI, MARKOMANNI**, a powerful nation of German nations. After Caesar's death, they lived between the Danube and the Rhine. After the Romans had conquered Noricum and Pannonia, and had become dangerous to the Marcomanni from their proximity, the latter retired, under their king, Maroboduus, made themselves masters of the kingdom of the Boii in the present Bohemia, called by the Germans *Bojenheim*. By artifice and violence, Maroboduus soon formed a union of a number of tribes under his sovereignty, and became dangerous to the Romans, as this league could bring 200,000 disciplined troops into the field. The Romans were prevented from attacking him by an *amission* of the Pannonians; for which reason Thrasea concluded a treaty with him, six years after Christ, but he was defeated by the Cherusci under Arminius (A. D. 19). The same was the fate of his successor, the Goth, Catualda. He fled to the Romans, who assigned them *Barren* and *Aquila* for a residence. Relations of friendship now governed the Marcomanni, who ceased all hostilities against the Romans till the time of Maximian. They subsequently made incursions into the Roman territory. Trajan and Hadrian held them in check. They invaded Pannonia (A. D. 166). After a long conflict, which is celebrated in Roman history, under the name of the *Marcomannic war*, Antoninus the Philosopher drove them back beyond the Danube. Commodus purchased peace in 182.

which they observed, however, only so long as they were paid tribute, or Rome had a resolute ruler. They devastated Noricum and Rhetia, and even advanced through the passes of the Alps. Under Aurelian, in 270, they filled all Italy with consternation. But in the fifth century, the name of Marcomanni disappeared. The general migration of the nations consigned the names of the ancient tribes to oblivion. After the overthrow of the dominion of the Huns, the Rugii, Heruli, Scyri, Turcelingi made their appearance in the countries of the former Marcomanni. A powerful nation, the Baioarii, we find in the mountains of Noricum and Rhetia, which Mannert assigns strong reasons for regarding as the same with the Marcomanni, who had emigrated hither, being driven from their residences by the Rugii, Longobardi, &c. The Baioarii are the progenitors of the Bavarians.

MARCO POLO. See *Polo*.

MARCULPHUS; a monk, known in the history of the feudal law, for his work, entitled the *Formulary*, consisting of a collection of *formulae* or forms of forensic proceedings and legal instruments, including charters, &c., of the kings of France. He lived about the middle of the seventh century. Jerome Bignon published the formulary of Marculphus, with learned annotations, in 1613, reprinted in 1666; but the most complete edition is that of Baluze, in the second volume of his *Capitularies* (1677).

MARCUS AURELIUS. See *Antoninus*.

MARDI GRAS (Fat Tuesday) is the French name for Shrove Tuesday, because it was formerly, and, in many cases, is still, customary to make this a day of feasting and merriment, by way of preparation for the forty days' fast of Lent, which immediately follows.

MAREMME; tracts of country in Middle Italy, partly in the States of the Church, partly in Tuscany, in the region of Sienna, on the Tuscan sea, and on the western declivity of the Apennines, and partly also in Naples. These tracts, by reason of the unhealthy exhalations of a soil abounding in sulphur and alum, cannot be inhabited in summer without danger. This unhealthiness has been especially observed since the fifteenth century, and has already begun to advance to the Arno, this side of the Volterra, although Volterra rises 3600 feet above the level of the sea. The population of a region, which was thus become unhealthy, must emigrate, or be swept away by fever, and this *mal' aria* already prevails in different streets of Rome, which it will, perhaps, one day render uninhabitable. Whenever, from a diminution of culture, the vegetation consumes less of the mephitic air, the evil becomes worse. On the other hand, the Maremme afford, in winter, a luxuriant pasturage for cattle, which graze, in summer, on the Apennines, and, in this season, man himself experiences no difficulty in dwelling here, in houses, or in the open air. In the Roman Maremme, which, the former small proprietors having been bought out, have become, for miles, he depopulated possessions of a few princes, a small part of the land is used in years of scarcity, for the cultivation of wheat. The earth is ploughed in autumn; hired labourers, from far and near, take care of the harvest, and, on the field, thrash out the grain, which is then deposited in the great magazines of the estates, whence it is conveyed to Rome or to Ostia, for further transportation. These labourers are so careless, that they sleep under the few trees, in the open air, and if they are attacked with the fever, after some heavy dews at night, the steward of the estate gives them their dearly earned wages and loaf, with which they return to their mountains, unless previously overtaken by death. The more

salubrious atmosphere of their mountains often restores them but slowly. From the oppressive poverty of the Italian mountaineers (of those, at least, who do not carry on robbery for a livelihood), there is never any want of men and women, who come down during the harvest, in the face of death, to collect a few scudi, to pay their rents, and for bread. The younger these labourers are, the more liable are they to the deadly fever. The insalubrity, moreover, betrays itself neither by mist nor by an offensive atmosphere; on the contrary, the air seems very pure, and the horizon of a clear blue. In part of Tuscany, exertions have been made to improve the corrupted air in these pestilent regions, by planting trees; by this expedient, the evil has been lessened in a degree, but by no means entirely removed, as is proved, for example, by the environs of the Lago di Bolsena (lake of Thrasymene), which have much wood, but suffer from the *mal' aria*. There were meadows at Antium, which were in ill report for their unhealthiness, even in the times of the Romans. At present, these same meadows, provided the open air at night is avoided, are perfectly healthy: 2000, and even 1500 years ago, the whole Campagna di Roma was very densely inhabited, and a garden; and probably for that very reason, the country was as healthy as it now is the contrary. Since the period of the migrations of the nations, husbandry on a small scale, and the use of the spade, which Cato Major esteemed so highly, have disappeared; and the more the property in the Campagna di Roma became accumulated in the possession of religious corporations and in entailed estates, the more unhealthy became the ancient territory of the Romans. According to Lullien de Chateauvieux, the smell and vapours betray, everywhere in the Maremme, the presence of sulphureous springs, which form permanent quagmires. But this *mal' aria* cannot proceed exclusively from the waters of the marshes, or the nakedness of the land, for it is equally dangerous on the mountains and in the depths of the forest. The evil probably has its origin in the chemical properties of the soil developed by some latent operation of nature. Unless some means of remedying the unhealthy air be discovered, or some new volcano shall effect the purification of the atmosphere by eruptions, it is highly probable that Middle Italy, south of the Alps, may become, after the lapse of centuries, a desert, used in winter for the pasturage of cattle, and totally uninhabitable in summer. The Pontine and other marshes do not belong to the Maremme. These are a consequence of the imperfect draining of the lowlands, between the coasts of the sea and the foot of the Apennines. A grand canal along the foot of this chain of mountains, should receive all its waters, and, as its bed would be higher than the level of the Mediterranean, where the former mouths of the rivers have been filled with sand, and have thereby become choked, should carry them, by many broad and deep canals, frequently cleared out, into the sea. And if the lowlands, which it is impossible to drain thoroughly, were planted with thickly-leaved trees, and many small villages were settled there, these swamps would soon become healthy.

MARENGO; a village in the plains between Alexandria and Tortona, in the royal Sardinian duchy of Montferrat, celebrated for the battle of June 14, 1800. Bonaparte had passed the Alps, between the 16th and 27th of May, with 60,000 men. Melas, the Austrian general, discovered his danger too late. June 2d, Bonaparte had obtained possession of the fortress of Bard, which commanded the entrance of the valley of Aosta; Murat advanced on Milan, Suchet took Nice, and Berthier defeated at Montebello the lieutenant field-marshal Von Ott.

June 13th, Desaix arrived from Egypt, at the headquarters of Bonaparte; the main body of the army was concentrated at Marengo: Desaix commanded the consular guard. On the 14th the battle was fought, in which Desaix was killed, and the Austrian army, under Melas, was driven beyond the Bormida, with a loss of 1200 killed, and 7000 taken prisoners. —About noon, on the day of battle, the French columns, under Lannes and Victor, destitute of ammunition, and reduced to half their number, were compelled to retreat. They retired under cover of Kellermann's brigade of cavalry. The slow advance of the Austrians, and the false direction of their numerous cavalry, gave the remains of the French army time to rally behind the corps of Desaix, which the first consul had already ordered to Novi, to cut off the enemy's retreat to Genoa, but which was now recalled in haste. Desaix had taken his position at St Giuliano, on the left side of the road from Tortona to Alexandria, when Kellermann arrived with his brigade of cavalry, having received from the adjutant Savary the command to support the attack of this general. Thus the battle was renewed. Kellermann had only 400 horse, and those fatigued by an eight hours' contest. The infantry of Desaix was about 3000 or 4000 strong. The enemy was certain of victory. Desaix was mortally wounded at the first attack, and his little corps, unable to resist, retreated. Behind the vineyards which covered him, Kellermann saw 6000 Hungarian grenadiers break their ranks in pursuit of the French. He threw himself into the midst of the enemy, who, terrified by this unexpected attack, cut off from their cavalry, and thinking themselves surrounded, threw down their arms before the little band. The Austrian main body supposed that the enemy had received a powerful reinforcement, and fell back, in haste and disorder, to Bormida. Thus Kellermann decided the victory. This defeat led to the armistice of Alexandria, between Bonaparte and Melas, according to the terms of which the Austrians evacuated within fourteen days, the citadels of Alexandria, Tortona, Milan, Turin, Pizzighitone, Arosa, and Piacenza, with the fortified places of Genoa, Coni, Ceva, Savona, and Urbino, and retired beyond Piacenza, between the Po and the Mincio.

MARFORIO; a colossal statue, representing the river Rhine, in a lying posture, and standing in the court of a wing of the Capitol at Rome. The name *Marforio* is said to be a corruption of that of the *Mamertine* prison or of the temple of *Mars*, which were near the spot where this statue originally stood, on the *forum Romanum*. The *Marforio* is famous for having served, like the *Pasquino*, as the place where the Roman satirists placed their sallies.

MARGARET, queen of Denmark, Norway, and Sweden, very justly called the *northern Semiramis*, the daughter of Waldemar III., king of Denmark, was born at Copenhagen, in 1363, and married to Haquin or Hacon, king of Norway, in 1363. The talents, firmness, and beauty of the princess rendered her popular among her countrymen, and, on the death of her father, she succeeded in placing her son Olaf on the throne of Denmark. The death of her husband in 1380, put the government of Norway in her hands, and the plan of uniting the three kingdoms, which was favoured by the imbecility of the Swedish monarch, seems now to have occupied the mind of this princess. Olaf died in 1387, and Margaret, by her address, caused herself to be declared queen. Taking advantage of the domestic dissensions in Sweden, and flattering the nobles with the prospect of greater power, she raised a party in that country who recognised her as queen; and having defeated the troops of Albert, the Swedish king, at Falkenberg,

she soon obtained possession of the throne. Looking forward to a permanent union of the three crowns, she endeavoured to effect her purpose in the celebrated act of union, or treaty of *Cumar*, 1397. She restored tranquillity at home, and was constant against the foreign enemies of her kingdom, but her peace was disturbed by the ingratitude of her son, whom she had nominated her successor. She died in 1407, after having, by her prudence, courage, and foresight, raised herself to a degree of power and grandeur, then unequalled in Europe since the time of Charlemagne. See *Norway*, *Sweden*, *the Danes*.

MARGARET OF ANJOU, daughter a legit. or René the Good, titular king of Sicily, was married in 1443, to the imbecile Henry VI. of England. By the marriage articles, Maine was given to her uncle Charles of Anjou, and this union retarded the conquest of Normandy by the French. To lose of this important province was almost Margaret, and the house of commons almost told the author of her marriage and the fortunes of the queen, of high treason. He was banished from kingdom. Soon after the execution, and after having quitted the country, he was arrested, and the war of the roses, which soon began to brew in England, Margaret played a conspicuous and important part. The bold, active, and even some say of this princess, contrasted singularly with the character of her husband. She was far a way to the life of the Lancastrian party. She defied the duke of York, and, placing a paper crown on his head, exposed him at the gates of the city of York. In 1461, the princess defended Warwick, a 1st Albany, and her victories were always attended with numerous executions. The son of the late duke of York, the gallant young Edward, was opposed to the head of the Yorkists, who now became queen Margaret's army was annihilated at Tewkesbury, and Edward was declared king. (See *Edward IV*.) The unhappy queen succeeded in obtaining ransom from Louis XI. of France, but was again defeated and compelled to flee. After committing herself to the wildest parts of the country, when she was compelled to suffer the greatest privations, she was ordered the greatest indignities from the hostile bands, with which the distracted kingdom was infested, the queen finally took refuge in France. It was not long before Warwick became entangled with the young king, and determined to seize Henry on the throne. Edward was in too deep to escape to the continent, but, having obtained a sistance from the duke of Burgundy, escaped to England after a few months, and defeated Warwick at Barnet, on the very day that Margaret fled to England with her son, then eighteen years of age. On hearing of the defeat and death of her champion the courage of Margaret seemed for once to fail her, and she took refuge in the monastery of Barking. But her undaunted and marvellous courage led her to the field; having collected her faithful the hostile forces met at Tewkesbury, and the Lancastrians were totally defeated. Her son was killed before the king. "How dare you," said Edward, "enter my realm with banner flying?" "I thought my father's kingdom," answered the queen, with spirit of his mother, "and having been his fifth and grandmother to him, and from him to our Lord descended." Edward pushed him back, and 6 barbarous lords despatched him. Henry was killed, if he was not murdered, in the Tower, and Margaret remained in prison four years. Louis XI. ransomed her for 50,000 crowns, and, in 1470, died, "the most unhappy queen, with, and without any Voltaire," in Europe. Her courage, her

ferings, and her crimes have been delineated with historic truth and poetic beauty by the genius of Shakspeare.

MARGARET OF AUSTRIA, daughter of the emperor Maximilian I., born in 1490, was sent to France, after the death of her mother, Mary of Burgundy, to be educated at the court of Louis XI., to whose son (Charles VIII.) she was affianced. Charles, however, having married Anna, heiress of Brittany, she was sent back to her father's court, and was married in 1407 to John, Infant of Spain. On the voyage to Spain, a terrible storm threatened the destruction of the ship. In the midst of the danger, while the rest of the company were at their prayers, she is said to have composed her epitaph in the following words:

*Cy git Margot, la gento demoiselle,  
Deux fois mariée et morte pucelle.*

She arrived in safety, but, October 4, 1497, the Infant died. In 1501, she was married to Philibert II., duke of Savoy, who died in 1504. Her father then named her governess of the Netherlands, where her administration was distinguished by prudence and vigour. She died in 1530. Jean le Maire collected her addresses before the court and the estates, in the *Couronne Margarithique* (1549), which contains also many poems, and her *Discours de sa vie et de ses infortunes*. Fontenelle has made her a speaker in one of his witty Dialogues of the Dead.

MARGARET OF VALOIS, queen of Navarre, sister to Francis I., was born at Angoulême in 1492. She was brought up at the court of Louis XII., and married the duke of Alençon in 1509, became a widow in 1525; and in 1527, was espoused to Henry d'Albret, king of Navarre. She joined with her husband in every effort to make their small kingdom flourish, by encouraging agriculture and the useful arts, and by improving knowledge and civilisation. She was fond of reading, and had been led by curiosity to make herself acquainted with the principles of the reformers, to which she became partially a convert, and not only afforded protection to reformed divines, but used her influence with her brother Francis to the same purpose. She also read the bible in the French translation, and formed mysteries for representation, from the New Testament, which she caused to be performed at court. She wrote a work entitled *Le Miroir de l'âme pécheresse*, printed in 1533, which incurred the censure of the Sorbonne. She underwent some ill treatment from her husband on this account, and might have suffered more, but for the interposition of her brother, Francis I., who was much attached to her, and in complaisance to whom she, externally at least, became more strict in her attention to the ceremonial of the ancient religion. It will appear extraordinary in the present day, that a princess so contemplative and pious as Margaret of Valois, should be author of a book of tales as free as their tendency as those of Boccaccio. Such is *leptameron, ou sept Journées de la Reine de Navarre*, which was written during the gayety of youth, and not printed until after her death. She died in 1549, leaving one child, Joan d'Albret, afterwards mother of Henry IV. In 1547, a collection of her poems and other pieces was printed, under the title *Marguerites de la Marguerite des Princesses*.

MARGARET, called *Madame de Parma*, duchess of Parma, the natural daughter of Charles V. and Margaret of Gest, was born 1522, and married first Alexander of Medici, and afterwards to Octavio Farnese, duke of Parma and Piacenza. Philip II., of Spain, appointed her to the government of the Netherlands, in 1559, where she acted, under the advice of Granvella (q. v.), with considerable prudence, and, perhaps, might have restored quiet, had

not the king sent the duke of Alva to aid in suppressing the disaffection. Alva brought such powers, that nothing but the title of sovereign was left to Margaret, who returned, indignantly, to Italy, to her husband, and died at Ortona in 1586. Her son was the famous Alexander Farnese, duke of Parma.

MARGARET OF FRANCE, queen of Navarre, wife of Henry IV., daughter of Henry II., was born in 1552, and was one of the greatest beauties of her age. Her talents and accomplishments corresponded to the charms of her person. She was married to Henry, then prince of Béarn, in 1572; but the duke of Guise was known to be the object of her affections, and notwithstanding her amiable qualities and brilliant beauty, she never possessed the heart of her husband. (See *Henry IV.*) The gallantries of Henry, which he never pretended to conceal from his wife, could not excuse nor authorize, but doubtless contributed to increase, her own irregularities. On the escape of Henry from Paris, she demanded permission of Henry III. to follow him, but was not, for a long time, allowed to depart. After living several years with the king of Navarre, she returned to Paris, on account of some disgust at the restraints placed on the exercise of the Catholic religion, and while there was guilty of the greatest licentiousness. Rejected at once from the court of Navarre and that of Paris, she maintained herself in the Agenois, in open defiance of her husband and brother. On the accession of the former to the throne of France, he proposed to dissolve their marriage, to which she consented, on condition of receiving a suitable pension, and having her debts paid. In 1605, Margaret returned to Paris, where she lived in great splendour, retaining her beauty, wit, and habits of dissipation, and died in 1616, at the age of sixty-three. The house of Margaret was frequented by the wits of the day, and she knew how to unite excessive indulgence in pleasure with attention to study. Some very agreeable poems by her are extant, and her *Mémoires* (1661 and 1713) are extremely curious.

MARGATE; a watering place in the isle of Thanet, Kent, 71 miles E. of London, with which it has frequent communication by steam vessels. It has several pleasant promenades, among which the pier is the favourite. It is much resorted to for sea-bathing. Population, in 1831, 10,339.

MARGRAVE (from the German, *Markgraf*, count of the mark; in Latin, *Marchio*; see *Marches*); originally a commander intrusted with the protection of a *mark*, or a country on the frontier. As early as the times of Charlemagne, marks and margraves appear; for instance, the mark of Austria. The margraves stood immediately under the German kings and emperors, and not under the dukes, in whose country the margraviate was situated; yet there were also some margraves dependent on dukes. In the twelfth century, margraviates became hereditary, and, at last, the margraves acquired the rank of princes of the empire, and stood between counts and dukes in the German empire. The word *mark* signified, anciently, a landmark, and was then taken for countries on the frontier; as the mark Brandenburg.

MARIA LOUISA, queen of Spain, daughter of Philip duke of Parma, born in 1751, was married to Charles IV., against his wishes, but in obedience to the express commands of his father, in 1765. Maria was prudent, not without address, and much superior to her husband in understanding. She soon overcame the violent temper of Charles, which at first broke out into acts of personal outrage, and so far prevailed over the formality of the Spanish court as to have unrestricted access to the king. Every thing was submitted to her approval. For her

favourites she took care to secure the favour of the king previously to avowing her own inclinations, and thus had the merit of appearing to yield to the wishes of her husband. Even while princess of Austria, an intrigue with the elder Godoy was only terminated by his banishment from Madrid. His place was supplied by his younger brother, don Manuel Godoy (q. v.), who became equally the favourite of Charles. (See *Charles IV.*) Their intrigues led to the affair of the Escorial, in which Maria acted a most unnatural part against her son. (See *Ferdinand VII.*) In 1808, the revolution of Aranjuez took place, Charles abdicated, and Maria threw herself into the arms of the French. Charles was obliged to retract his abdication, and that celebrated correspondence with Murat followed, in which Maria Louisa, in a letter written with her own hand, accuses her son of hardheartedness, cruelty, and want of affection for his parents. After the well-known proceedings at Bayonne, Maria Louisa remained in France a short time with Godoy and the ex-king, and finally went to Rome, where she died in 1819. See *Spain*.

MARIA THERESA, queen of Hungary and Bohemia, arch-duchess of Austria, and empress of Germany, daughter of the emperor Charles VI., was born at Vienna, 1717, and, in 1736, married duke Francis Stephen of Lorraine (who, in 1737, became grand-duke of Tuscany, by virtue of the treaty of Vienna, October 3, 1735); the day after the death of Charles (October 21, 1740), ascended the throne of Hungary, Bohemia, and Austria; and, November 21, declared her husband joint ruler. She found the kingdom exhausted, the people dissatisfied, the treasury empty, and the army (with the exception of the troops in Italy) only 30,000 strong. The elector, Charles Albert of Bavaria; supported by France, laid claim to the Austrian hereditary territories, and the electors of Cologne and the Palatinate would likewise not acknowledge the succession of Maria Theresa. Charles Albert of Bavaria was descended from Anna, elder daughter of Ferdinand I., who, by will, had appointed that, upon the extinction of the Austrian male line, the succession to the throne of Bohemia and Austria should devolve upon his daughters and their heirs. Meanwhile Prussia, Poland and Saxony, Russia, the States-General and England, declared for the queen. France only delayed to make an express acknowledgment. Just in this situation of the Austrian court, Frederic II. renewed his claim to four Silesian principalities, and offered, if he received them, to defend the young queen against her enemies. At the same time (December 23, 1740), he marched with an army into Silesia. Maria Theresa was as much surprised as enraged at this step of the king, and Frederic's offers were refused altogether. Meanwhile, the king made rapid progress in Silesia, where the Protestants, who were much oppressed by the government of Austria, received him with joy. The queen of Hungary, although she could nowhere find an ally, with great resolution refused any kind of submission, and collected an army in Moravia, under general Niepperg. But the want of magazines, and the bad roads, prevented Niepperg from acting effectively. The Austrians were beaten at Molwitz, April 10, 1741. Marshal Belle-Isle, in the name of France, now negotiated with the king of Prussia, at Molwitz, upon the dissolution of the Austrian monarchy. Philip V., king of Spain, as a descendant in the male line of the house of Hapsburg, by virtue of the family contracts of 1617, laid claim to the throne of Austria; Charles Emanuel, king of Sardinia, a descendant of Catharine, second daughter of Philip II., demanded Milan; Augustus III., notwithstanding the treaty

just concluded by him with Maria Theresa, and similar demands on account of his war with daughter of Joseph I. France had already contrived a plan of diversion; however, France would not accede to it, lest France should become too powerful in Germany, as under George II. of England, happened. In a moment, she remained determined to defend the sovereignty of her fathers, and England promised a subsidy of £500,000. She had even announced the design of dividing the states of Prussia, and invited the king of England to invade them. But Great Britain would not negotiate a peace. Bavaria, in July, 1740, began the war against Austria, and the French armies having crossed the Rhine as to Maese; Frederic, likewise, having conquered all Silesia; the attempt at mediation, in the England, proved fruitless. Maria Theresa considered herself not warranted in giving up the best part of her kingdom. She became so fixed in this determination, by the birth of her duke Joseph. Her husband had no share and interfered little in the business of government. Hardly had the negotiations with France broken off, when Belle-Isle with a French army as the elector of Bavaria, marched into Austria. It was taken, and the elector acknowledged himself king. The Bavarians and French marched into Vienna and Vienna was summoned to surrender. The king of England, who wished to send assistance to Maria Theresa, was compelled, by a second French offer to conclude a treaty of neutrality, in respect to her, and to promise not to oppose the entrance of the elector of Bavaria to the imperial throne. The electors of Saxony, of Cologne, and of the Palatinate acceded to the union against Maria Theresa. Just on the point of entering Italy, had received the neutrality of the pope and the remaining Italian powers and the king of Sardinia was prepared to send troops to those of the house of Hapsburg. Frederic was master of the capital, and at the point of uniting himself with the French in Vienna. Maria Theresa's cause was desperate, broken by her allies, without troops, or money, or just matters, she was preserved only by her courage, by the attachment of the brave Hungarians, and by the aid of England. In this necessity, she summoned her at Presburg, and appeared before the assembly in mourning, clothed in the Hungarian habit, the crown of St Stephen on her head, and cut with the king's sword. She addressed a speech to the states, in which she described her situation, and committed herself and her children to the protection of her Hungarians. The words, beauty, and the misfortunes of the queen, made a deep impression. The magnates drew their hats and exclaimed, "*Mortem pro rege nostro Maria Theresa.*" Till then she had preserved a majestic demeanor; now she melted into tears, and the interest was still more increased. The help furnished by Hungary, by their manner of fighting, and by their ferocity, spread terror through the German and French armies. In the mean time, the allies quarrelled among themselves, to want the pride of Belle-Isle much contributed, who would treat the German princes as vassals of France. Bavaria and Saxony contended for the supremacy. The king of Prussia therefore concluded, under British mediation (October 9, 1741), a secret treaty with the English ambassador (who was awarded with authority, for this purpose, by the queen of Hungary, according to which Lower Silesia was to be rendered to Prussia. Soon after (October 26) the

was conquered by the French and Bavarians, and the elector (November 19) was crowned king of Bohemia. He was likewise crowned emperor of Germany, at Frankfort, February 12, 1742, and took the name of *Charles VII.* But his troops were defeated near Scharding (January 23, 1742), and the electorate occupied by Khevenhiller, who gave up the land to be plundered by his army, and entered Munich upon the same day upon which Charles was crowned emperor. Frederic II., alarmed for Silesia, in consequence of the progress of the Austrians, put an end to the truce, pressed forward to Iglau, invaded Austria, and his hussars spread terror even to the gates of Vienna. He was obliged to retire, and Maria Theresa rejected his renewed proposals of peace; but the victory of Frederic at Chotusitz (May 17) hastened the conclusion of the preliminaries of peace, at Breslau (June 11, 1742). The queen ceded Upper and Lower Silesia and the county of Glatz, with the exception of the principalities of Teschen, Jagerndorf, and Troppau, and the mountains on the other side of the Oppa. The definitive peace was signed the 28th July, under the guarantee of England. From this time, the arms of Austria were victorious; prince Charles of Lorraine drove back the French to Braunau, and blockaded Prague. The general opinion that the balance of Europe depended upon the continuance of the house of Austria, excited England to arm for Maria Theresa, and Holland paid her subsidies. In Italy, the king of Sardinia, injured by Spain, became reconciled to Maria Theresa (who ceded to him a part of Milan), and supported the Austrian arms against Spain and France. The internal condition of the latter country, and the age of the prime minister, cardinal Fleury, induced this statesman to think of peace. Maria Theresa rejected the proposed conditions. Maillebois, the French commander, received, therefore, orders to press forward from Westphalia to Prague. But prince Charles of Lorraine went to meet him with a part of his army, and Maillebois was compelled to give up his intention of relieving Prague. Belle-Isle, however, escaped by artifice with the greater part of his garrison, out of the unfinished city, and marched to Eger. The whole of Bohemia was now, as far as Eger, in the power of Austria, and Maria Theresa was (May 12) crowned queen of Bohemia.

After the death of Fleury (January 9, 1743), the arms of Austria triumphed throughout Europe. England granted new subsidies, and Sardinia received £200,000 in order to support the queen of Hungary. The States-General supplied 6000 auxiliary troops. The French were now driven out of the Upper Palatinate, by prince Charles of Lorraine, and the Bavarians, beaten in their own territories a short time before, conquered by him. The emperor, Charles VII., concluded, therefore, with the queen of Hungary, a treaty of neutrality, according to the terms of which he delivered to her, until a general peace, his hereditary states, and renounced his right of succession to the Austrian territories. The victory of the so called *pragmatic army*, consisting of English, Hanoverians, Austrians, and Hessians, over the French, at Dettingen on the Maine (June 27, 1743), where George II. of Britain fought in person, affirmed the queen and her allies still more in the determination to humble France. But through a want of unanimity, the plan, that prince Charles of Lorraine should enter France, was frustrated. The emperor Charles VII., stripped of his states, had fled, with George II., the preliminaries of peace, according to which he broke off his connexion with France, and agreed to other stipulations favourable to the court of Vienna. In return for these, he was

to be recognised as emperor, and, for the support of his dignity and for the recovery of his states, was to receive subsidies. George promised to obtain Maria Theresa's consent, but she insisted on the deposition of Charles, and wished to retain Bavaria. As little was she inclined to transfer to the king of Sardinia the provinces promised him in the Milanese. Sardinia assumed, therefore, a threatening position. This and the representations of Britain compelled the queen, at length, to compliance. She gave up to Sardinia the province of Vigevano, together with some other districts, relinquished her claims on the margravate of Finale, and gave to king Charles Emanuel III. the chief command of 30,000 Austrian troops in Italy. But in spite of this, as well as of the previous victory of the Austrians near Campo Santo, over the Spaniards (Feb. 8, 1743), the Spanish and French, under the Infant don Philip, subjected all Savoy. As now prince Charles of Lorraine could not effect his entrance into France, he returned to Vienna, where he married the archduchess Maria Anna, the sister of Maria Theresa, and received, as the reward of his service, the general government of the Netherlands. Until 1744, Britain and France had fought against each other as auxiliaries to the chief contending parties. Now followed a formal declaration of war on the side of France, as well against Britain (March 15) as against Austria (April 11). The French conquered the most important fortresses in the Netherlands, and marshal Saxe threatened to subdue the whole country, when prince Charles of Lorraine fell upon Alsace. Already the Austrian light cavalry had spread terror to the gates of Luneville, and king Stanislaus was compelled to fly from the place. The king of France, nevertheless, prepared a great force to meet the prince, and Charles was recalled, in order to oppose the king of Prussia, who had again taken up arms. The proud and passionate Maria Theresa had refused to acknowledge the emperor at the diet of Frankfort. Moreover, she let her purpose be too plainly seen of holding Bavaria, of making conquests in France and Italy, of again taking Silesia, and, in connexion with Saxony and Britain, of dividing the Prussian states. Frederic, therefore, in order to anticipate her, and for the defence of the emperor, formed (May 22, 1744) with the emperor, with France, the elector of the Palatinate, and the king of Sweden, as landgrave of Hesse, a union at Frankfort. Accordingly, in August, he made an irruption into Bohemia, with 80,000 men, conquered Prague and the whole province upon the east side of the Moldau. The Bavarian and Hessian troops, at the same time, pressed forward into Bavaria, and placed the emperor again in possession of his capital. The terror of them spread even to Vienna, but Maria Theresa remained unshaken. She animated her Hungarians at the diet of Breslau, and these, assisted by Saxony and the Austrians, hurried to the deliverance of Bohemia. Charles of Lorraine also hastened out of Alsace and Lorraine, to the borders of Bohemia, and the Prussians were again compelled to quit the kingdom. On the other hand, France conquered Freiburg, the Austrian bulwark on the west, and pressed forward into the Netherlands. Even in Italy, the Austrian commander, prince Lobkowitz, after he had driven back the Spaniards, and almost made prisoner don Carlos, king of Naples, near Belletre, was compelled to retreat to Lombardy, on account of a want of troops. But the death of Charles VII. (Jan. 20, 1745) opened a new field to the ambition of Maria Theresa. France endeavoured anew to wrest from the house of Austria the imperial throne. But the cause of Austria prevailed, in spite of French artifice, at the Russian court. Britain also assisted the queen, Maria Theresa, again

with troops and money. The object of the union of Frankfort having failed, Frederic II. sought the intervention of Great Britain, in order to be reconciled with Austria.

In the mean time, Maria Theresa concluded a treaty (April 22, 1745) at Fuesen, with the new elector of Bavaria, by which the latter recognised the pragmatic sanction, and pledged himself to remove the foreign auxiliaries from his states, and to vote for the accession of the duke of Lorraine, the husband of Maria Theresa, to the imperial throne. The queen of Hungary had, besides, concluded a quadruple alliance with the king of Poland, with Holland and England (June 8, 1745), at Warsaw, as well as a treaty at Leipsic (May 18), in which secret articles were introduced respecting the division of the Prussian states between Austria and Saxony. During these proceedings, the French made some progress. After the victory of marshal Saxe over the allies, near Fontenoy (May 11, 1745), the most important places of the Austrian Netherlands fell into the hands of the French. In Italy, where Genoa united itself with Spain, the French and Spaniards took a great part of the Milanese territories, and the king of Sardinia was compelled to withdraw to his capital. In Germany also, Frederic delivered himself from a critical situation by his victory over the Austrians and Saxons, at Hohenfriedberg (June 4, 1745). Soon after, the British cabinet concluded, at Hanover, a secret treaty with Frederic, in which Silesia was guaranteed to him, in conformity with the peace of Breslau. But the queen of Hungary and the elector of Saxony showed no inclination to negotiate.

Meantime, Charles of Lorraine was defeated near Sorr, by Frederic II., and Maria Theresa had merely the consolation of having her husband, Francis Stephen, chosen emperor (September 13). October 4, he was crowned with the title of *Francis I.* At this solemnity, Maria Theresa was the first to exclaim, from a balcony, "Long live the emperor Francis I." Notwithstanding her finances were entirely exhausted, and even the silver vessels of the churches had been sent to the mint, the imperial queen was unwilling to consent to peace. The Prussian proposals were altogether rejected, revenge was sought for, and Maria Theresa embraced the bold plan of marching an army, composed of Saxons and Austrians, against Berlin. Besides, she expected powerful support from Russia; but Frederic was beforehand with her: he defeated the Saxons, near Hengersdorf (November 23), upon which Charles of Lorraine drew back, from Lusatia to Bohemia, and the defeat of the Saxons, near Kesselsdorf (Dec. 15), made the Prussians masters of the whole electorate of Saxony. The imperial queen did not yield to her own misfortunes, but, moved by the fate of her allies, concluded, under the British mediation (Dec. 25, 1745), the peace of Dresden, in which Frederic received Silesia, and Maria Theresa was recognised as queen of Bohemia, and her husband as emperor. This peace was so much the more necessary for Austria, as Britain, on account of the landing of the Pretender in Scotland, had been obliged to withdraw her auxiliary troops from the Netherlands, by which means the French had gained a superiority there. May 4, 1746, Louis XV. made his entry into Brussels, and, with the exception of Luxembourg, all the Austrian Netherlands was in the hands of the enemy. The loss of a battle near Rocou (October 11), increased the misfortunes of Austria in this quarter. On the other hand, the army of the empress was victorious in Italy, under the prince of Lichtenstein, at San Lorenzo, over the Spaniards and French; and when, after the death of Philip V., his successor,

Frederic VI., withdrew his troops from Italy to Austria, obtained a complete supremacy, and, particularly, blockaded Genoa. The French blockaded the same by sea, and the city sustained almost without any conditions, to the human. But, exasperated by extortions, the citizens drove the imperial general Botta (who had 1000 men, his whole artillery and baggage) from Genoa and its territories (December 5—9). Meantime Genoa, as well as France and Spain, wished to join. But the imperial queen had made a defence alliance with Russia (May 22, 1746), to which no island and Britain had acceded. The French, however, drove the Austrians from Provence, which they laid waste, and freed Genoa (1747), when it was besieged anew. In the Austrian Netherlands, they made still greater progress. But the advance of the Russians into Germany, and the victory of Lord Hawke over a French squadron, by which the sea force of France was destroyed, hastened the peace. April 30, 1748, the preliminaries were signed at France, Great Britain, and Holland; the terms of the peace of Aix-la-Chapelle (November 11), which, also, Spain, Austria, and Sardinia sought. Maria Theresa was acknowledged as the lawful ruler of her father's kingdom; the infant don Philip claimed only the duchies of Parma, Placencia, and Tuscany; several provinces also ceded to the king of Sardinia by the treaty of Worms, were left to him.

Maria Theresa now turned all her attention to the restoration of her finances and the improvement of the army. The yearly income, which, in the time of Charles VI., had amounted only to 20,000,000 roubles, by prudent management, to 30,000,000 roubles, although Parma and Silesia, which had also produced 6,000,000, were lost. The army consisted of 108,000 men, besides the troops in Italy and the Netherlands, and the whole military department, under the direction of Daun, was placed upon a better footing. Maria Theresa also made great changes in the administration of justice, of the finance, and of the police. Though she unwillingly allowed herself to be governed, yet, from her inexperience, she did not rely upon herself, and sought to procure exact information by consultations with her counsellors, her husband, and others. The disconcerting of opinion of two of her counsellors, Waser and Thun, frequently led her to waver between opposite measures until she at length confided to the more pliable prince Kaunitz, the chief director of public affairs. Several causes of dissension, which were often between Britain and Austria, induced the latter to think of a reconciliation with France; and Maria Theresa, in spite of her pride and her strong principles, consented, upon the advice of Kaunitz, to write very kindly to the marchioness of Penthièvre, who, enraptured by this conciliatory of the greatest queen of Europe, exerted all her influence to effect the connexion which Maria Theresa desired. Yet her endeavours were foiled, at the same, by the counter representations which the friends of Frederic II. and the enemies of Austria made to the court of Versailles.

In 1755 arose dissensions between Britain and France, respecting their possessions in America, and Great Britain demanded aid of Austria. This she refused, and thus the foundation for the dissension of these powers, hitherto friendly, was laid. Frederic II. made use of this opportunity, and concluded with George II. (Jan. 16, 1756) a treaty, in which they mutually agreed to prevent the entrance of foreign troops into Germany. The marchioness of Penthièvre, in this year, effected a change in the French ministry, and this made it possible to establish friendly relations between the courts of Vienna and

Versailles. Maria Theresa concluded now (May 1) the union with France against Frederic the Great, which occasioned the seven years' war (q. v.; also *Frederic II.*). After the conclusion of this unfortunate war, Maria Theresa's son, the archduke Joseph, was chosen Roman king, March 27, 1764, by which means the imperial queen confirmed her family in the possession of the German imperial dignity. Her husband, the emperor Francois, died Aug. 28, 1765, and his death caused her deep and lasting distress.

Joseph II. was now emperor, but, although declared by his mother, her colleague in his hereditary possessions, he mingled as little as his father had done in the internal government. Only the direction of the army was given to him. Maria Theresa founded and improved schools, universities, and academies, and granted prizes to the students. She rewarded also those who made any important improvements in the arts, and turned her attention particularly to agriculture, which was denominated, on a medal that she caused to be struck, the support of all the arts. Still greater was her merit in the abolition of many abuses of the church. She reduced the presence of the clergy at the making of wills, deprived the church and the convents of their gift of sanctuaries, and suppressed the inquisition in Milan. She abolished the order of Jesuits, and prohibited the admission of individuals of both sexes into convents before the age of twenty-five years. She also abolished the rack in all her states. Apparently through the influence of Kaunitz, she concluded at Petersburg (Aug. 5, 1772), with Russia and Prussia, the agreement for the partition of Poland. In this partition, she received Galicia and Lodomeria (37,000 square miles, with 2,500,000 inhabitants). To induce her to abstain from farther wars, the Porte was compelled to give up Bukovina to her (Feb. 25, 1777). Austria was now in a prosperous situation. It had 260,000 troops, and an income exceeding its expenditures. The political dissension therefore sought, by the marriage of the archduke with the daughter of Maria Theresa (1770), afterwards so unfortunate Maria Antoinette, to make a closer union between France and Austria; and the court of Vienna acceded to the proposal, hoping, the accession of Louis XVI. to the throne, to gain a powerful influence over the cabinet of Versailles. About this time, the death of the elector of Bavaria (Dec. 30, 1777) produced the Bavarian war succession. (See *Teschen, Peace of.*) Austria refused, on this occasion, the Inviviertel; but the line of her influence over Germany was perceptible. After this peace, the court of Vienna sought to unite Britain as well as Russia more firmly to it, in order to procure for the archduke Maximilian the electoral dignity of Cologne and the bishopric of Munster, which was at last effected, in spite of the opposition of Frederic II. Thus had Maria Theresa obtained for her three younger sons government of important states: for Leopold, the grand duchy of Tuscany; for Ferdinand, by a marriage with the daughter of the duke of Modena, the possession of that duchy; and for Maximilian, the dignity of elector and bishop of Cologne and Munster. Her six daughters, the two younger were united to kings, namely, of France and Naples; and the house of Austria, which, in 1740, seemed on the brink of ruin, was now, by the internal situation of its states, as well as by its foreign family and other connections, at the very summit of power.

Maria Theresa died Nov. 29, 1780, at the age of 63 years. As a ruler, she was unceasingly active. She loved her children with the deepest tenderness. Her servants she was very kind. The welfare of her subjects was her highest aim. But she lent an

ear too easily to spies and informers, and endeavoured to introduce them into the privacy of families. Her great piety bordered upon enthusiasm, and made her intolerant; hence the pernicious restraint of the press, &c. She wrote two or three books of devotion, of which one was published at Vienna (1774). She sometimes gave way to her passions, yet knew how to control herself quickly. When young, she was one of the handsomest women of her time. In advanced age, she became very corpulent. The small-pox, in 1767, and, soon after, a fall from a carriage, which nearly deprived her of sight, destroyed her beauty. After the death of her husband, she appeared to be sunk in deep melancholy, and neglected her appearance entirely. She deserves to be recorded as an instance of conjugal love. Of sixteen children, which she bore the emperor, ten survived her. The four sons and the two younger daughters, we have noticed above. Of the four elder ones, the first was abbess of Prague and Klagenfurt; the second, Marie Christine (the favourite of her mother), was married to duke Albert of Saxe-Teschen, a son of Augustus III., king of Poland; the third was abbess of Innspruck, and the fourth, wife of the duke of Parma.

MARIANA, JUAN, or JOHN, one of the first Spanish historians, was born at Talavera, 1536, devoted himself to the clerical profession, and entered the society of the Jesuits. At the university of Alcalá, he acquired that pure taste and that eloquence which are found in his writings. He then journeyed, and taught theology, for thirteen years, with distinction, in Rome, Sicily, and Paris. The climate of the latter city, however, and still more his indefatigable industry, undermined his health, so that he returned, in 1574, into the Jesuits' college at Toledo. He now wrote his *Historia de Rebus Hispanis* (first ed., Toledo, 1592), in elegant Latin, that the great deeds of his countrymen might become known to all nations. His tone is impartial, though he ardently loves Spain, and admires Spanish virtue. Though a Jesuit, he complains of pope Alexander VI., and says that he caused Cæsar to leave the clerical order *contra fas, contra auspicia, contra omnia aequilatis jura*. Though a Spaniard, he is not blindly prejudiced for his king. He describes, with sorrow, the conquest of Naples; and his censure of Ferdinand is moderated only by considering his good qualities as personal, his bad ones as common to all princes. His style is elegant, and often beautiful and concise. His freedom excited the suspicions of the inquisition. He has not, however, much claim to originality. Ranke, in his *Zur Kritik neuerer Geschichtschreiber* (Leipsic and Berlin, 1824), says that, having made excerpts of Mariana and Zurita throughout, he hardly found a single instance in which Mariana followed sources peculiar to him. Every thing important appears to have been taken from Zurita, because they agree entirely; and Zurita's work preceded Mariana's considerably, having been dedicated to the deputies of Arragon, in 1579, while the five last books of Mariana's History appeared in 1605. Ranke concludes, therefore, that Mariana cannot maintain a place among the sources of modern history, but admits that his nature and spirit will always render him worth reading. The great success of Mariana's work, and the fear of seeing it badly translated, induced the author to translate it into the Castilian idiom himself, with those improvements which the progress of years had suggested to him. Four editions of the translation appeared during his lifetime, each with corrections and additions. Excellent editions of the Spanish work appeared at Valencia (1785 to 1796, nine vols., folio) and at Madrid (1819, eight vols.) An English translation was made by captain Stephens, the conti-

nuator of Dugdale's *Monasticon* (London, 1699, folio). Mariana's other writings are, 1, his famous essay *De Rege et Regis Institutione*, which exposed the author to much inconvenience, and, eleven years after its publication, was condemned to be burned by the parliament of Paris as a revolutionary work, because it maintains that it is permitted to make way with a tyrant. The original edition of this work has become very rare. 2, *De Ponderibus et Mensuris*. 3, Seven essays, which appeared together in a folio volume, 1609, at Cologne. Mariana dedicated his last years to his *scholia* on the Old and New Testament, the completion of which his infirmities prevented. Yet he caused them to be printed, in 1619, at Madrid. He died in 1623, at Toledo, eighty-seven years old.

MARIANA, or MARIANNE ISLES. See *Ladrones*.

MARIE ANTOINETTE. See *Antoinette*.

MARIEGALANTE; an island in the West Indies, belonging to France; lat. 16° N.; lon. 65° 50' W.; five leagues from Guadaloupe. The chief productions are sugar, coffee, and cotton. Population, 11,778; 1555 whites, and 9529 slaves. It is a dependent of Guadaloupe. Columbus discovered it in 1493, and called it from his vessel. The French occupied it in 1697, and have lost it several times. In 1825, it suffered severely from the hurricane which desolated Guadaloupe.

MARIENBAD (German for *Mary's bath*); a watering-place in the circle of Pilsen, in Bohemia, about thirty miles distant from Carlsbad, in a woody country, ranking with the famous watering-places of Teplitz, Carlsbad, and Franzensbrunn. The mineral wells, at present so important in a medicinal respect, were little known before 1781. See Heidler, *Marienbad nach eignen bisherigen Beobachtungen und Ansichten ditzlich dargestellt* (2 vols., Vienna, 1822).

MARIENBURG; a town on the Nogat, with 5000 inhabitants, in the Prussian government of Dantzic, province of Western Prussia. This town is famous for the ruins of one of the finest monuments of German architecture—the castle of the Teutonic knights. The first castle was finished in 1276, but it was completely rebuilt from 1306 to 1309. The style was truly elevated, accompanied with a rare lightness and elegance of proportions. The ruins have lately been secured from further decay. Much has been written on them: Jacob's *Das Schloss Marienburg* (1819); professor Büsching's *Das Schloss der Deutschen Ritter in Marienburg* (Berlin, 1823, 4to, with seven engravings); and professor Voigt's *Geschichte Marienburg's, mit Ansichten des Ordenshauses* (Königsberg, 1824).

MARIETTE, PIERRE JEAN, born at Paris, 1694, died in 1774, was instructed by his father in the art of engraving, and, by his travels in Germany and Italy, rendered himself familiar with the fine arts. In 1750, he purchased the post of royal secretary and *contrôleur* of the chancery, and devoted himself entirely to his collection of engravings. His works are *Traité du Cabinet du Roi* (1750); *Lettres à M. de Caylus*; *Lettres sur la Fontaine de la Rue de Grenelle*; *Architecture Française*; Descriptions of D'Aguilles's and Crozat's collections, &c. His taste and learning procured him the friendship of Caylus, Barthelemy, and Laborde, by whom he was intrusted with the supervision of the *Recueil des Peintures antiques*, from drawings by Pietro Santo Bartoli.

MARIGNANO, or MELEGNANO; a town in Italy, three leagues and a half south-east of Milan; rendered famous by the victory of Francis I. over the Swiss and the duke of Milan. See *Francis I.*

MARINE. See *Nary*.

MARINE LAW. See *Commercia' law*.

MARINI, or MARINO, GIAMMARCO, stands the head of a school of Italian poets of the present (See *Italy*, division *Italian Poetry*). He was born 1569, at Naples. Against the wish of his father who intended him for the study of law, he followed his inclination for poetry. The duke of Savoy took him into his palace, and the duke of Cosca, high admiral of the kingdom, sent him to Rome, where he became acquainted with Torquato Tasso and in intercourse with him, his powers were improved. At a later period, he found a patron in cardinal Pietro Aldobrandini at Rome, with whom he went to Turin, where a flattering poem, on the duke of Savoy, entitled *Il Ritratto*, procured him a royal reception, an order, the title of the duke's counsellor &c. The envy of his courtiers, and in some humour, involved him in various disputes. His mother, the divorced wife of Henry IV., had come to Paris. After her death, Maria de' Medici was his patroness there. He showed his gratitude in a poem—*Il Tempio*—for which new rewards were bestowed upon him. Towards the end of 1620 he returned to Italy, was elected president of the *Accademia degli Umoristi* at Rome, and, after some time, proceeded to his native place. Here he died the incomparably beautiful Posilippo for his wisdom, and hoped to enjoy the fortune he had acquired, but death removed him in 1625. Marini's most famous work, the epic *Adone*, was first published in 1623, and has been equally praised and blamed for its plan and execution. The voluptuousness of many passages has placed it among the popular books. The other works of Marini are a satirical poem *La Strage degli Innocenti*, and a great number of miscellaneous poems (published at various times, under the titles of *La Lira*, and *La Zampogna*), also *Lettere* grave, argute, facetie, and other compositions in prose and verse. Some of his verses are among the most perfect in the Italian language. He who has read Marini—and there are many who condemn him without having done this—will readily admit that nature endowed him with the gifts of a poet, but ambition made him fail. For the pursuit of the laurels of Ariosto and Tasso and even after a new distinction, attempted to penetrate into the recesses of the human heart, to estimate the beauty of the beautiful, and to give an exact and voluptuous description; hence the number of his colouring; hence his far-fetched metaphors and forced conceits; yet, in spite of these, there is still and the power of imparting new charms to common things, cannot be denied him; but the fault of a master became insupportable in his followers, who could imitate indeed his conceits, but could not deem them by flashes of genius.

MARINO, SAN, an Italian republic, in the duchy of Urbino, is the smallest state in Europe. In the fifth century, a stone-mason, named Marini, established himself in a hermitage on the hill occupied by the town. His followers were so numerous as to constitute an independent community which received its name from the hermit. The mountain on which the town stands, the republic possesses two adjoining hills, the whole territory covering an extent of about thirty square miles, comprising, in the capital and four villages, 10,000 inhabitants. The territory is industriously and well cultivated, and yields fruits, silk, oil, wine, &c. The capital is situated on the summit of a mountain accessible only by one narrow road, and surrounded by walls. The government is in the hands of a council of 300 elders, and an executive council of twenty-five, consisting of twelve patricians, twenty burghers, and twenty *gonfalonieri*, elected quarterly, are at the head of the executive. The laws are collected in a code of

*Statuta Illustrissima Reip. S. Marini.*—See Valli, *Origine e Governo di San Marino* (1655); Dellico, *Memorie di S. Marino* (1804); Sinoud's *Travels in Italy*.

MARIONETTES. See *Puppetshows*.

MARI TIME LAW. See *Commercial Law*.

MARIUS, CAIUS; a Roman of Arpinum, in the territory of the Volsci, born of obscure parents, whom he assisted in the labours of the field. With strength of body he united much understanding, firmness of purpose, and a spirit of enterprise. His character was rough, ambitious, and unyielding. Marius devoted himself to a military career, and gave the first proofs of his courage at Numantia, under Scipio Africanus. His merits successively raised him through the different ranks, and Scipio foresaw in him a great general. During the consulship of Cæcilius Metellus and L. Aurelius Cotta, he was made tribune by the influence of the former. In order to check the abuses at the Comitia, he proposed the law making the entrance to the place of voting narrower, so as to protect the citizens from the solicitations of the candidates and their friends (*lex Maria*). The patricians, indignant at a law so injurious to their influence, demanded of Marius an explanation of his motives. The two consuls declared against him; but Marius threatened them with the weight of his tribunitial authority, and, without regard to his obligations to Metellus, ordered the lictor to conduct the consul to prison. His firmness triumphed, and gained him the favour of the people. He afterwards modified the law proposed by Gracchus for the division of corn among the poor citizens, so as to spare the public treasury. He then stood candidate for the edileship, but without success. He was, however, appointed prætor. Having been charged with procuring his election by bribery, he was acquitted, and discharged the duties of his office to general satisfaction, supplying the deficiencies of his education by the natural strength of his understanding. The office of proprætor of Spain, which was conferred on him the following year, he discharged with great reputation. He delivered the country from robbers, and endeavoured to civilize the yet savage natives. On his return, he again devoted himself to political affairs; and by his marriage with Julia, the daughter of Julius Cæsar, connected himself with the illustrious Julian family.

A wilder career was now open to him. He accompanied the consul Q. Cæcilius Metellus, as his lieutenant, to the Jugurthine war. His courage and patience in hardships, in which he placed himself on a level with the meanest soldier, gained for him the esteem of Metellus and the love of the army. But Marius was so ungrateful as to vilify the man who had raised him from obscurity, in order to rise himself. Their hatred increased daily. At length Marius asked permission of Metellus to return to Rome, in order to seek for the consulship. Metellus, not without ridicule, refused his request; but Marius continued his importunity, till he obtained object, a few days before the election of the consuls.

In six days he hastened to Rome, and, by promises against Metellus, and the most extravagant promises, he gained over the minds of the people completely, that he was chosen unanimously; and, though Metellus had been appointed proconsul of Africa for the third time, he obtained the command of the province (B. C. 108). L. Cassius Longinus

his colleague in the consulship. As Marius perceived that his plebeian origin would never permit him to gain the support of the patricians, and that he could expect nothing but from a powerful party among the common people, he declared himself the enemy of the nobles. In proportion to the violence

with which he attacked the nobility in his public speeches, was the favour of the populace. As the rich refused to enrol themselves in his legions, in order to complete the number, he had recourse to the lowest class of citizens, who had previously been employed only in cases of the most pressing necessity, and taught the Roman people to enrich themselves by the service. With the speed of lightning, he appeared in Utica, and began the campaign.

In the mean time, Jugurtha had found an ally in Bocchus, king of Mauritania. Two armies opposed the Romans. Marius avoided a general engagement till he was forced to yield to the impatience of his men. He then directed his march through the deserts of Numidia to Capsa, the capital of the country, which he stormed and destroyed. Terrified by this cruel example, every place which he approached surrendered. While Marius was prosecuting the war, L. Cornelius Sylla, the quæstor, arrived with a reinforcement of cavalry, and, by his courage, his perseverance against obstacles, and his austere manner of living, gained the friendship of his commander. After the capture of Mulucha, Marius led his troops back to the sea-coast, in order to place them in winter quarters. On this march, Bocchus and Jugurtha attacked him, and surrounded him in his intrenchments. The Romans seemed to be lost; but, during the night, Marius fell upon the enemy, exhausted with dancing and revelry, and almost entirely destroyed them. After this defeat, Bocchus made his peace with the Romans, and was persuaded by Sylla to betray Jugurtha to them. Marius divided a part of Jugurtha's territory between Bocchus and Hiempsal II., or Mandrestal, and made the remainder a Roman province. Before his return to the capital, he received the unexpected information that he was chosen consul the second time. The people, terrified by the approach of the Cimbri and Teutones, had chosen him contrary to the laws. Marius received in Rome the honour of a triumph. He then marched over the Alps to Gaul, while C. Fulvius Fimbria, his colleague, went to Upper Italy. The Cimbri and Teutones, instead of passing into Italy, had invaded Spain, and thus given Marius an opportunity to discipline his army. As the terror of the Cimbri was unabated, he was made consul a third and fourth time in succession. The barbarians at length returned from Spain, and threatened to invade Italy from two sides. Marius stationed his army at the confluence of the Rhone and the Isère, while his colleague Lutatius Catulus was to take his position at the foot of the Norican Alps. As it was impossible for ships to enter the mouths of the Rhone, he constructed a canal, the Fossa Mariana, uniting the waters of the Rhone with the Mediterranean, to supply the army with provisions from the sea. This work was scarcely finished, when the Teutones, with the Ambrones, pitched their camps opposite to the Romans. Marius hesitated to meet in the open field so superior a force; and, by cutting off their means of subsistence, he hoped, if not to destroy, at least to weaken, them. But the barbarians determined to continue their course, without regard to the Roman army. Marius pursued and overtook them at Aquæ Sextiæ. He first attacked the Ambrones, and, on the next day the Teutones, and destroyed both armies (B. C. 102).

On the report of this victory, messengers were sent from Rome, to inform him that he was appointed, for the fifth time, to the consulship, and that the honour of a second triumph was decreed him. The latter, however, he would not accept until he had made himself worthy of it by the defeat of the Cimbri. These barbarians had entered Italy on the east: Marius united his forces with those of Lutatius, and marched against them. They then sent an em-

bassy, requesting a grant of territory in which they might reside. But Marius scornfully announced to them the total destruction of their allies. Exasperated by this news, the Cimbri advanced to meet him. Bojorix, their king, called upon Marius, to fix upon a time and place for a decisive engagement. He selected a plain called *Campi Raudii*, not far from Vercelli, which would not allow the Cimbrian army (300,000 foot and 15,000 horse) to avail themselves fully of their superiority of numbers. The Roman army was 52,000 strong. Marius reserved to himself the chief attack, but the battle was decided by Lutatius and Sylla. The defeat of the barbarians was complete: 150,000 fell, 60,000 surrendered, and the remainder preferred a voluntary death to slavery (B. C. 101). Marius and Lutatius entered the city in triumph.

The victorious general was appointed consul for the sixth time, although the noble Metellus Numidicus was his rival. He now entered into a combination with the tribunes of the preceding year: Apuleius Saturninus and the prætor Servilius Glaucia, and, in connexion with them, employed every means to gain the people, and deprive the patricians of their privileges. This was effected chiefly by the law, that every order of the people should be confirmed by the senate, within five days after its promulgation. The senators were compelled to swear obedience to this law; and Metellus, refusing to do it, was punished with exile. In the mean time, Marius had become an object of suspicion to both parties, by his ambiguous conduct, and on the next consular election, he was not rechosen. Saturninus and Glaucia were the victims of popular fury.

Chagrined at the recall of his enemy Metellus, Marius went to Asia, under pretence of performing a vow to Cybele, but, in reality, to gain new importance by kindling a new war. On his return, he was astonished to find himself almost entirely forgotten, and Sylla the favourite of the people. His hatred was excited, and a civil war would have been the consequence, if the consuls had not checked it in its commencement. Soon after this, the social war broke out. Marius gained a few victories in an inferior command, but acquired less reputation than might have been anticipated. His strength was broken by age and sickness, and, in the midst of the war, he resigned his office. This dangerous contest was hardly closed, when the civil war broke out between Marius and Sylla. They were both candidates for the command against Mithridates. The consuls favoured Sylla. P. Sulpitius, tribune of the people, who favoured Marius, attacked them sword in hand, and drove Sylla from Rome. Marius received the chief command; but the army marched to Rome under his rival, where Marius was committing the greatest violences against the friends of Sylla. Sylla entered the city without resistance. Marius and his son fled, and were proscribed. Separated from his son, Marius wandered about on the coasts of Italy, and, after escaping several times the pursuit of his enemies, was found by some horsemen in a marsh. He was conducted naked to Minturnæ, where the magistrate, after some deliberation, resolved to obey the orders of the senate, and of Sylla. But the Cimbrian slave, to whom the execution was intrusted, awed by the look and words of Marius, dropped his sword, and the people of Minturnæ, moved with compassion, conducted him to the coast, whence a vessel conveyed him to Africa. He landed amid the ruins of Carthage, and joined his son, who had sought assistance in Numidia in vain. They spent the winter together in the island of Cercina. When they received information that their party had once more triumphed in Italy, by means of Cinna,

Marius hastened to return. He declined the honours offered him, and united himself with Cinna and Sertorius. They resolved to attack the city, which was defended by Octavius. Provisions and water falling in the city, the senate, therefore, chose to throw open the gates, on condition that Cinna should be put to death without trial. This was granted. Marius was at first unwilling to enter the city, till the act of proscription upon him was repealed. But while the citizens were assembled to rescind the act, he entered with a mob of followers, and in violation of the condition, a dreadful massacre took place, to which Cinna and Cinna finally put an end. He had given orders for the death of every one whose name was on the list, not return. Almost all the senators, so opposed to the popular party, were put to death, and their estates confiscated. When the term of his consulship was completed, he declared himself Marius consul. Marius was now seventy years of age, and enjoyed this dignity for the second time, but seventeen days after he died (B. C. 86), exhausted by his preceding sufferings, and by the anxiety which the threats of Sylla occasioned.

MARIVAUX, PIERRE CHARLES DE CASTEL-DE; a novelist and dramatic writer, born at Paris, 1688. He was led by his inclination to write for the theatre; and, thinking that new was to be done in the way of dramatic poetry, he wrote comedies of intrigue. At the time of his appearance, his dramas were popular: but they only have remained on the stage. His characters want life, his plots variety. The development of the intrigue is so simple, that the dramatic is discoverable from the beginning. He is so tractable, and affected, that the French have given to him a conceit and affectation of manner, a *marivaudage*. Among his other productions the best is his *Vie de Marianne*, which shows a number of interesting situations, faithful delineation of a tenderness of sentiment; *Le Payan philosophe*, *Philosophe indigent*, &c., are not of much merit. The same forced and concerted style is displayed in his theatrical productions, prevalent in that century. He became a member of the French Academy in 1743, and died in 1763.

MARJORUM (*origanum*): a genus of plants, two or three species of which are cultivated in gardens, and used for culinary purposes. They are very agreeable aromatics, and diffuse a strong and pleasant odour.

MARK, COUNTY OF, in the former county of Philadelphia, at present in the Prussian province of Pennsylvania, government of Minden, contains 15 square miles. Part of it is extremely fertile, and very productive. It affords much iron-ore and coal, which furnish fuel for the many manufactures of a kind of wares of metal. About 5000 people are engaged in manufacturing. In 1904, the population amounted to 133,000. In 1907, the county of Mark was added to the grand duchy of Hesse, and now the greater part of the department of the Ruhr. In 1813, it reverted to Prussia.

MARK. See *Marches*.

MARK ANTONY. See *Antony*.

MARK, THE EVANGELIST; according to the old ecclesiastical writers, the person known in the Acts of the Apostles by the name of Jude Barsabbæus, was, for many years, the companion of Paul and Peter on their journeys. His mother Mary was generally in the train of Jesus, and his home at Jerusalem was open constantly for the reception of the apostles. He was himself present at a number of the events which he relates, and received his information partly from eye-witnesses. His gospel

plainly intended for Christian converts from paganism. It is not certain, however, whether it was first read at Rome or Alexandria, where he had established churches, or at Antioch. He is distinguished from the other evangelists by his brevity, passing over much that relates to the character of Christ as Messiah, which could be important only to Jewish converts. The genuineness of his gospel has never been questioned on any good grounds.

MARK, or MARC, denotes a weight used in several parts of Europe, and for several commodities, especially gold and silver. When gold and silver are sold by the mark, it is divided into 24 arats.—*Mark* is also, in England, a money of account, and in some other countries a coin. The English mark is two thirds of a pound sterling, or 3s. 4d., and the Scotch mark is of equal value in Scotch money of account. For the mark-banco of Hamburg, see *Coins*.

MARK, LIBRARY OF ST. See *Venice*.

MARK, ORDER OF ST.; a Venetian order, the origin of which is not known. The doge, as well as the senate, elected knights of St Mark, who enjoyed a pension. Foreigners, also, particularly scholars, were elected.

MARK, PLACE OF ST. See *Venice*.

MARKLAND, JEREMIAH, an eminent critic, was born in 1693, and received his education at Cambridge. In 1717, he obtained a fellowship in that university, which he held until his death in 1776. His time was devoted to his favourite studies, uninterrupted by any avocations but those of a college and travelling tutor. His principal works are, an edition of the *Sylva* of Statius; Notes on Maximus Tyrius; Remarks on the Epistles of Cicero to Brutus, and of Brutus to Cicero; with a Dissertation upon four Orations ascribed to Cicero; an edition of the *Supplices* of Euripides; to which was annexed a tract *De Græcorum quintâ Declinatione*, and other philological works.

MARLBOROUGH, DUKE OF. See *Churchill*.

MARL. Compact limestone (q. v.), by increase of argillaceous matter, passes into marl. Marl is essentially composed of carbonate of lime and clay, in various proportions. But some marls are more or less indurated, while others are friable and earthy. In some, the argillaceous ingredient is comparatively small, while in others it abounds, and furnishes the predominant characters. The calcareous and argillaceous marls unite by imperceptible degrees, and the latter sometimes pass into clay. Marl frequently contains sand and some other foreign ingredients. We divide marls into calcareous and argillaceous, and into indurated and earthy. The hardness of indurated marl is inconsiderable. In most cases, it may be scratched by the finger nail, and may always be easily cut by a knife. It has a dull aspect, like alk or clay, often with a few glimmering spots arising from sand or mica. Its fracture, usually earthy, is also be splintery or conchoidal. It is opaque; colour commonly gray, often shaded with yellow, red, brown, black, &c. It also presents shades of green, and is sometimes reddish or yellowish-brown. Specific gravity usually between 2.3 and 2.5. It occurs in masses either compact, or possessing a slaty structure. All solid marls crumble by exposure to the atmosphere, usually in the course of a year, but sometimes a longer period is requisite. The same changes generally take place in a very short time, when the marl is immersed in water, in which it forms a short paste. It crumbles very easily, and forms a more tenacious paste in proportion as it becomes more argillaceous. It is very much more or less easily fusible. All marls effervesce with acids, sometimes very briskly, and sometimes feebly, according to their solidity and the pro-

portion of carbonate of lime, which may vary from 25 to 80 per cent.; indeed, in the argillaceous marls, it is often much less. Earthy marl differs from the preceding by being more or less friable, or even loose; but they gradually pass into each other. Like the indurated marl, it may be either calcareous or argillaceous. It sometimes greatly resembles clay, but may be distinguished by its effervescence in acids. Marl, like clay, belongs both to secondary and alluvial earths, where it occurs in masses or in beds. Hence it is found associated with compact limestone, chalk, gypsum, or with sand or clay. It contains various organic remains, as shells, fish, bones of birds and of quadrupeds, and sometimes vegetables. The organic remains are numerous and extremely interesting in the marly strata examined by Cuvier and Brogniart in the vicinity of Paris. Marl is found more or less in most countries. Its most general use is as a manure. The fertility of any soil depends in a great degree on the suitable proportion of the earths which it contains; and whether a calcareous or an argillaceous marl will be more suitable to a given soil, may be determined with much probability by its tenacity or looseness, moisture or dryness. To employ marls judiciously, therefore, the farmer should be in some degree acquainted with the chemical properties or constituent parts of the marl itself, and with the ingredients of the soil. He may, in general, determine the existence of marl by its falling into powder, when dried, after exposure to moist air. To ascertain the proportion of its ingredients, the calcareous part may be extracted from a given weight of the marl, by solution in acids, and the residue, being dried and weighed, will give the quantity of clay with sufficient accuracy. See *Manures*.

MARLOWE, CHRISTOPHER; an eminent English poet and dramatist of the Elizabethan age, was educated at Cambridge, whence he proceeded M. A. in 1587. He afterwards settled in London, and became an actor, as well as a writer for the stage. Besides six tragedies of his own composition, and one written in conjunction with Thomas Nashe, he left a translation of the Rape of Helen, by Coluthus; some of Ovid's Elegies; the first book of Lucan's Pharsalia; and the Hero and Leander of Musæus, completed by George Chapman. The exact time of his death is not known; but, according to Anthony Wood, it took place previously to 1593, and was owing to a wound received from the hand of a servant man, whom he had attacked on suspicion of being rivalled by him in the favours of a mistress.

MARLY, MARLY-LE-ROI, or MARLY-LA-MACHINE; a village of France, 1½ league from Versailles, on the edge of the forest of the same name. It still contains some fine country seats; but the royal castle built by Louis XIV., and the beautiful gardens attached to it, no longer exist, having been destroyed during the revolution. It is now remarkable only for its water-works for supplying Versailles with water. The celebrated machine, which conducted the water over the Seine, having fallen to decay, its place is supplied by a forcing pump, which raises the water 500 feet, and an aqueduct of thirty-six arches.

MARMONTEL, JOHN FRANCIS; a distinguished French writer, was born in 1723, at Bort, a small town in the Limousin. He was the eldest son of a large family, the offspring of parents in an humble situation of life; but his mother, a woman of sense and attainments much superior to her rank, favoured his ardour for mental cultivation; and by her influence he was sent to the Jesuits' college of Mauriac. At the age of fifteen, his father placed him with a merchant at Clermont; but having expressed his dislike of this occupation, he was enabled to obtain

admission into the college of Clermont, where he gradually acquired pupils; and his father soon after dying, he showed the goodness of his heart, by taking upon himself the care of the family. He subsequently engaged as a teacher of philosophy, in a seminary of Bernardines, at Toulouse, and became a distinguished candidate for the prizes at the Floral games, which acquired him the notice of Voltaire, who recommended him to try his fortune at Paris. He accordingly arrived there in 1745, and, after experiencing some vicissitudes, brought out a tragedy in 1748, which at once raised him into competence and celebrity; and, having been recommended to the king's mistress, madame Pompadour, he was appointed secretary of the royal buildings, under her brother, the marquis de Marigny. Having distinguished himself by writing some of his well-known tales, to assist his friend Boissy, then intrusted with the *Mercure de France*, on the death of the latter, it was given to him, and resigning his post of secretary, he took up his abode with madame Geoffrin. He subsequently lost the *Mercure de France*, by merely repeating, in company, a joke upon the duke d'Aumont, and was committed to the Bastille, because he would not give up the real author. In 1763, after much opposition, he succeeded Marivaux as a member of the French academy. His next literary production was *Bélisaire*, which, in consequence of its liberal sentiments in favour of toleration, was censured by the Sorbonne, and widely read in every country in Europe. In order to benefit Grétry, he worked up several little stories into comic operas, which were all acted with great success. On the death of Duclos, he was appointed historiographer of France. He took part in the celebrated musical dispute between Gluck and Piccini, as a partisan of the latter. In 1783, on the death of D'Alembert, he was elected secretary to the French academy. On the breaking out of the revolution, he retired to a cottage in Normandy, where he passed his time in the education of his children, and the composition of a series of tales of a more serious cast than his former ones; together with his amusing *Memoirs of his own Life*. In April, 1797, he was chosen member of the council of elders; but, his election being subsequently declared null, he again retired to his cottage, where he died of an apoplexy, in December, 1799, in the seventy-seventh year of his age. Marmontel holds a high place among modern French authors. Warm and eloquent on elevated subjects; easy, lively, inventive, and ingenious on light ones, he addresses himself with equal success to the imagination, the judgment, and the heart. His *Contes Moraux*, in general, inculcate useful and valuable lessons, but their morality is sometimes questionable. Some of his didactic works in prose, continue to be highly esteemed, and more especially his course of literature inserted in the *Encyclopédie*. Since his death, besides his own memoirs, there have appeared *Memoirs of the Regency of the Duke of Orleans* (printed from his MS., in 2 vols., 12mo). The works of Marmontel have been collected into an edition of thirty-two volumes, octavo.

**MARMORA**, SEA OF, anciently the Propontis; a sea between Europe and Asia, about sixty leagues in length, and twenty in its greatest breadth. It communicates to the S. W. with the Archipelago, by the Dardanelles, and with the Black sea to the N. E. by the straits of Constantinople. Constantinople lies on its western shore. The tides are hardly perceptible, the navigation easy. A current sets from the Black sea into the sea of Marmora, which, in turn, runs into the Archipelago.

**MARMOT** (*arctomys*); a genus of small quadrupeds, somewhat resembling the rat, with which they

were classed by Linnæus. They have two incisors in each jaw, and ten grinders in the upper, and in the lower jaw; four toes, and a claw on the first of a thumb, on the fore feet, and five on the hind.

There are several species, the most common of which are the Alpine marmot, *M. flaviventris*, the size of a rabbit, with a short tail of a greyish-yellow colour, approaching to brown on the head. This species inhabits the mountains of Europe, just below the region of perpetual snow. It feeds on insects, roots, and vegetables. Various animals (which live in societies) are more or less a sentinel, who gives a shrill whistle on the approach of any danger, when they all retire into their rows, which are formed in the shape of the letter M, and well lined with moss and hay. They pass these retreats, in a torpid state, from the middle of April. They are easily tamed.

The Quebec marmot (*M. campbelli*), inhabits the northern part of the American continent. It is not a solitary animal, dwells in burrows, and is not a but has the faculty of ascending trees. Its burrows are almost perpendicular, and extend a considerable distance from the water. When killed, sometimes eaten. Its fur is of no value.

Woodchuck (*M. monax*). This species is also known by the name of ground hog, and is found in all the Middle States of America, in great numbers, and making burrows in the sides of fields. It extends a considerable distance, and forms chambers lined with dry grass, leaves, &c. It feeds on vegetables, and are very fond of potatoes. They are capable of being tamed, and are very common. The female produces six young at a birth.

There are many other marmots inhabiting America which have been considered as belonging to the sub-genus *spermophilus*. The most common of these is the Prairie dog, or *Worm-eating marmot* (*M. flaviventris*). It has received the name of prairie dog, from a supposed similarity between its sound and the barking of a small dog. They live in great communities; their villages, as they are called by hunters, sometimes being many miles apart. The entrance to each burrow is at the end of a mound of earth thrown up, during the progress of the excavation below. The hole descends to the depth of one or two feet, and then continues in an oblique direction. The marmot, the rest of the species, becomes torpid in winter, and, to protect itself against the cold of the season, stops the mouth of its burrow with a neat globular cell at the bottom of the entrance, made of dry grass, so compactly put together, that it is rolled along the ground almost as hard as stone. Other American species of this sub-genus are *M. guttatus*, *Richardsoni*, *Franklini*, *Burtoni*, *glans*, *lateralis*, *Hoodi*. See Richardson, *Fauna Bor.* and Goodman's *Nat. Hist.*

**MARNE**, a river of France, rises near Paris, runs about 220 miles, and enters the Seine a few miles above Paris.

**MAROCÇO**. See *Morocco*.

**MARONITES**; a sect of Eastern Christians whose origin was a consequence of the Maronite controversy. In the seventh century, the sect of Christ, though he united to himself the divine and human nature, had but one will. A controversy arose among the Eastern nations, and was settled by several emperors, particularly Heraclius, when their last patron, the emperor Philip the Arab, died, in 713, the Monothelites were banished by his successor, Anastasius. The sect of this party survived in the Maronite sect, which from their founder Maron—a sect of monks from Syria, about mount Lebanon, which is now a

early as the sixth century. Another monk, John Maro, or Marum, also preached Monothelitism there in the seventh century. Regarded as rebels by the Melchites, or Christians who adhered to the opinions of the emperor, they became, in the country of Lebanon, which is now called *Kesruan*, a warlike mountain people, who defended their political as well as their religious independence boldly against the Mohammedans, and who, even now, under the Turkish government, resist the payment of a tribute, like the Druses. The political constitution of the Maronites is that of a military commonwealth. Governed by their ancient customary rights, defended from external attacks, they support themselves, among the mountains, by husbandry and the produce of their vineyards and mulberry-trees. A common spirit unites them. In simplicity of manners, temperance, and hospitality, they resemble the ancient Arabians. Revenge for murder is permitted among them, and, as a sign of nobility, they wear the green turban. Their church constitution resembles very much that of the old Greek church. Since the twelfth century, they have several times submitted to the pope, and joined the Roman Catholic church, without giving up their own peculiarities. At last, Clement XII. induced them to accept the decrees of the council of Trent, at a synod held in 1736, at their convent of Marhanna. Till that time, they had received the sacrament under both forms. After this synod, their priests still retained the right to marry, after the manner of the Greek church. The use of the Arabic language was preserved in the church service. Mass, only, was read in the ancient Syriac. Their head is called the *patriarch of Antioch*, although his residence is in the monastery of Kanobin, upon mount Lebanon, and he gives an account, every ten years, to the pope, of the condition of the Maronite church. Under him are the bishops and other clergymen, who form seven degrees of rank. In Kesruan are over 30 Maronite convents and nunneries, which profess the rule of St Antony, and devote themselves to agriculture and gardening. Since 1548, there has been a Maronite college established at Rome, for the education of clergymen; yet neither this establishment, nor the mission of papal nuncios, has effected an entire incorporation of this sect with the Romish church; and those in Kesruan, as well as the large numbers at Aleppo, Damascus, Tripoli, and in Cyprus, still retain their ancient habits, and some even their ancient liturgy.

**MAROONS**; the name given to revolted negroes in the West Indies and in some parts of South America. The appellation is supposed to be derived from Marony, a river separating Dutch and French Guiana, where large numbers of these fugitives resided. In many cases, by taking to the forests and mountains, they have rendered themselves formidable to the colonies, and sustained a long and brave resistance against the whites. When Jamaica was conquered by the English, in 1655, about 1500 slaves retreated to the mountains, and were called *Maroons*. They continued to harass the island till the end of the last century, when they were reduced by the aid of bloodhounds. See Dallas's *History of the Maroons*.

**MAROT, CLEMENT**, a French epigrammatist and writer of light lyrical pieces, from whom the French date the beginning of their poetry, born at Cahors, 1505, went to Paris as page of Margaret of France, Duchess of Alençon, whose brother Francis I., he afterwards accompanied to the Netherlands. His court with the beautiful Diana of Poitiers is well known. In 1525, having followed the king to Italy, he was wounded and made prisoner in the battle of Pavia. After his return to Paris, he was suspected of being favourable to Calvinism, and was thrown

into prison. His time, during his confinement, was spent in preparing a modernized edition of the Romance of the Rose, and the king finally set him at liberty. His connexion with Margaret, now queen of Navarre, with whom he had quarrelled, was renewed, but could not protect him from new difficulties on account of his religious sentiments, and he fled to Italy, and thence to Geneva (1543), where Calvin succeeded in making him a proselyte to the new doctrines. He soon recanted his profession of faith, returned to Paris, and, not long after, again fled to Turin, where he died in 1544. Marot had an agreeable and fertile fancy, a lively wit, with a certain levity of character. All his poems, even his translation of the Psalms, made in conjunction with Beza, and for a long time used in the Protestant churches in France, are in an epigrammatic manner. Nature and *naïveté* are the characteristics of his style, called, by the French, *style Marotique*. His works have been repeatedly printed, with those of his father, John, and his son, Michael. They appeared by themselves (Paris, 1824), with his life and a glossary.

**MARPURG, FREDERIC WILLIAM**, a German musician of eminence, born at Seelhausen, in the Prussian dominions, in 1718. He passed some portion of his youthful years in the French metropolis, and, on his return to his native country, acted in the capacity of secretary to one of the ministers at Berlin, in which capital he was afterwards placed by the government at the head of the lottery department. He was the author of many valuable works connected with the science of music, especially of a history of the organ from the earliest antiquity, replete with information, but which he unfortunately did not live entirely to complete. Among his numerous writings are the Art of Playing on the Harpsichord; a Treatise on Fugue (Berlin), considered by Kollman to be the most profound and masterly work of the kind in the German language; Historical and Critical Memoirs to promote the Study of Musical History, a periodical work, filling five octavo volumes; a Manuel of Thorough Bass and Composition; Elements of the Theory of Music; Introduction to the Art of Singing; Introduction to the History and Principles of Ancient and Modern Music; Critical Letters on Music (2 vols.); Essay on Musical Temperament; besides a vast number of single songs, odes, &c. His death took place at Berlin, from a consumption, in 1795.

**MARQUE, LETTER OF.** See *Letter of Mart*.

**MARQUESAS, MARQUIS OF MENDOZA'S ISLANDS, or MENDOCA ISLANDS**; a cluster of five islands in the South Pacific ocean, first discovered by Mendoc, a Spaniard, in 1597, and visited by captain Cook, in 1774. The trees, plants, and other productions of these isles, are nearly the same as at Otaheite and the Society isles. The refreshments to be got are hogs, fowls, plantains, yams, and some other roots; likewise bread-fruit and cocoa-nuts; but of these not many. The inhabitants are the finest race of people in this sea. The affinity of their language to that spoken in Otaheite and the Society isles, shows that they are of the same nation. The men are punctured or tattooed from head to foot. Lieutenant Paulding, in his account of the cruise of the United States' schooner Dolphin among the islands of the Pacific ocean (New York, 1831), says, "The men of the Marquesas were in general quite naked; but few ornaments were worn by either sex. A few were tattooed all over; others but slightly. Some had pricked into their flesh, fish, birds, and beasts, of all kinds known to them. Others were tattooed black, even to the inner part of their lips. There are men who pursue tattooing as a regular business. The men are finely formed,

large, and active. Their teeth are very beautiful. A plurality of wives is not admitted among them. The only arms now generally used are muskets." Population of the group, vaguely estimated at 50,000. Lon. 138° 45' to 140° 30' W.; lat. 8° 30' to 10° 30' S.

**MARQUETRY** (French, *marqueterie*, *marqueter*, to inlay); inlaid cabinet work, in which thin slices of different coloured wood, sometimes of ivory, pearl, shell, or metal, are inlaid on a ground. Works in which black and white only are employed, are called *Morescoes*. Marquetry in glass, precious stones, or marble, is more commonly called *Mosaic*.

**MARQUETTE**, JOSEPH, a French Jesuit, and missionary in North America, after having visited the greater part of Canada, was sent, by the French authorities, in company with Joliette, to examine the situation and course of the Mississippi. Marquette and his party (1673) ascended the Outagamis from lake Michigan, and descending the Wisconsin, reached the Mississippi, and proceeded as far as the mouth of the Arkansas. Their voyage left little room to doubt that it emptied into the gulf of Mexico, and, not thinking it prudent to continue their course, they returned to lake Michigan, by the Illinois. Marquette remained among the Miamis till his death, in 1675. This event caused his discoveries to be lost sight of until they were again brought into notice by La Salle. (q. v.) Marquette's relation was published by Thévenot (1681), in a supplement to his *Recueil de Voyages*.

**MARQUIS**, **MARQUESS** (in middle Latin, *marchio*; Italian *marchese*; French, *marquis*; German, *markgraf*); a title of honour, next in dignity to that of duke, first given to those who commanded the marches (q. v.). Marquises were not known in England, till King Richard II., in the year 1337, created his great favourite, Robert Vere, the earl of Oxford, marquis of Dublin. The title given a marquis, in the style of the heralds, is *most noble and potent prince*.

**MARRIAGE**.\* No social relation is more universally established than matrimony, resting, as it does, on the fundamental principles of our being, and giving rise to the primary element of all social order and civilization—the domestic connexions. Misguided philosophers and fanatic sects have, indeed, at different times, preached against it, and even suspended its exercise, in a limited circle, for a limited time; but such a violation of the order of nature was necessarily brief. As marriage is a connexion existing in all ages, and probably in all nations, though with very different degrees of strictness, it constitutes one of the most interesting phenomena for the inquirer into the various manifestations and different developments of the common principles of our nature. In almost all nations, the day of marriage is celebrated with religious ceremonies. Nothing is more natural than to pray for the blessing of Heaven on such a union, and the prayer of a priest is generally esteemed, in the early ages of nations, as most efficacious. With the most ancient inhabitants of the East, the bride was obtained by presents made, or services rendered, to her parents. (See *Jacob*.) To this day the same practice prevails among the Circassians, and the poorer Turks and Chinese. Respecting the customs of the ancient Persians, Babylonians, Indians, and other inhabitants of Asia, the ancient writers have left us little or no information. It is only known that polygamy was customary with them. The women lived in harems, yet they were probably not so restricted as at pre-

sent; at least, it was customary for every woman in Babylon, once in her life, to give herself up to any stranger, in the temple of the goddess of love. In Syria and the other countries of Western Asia, girls served, for several years, in the temple of the Asiatic Aphrodite, and bestowed the favours on the visitors of the temple. In India, and other countries of Upper Asia, the first object of a woman, immediately after marriage, brought to the Bramins. This connexion with the priests was sought for with prayers and gifts. Under the Egyptians practised polygamy is common. Herodotus maintains that it existed among all the nations except the priests; Herodotus denies it. A custom existed in Assyria (according to Herodotus in Thrace): the marriageable girls were sold by public auction, and the money thus received furnished marriage portions for those whose charms were not sufficient to attract purchasers.

With the ancient Hebrews, the wedding lasted ten or twelve months after the betrothment, and was called *mishteh* (i. e. festival meal). From the time of Moses, polygamy was prohibited; and if a man and others took several wives, they rendered themselves guilty of a violation of the law, particularly if these wives were foreigners. The Hebrews married, as the Jews even now do, very young. On the day of the wedding, the bridegroom, dressed, anointed and ornamented, accompanied by a band (*paranymph*), and followed by several companies, entered the house of the bride, and conducted her into it, and followed by her companions, with song and music (at a later period also with torches, as in his or his father's house, where the wedding feast was celebrated at his expense (generally for seven days; if a widow was married, only for three), at which the bridegroom appeared with a crown; the bride, likewise, wore a high golden crown, resembling the pinnacle of a wall (see Hirt, *De Corona* ap. Her. Sept. Jena, 1740, 4to), and the conversation was enlivened by songs and enigmas.—See Zorn, *De Cer. vet. Hebr. Nupt.* (Hamburg, 1722, 4to). The duty of the *paranymph* was, to play the part of the best man in the room of the bridegroom, and to do as he ordered him (*John* iii. 29; ii. 9; *Judges* xiv. 25). Men and women took their meals separately, and had also their separate entertainments. The rapid familiarity seems to have consisted in pronouncing a blessing over the couple. After the wedding meal, the bridegroom and bride were led, yet still veiled, into the bridal chamber, where the bridemaids accompanied them with torches and song; hence the parable of the ten virgins, who took their lamps in order to meet the bridegroom. If the examination made by the matrons the next day led to the conclusion that the wife had not been previously chaste, she was stoned.—Compare Hirt, *De Nuptiis* (Jena, 1754, 4to).

The wedding ceremonies of the modern Jews deviate considerably from those of their forefathers. The rabbies, indeed, maintain that they follow strictly the ceremonies observed at the wedding of Tobias, though the Bible says nothing of the greater part of them. The Jews marry very young, and hold it a direct sin against the commandment to "be fruitful and multiply," if they are not married in their eighteenth year. Marriage is permitted to males at the age of thirteen years and one day, if they appear to have reached the age of puberty. Girls may marry at the age of twelve years and one day, under the same condition. If the signs of maturity are wanting, or evident impotency exists, Jews are not permitted to marry until the thirty-fifth year. Barrenness is esteemed a great misfortune with them, as with the Arabians, and

\* For the legal relation between husband and wife, in modern civilized countries, see the article *Husband and Wife*.

most, perhaps all, Oriental nations, and perhaps we might say, all nations living in a state in which the natural feelings are unchecked. After the suitor has obtained the consent of the girl and her guardians, the betrothment takes place with certain ceremonies. The bridegroom pays (or, at least, formerly paid) a *morning gift*, so called—a remnant of the custom of buying the daughter from the father. The wedding is not allowed to take place on Saturday (Sabbath), and was usually performed on Wednesdays, because Thursday was a day of justice, and the husband would immediately go to court, and ask for a divorce, in case the signs of virginity had been wanting. At present, the marriage takes place sometimes on Friday. The eve before the wedding, the bride goes into the bath, accompanied by her female friends, who make a great noise. The ceremony of the wedding generally takes place in the open air, seldom in a room. The couple sit under a canopy, generally carried by four boys. A large black veil covers both, besides which, each of them has a black cloth (*taled*), with tassels at the four corners, upon the head. The rabbi, the preceptor of the synagogue, or the nearest relation of the bridegroom, offers to the couple a cup of wine, and says, "Praised be thou, O God, that thou hast created man and woman, and hast ordained matrimony." Both drink. The bridegroom then puts a gold ring, without a stone, on the finger of the bride, and says, "With this ring I take thee as my wedded wife, according to the custom of Moses and the Israelites." Then the matrimonial contract is read (see *Jewish Law*), and the bridegroom shakes hands with the parents of the bride. Wine is brought once more, in a vessel easily to be broken; six prayers are spoken; the couple drink of the wine, and the cup is thrown violently to the ground, according to custom, in remembrance of the destruction of Jerusalem; according to others, to admonish the company to orderly behaviour. The company then proceeds into the dwelling of the bridegroom, where they sit down to dinner, and he chants a long prayer. After the meal, men and women perform a certain dance, each sex separate. In presence of ten persons of advanced age, another prayer is pronounced over the bride, and she is led into the bridal-chamber, from which moment the marriage is considered to be complete.

Of the multifarious ceremonies accompanying the wedding, with the latter Greeks, the germs are to be found as early as the time of Homer, viz. the veiling of the bride veiled to the shoulders, from the house of her father to that of her husband, with pipes, the singing of joyous songs, playing on the flute and harp, dancing, bathing of the bride, ornamenting her, conducting of the couple to their apartment by the *thalamepos*, a female guardian of the bride chamber. At later periods, the ceremonies of the festival were more extended. The day before the wedding, which was celebrated particularly in the month Gamelion, or on the fourth day of each month, the betrothed parties each cut off a lock of hair, and dedicated it to all the patron gods of matrimony (Jupiter, Juno, Diana, the Fates); the pile of the victims was thrown away; the entrails were observed. The ceremonies were, properly speaking, nothing but a mimic repetition of the first marriage of the gods (*gamos hieros*). On the day of the wedding, the couple put on wreaths of flowers or leaves, sacred to Venus, or having some other allusion to marriage. The house was also ornamented with wreaths. Towards evening, the bridegroom took the bride from her father's house, generally in a chariot, accompanied by a *paranymphos*. If he had been already married, the

*paranymphos* alone conducted her, and was then called *nymphagagos*. The bride, (who carried a vessel containing barley, and called *phrygetron*) was preceded by torch-bearers, music and song, also by females who carried symbols of domestic life, as a sieve, a spindle, &c. When the couple arrived at home, fruits were poured over them, as a symbol of plenty; the axle of the vehicle in which they had ridden was burnt, to indicate that the bride could not return, after which the meal followed, in apartments adorned for the occasion, for which friends and relations assembled, dressed in festival dresses. In Athens, a boy appeared during the meal, crowned with thorns and acorns, holding a basket, which contained bread, and calling out, "I left the bad and found the better" (*ἔφυγον κακόν, εὑρον ἀγνόν*)—an allusion to the life of the primitive inhabitants of Attica, without bread and matrimony. Dances and songs diverted the guests. After the dance, followed the procession into the bride chamber, where the bed was generally covered with a purple cloth, and strewn with flowers. Another bed was also placed in the same room, for the bridegroom, in case evil omens should prevent the consummation of the marriage. Here the bride washed her feet (in Athens, in water from the fountain Callirrhoe), served by the *luthrophoros* (a boy always the nearest relative). In Athens, the pair also ate a quince, probably in allusion to Proserpine. The bride was now placed in the bed by her nearest relatives, particularly by the mother of the bride, who wound the fillets of her own hair round the torch, and, whilst the bridegroom unloosed the zone of the bride, which was consecrated to Minerva or Diana, boys and girls danced before the door, stamping and singing songs (*epithalamia*, choruses, praises of the young couple, good wishes, &c.—(See Theocritus, 18th idyl.) A *thyroros* (door-keeper) prevented the women from entering to assist the bride. The next morning, the same boys and girls sung *epithalamia egetica* (awakening songs). The festival lasted for several days, each having its proper name.

Very different from all this was the custom of the Lacedæmonians. They retained the ancient form of carrying off the bride by force. After the bridegroom had carried off the girl, a female paranymph cut the hair of the bride, put on her a male dress, seated her in a dark room, upon a carpet; the bridegroom then came clandestinely, unbound the zone, placed the bride upon the bed, and, soon after, stole away to the common sleeping room of the youths, and repeated these visits several times before the marriage was made known. After this, the solemn conducting home of the bride, accompanied by sacrifices, took place.

The Romans had, in a legal sense, three different ways of concluding a marriage—*coëntio*, *confarreatio*, and *usus*—of which the *confarreatio* was the most solemn and most conclusive. At the betrothment (*sponsalia*), the day of marriage was settled, great care being taken not to fix upon one of the *atri dies* (unlucky days), viz., the month of May, the calends, nones, and ides, and the days following them, the feast of the Salians, the *parentalia*, &c. On the other hand, a peculiar predilection was entertained for the second half of June. The day before the wedding, the bride sacrificed the virgin-like *toga prætexta* to the *Fortuna virginatis*; her *bullæ aureæ*, her *strophæ* and toys to the *Lar familiares*, or to Venus, after she had first sacrificed to *Juno jugo*, the goddess of marriages, and after her hair had been divided with a lance (*calibaris*) into six locks (in allusion to the rape of the Sabines), and arranged according to the fashion of matrons. On the day of the wedding, the bride was ornamented. She

covered her hair with the *vitta recta*, put on a wreath of flowers, the tunic of matrons, and encircled her waist with a woollen zone, tied in a *Hercules knot* (so called), at which moment she implored the *Juno cinxia*. A red or fire-coloured veil now covered her face (allusion to bashfulness); shoes of a like colour were put on. After the auspices were taken, and sacrifices had been offered to the gods of matrimony, particularly to Juno, the bile being thrown away, the couple seated themselves upon the fleece of the victim, in allusion to the original dress of men, and to the domestic duties of the wife. In the evening, the bride was led home by the bridegroom. The bride rested in the arms of her mother, or one of the next relatives, and the bridegroom carried her off, in allusion to the rape of the Sabines. The bride was led by boys; others preceded her, bearing torches. The bride (or female slaves) carried distaffs, wool, &c. The music of the lyre and the flute accompanied the procession, during which the bridegroom threw walnuts among the people. The bride was lifted, or stepped gently over the threshold of her parents' house, and of that where she entered, this part of the dwelling being sacred to Vesta, the protectress of virgins. These thresholds were ornamented with flowers, &c. She was followed, or, according to some, preceded by the boy Camillus.\* Relations and friends accompanied the procession, where jokes and merriment abounded. Arrived at her new house, she hung woollen bands, as signs of chastity, at the door-posts, and rubbed the posts with the fat of hogs and wolves, to guard against enchantment. Her first step in the house was made on a fleece (symbol of domestic industry). The keys were handed over to her, and both she and the bridegroom touched fire and water, as signs of chastity and purity. With the water the feet were washed. In the times of the republic, the bride carried three pieces of the coin called *as*. One she held in her hand, and gave to the bridegroom, as if purchasing him; another, lying in her shoe, she put on the hearth of the new house; the third, which she had in a pocket, she put on a cross-way. After some more ceremonies, followed the wedding meal, accompanied by *epithalamia*. The bride was then conducted by matrons, only once married (*pronubæ*), into the nuptial chamber (*thalamus*), and laid on the bed (*genialis lectus*). Virgins now sung *epithalamia*, in praise of the couple, and, in order not to excite Nemesis by such praises, boys used to sing indecorous songs. After the husband had given another feast, (*repotia*), the wife entered on her new duties.

Of the marriage rites of the ancient Celtic and German tribes, as little is known as of the ancient Asiatic tribes; and in the little which is recorded, the ancient authors contradict each other. They are almost unanimous, however, in stating that the ceremony of buying the wife was customary with them; but it is doubtful whether polygamy existed among them or not. Cæsar says it prevailed among the Britons; others say the same of the inhabitants of Spain. The Germans and Gauls seem to have had, generally, but one wife; yet exceptions are known (for instance, Ariovistus). According to the historian Adam, of Bremen, polygamy was common with the ancient Saxons and people of Ditmarsh. Among the ancient Germans, the marriage of a free person with a slave was punished. If a slave had seduced a free girl, he was beheaded, and she burned. They married late; marriage was prohibited before the twentieth year. The suitor paid a price to the father of the girl, from which, afterwards, the *morning gift*, so

called, originated. If a girl was beheaded, she was watched by the friends of the suitor, if the latter delayed the marriage longer than six years, the engagement was dissolved. After marriage, the wife was inseparable from the husband as to avoid him to the chase, in war, &c., and she betrayed herself when the husband had slain. Divorce was very rare; violation of matrimony was punished by death.

The Mohammedans consider marriage a civil contract. They practise polygamy. The Mohammedans may have four regular wives; they may, besides, purchase concubines (Circassian and other slaves); they have, and wives, whose obligation to live with a man is for a certain time. Generally, the Mohammedans have but one wife; the wealthier sort have more, the very rich, still more. With the Turks, the marriage is concluded upon between the parents, and in most, the contract is only confirmed before the law. Generally, the bridegroom has to buy the bride most commonly, they do not see each other before marriage. The bride is conducted as before, closely veiled, to the bridegroom. Entertainments follow, and, in the evening, the bride is met by an eunuch (or, with the poorer classes, by a servant), into the bride chamber. It is a real marriage for a Turk to be obliged to marry a daughter of a sultan. He prescribes the pretence to be made to his daughter; the husband is obliged to do as he will in all things. He must give to many people, that he is frequently ruined.

In Arabia, if a young man is pleased with the appearance of a girl in the street, where the women appear always veiled, he endeavours to get a view of her face, by procuring acquaintance with a house where she frequently comes, and requesting to be there by the aid of some kind relation. If he is pleased, he makes a bargain with the father; the contract is signed before the sheik. After the ceremonies, baths, entertainments, &c. he awaits his bride in his tent. Matrons remain at home, where the bride bows, and receives a gold piece pressed on her forehead. She is then carried by him into the interior of the tent. The bride and other women dance around it all night.

In Barbary, the marriage contract is concluded with the father or some relation, or, in want of them, with the cadi, a price paid for the bride, and a sum assigned for her support in case of divorce. The evening before the marriage, the bridegroom proceeds, on horseback, accompanied by many friends, to the house of the bride. The bride is then carried on a mule, covered with a sort of bus (or among the wealthier classes, on a camel, bearing a sort of canopy) to the house of the bridegroom. The bridegroom and his friends accompany her, the latter expressing their joy by the discharge of firearms. The bride is then conducted to the bridegroom, in a dark apartment, and it is not till after the consummation of the marriage that he obtains a sight of her face. He cannot go out of the house for eight days, and so for two months. Formerly the bridegroom, at the end of the eight days, played the king, and made a number of petty disputes; but since the middle of the eighteenth century, when the emperor of Morocco had eight of such kings tied to the walls and dragged to death, this custom has ceased. The wedding ceremonies, among the Mohammedans of Hindostan, are similar, only the procession is accompanied by music and song.

With the Persians, the bridal purchase-money is agreed upon by the bridegroom and the father of the bride; this is either left to the father, or given to the bride in case of divorce. The ceremony is

\* His office was to carry the bride's ornaments, and the amulets for the future offspring, in a small box.

signed before a cadi, in a solitary place, so that enchanters may not deprive the bridegroom of his vigour.

As it is considered, with all the Mohammedans, a matter of the greatest importance to find the signs of maidenhood in the bride, and as the whole relation between the two sexes is such as not to enable the bridegroom to take the bride's virtue upon trust, it is often made a point of the marriage contract, that the marriage shall be null if satisfaction is not received on this point. So much attention is paid to this subject, that, in case an accidental injury, as by a fall from a camel, &c., might bring it in question, fathers not unfrequently have an attested record made of the cause of the accident. The Circassians, who sell their daughters to the Turks, use mechanical means to prevent the loss of their virginity, from the age of puberty.

With the heathen Hindoos, any one who marries out of his caste, loses its privileges, and becomes little better than a Paria (q. v.). The Hindoos marry their children very early, often in the seventh year. When the marriage is agreed on, gifts are sent, with song and music to the bride. Similar ones are returned to the bridegroom. On the day before the marriage, the bridegroom, adorned with a crown and flowers, proceeds through the city, accompanied by music, and attended by the young men of his own occupation, in palanquins, carriages, and on horseback. The bride does the same, on the day of the wedding, attended by her young female acquaintance. In the evening, the wedding takes place. A fire is lighted between the couple, a silk cord wound round them, and a kerchief, folded up, is placed between them, after which the Bramin pronounces a certain formula, the purport of which is, that the husband ought to give sufficient support to the wife, and that she ought to be faithful: the blessing follows. The Buddha religion prescribes other ceremonies and rules.

In Pegu, the women are bought, and generally only for a certain time.

In Siam, the husband may have, besides the legitimate wife, others, whose children, however, are not legal, and are sold as slaves.

In China, the wife is bought; poor people ask ives from the founding houses. The young couple do not see each other before the contracts are exchanged. The bride is then conveyed, with music, robes, &c., to the husband. She is carried in a chair, securely enclosed, the key to which is given, after arrival, to the bridegroom. Here he sees her for the first time. Formerly, the wife was sent back immediately, but at present this is generally evented by the contract; the relations also conve to get a pretty accurate description of the bride beforehand. The bride is then led into the house, where she bows low before the family idol. Entertainments then follow, each sex being separate. After marriage, the wife sees only the husband, and, on particular occasions, the father or some other relative, unless express provision is made for more liberty in the contract.

In Japan, the bridegroom awaits the bride in the temple of Fo, where the bonze blesses them, during which ceremony the couple bear a torch or lamp. The festival then lasts for seven or eight days.

The Parsees, or worshippers of fire, consider matrimony a holy state, conducive to eternal felicity, and betroth children very young. Matrimony between cousins is most esteemed. Betrothment is, with them, a ceremony entirely binding. At the wedding, the priest asks the parties whether each have the other; if they say yes, he joins their hands and strews rice over them. Weddings

among them are celebrated with much public festivity.

Among the Indians of North America, the weddings are very simple.—See the article *Indians*.

Among Christians, marriages, of late, are celebrated with much less ceremony than formerly. In England, among the wealthier classes, it is customary for the couple to go, in a morning dress, to church, and, immediately after the marriage, to set out on a journey. With the Catholics, matrimony is a sacrament, and dissolvable by the pope only. With Protestants this is not the case. In Scotland and the United States of America matrimony in the eye of the law is a mere civil act; justices of the peace may perform the ceremony; yet such instances are rare. Marriages concluded by clergymen simply are valid also, and, in so far, the law differs from that in the former French republic and empire, where the contract, in the presence of the civil officer, could not be omitted.

MARROW. See *Bone*, and *Medulla*.

MARS, MAVORS (with the Greeks *Ares*); the god of war. According to the oldest poets, he was the son of Jupiter and Juno; according to later ones, of Juno alone, and the fiercest of all the gods. Ares or Mars is, originally, a Pelasgian deity, whose worship was first celebrated in Thrace, and afterwards transferred to Greece. In the earliest times he was the symbol of divine power, and with the Greeks, the symbol of war, so far as regards strength, bravery and fierceness, or, in other words, was the god of battles. Minerva, on the contrary, as the goddess of war, was the symbol of courage joined with wisdom and military art. In later times, he is always represented in the human form, and is the protector of innocence. The Romans early adopted his worship from the Greeks. According to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him. His service was celebrated by particular *flamines* devoted to him, and by the college of the Salii, whose duty it was to preserve his shield (*ancile*), said to have fallen from heaven. The month of March was sacred to him, and his festivals were celebrated on the 1st of March and 12th of October. He was likewise the god of spring. Among the Romans, soldiers, and gladiators, and fire were sacred to him; also horses, birds of prey, vultures, cocks, woodpeckers, and wolves; the *suovetaurilia* were also in honour of him. In peace, they called him *Quirinus*; in war, *Gradivus* (the striding). They considered Bellona as his wife and sister. The Greeks, on the other hand, assigned him no wife, although he had children by Venus and several other mistresses. His intrigue with the former was betrayed to Vulcan by Sol. Vulcan immediately made a fine iron net, which he threw over the two lovers, whom he found in bed together: he then called together all the gods, and exposed his captives to the scorn of Olympus. He was the father of Harmonia, by Venus; Deimos (*Terror*) and Phobos (*Fear*) were his sons. Simonides also calls Cupid the son of Mars and Venus. Phobos is his constant companion in war; Phobos and Deimos harness the steeds to his chariot, and guide him to the fight. Enyo, the destroyer of cities (Bellona), and Eris, always hover around him in battle. The fables relate many of his exploits. He is mentioned in the account of the war of the giants only by the later poets. According to Claudian, he was the first who attacked the giants: he slew Pelorus and Mimas. But he was compelled to flee, with the other gods, before Typhæus, and, to escape his fury, changed himself into a fish. In the fight with Otus and Ephialtes, the sons

of Aloeus, he was taken and confined in a brazen prison, where he languished thirteen months. But the mother of the Aloides, discovered the place of his confinement to Mercury, by whom he was delivered. He twice engaged in combat with Hercules, for the protection of his sons. In one of the combats, the god was wounded; in the other, Jupiter separated the combatants by hurling his thunderbolts between them. Mars having slain Halirrhoëtus, the son of Neptune and the nymph Euryte, for offering violence to his daughter Alcippe, Neptune accused him before the twelve gods, who judged the cause on a hill near Athens (Areopagus, Mars' Hill), and acquitted him. As Mars was the first who was tried in this place, it derived its name from that circumstance. In the Trojan war, he assisted the Trojans against the Greeks. Diomedes wounded him, and he bellowed like 10,000 men united. He fought also against Minerva, and hurled his spear against her ægis: she smote him to the ground with a rock. Mars is represented as a young warrior in full armour, of a strong frame, broad forehead, sunken eyes, thick and short hair. His attributes are a helmet, a spear, a sword, and a shield.

*Mars* is also the name of a planet. See *Planets*. In chemistry, *Mars* was formerly put for iron; in both cases, it is marked by this sign: ♂

MARS' HILL. See *Areopagus*.

MARSDEN, WILLIAM, born in 1754, at Verval, in Ireland, was sent out, early in life, as a writer, to the island of Sumatra, where he rose to be chief, and gained much information respecting the language, manners, and antiquities of the Oriental archipelago, a part of which he communicated in articles sent by him to the royal and antiquarian societies. The chief of these are, On a Phenomenon observed in the Island of Sumatra; Remarks on the Sumatran language; Observations on the Language of the People commonly called Gipsies; On the Hejira of the Mohammedans; On the Chronology of the Hindoos; and On the Traces of the Hindoo Language and Literature extant among the Malays. His separate publications are, the History of Sumatra (1802); a Dictionary of the Malayan Language, in two parts, Malayan and English, and English and Malayan, (1812); and a Grammar of the Malayan Language; to which is prefixed an interesting Discourse on the History, Religion, and Antiquities of the Oriental Islands.

MARSEILLAISE HYMN, the celebrated song of the patriots and warriors of the French revolution, was composed by M. Joseph Rouget de l' Isle, while an officer in the engineer corps at Strasburg, early in the French revolution, with a view of supplanting the vulgar songs then in vogue, relative to the struggle then going on. He composed the song and the music in one night. It was at first called *L'Offrande à la Liberté*, but subsequently received its present name, because it was first publicly sung by the Marseilles confederates in 1792. It became the national song of the French patriots and warriors, and was famous through Europe and America. The tune is peculiarly exciting. It was suppressed, of course, under the empire and the Bourbons; but the revolution of 1830 called it up anew, and it has since become again the national song of the French patriots. The king of the French has bestowed on its composer, who was about seventy years old at the time of the last revolution, having been born in 1760, a pension of 1500 francs from his private purse. M. Rouget de l' Isle had been wounded at Quiberon, and persecuted by the terrorists, from whom he had escaped by flying to Germany. The celebrity of the Marseillaise hymn, and the important influence which it has exerted, induce us to give it at length.

Allons, enfans de la patrie!  
Le jour de gloire est arrivé!  
Contre nous de la tyrannie  
L'étendard sanglant est levé.  
Extendez-vous dans les rangs  
Muez ces héros soldats!  
Ils viennent jusques dans vos bras,  
Égarer vos fils, vos compagnons.

Aux armes, citoyens, formons nos bataillons,  
Marchez;—qu'un sang impur alarme vos sens.

CHŒUR.

Aux armes, citoyens; formons nos bataillons,  
Marchons;—qu'un sang impur alarme vos sens.

Que veut cette horde d'étrangers,  
De traitres, de vils conjurés?  
Pour qui ces ignobles entrailles,  
Ces fers dès long-temps préparés?  
Français, pour nous, ah! quel outrage!  
Quels transports il doit exciter!  
C'est nous qu'on ose massacrer!  
De rendre à l'antique esclavage!

Aux armes, &c.

Quoi! des cohortes étrangères  
Feraient la loi dans nos foyers?  
Quoi! ces phalanges étrangères  
Terraieraient nos fers guerriers!  
Grand Dieu! par des mains étrangères  
Nos fronts sous le joug se ploieraient!  
De vils despotes deviendraient  
Les maîtres de nos destins!

Aux armes, &c.

Tremblez, tyrans! et vous, perfides!  
L'opprobre de tous les partis!  
Tremblez—vos projets parricides  
Vont enfin recevoir leur prix.  
Tout est soldat pour vous combattre!  
S'ils tombent, nos jeunes héros  
La France en produit de nouveaux,  
Contre vous tous prêts à se battre.

Aux armes, &c.

Français, en guerriers magnanimes,  
Portez ou retenez vos coups!  
Épargnez les tristes victimes  
A regret s'armant contre vous!  
Mais ces despotes sanguinaires,  
Mais les complices de Bouillie—  
Tous ces tigres qui, sans pitié,  
Déchirent le sein de leur mère!

Aux armes, &c.

Amour sacré de la patrie,  
Conduis, soutiens nos bras vengeurs!  
Liberté, Liberté chérie,  
Combats avec tes défenseurs.  
Sous nos drapeaux, que la victoire  
Accoure à tes mille accents;  
Que tes ennemis expirants  
Voient ta triomphe et notre gloire.

Aux armes, &c.

MARSEILLES (properly *Marsellia*, the ancient Massilia; a city of France, capital of the département Bouches du Rhône, on the lion's gulf; lat. 43° 27' N.; lon. 5° 22' E.; seat of a bishop, and of many civil and military authorities. The port is safe and spacious, capable of accommodating 1200 vessels, but not admitting a ship of larger size than a frigate. A new port has recently been constructed, adjacent to receive ships of the line, and is used for quarantine ground. The lazaretto is the finest in Europe. The old city is principally composed of crooked streets, and steep streets, lined with high houses. The city has wide, straight streets, with foot-ways. The houses are in general handsomely built, and possess several agreeable promenades and squares. The cathedral is one of the oldest in France; its bell de Ville is the handsomest building in the city. There are an observatory, several hospitals, a museum of arts and sciences, a royal college, a public library of 60,000 volumes, and numerous other literary, scientific, and charitable institutions. The principal articles of export are Naples soap (made at Marseilles), olive-oil, brandy, anchovy, spirits, excellent corks, chemical preparations, coral, perfumes, &c. It carries on a considerable commerce with

parts of the world, particularly with Italy, Spain, Barbary, and the Levant. In 1826, 82,000 bales of cotton (one quarter of the whole amount imported into France) were carried into Marseilles. Sugar (for its refineries), dye-wood, and other colonial articles, from its imports. In 1824, 5723 vessels, with a burden of 392,996 tons, were entered at this port. The inhabitants are laborious, intelligent, and honest, but quick and ardent; they are very fond of music, dancing, and shows. Population, 115,943.

Marseilles was founded, 600 B. C., by a colony of Phœceans, and formed, at an early period, a flourishing republic, celebrated for the wisdom of its institutions. Cicero calls it the *Athens of Gaul*. Under the domination of the Romans, it continued to rival Alexandria and Constantinople in commerce. During the middle ages, it again became a republic, but, in 1251, was reduced by the counts of Provence. In 182, it was annexed to the crown of France. In the revolution, its inhabitants were at first distinguished by their zeal in favour of the new doctrines; but, in 1793, it was found on the side of the ironists.

MARSHAL (in ancient German, *Marschalk*); derived, according to some, from the ancient German word *Mar*, a horse of the nobler kind, and *Shalk*, originally a servant (though at present a cunning fellow); hence *Marschalk*, a man appointed to take care of the horses. *Martchal*, in French, still designates a farrier, though it also denotes a high dignity. As the word came, in the sequel, to designate high officers of state and war, this derivation of the word proved unacceptable to some persons, and it was tempted to derive it from *mar*, *maer*, from the Latin *major*, as in *major-domo*; but the first derivation is the most probable, and it is by no means the only instance in which the names of high dignities originated with low employments. A similar instance is the French *connétable*, from *comes stabuli*. *Marshat* signified at first a person intrusted with the care of twelve horses under the *comes stabuli*. In France, the title sunk still lower, so as to designate, as we have said, every farrier; but in other parts of Europe, it rose in dignity, as horses were highly valued at courts, so that it came to signify the person appointed to the care of all the horses of a prince; and, these persons being at length appointed high commands in the army, and important posts in the state, the title came to signify one of the best officers of the court. The marshal of the man empire derived his origin from the Frankish *marshals*, and was equivalent to the *comes stabuli* or *nétable*. He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He is called *arch-marshal*, a dignity belonging to the Electorate of Saxony. At the coronation it was his duty to bring oats, in a silver vessel, from a heap in an open market-place, and to present the vessel to the emperor. His duties were discharged by a military marshal (*Erbmarschal*). In France, *échal de France* is the highest military honour; *échal de camp* is equal to major-general, in Austria to field-marshal. In Prussia, general-field-marshal is the highest military honour. In England, *marshal* means the commander-in-chief of all forces. It is also given as an honorary rank to royal officers who have no immediate command. *Marshal* was, and in many countries of Germany is, the title of the president of the diet of the estates. The office is sometimes hereditary. *Marshal* also signifies a person who regulates the ceremonies on solemn celebrations. *Marshal* is also used to denote inferior officers in England. The marshal of the king's bench has the custody of the prison

called the *King's bench*. He attends on the court of the same name, and takes into custody all prisoners committed by it.

*Marshal, Earl*. See *Earl Marshal*.

*Marshal, Provost*. See *Provost Marshal*.

MARSHAM, SIR JOHN, a learned writer on ancient history and chronology, born in 1602, in London, was educated at Oxford, and entered as a student of the law at the Middle Temple. In 1638, he was made one of the six clerks in chancery, which place he lost; and suffered in his estate for his attachment to royalty during the civil wars. At the restoration of Charles II., he recovered his office, was knighted, and became a member of parliament. Three years after he obtained a baronetcy. He died in 1685. His *Canon Chronicus Ægyptiacus, Ebraicus, Græcus* (London, 1672, folio), displayed much erudition and some ingenuity. He also published a work on the difficulties in the chronology of the Old Testament, and wrote the preface to the first volume of Dugdale's *Monasticon*.

MARSI; 1. a tribe in Samnium, on the northern bank of the *Jacus Fucinus*, in the present *Abruzzo ulteriore*. They had the same language with the Sabines. They distinguished themselves in the social war, which, from them, is also called the *Marsian war*.

2. A German tribe belonging to the Istævones, a member of the Cheruscan league. (See *Cherus-cans*.) They pressed forward after the defeat of Varus, and settled chiefly on the banks of the Lippe, but retreated during the succeeding wars with the Romans.

MARSIGLI, LODOVICO FERNANDO, count of, was born in 1658, of an illustrious family at Bologna, and, after having received a good education, went to Constantinople in 1679, with the Venetian ambassador. On his return, he entered into the imperial service, and was employed as an engineer in the war with Turkey. He was taken prisoner at the passage of the Raab, and sent as a slave to Bosnia. On obtaining his liberty, he was again employed, and, having been made a colonel of infantry, was sent, with his regiment, to garrison the fortress of Brisac; and, that place being taken by the French in 1702, was accused of misconduct, and ignominiously dismissed from the Austrian service. Retiring to Switzerland, he published a justificatory memoir, and afterwards took up his residence at Cassis, near Marseilles, where he occupied himself with the study of marine botany, and other scientific pursuits. In 1709, pope Clement XI. made him commander of his troops; but he soon relinquished this office, and retired to his native place, where, in 1712, he founded the institute of Bologna. He afterwards travelled in England and Holland, and, in 1725, published, at Amsterdam, his *Histoire Physique de la Mer* (fol.); and, in 1726, his most valuable work, the *Danubius Pannonico-Mysicus* (6 vols., fol.), containing the natural history of the Danube, in its course through Hungary and Turkey. He died at Bologna in 1730, at the age of seventy-two.

MARSTON, JOHN; an English dramatic author, who lived in the reign of James I., was educated at Corpus-Christi college, Oxford, and was entered at the Middle Temple, of which society he became lecturer; but little more of his personal history is known, except that he was at one time upon terms of friendship with Ben Jonson. He was the author of eight plays, all acted at the Black Friars, with applause. Six of these were printed in one volume, in 1633, and dedicated to the viscountess Falkland. He also wrote three books of satires, entitled the *Scourge of Villany* (1599), reprinted in 1764.

MARSTON MOOR, in Yorkshire, England;

celebrated for the battle between the royal forces under prince Rupert and the troops of the parliament under Fairfax and Cromwell (1644), in which the latter were victorious. See *Charles I.* and *Cromwell*.

**MARSUPIALS**, in zoology; a singular family of the order *carnivora*, in the class *mammalia*, so called from a pouch (*marsupium*), in which the young remain immediately after birth, and into which they retreat in case of danger, when older. See *Kangaroo*, *Opossum*.

**MARSYAS**; a son of Olympus, Oagrus or Hyagnis. Fable relates that, after Minerva had thrown away the flute which she had invented, displeased because it disfigured the countenance in playing, and had pronounced the severest maledictions against any one who should take it up, Marsyas accidentally found this instrument, on which he soon acquired such skill, that he dared to challenge Apollo to a contest. The Muses were invited to be the umpires. At first, the stronger music of the flute drowned the softer tones of the lyre, on which the god played; and Marsyas was on the point of winning the victory, when Apollo accompanied his instrument with his voice. Marsyas was unable to do the same with his flute. The Muses decided in favour of Apollo, who put to death his rash competitor by flaying him alive. In this way was the curse of Minerva accomplished. This fable is emblematic of the preference given by the inventors of the fable to the art of singing to the lyre above that of performing on the flute. Many ancient and modern artists have represented the contest, as well as the punishment of Marsyas.

**MART**, or **MARQUE**, LETTER OF. See *Letter of Mart* or *Marque*.

**MARTELLO TOWERS**, so called, by corruption, from *Mortella*, in Corsica, where a strong tower maintained a determined resistance to a superior English force in 1794. In consequence of the great strength exhibited by this fort, the British government erected twenty-seven similar towers on the Kentish coast, at intervals of about a quarter of a mile, as a defence against the threatened invasion from France. They are circular, with walls of great thickness, and roofs bomb-proof. One traversing gun is mounted upon each, in working which the men are secured by a lofty parapet. They are surrounded by a deep dry fosse: the entrance is by a door several feet from the ground, approach to which is then cut off by drawing up the ladder. The ordinary guard consists of from six to twelve men.

**MARTEN** (*mustela*). The term *marten* is sometimes applied to the whole weasel tribe. The European marten (*M. foina*) inhabits most parts of Europe. It is a most elegant and lively animal, exceedingly agile and graceful in its motions. The female breeds in hollow trees, and produces from three to seven young at a time, which, in winter, have sometimes been found sheltered in magpies' nests. These animals are very destructive to poultry, eggs, &c., and also feed on rats, mice, and moles; they are also very fond of honey, and will sometimes eat seeds and grain. They have a musky smell. They are capable of being tamed, but generally require to be kept chained. The pine marten (*M. martes*), is an inhabitant of the woody districts in the northern parts of America, from the Atlantic to the Pacific. This species is also found in Northern Asia and Europe. It very closely resembles the marten of Europe, but may be distinguished by its smaller size, longer legs, finer, thicker, and more glossy fur, and from the throat being marked by a broad yellow spot, whilst the same part in the European marten is white. The pine marten preys on mice, rabbits, and partridges, &c. A partridge's head, with the feathers, is the best bait for the log traps in which this animal

is taken. When this animal is pursued, and is retreat cut off, it shows its teeth, crouches to arch its back, and hisses like a snake. It will creep dog by the nose, and bite so hard that even the latter is accustomed to brist, then, to allow the animal to escape. It is easily tamed, but very untamed. It burrows in the ground, and is very about six weeks, and brings forth from two to four in a litter, about the latter end of April. The fur is fine, and much used for trimmings. About 100,000 are collected annually in the north-west. Pennant's marten, commonly called the *M. canadensis*, is also a native of the north-west of America. It is a larger and stronger animal than the last mentioned species; climbs very well; and preys principally on mice. It lives in a hole, preferring damp places in the variety of trees; inhabits a wide extent of country, from Pennsylvania to the Great Slave lake. It brings forth from two to four young. It is sought for by the fur traders.

**MARTENS**, GEORGE FRIEDRICH VON; born at Gottingen, and Hanoverian noble commander of the most eminent writers and lecturers at the universities. His earliest work, which has been a standard book on the subject, was published at Gottingen, in 1789, and has been translated by (M.). It bears the title of a *Compendium of the Law of Nations*, founded on the *Treaties and Customs of the Modern Nations of Europe*. He afterwards published a *Course of Diplomacy* (in 3 vols. 8vo). Collection of the principal *Treaties of Peace and Alliance* since 1761 (14 vols. 8vo); and several other works. The merit of these works caused the name of the author to be sought for by the German emperors. In 1807, Jerome Bonaparte appointed him a counsellor of state, in the *Imperial government*, and he was retained in it after the fall of Napoleon. In 1814, he was employed, at the congress of Vienna, to draw up the reports of the plenipotentiaries between the ministers, and was afterwards sent as a minister to prince Christian, in Norway. In 1820, he was nominated minister from Hanover to the diet at Frankfurt, where he died in 1821.

**MARTHA**, SISTER, was long deservedly admired for her active and impartial humanity. Anne Blyth, known by the name of *Sister Martha*, was, before the French revolution, what is called a *barber* in a convent; that is, a nun who has the care of the shaving box fixed on pivots in the wall, by means of which messages and articles are conveyed to and from the convent, without any of the nuns being seen. When the dissolution of the convents compelled her to return into society, she dedicated her time and her means to the consoling of the poor, and particularly of prisoners. Though her pecuniary resources were small, her kindness was unbounded. In 1800, when she was between sixty and seventy years of age, a hundred Spanish prisoners arrived at Besançon, the place where she resided. She hastened to their assistance, did her utmost to supply their wants, and watched over those who were sick. She was employed by them to solicit the governor of Besançon, when they had any thing to request; and one day, when she was visiting him on this kind of errand, he said, "Sister Martha, you will be much surprised to hear that your good friends the Spanish are going to leave Besançon." "Yes," replied she, "but the English are coming, and all the others are my friends." Her impartial benevolence was, indeed, extended to all; and, in 1814, in the powers were called forth to comfort and sustain the wounded French and allied soldiers. "It was in the field of battle," said the duke of Reggion, "that

"that I became acquainted with your character. Our soldiers, when they were wounded, and far from their country, used to exclaim, 'Oh, where is Sister Martha? If she were here, we should suffer less.'" After the confederated sovereigns obtained possession of Paris, they were desirous of seeing this admirable woman, and did not forget to reward her virtues. The emperor of Russia gave her a gold medal, and a sum of money; the emperor of Austria, the cross of civil merit, and 2000 francs; and the king of Prussia, a gold medal. The Spanish monarch sent her a cross. She was also presented to Louis XVIII., who received her graciously, and conferred honours upon her. She died at Besangon, in 1824.

MARTHA, SANTA; a city of Colombia, on the northern coast, with a large, safe, and commodious harbour, strongly fortified; lat. 11° 19' N.; lon. 78° 18' W.; population, 5000. The heat is great, and the houses are liable to be filled with a fine sand, blown up by the south-west winds. It has considerable commerce.

MARTHA'S VINEYARD; an island of Massachusetts, on the south side of Cape Cod, twelve miles west-north-west of Nantucket, nineteen miles long, and from two to ten broad; lon. 70° 40' W.; lat. 41° 0' N. The greatest part of the island is low and level, and but a small part of the land is good. The principal manufactures are those of wool and salt. The island contains three towns, Edgartown, Tisbury, and Chilmark. On the north side of the island is the harbour of Holmes' Hole.

MARTIAL, MARCUS VALERIUS, the most celebrated of the epigrammatical writers among the Romans, was born at Bilbilis, in Celtiberia, A. D. 43, and educated at Calagurris (*Calahorra*), the birth-place of his friend Quintilian. He went to Rome when young, during the reign of Nero, and lived under the reign of Galba and the following emperors; from one of whom he received marks of esteem and favour. Domitian appointed him tribune, and made circumstances more easy by presents. Trajan, who was no friend to satirists, withheld the favour which Martial had received from his predecessors. This induced the poet to retire to his native city. Pliny the Younger gave him a sum of money to pay the expenses of the journey. While in Italy, he married a Spanish lady, who brought him a considerable estate. He died in the year 101. His celebrity is founded on fourteen books of epigrams, of which he himself modestly says, "*Sunt bona, sunt quedam mediocritas, et mala plura.*" The number and value of his epigrams give a high idea of the wit of the poet. Most of them are ingenious and cutting; many are full of grace and attic salt; and many, in which he satirises the vices of his age, are extremely indecent and immodest. He is the true father of modern epigram, which is distinguished from the simple Greek epigram, by the convergence of all its parts to one witty point. The best editions of his works are that of Paris, 1617, folio; of Scriverius (Leyden, 1618 and 19, 3 vols. 12mo); of Schrevelius (Leyden 1656); of Rader (Mentz, 1627, folio); an expurgated German translation has also been published by Willmann, Logne, 1825.

MARTIAL LAW. The law martial applies to soldiers in actual service, and in Britain, is founded on particular statutes. Chief-justice Hale, in his history of the Common Law, chapter ii. says, it is a law of rules, and a jurisdiction rather indulged by the law than constituting a part of it. But it does not appear why it is not a part of the law of the land, much as the law merchant or any other branch of law. It is true it applies only to persons in actual military service, and only to their conduct in such service; but so the maritime law applies only to per-

sons engaged in maritime trade, and has reference only to acts done, or obligations arising in that trade. The jurisdiction under the law martial is in a distinct tribunal, and the mode of proceeding is different from that which prevails in the common law and in equity jurisdiction; the tribunal for the trial of offences against the military law being a court-martial appointed by some superior officer. A military code, and also a special tribunal for the trial of offences against its provisions, are absolutely necessary for the government and regulation of an army, since the offences to which such a code relates, are quite different from those cognizable by the common law, and are such that the ordinary tribunals are not fitted to have jurisdiction of them; the proceedings, too, must be more summary than is practicable before the standing judiciary.

MARTIN, Sr, the most famous of this name, was born of heathen parents at Sabaria, in Pannonia (now *Stein*, in Lower Hungary), about the year 316. He attended the catechetical school at Pavia. His father was a military tribune, and compelled him, in his sixteenth year, to take up arms. He is said to have early escaped from his father, and received instruction in a Christian church. While a soldier his life was marked with the rigour of a monk. He served under Constantius and Julian, and went to Gaul, where he appeared as the model of all virtue. Among other acts, he divided his cloak with a poor man, whom he met at the gates of Amiens. The legend says that Christ appeared to him in the following night, covered with the half of this cloak. Soon after this vision, Martin was baptized in 337, and lived many years in retirement, till St Hilarius, bishop of Poitiers, appointed him exorcist. While on a journey to visit his parents, he was attacked in the Alps by two highway robbers; the axe of one assailant was already hovering over his head, when the other, touched by his look of innocence, saved him, and was immediately converted. In Pannonia, to which he returned, as was alleged, at the command of the Divinity in a dream, he converted his mother, and opposed, with zeal, the Arians who prevailed in Illyria. For this, he was scourged from the country, on which occasion he manifested the firmness of a martyr. He now established a monastery in Milan, and afterwards, having been driven thence by the bishop Auxontius, founded another on the island of Gallinaria, in the Ligurian sea. He next settled at Poitiers, where he assembled a number of religious persons, and is said to have wrought many miracles; for instance, to have raised one of his pupils from the dead. In the year 375, the bishopric of Tours was conferred on him against his will. In order to withdraw himself from the world, he built the famous convent of Marmoutiers, between the Loire and a steep rock, where he finished his life in the year 400. This is regarded as the oldest abbey of France. St Martin was the first to whom the Roman church offered public adoration. His exertions in spreading the true belief, and exterminating paganism in France, are deserving of all commendation. The anecdote, that the emperor Maximinus, at a banquet, to which he invited Martin, offered him the goblet in order to receive it from his hand, has made him the patron of drinkers. His festival, which takes place on the 11th of November, was formerly celebrated with banquetings and carousals, where the hilarity was frequently excessive (as is shown by the French expression *Martinier*, and *le mal de St Martin*). The *Professio Fidei de Trinitate*, attributed to St Martin, is regarded as spurious.

MARTIN. Of five popes of this name, the most important are,

*Martin I.*, of Todi, in Tuscany, who was educated

with care, and elected pope in 649. At a synod of Italian bishops in the Lateran church at Rome, he caused the Monothelites and the emperor Heraclius to be solemnly condemned. He was therefore carried captive to Constantinople, and condemned to death as a traitor. At the request of the patriarch Paulus, the punishment of death was transmuted into that of banishment. Martin was deprived of all marks of his dignity, exposed to the contumelies of the people and soldiers, and banished to the Chersonese, where he died in 655. On account of these sufferings, he was numbered among the saints. We have eighteen epistles of his, of little value.

*Martin V.*, of the ancient family of Colonna, was chosen pope in 1417, after the abdication of Gregory XII., and the deposition of Benedict XIII., during the council of Constance. No one of his predecessors or followers has ever been consecrated with such solemnity. He rode on a white horse, which the emperor of Germany and the elector of the Palatinate, both on foot, led by the bridle. A number of princes, and a whole council, formed his retinue. His first act was to promulgate a bull against the Hussites, which is remarkable from the circumstance that in it the pope seems to recognise the supreme authority of the councils. In 1418, he dissolved the council of Constance, though a number of difficulties were not adjusted, and dissensions continued in the church. Benedict XIII. still lived; and, at his death, in 1424, a new antipope was elected in Clement VIII., who first renounced his pretensions in 1429, when he received the bishopric of Minorca as an indemnification. A council which Martin V. convened at Pavia, and thence removed to Sienna, was dissolved, without having established any thing. He died soon after, in 1431. He has the merit of having restored unity to the church, and pacified Italy. We yet possess some works of his.

MARTIN, DON JUAN, EL EMPECINADO. See *Diaz*.

MARTIN, LOUIS CLAUDE, St, a mystical writer, of noble descent (marquis), was born at Amboise, in Touraine, Jan. 18, 1743, entered early the military service, travelled over Europe, served during the revolution in the national guard, and retired to solitude. He died at Antray, near Chatillon, Oct. 14, 1803. He was modest and pious: his works are full of symbolic mysticism. He found a number of adherents, who called themselves *Martinists*. He translated Jacob Bohme's *Aurora* (*Morgenrothe*). His mystical work *Des Erreurs et de la Vérité* (Lyons, 1775) is famous. He farther wrote *Tableau naturel des Rapports qui existent entre Dieu, l'Homme, et l'Univers* (Edinburgh, 1782, 2 vols.); *De l'Esprit des Choses* (1800, 2 vols.); *Ecce Homo*; *Le nouvel Homme* (1796); *Ministère de l'Homme d'Esprit* (1802); *L'Homme de Désir* (new ed., Metz, 1802, 2 vols.); *Le Crocodile, ou la Guerre du Bien et du Mal, Poème épico-magique, en CII. Chants* (1800); *De Dieu et de la Nature*, &c.

MARTINET; a word frequently used to signify a strict disciplinarian, who sometimes gives officers and soldiers unnecessary trouble. It is supposed to have originated from an officer of that name, who was in high repute as a drill officer, during the reign of Louis XIV. The word also signifies, in French, a sort of scourge, used by schoolmasters; and perhaps this instrument may have been the true source of the above military term.

MARTINI, JOHN BAPTIST, a skilful composer and musician, born at Bologna, in 1706, entered early into the order of Minimi Friars, and travelled for some time in Asia; and it was not until his return, that he entirely devoted himself to music. His progress was so rapid, that, at the age of seven-

teen, he was appointed chapel-master of his order in Bologna, where he remained until his death, in 1774, composing a large number of time, the functions of professor in the school of Martini issued some of the most celebrated composers in Italy. He wrote a *Trattato di Musica* (in 3 vols., folio; as also an *Essay on Musick*, and *Compendio della Theoria de' Soni*.

MARTINICO or MARTINIQUE is the largest of the Caribbee islands in the West Indies, belonging to France; forty-eight miles long, and about sixteen broad; square miles, 245 square, in 1827, 101,865; 9937 whites, 10,000 of colour, and 81,142 slaves; chief towns, St. Pierre and Fort Royal; lon. 61° to 61° 25' E. and 24° to 14° 56' N. It is very fertile, and covered in all parts, by a number of hills, rising mostly of a conical form. These mountains are above these smaller eminences. The hills are the indelible marks of a volcano. The island is covered with which it is covered, constantly with clouds, which occasion noxious fogs, and contribute to make it horrid and unwholesome, and two others are in most parts cultivated. From the mountains, but chiefly from the first, issue many springs that water the island. These waters flow in gentle streams, are changed into rain by the slightest storm. Their quality pertains to the nature of the soil they pass through, and as they are excellent, in others, so bad that the inhabitants are obliged to drink the water they have collected in the rainy seasons. The island has suffered great ravages in 1825: hurricanes, in 1823 and 1823, were destructive: the earthquake of 1825 and 1828 did but little damage. The superficial area of the island, 17,000 square miles, employed in raising sugar-cane, 3461 acres; and 491 cotton; 17,191 is pastureage. The annual production is valued at 10,000,000 francs. The island consumed French produce to the value of 16,000,000 in 1824, and exported to the mother country 18,000,000 in value. The commerce engaged in this commerce was 2500 tons. The revenue, in 1823, was 4,000,000 francs. The administration is conducted by a council, the head of which is the governor. The island was discovered by the Spaniards, in 1493, and named by the French in the middle of the seventeenth century. The British captured it repeatedly in the last time, in 1809, and restored it to France in 1814.

MARTYN, HENRY, an able missionary, was born in Cornwall, in 1781; in 1797, entered a divinity college, Cambridge, of which society he was chosen fellow, in 1802. The following year, he sailed for India, and in 1805, went to India, as a chaplain in the East India company. In the East, he distinguished himself by his rapid acquirement of the languages. He became master of Sanscrit, and translated the Common Prayer into Hindustani, and performed divine service publicly in that language. From India, he proceeded to Shiraz in Persia, and translated the Psalms and New Testament into the Persian tongue. He also held conferences with learned Mohammedans, and converted some of them to Christianity. He died of a decline, in London, October 16, 1812.

MARTYR, PETER, (more correctly Ferdinando d'Angiera), an Italian writer, who, after having attached himself to the cardinal Vincent, and then to the archbishop of Milan, went to Spain (1610), distinguished himself in the military service of Ferdinand and Isabella, and then embraced the clerical profession. Ferdinand employed him in some important

\* A declivity is nearly two and a half degrees.

affairs, and created him counsellor of the Indies. Charles V. also treated him with favour. He died in 1526, at the age of seventy-five years. His principal works are *De Rebus Oceanicis et Orbe novo Decades*,—a history of the discoveries of Columbus and his successors, from their own relations; *De Insulis nuper inventis* (1521); *De Legatione Babylonica*,—an account of his embassy to Egypt, whither Ferdinand sent him, in 1501; and his *Opus Epistolarium*.

MARTYR, PETER (whose family name was *Ersmigli*), one of the earliest Protestant divines, distinguished for learning and abilities, was born at Florence, in the year 1500, and entered, at the age of sixteen, into the order of the regular canons of St Augustine, at the monastery of Ficsole. In 1519, he removed to Padua, where he studied Greek and philosophy. In 1526, he commenced preacher, and attracted great applause in several cities of Italy. After receiving numerous important offices in his order, his religious opinions were considered as favouring too much of the doctrine of the reformers, and it became necessary for him to quit Italy, and

Zurich, in Switzerland, he was received in a friendly manner by the Protestant clergy (1542). Soon after, he became professor of divinity at Strasbourg, and, in 1547, accompanied Bucer, Fagius, and other learned reformers, on the invitation of archbishop Cranmer, to England. Martyr had followed the example of Luther, in marrying a nun, who had renounced her vows. He was appointed to the theological chair at Oxford, in 1549, and became a very efficient assistant to the English reformed clergy, in carrying on their plans of innovation in the church. On the accession of queen Mary, being commanded to quit the country, he returned to Strasbourg, and resumed his former situation. In 1556, he removed to Zurich, to occupy the office of theological professor. In 1561, he assisted at the famous conference between the Catholics and Protestants held at Poissy, in France; and died at Zurich, the following year. Peter Martyr was the author of many works on divinity, including commentaries on some parts of the Old and New Testaments. He is said to have excelled Calvin in erudition, and the knowledge of languages, and his personal character was extremely amiable.

MARTYRS (from the Greek *μαρτυρ*, a witness); a name applied, by the Christian church, to those persons, in particular, who, in the early ages of christianity, and during the great persecutions, suffered ignominy and death, rather than renounce their faith; and thus testified their unshaken confidence in the truth and divine origin of the new doctrine. The animation which faith inspires in noble souls, wherever it is opposed and oppressed, has given to the Christian church many heroic examples of this sort; and, in all ages and countries, religious men have aroused the spirit of martyrdom, which leads to the sacrifice of life and worldly good for the truth. An account of the life, persecutions, and death of the Christian martyrs, is called *martyrology*. The first, I., bishop of Rome, was the first who adopted a work of this kind. The Roman martyr is the most celebrated. On the worship of martyrs, see the article *Saints*.

*Martyr*, in a wider sense, is used for any innocent man who suffers in a good cause, or in a cause which he considers so; thus we say, to be a martyr for the truth, to a cause, &c. For further information see *Persecutions*.

*Martyrs, Era of.* See *Epoch*.

*Martyrs, Festivals of the,* seem to have been observed as early as the second century. The Christians offered prayers at the tombs of the martyrs, thanked God for the example which they had

given to the world. The rite was concluded with the sacrament of the Lord's supper and the distribution of alms. Eulogies were also delivered, and accounts of the lives and actions of the deceased read. These festivals were called the *birth-days of the martyrs*, because on the day of their death they were born to the joys of eternal life. The churches or chapels consecrated to the martyrs were styled *martyria*. They sometimes, though not always, contained their bones, and sometimes were particular rooms in the great churches.

MARVELL, ANDREW, was born at Kingston-upon-Hull, in 1620, and sent to Trinity college, Cambridge, whence he was inveigled away by some jesuitical emissaries, and was found by his father in a bookseller's shop in London, and induced to return to college. On the death of his father, in 1640, he made the tour of Europe, and distinguished himself by some humorous satires against Richard Flecknoe, an English poetaster, resident at Rome, which circumstance induced Dryden to give the name of *Mac Flecknoe* to his satire against Shadwell. He afterwards acted as secretary to the English legation at Constantinople, and, on his return, was appointed assistant to Milton, in his office of Latin secretary. In 1660, he was chosen member of parliament for his native place, which he represented to the end of his life, and obtained a high character for diligence, ability, and integrity. In the reign of Charles II. Marvell was in the opposition, and his whole efforts, both in and out of parliament, were directed to the preservation of civil and religious liberty. Although he rarely spoke, his influence was great. The earl of Devonshire was intimate with him, and prince Rupert often followed his advice. He had the character of being the wittiest man of his time, and wrote a number of poetical effusions, of the humorous and satirical kind, which were very effective as party pieces. Marvell was the author of several tracts, one of which, entitled an *Account of the Growth of Popery and Arbitrary Power in England*, gave so much offence, that a reward was offered for the printer and publisher. Notwithstanding the earnestness with which he opposed the court, his wit made him a favourite with Charles II., who deputed the lord treasurer Dauby to wait upon him, with the offer of £1000, and a promise of future favour. He rejected the bribe without hesitation; and was obliged, on the departure of the courtier, to send to a friend for the loan of a guinea. The life of Marvell was more than once threatened by his irritated enemies; and his death, which happened in August, 1678, without much previous illness, has been attributed, with no support from direct evidence, to poison. He was buried at St Giles's in the Fields, at the expense of his constituents, who voted a sum to erect a monument to his memory; but it was not admitted by the rector. The most complete edition of his works is that by Thompson, with an account of his life (3 vols. 4to, 1776).

MARY is probably derived from the Hebrew *Miriam*, (strife, disobedience). Mary, the mother of Jesus, in the language of the church, *Our Dear Lady*, or the *Holy Virgin* (in French, *Notre-Dame*; Italian, *Madonna*; English, *Our Lady*), is described in the gospel history as a virgin in humble circumstances, but of the stem of David, who lived in obscurity in Nazareth, a city of Galilee, and was betrothed to Joseph, a carpenter. A heavenly messenger broke in upon her solitude with a salutation of the deepest veneration. The Virgin was astonished at the appearance: her modest feelings could not account for such a mark of distinction. The angel saluted her as the highly-favoured of God, and announced to her that she should bear a son, who

should be called the Son of God, the long expected Saviour of the Jews. "How shall this be," she replied, "seeing I know not a man?" The angel informed her that the power of God should overshadow her, and make that which was impossible a reality, as had been the case with her aged friend Elizabeth, who was barren. She bowed in submission to the will of the Supreme,—"Behold the handmaid of the Lord: be it unto me according to thy word." The feelings excited by her high and wonderful destiny raised her above doubt, and the song of praise into which she bursts forth at her meeting with Elizabeth expresses the joy which she felt at her destination. The little we learn of her feelings at the birth of Christ, the salutations of the shepherds, and his presentation in the temple, show that the emotions which were excited by the annunciation still remained. She sees the connexion between the vision of angels, which the shepherds related, and what she already knew: she was not astonished when she heard the prophetic blessing of Simeon. At the wedding in Cana, she sought the miraculous power of her Son to relieve the embarrassment occasioned by a want of wine. She doubtless attended him through all his perilous course, with ever-watchful anxiety; for we find her absorbed in silent sorrow at his cross, with the beloved disciple John. To his care, Jesus intrusted her as to a son, after which she disappears from history.

Towards the end of the fourth century, parties were formed among the Christians, which paid her too little or too much veneration. Some Thracian and Scythian women, having a very slight knowledge of Christianity, carried into Arabia their pagan feelings towards a mother of the gods, and established a formal worship of the Virgin Mary. They worshipped her as a goddess with prayers, processions, and sacrifices, and, among other ceremonies, offered her, on a carriage consecrated to her service, small cakes (Greek, *kollyris*), whence they were called *Collyridians*. Even orthodox theologians began to maintain the opinion that Mary always remained a virgin as a doctrine of faith; and a party in Arabia, which regarded her as the actual wife of Joseph and the mother of several children by him, was called *Antidikomarianites*, that is, the adversaries of Mary. At the end of the fourth century, Helvidius in Palestine, and bishop Bonosus in Illyria were declared heretics for the avowal of similar opinions. Poetry and the Catholic church readily adopted the image of Mary for an ideal of female excellence. With the worship of saints, the veneration of the Virgin Mary is naturally connected. In the sixth century, the Christian church began to celebrate festivals in her honour, of which the Purification, the Annunciation, and the Visitation (the visit of Mary to Elizabeth) are still retained in many Protestant countries. The Greek and Catholic Christians, and the schismatic churches in the East, observe several feasts besides the above in honour of the Virgin; for instance, the birth of Mary, and her ascension to heaven; that is, her death and reception to heaven (by the Catholics called the *Assumption*). The festival of the immaculate conception is celebrated only by the Catholic church. It was first introduced in 1145: it was not received, however, universally, on account of the violent opposition of the Dominicans. These disciples of St Thomas Aquinas (q. v.) refused to admit that Mary was conceived and born without original sin. The council of Trent left this dispute undecided, notwithstanding the violence with which it had often been renewed. The worship of Mary gave rise to a belief in the miraculous power of several old images of the Virgin. Those at Loretto, in Italy, and Czestochow, in Poland, are particularly celebrated

for their healing powers, but a *divine* of soul and body. To such images, the *devotion* has been accustomed to perform pilgrimages to obtain the indulgence promised to pilgrims in *the* *image*. Several religious orders have been instituted in honour of the Virgin Mary, among which are the mendicant order of Servites, and it is orders of females called by her name; for *example* the *order* of the Conception, of the *Annunciation* or *Immaculate*, of the Visitation. For the *scriptural* worship of the Virgin, so important in *Eastern* as in *Western* influence on the fine arts, see *Virgin* art. *and* *and*.

Sacred history mentions several Marys

1. *Mary of Bethany*, the sister of *Lazarus*, to whom he vouchsafed his peculiar knowledge as a imperishable name (*Matthew* xxiii. 12).

2. *Mary of Magdala*, or *Mary Magdalen* who was cured by Christ of an *evil* *spirit*, and proved her gratitude by the most devoted *affection* to him. She served him with her property *and* him on his journeys, and *wept* at his crucifixion. She was the last to leave his grave, and the first to visit it on the morning of the resurrection, and behold her risen Lord. See *Magdalen*.

3. *Mary*, the wife of Cleophas, the mother of the apostle James, and, 4. *Mary*, the sister of *Mary* the mother of Jesus, both of whom we find at his birth and his sepulchre, and who had probably been a train.

MARY OF MEDICI, daughter of Francis I. Medici, grand duke of Tuscany, was born in France, in 1573, and married to Henry IV. king of France, in 1600. After his death in 1610 she became regent. The duke of Epernon had access to parliament of Paris to confer on her the regency. Mary, at the same time regent and guardian of a minor son, Louis XIII., dismissed the duke, and allowed herself to be guided by Italian and Spanish favourites. The state lost its respect and was torn by the dissensions of the great ones. A treaty, concluded in 1614, granted to the nuns tents everything which they had asked for; the party spirit rose anew, as Mary's conduct caused universal dissatisfaction, she having given herself totally up to the guidance of the *cardinal* *Richelieu* and his wife, the two most *disseminators* of *evil* that ever stood near a throne. The death of the marshal, murdered by order of Louis XIII. at the end of the civil war. Mary was *assassinated* in 1631, whence she proceeded to Angoulême. Richelieu, then bishop of Lugon, recommended the *cardinal* *Richelieu* to her son, in 1619, but Mary, dissatisfied with the fulfilment of the terms of the agreement, *declared* a new war, which, however, was soon ended. At the death of the *cardinal* *Richelieu*, Mary stood at the head of the *cardinal* *Richelieu* in order to strengthen her authority, she appointed Richelieu, her favourite, into the *cardinal* *Richelieu* had the cardinal reached the *cardinal* *Richelieu* when he made his former protector *cardinal* *Richelieu* was no longer dependent upon her, and he immediately laboured to effect his downfall. Louis XIII. having fallen seriously sick at Lyons, he sought him to promise to abandon the *cardinal* *Richelieu* to avoid the fulfilment of this promise, the *cardinal* *Richelieu* vowed to reconcile the two parties after his death. Mary was not to be moved, and the king was much displeased that he consented to *cardinal* *Richelieu* secret council of state was held, the *cardinal* *Richelieu* which was the cardinal, who showed, as a *cardinal* *Richelieu* that either the queen or he himself *cardinal* *Richelieu* He then set forth the dangers which threatened the state from without and within so *cardinal* *Richelieu* the king held himself lost without the support of *cardinal* *Richelieu*

prime minister. All the other members of the council of state agreed with the king, partly from flattery, partly from fear of opposing him, partly from the wretched state of the kingdom. The king was apprehensive, in consequence of the suggestions of the cardinal, that the queen intended to put her second son Gaston on the throne. The queen therefore received orders, in 1631, to retire to the castle of Compiègne, and all her adherents were either banished, or confined in the Bastille. The queen soon felt that she was in reality a prisoner at Compiègne, and fled, in the same year, to Brussels. She afterwards repeatedly demanded justice from the parliament, and died in 1642, in great want, at Cologne. Paris owes to her the magnificent palace of the Luxembourg, the aqueducts, and the public walk, called *Cours-la-Reine*. She was jealous, obstinate, and ambitious. With Henry IV. she had not been happier than with Louis XIII. The amours of her husband caused her the greatest grief, and jealousy often excited her to violence. With unbounded passion, she united all the weaknesses of her sex. She was ambitious from vanity, confiding from want of intelligence, and more variegated of distinction than power. Her biography appeared in 1774 (Paris, 3 vols.)

MARY I., queen of England, daughter of Henry VIII., by Catharine of Arragon, was born in 1516. In her infancy, she was betrothed, first to the dauphin of France, afterwards to the emperor Charles V., and, lastly, to the duke of Orleans. After her mother's death, she was declared illegitimate, but was restored to her rights, when the succession was finally settled in 1544. She was bred up by her mother, in a zealous adherence to the Roman Catholic faith; on which account, she was treated with rigour under Edward VI. She ascended the throne in 1553, after an abortive attempt to set her aside in favour of lady Jane Grey. One of her first measures was the reinstatement of the prelates who had been superseded in the late reign, while Cranmer was prosecuted for high treason, and several other Protestant bishops imprisoned. The marriage of the queen with the archbishop Philip, son of the emperor Charles V., afterwards Philip II., united as it was with a complete restoration of the Catholic worship, produced much content. Insurrections broke out under Cave, in Devonshire, and Wyatt, in Kent, which, although oppressed, formed sufficient excuses for immuring princess Elizabeth in the Tower, and dooming the faithful and unfortunate Jane Grey and her husband, Guildford Dudley, who had been hitherto spared, to execution. Philip arrived in England in 1554, when nuptials were celebrated; but the attempts of Mary to secure him a paramount authority in England were unsuccessful. She succeeded better in a conciliation of the kingdom to the pope, which was effected, in great form, by the legate cardinal Pole. The sanguinary laws against heretics were revived, and those shocking scenes of cruelty followed, which were fixed upon this princess the hateful epithet of *bloody queen Mary*. The legate Pole disapproved of her severity; but the arguments of Gardiner and others were more congenial to the gloomy bigotry of the sovereign, and 277 persons were committed to the flames, including prelates, private clergymen, laymen of all ranks, women, and even children. Her union with Philip II. was equally unpropitious to herself and the nation. Eleven years younger than the queen, he treated her with great neglect; and, to prevent the fulfilment of his threat of desertion, England was forced into a war with France, and the stance of English troops facilitated the Spanish victory over the French at St Quentin. This result, which was of no service to England, was quickly counterbalanced at her expense, by the loss of Calais,

which was taken in 1558, after it had been in the hands of the English for 200 years. This disgrace sank deep in the heart of Mary, who was already declining from a dropsical complaint, and preyed upon by a consciousness of the hatred of her subjects, and the indifference or aversion of her husband. She terminated her short and dark reign, of little more than five years, in November, 1558, in the forty-second year of her age. Mary was not destitute of the characteristic vigour and ability of her family; but her natural capacity was clouded by bigotry, and the prejudices fostered by the connexion of her mother's divorce and ill-treatment with the separation from the see of Rome. Hateful as was the severity really displayed, it has not unfrequently been highly exaggerated, and censured with too little regard to the intolerance prevalent in that age. With Mary I., ended the dominion of popery in Great Britain.

MARY II., queen of England, born in 1662, was the daughter of James, duke of York, afterwards James II., by his wife Anne Hyde, daughter of lord Clarendon. She was married, in 1677, to William, prince of Orange, and, when the revolution was effected, which dethroned her father, Mary was declared joint-possessor of the throne with her husband, king William, on whom all the administration of the government devolved. This arrangement cost Mary no sacrifice, her strong regard to, and profound respect for, her consort being always conspicuous. She was strongly attached to the Protestant religion and the church of England. During the absence of William in Ireland, in 1690, Mary managed parties at home with extreme prudence, and acted with equal ability during his various visits to the continent. The unfriendly terms on which she lived with her sister Anne have been regarded as a blemish in her character; but political jealousies, and the weak attachment of the latter to overbearing favourites, may sufficiently account for it. Mary died of the small-pox, at Kensington, in the year 1695, in her thirty-third year. See *William III.*

MARY STUART, queen of Scots, celebrated for her beauty, her accomplishments, her errors, and her misfortunes, was born at Linlithgow palace, December 8, 1542, and was the daughter of James V. of Scotland, by his queen, Mary of Lorraine, a French princess, of the family of Guise. Her father dying when she was about eight days old, violent disputes arose among the nobility about the guardianship of the infant sovereign, and the conduct of public affairs. The regency was at length vested in the earl of Arran, and Henry VIII. of England having demanded the hand of Mary in marriage for his son Edward, the regent's rejection of the proposal occasioned a war, in which the Scots were defeated at the battle of Musselburgh. At the age of six, the young queen was sent by her mother to France, where she was educated in a convent, and appears to have been instructed in every branch of learning and polite accomplishment which was fashionable at that period. April 20, 1558, she was married to the dauphin, afterwards Francis II. He died about six months after his accession to the crown, in December, 1560, and the widowed queen returned to Scotland. The future incidents of her life are matter of well-known history, and, remarkable as they are, a very slight notice of the most important can alone be introduced into this article. The queen, having received overtures of marriage from various quarters, gratified her inclination by uniting herself with her cousin, the young and handsome Henry Stuart, lord Darnley, by whom she became the mother of James VI. Darnley proved a profligate and ungrateful husband, and a weak and worthless man. Excited by jealousy, he caused his wife's secretary, David Rizzio, to be

murdered in her presence, and offered her many other indignities, which produced an open quarrel between them. An apparent reconciliation took place, when Darnley, who had continued to reside separately from the queen, was assassinated, and the house he had inhabited was blown up with gunpowder, in February, 1567. This barbarous transaction was but very imperfectly investigated; and, in the month of May following, the imprudent Mary wedded the earl of Bothwell, who was openly accused as the murderer of the late king. Scotland soon became a scene of confusion and civil discord. The people rebelled against the authority of the queen. Bothwell, a fugitive and an outlaw, took refuge in Denmark; and Mary was made a captive, treated with insult and contempt, and committed to custody in the castle of Loch Leven. After some months' confinement, she effected her escape, and, assisted by the few friends who still remained attached to her, made an effort for the recovery of her power. She was opposed by the earl of Murray, the natural son of James V., who had obtained the regency in the minority of her son. The battle of Langside ensured the triumph of her enemies; and, to avoid falling again into their power, she fled to England, and sought the protection of queen Elizabeth. That princess treated her with all the jealousy of a personal and political rival; and, after keeping her a prisoner during eighteen years, she caused her unfortunate captive to be tried and executed for an alleged conspiracy against her government. Mary received the news of her destined fate with great serenity; wrote her will, and, having prepared herself for death, by practising the ceremonies enjoined by the Catholic faith, to which she was devotedly attached, suffered decapitation, February 8, 1587, in the castle of Fotheringay, where she had been long confined; and, August 1, was interred, with great pomp, in the cathedral of Peterborough. Her body was subsequently removed, by her son, James I., to Henry VII.'s chapel, Westminster, where a magnificent monument was erected to her memory. She wrote with elegance in the Latin and French languages, and many of her compositions have been preserved, consisting of poems, letters, and a discourse of royal advice to her son. The character and conduct of Mary, queen of Scots, have been made the subject of much controversy. In the list of her partisans may be mentioned Goodall, W. Tytler, Whitaker, H. G. Bell, and professor Rennie; while the Scottish historians, doctor Robertson and Laing, have exhibited the evidence against her. "No inquiry," says Sir Walter Scott, in his History of Scotland, "has been able to bring us to that clear opinion upon the guilt of Mary which is expressed by many authors, or to guide us to that triumphant conclusion in favour of her innocence of all accession, direct or tacit, to the death of her husband, which others have maintained with the same obstinacy. The great error of marrying Bothwell, stained as he was by universal suspicion of Darnley's murder, is a spot upon her character for which we in vain seek an apology. What excuse she is to derive from the brutal ingratitude of Darnley; what from the perfidy and cruelty of the fiercest set of nobles who existed in any age; what from the manners of a time in which assassination was often esteemed a virtue, and revenge the discharge of a debt of honour; must be left to the charity of the reader." Chalmers's Life of Mary (1818) and Miss Benger's Memoirs of Mary (1823) may be consulted. The misfortunes of Mary have furnished a subject for the tragic muse of Schiller, Alfieri, and others.

MARY'S COLLEGE, MOUNT ST., is situated in a romantic spot at the foot of a branch of the Blue

Ridge mountains, two miles from the town of its metropolis, in Frederick county, Maryland; distant from Baltimore, fifty miles, and near Washington city. It was established, in 1789, by doctor Dulois, now Catholic bishop of New York. In 1820 it was raised to the dignity of a college by the general assembly of Maryland, and named St Mary's college. Only twelve students were graduated; but the number of students in the year beginning with July, 1831, is 120. The government of the college is vested in a council of trustees. There are nine professors, and sixteen assistant professors and tutors. The philosophical course is very good, and the library consists of 20,000 volumes. There is only one vacation, viz. from the 15th of August to 15th of September. Commencement is in the last week of June.

MARY'S COLLEGE, ST. See Baltimore.

MARY'S FALLS, ST.; rapids on the river Mary's, between Lake Superior and Lake Huron. The water descends twenty-two feet in more than two quarters of a mile. Canoes and large boats do not pass with a full load, and ascend with great difficulty.

MARY'S RIVER, ST.; a small river which separates Georgia from Florida, and runs into the Atlantic ocean; lat. 30° 43' N.; lon. 82° 0' W.

MARYLAND; one of the United States of America, bounded north by Pennsylvania and Delaware, east by Delaware and the Atlantic ocean, south-west and west by Virginia; lat. 37° 30' N. to 39° 30' W.; lat. 36° to 39° 44' N.; area 13,950; population in 1790, 349,721; in 1800, 349,692; 1810, 380,546; in 1820, 467,300; in 1830, 446,913. The number of slaves included in the last number was 102,578; and of free people of colour, 52,912. The increase of population in the last forty years has been nearly equal to one per cent. per annum. The proportion between the coloured population and the white is as 1 to 15. The seat of government for Maryland is Annapolis. Baltimore is much the largest city. Frederick, Hagerstown, Easton, and Cumberland are considerable towns. Chesapeake bay divides the state from north to south. The part of the coast on the bay is called the eastern shore, the part west, the western shore. The country on the eastern side of the Chesapeake, with the exception of a small part of its northern extremity, is an extensive plain, low and sandy, much intersected by rivers and creeks, having few springs, and abounding with stagnant water. In this part, the air, in summer, is most oppressive, disagreeable, and the inhabitants are subject to agues and intermittent fevers, and many of them have a sickly appearance. The Maryland part of the peninsula included between the Potomac and Chesapeake bays, is much lower and more uniformly level than the Delaware part. The soil is well adapted to corn, wheat, tobacco, and sweet potatoes. The genuine white wheat, which is said to be peculiar to this state, is raised in some of the counties on the eastern shore. The country on the western shore of the Chesapeake, below the falls of the rivers, resembles that on the eastern shore. Above these falls, the country becomes high, and the western part of the state, it is mountainous. The western parts of the state are crowned by ranges of mountains. All the mountain country abounds with springs of excellent water, and the climate is salubrious and agreeable. There are extensive orchards of apples, pears, peaches, plums, and cherries. The forests abound in nut trees, which feed great numbers of swine. There is much deer and wild, and when fattened, are killed, and exported. Beef and mutton are also produced. Some cotton for domestic use is raised in Maryland.

but its quality is not good. The principal rivers are the Potomac, which divides this state from Virginia; Susquehanna, Patuxent, Elk, Sassafras, Chester, Choptank, Nanticoke, and Pocomoke. The most considerable export from this state is that of flour; next to this is that of tobacco. The other exports are principally of iron, Indian corn, pork, flax-seed and beans. The trade of Maryland is principally carried on from Baltimore with the other states, the West Indies, and various parts of Europe. The value of exports of domestic produce during the year ending Sept., 1829, was 3,662,273 dollars. The tonnage of vessels owned December 31, 1828, was 70,948. The tonnage of steam-boats, in 1827, was 207½. The most numerous denomination of Christians in Maryland is the Roman Catholic. There are also many Presbyterians, Methodists, Episcopalians, Baptists, and Friends, and several denominations having less numbers. The legislative power is vested in a senate of fifteen members, and a house of delegates, consisting of eighty members; and these two branches are styled the *general assembly of Maryland*. The members of the house of delegates, one from each county, are elected annually by the people, on the first Monday in October; and the members of the senate are elected every fifth year, on the third Monday in September at Annapolis, by electors who are chosen by the people on the first Monday of the same month. These electors choose by ballot nine senators from the western shore, and one from the eastern, who hold their office for five years. The executive power is vested in a governor, who is elected annually on the first Monday in January, by a joint ballot of both houses of the general assembly. No one can hold the office of governor more than three years successively, nor be eligible for governor until the expiration of four years after he has been thrice elected. The governor is assisted by a council of five members, who are chosen annually by a joint ballot of the senate and house of delegates. The general assembly meets annually at Annapolis, on the last Monday in December. The council of the governor is elected on the first Tuesday in January; the governor nominates to office, and the council appoints. The constitution grants the right of suffrage to every free white male citizen, above twenty-one years of age, having resided twelve months within the state, and six months in the county, in the city of Annapolis, or of Baltimore, next preceding the election at which he offers to vote. The state is divided into six judicial districts, four of which there are three judges. Each court is constituted of one of the judges of the court of appeals, and two associates. The chancellor and judges are nominated by the governor, and appointed by the council; and they hold their offices during good behaviour. The principal literary seminaries in Maryland are the university of Maryland, St. Mary's college, Mt. St. Mary's college and Baltimore college in Baltimore, and St. John's college at Annapolis. There are several academies, which receive 800 dollars a year from the state treasury. A law in favour of primary schools was passed in 1825, and has been partially carried into effect in three counties. The state has a school fund of 75,000 dollars, together with a tax for the same purpose on bank capital, of twenty cents on every 100 dollars.

Maryland was granted, in 1632, by Charles I. of England, to Sir George Calvert, lord Baltimore, a Roman Catholic, and an eminent statesman, who had been secretary to James I.; but, before the patent was completed, lord Baltimore died, and the patent, dated June 20, 1632, was given to his eldest son, Leonard, who succeeded to his titles, and who, for

upwards of forty years, directed, as proprietor, the affairs of the colony. Leonard Calvert, brother of Cecilius, lord Baltimore, was appointed the first governor; and he, together with about 200 persons, commenced the settlement of the town of St. Mary's, in 1634. A free toleration of religions was established, and a system of equity and humanity was practised with regard to the Indian tribes. The state was named for Henrietta Maria, queen of Charles I. After the colony of Maryland had established its general assembly, even to the time of the revolution, the right of appointing the governor, and of approving or disapproving the acts of the assembly, was retained by the family of lord Baltimore. The constitution of Maryland was formed in 1776, but many amendments have since been made. For further information, see *An Historical View of the Government of Maryland, from its Colonization to the present Day* (Baltimore, 1831).

MASACCIO (properly *Tommaso Guido*); one of the oldest painters of the Florentine school, to whom the art of painting owes very much, is said to have been born about 1402, at St. Giovanni, in the Val d'Arno. In the church del Carmine, at Florence, are some excellent paintings of his, also at St. Clemente, in Rome, but in a bad state. Baldinucci has described his life accurately, and corrected Vasari. Both place Masaccio among the first painters, by whom the harshness and difficulty of the art was diminished, and life and expression given to it. Annibal Caro composed an epitaph for him, in which he says Buonarroti taught all other painters, and learned from Masaccio alone.

MASANIELLO. See *Massaniello*.

MASCARET; the swell occasioned near the mouth of a river by the influx of the tide from the sea, counteracting its current, and thus forcing back its waters. In large rivers, where the latter part of their course is but little if at all above the level of the ocean, the collision is sometimes tremendous, and is attended with loud roarings, as is the case at the mouth of the Amazonas. It has been poetically said that the genius of the river and the god of the ocean contend for the empire of the waters. The Indians in South America call it *pororoca*. The reader will recollect the lines in Rokeby:—

Where Orinoco, in his pride,  
Rolls to the main no tribute tide,  
But 'gainst broad ocean wages far  
A rival sea of roaring war.

MASERES, FRANCIS, cursitor baron of the exchequer, was born in 1731, of a French refugee family, studied law, was made attorney-general of Quebec, and some years after, on his return to Britain, cursitor baron of the exchequer. He was an excellent mathematician, and published, in 1759, a treatise on the negative sign, in which he argues against the doctrine of negative quantities. He also printed a collection of *Scriptores Logarithmici*, a work in 6 vols. 4to; a Treatise on Life Annuities, with several Historical Tracts; and by his liberality, induced the reverend Mr Hellins to undertake his edition of Colson's translation of Agnesi's *Idiuronum Analyticarum*. He died in May, 1824, aged ninety-three.

MASHAM, ABIGAIL, the favourite of queen Anne, noted in English history for her political intrigues, was the daughter of Mr Hill, a rich merchant of London, who married the sister of Mr Jennings, the father of the duchess of Marlborough. The bankruptcy of her father obliged her to become the attendant of a baronet's lady, whence she removed into the service of her relative, then lady Churchill, who procured her the place of waiting-maid to the princess Anne. She retained her situation after her

mistress ascended the throne, and, by her assiduity and complaisance, acquired a great degree of influence over her. The high church principles in which she had been educated, contributed to increase her credit with the queen, who was secretly attached to the tory party, though obliged, in the beginning of her reign, to favour the whigs. The marriage of Miss Hill with Mr Masham, in 1707, occasioned an open quarrel with lady Marlborough, who was, in consequence of it, deprived of her majesty's confidence. Harley, afterwards earl of Oxford, connected himself with the new favourite; a change of ministry took place, and, in 1711, Mr Masham was raised to the peerage. He and his wife appear to have been actively engaged in the intrigues of the tories in favour of the exiled house of Stuart. Lady Masham lived a long time in retirement after the death of the queen, and died herself at an advanced age. The title of baron, bestowed on her husband, became extinct on the death of her only son, June 14, 1776.

MASINISSA, king of the Massylians, in Numidia, the son of king Gula, was educated at Carthage. While yet young, he defeated Syphax, king of the Massesylians, an ally of the Romans. He then served in the Carthaginian armies in Spain against the Romans. Fortune at first favoured his enterprises; but, having been totally defeated by Scipio Africanus at Bætula, with Asdrubal and Mago, he capitulated, and became an ally of the Romans. In the mean time, his father died, and Mesetulus, an enemy to his family, usurped the dominion, under the name of a guardian. When Masinissa was informed of this, he hastened back to Africa, and re-conquered his paternal kingdom. During this period, the enmity between Syphax and Carthage had ceased, and Asdrubal had given to Syphax his daughter, Sophonisba, who had already been betrothed to Masinissa. Syphax, at the instigation of Asdrubal, attacked Masinissa, with such success as to compel him to flee, with only a few horsemen. He then conquered the country of the Massylians, and Bochar, one of his generals, pursued Masinissa so closely that he escaped with a few attendants, and severely wounded. They concealed themselves in a cave, and supported themselves by plunder, till Masinissa recovered from his wounds. He then hastened to the frontiers of Massylia, and, aided by the inhabitants, not only recovered his patrimony, but invaded Massesylia itself. Syphax, however, again defeated him, and he escaped to the Syrtis Minor, with only seventy horsemen. He awaited there the arrival of his allies, the Romans. Syphax was now persuaded, by the Carthaginians, to restore Masinissa his kingdom; for they hoped to gain him thus to their interests; but they were disappointed. The junction of his Numidian cavalry with Asdrubal was only to save appearances; he kept up a secret connexion with Scipio, and acquainted him with all the plans of the enemy, and at last openly went over to him. He now had it in his power to take vengeance on Syphax. With the assistance of the Romans, he defeated him several times, pursued him into his own territories, and finally made him prisoner, with his son. By the capture of the metropolis, the conquest was completed, and Sophonisba now fell into his power. Although he had resolved to punish her infidelity, his early love was revived, when, throwing herself at his feet, she begged for death, as the only deliverance from the shame of Roman bondage. He took her for his wife, expecting thus to evade the claims of the Romans; but Scipio demanded her as the prisoner of the Romans. The unhappy prince, who was entirely in their power, found that nothing but death could deliver her from their hands. He therefore sent her a poisoned chalice, which she willingly drank off,

declaring that she died with pleasure, since it was by his command, and that he was the last and avowed object of her love. Scipio strove to make the god of Masinissa by the highest marks of honour he conferred on him the title of king, and to restore to the army, granted him a crown of gold, a robe of purple, &c., and procured from the senate the restoration of his regal dignity. Masinissa became a leader of the Roman army, and gained fresh laurels at the battle of Zama, against Hannibal. At the return of peace with Carthage, he recovered not only his former possessions, but also a part of the province of Syphax. His hatred against Carthage remained unabated, and he took from this republic a number of provinces, which the Romans confirmed to him. This led to an open rupture between Masinissa and Carthage. The king then eighty years of age, was victorious. Towards the close of his life, the second Punic war broke out. When Masinissa was approaching, he sent for the young Scipio Africanus, and gave him full power to take any measures he thought most conducive to the good of his children. He was at the age of ninety years, and left behind him a name of a valiant and enlightened prince. He introduced a higher degree of civilization among his subjects, and taught them the advantages of agriculture.

MASK, THE IRON, OR, THE MASK WITH THE IRON MASK. This is the name by which is designated an unknown prisoner, who has excited a curiosity much the more lively as it has appeared impossible that it should ever be completely obtained. The personage was above the middle size, and of the finest and most noble figure. (See *Voyage de Louis XII.*, ch. 25.) He was carried about in the year 1662,\* with the greatest secrecy to the castle of Pignerol, of which Saint Mars was governor. He wore, during the journey, a black velvet mask, and orders were given to kill him if he discovered himself. In 1686, he was carried by Saint Mars to the island of St Marguerite; and on the passage, the usual precautions were observed as upon his first journey. The marquis de Louvois went to see him, and spoke to him standing, and with deference. The governor himself placed the plates upon the table, and afterwards retired, shutting the door, of which he held the key. One day, it is said, the prisoner wrote on a knife upon a silver plate, and threw the plate out the window towards a boat, which was almost at the foot of the tower. A fisherman picked up the plate, and carried it back to the governor. The latter, astonished, inquired of the fisherman if he had read what was upon the plate, or if he had seen it in his hands. "I do not know how to read," answered the fisherman; "I have just seen it; no one has seen it." He was, nevertheless, detained for several days; and the governor, who dismissed him, said to him, "Go; you are very fortunate in not knowing how to read." (See *Journal de Pignerol*, vol. 3, page 128.)

\* This date is subject to some difficulties. Saint Mars was not appointed governor of Pignerol until Fouquet was there, whose arrest took place Dec. 30, 1664. (See *Journal de Pignerol*, vol. 3, page 128.)

+ May not the history of the plate be an invention of that of the fine shirt, carefully folded, upon which there had written from one end to the other, and which a fisherman saw it floating under the window of this unknown prisoner directly to M. de Saint Mars, who pressed him to tell him if he had read any thing upon it. It appeared that the fisherman found, two days afterwards, about the same place, a plate of silver, upon which was written the same words. These details, and others concerning the escape of the prisoner at the island of Saint Marguerite, were given by M. de Papon, who visited this prison, Feb. 2, 1770, by order of the French government, then about seventy years of age, whose father had been, in some particulars, the governor of Saint Mars, and had carried away, upon his departure, the body of the prisoner of the tower. (See *Journal de Pignerol*, vol. 3, page 128.)

having been appointed governor of the Bastille, in 1698, carried the prisoner with him there, but still masked. An apartment had been prepared for him, more convenient, and furnished with more care than those of the other unfortunate beings who inhabited this sad abode. He was not permitted to cross the courts, and he could not take off his mask even before his physician. In other respects, the greatest attention was shown him, and nothing which he requested was refused him. He was fond of fine linen and lace, and was very attentive to his whole personal appearance. His education appeared to have been carefully attended to; and he amused his leisure by reading, and playing upon the guitar. The physician of the Bastille related that this unknown person was admirably formed, and that he had a very fine skin, although rather brown. He interested by the mere sound of his voice, never complaining of his situation, and never giving any hint of his character. His unknown person died Nov. 19, 1703, at ten o'clock in the evening, without having undergone any severe sickness. He was buried the next day, at four o'clock in the afternoon, in the cemetery of the church of St Paul. He was, it is said, about thirty years of age, although the record of his decease, which he is mentioned under the name of Maroli, makes him only about forty-five. Orders were given to burn every thing which had been employed in his service. The walls of the chamber which he occupied were rubbed down and white-washed. The precautions were carried so far, that the tiles in his room were removed, in the fear that he might have displaced some of them, to conceal a letter behind them. Voltaire, from whom the greater part of these particulars is borrowed, remarks, that at the period when the prisoner was confined, no person of importance disappeared from Europe; and yet it cannot be doubted that he must have been one. The marks of respect which Louvois showed him, prove sufficiently.

Conjecture has exhausted itself to discover who this mysterious personage might be. Laborde, first *et de chambre* of Louis XV., and who had received from this prince many proofs of confidence, showed a desire to discover him. The king replied, "I pity you, but his detention injures only himself, and has cost great misfortunes; you cannot know him." The king himself had not learned the history of the man in the mask till his majority, and he never intrusted it to any one. The author of *Secret Memoirs*, to which is prefixed the History of Persia (Pecquet), is the writer who has attempted to raise the veil which covers the unknown prisoner. In this book, published in 1745, he pretends that it is the count of Vermandois, who was arrested, it was said, for having given birth to the dauphin; but it is known that the count of Vermandois died in 1683, at the siege of Stralsund. Lagrange Chancel, in a letter to Fréron, attempts to prove that the prisoner is the duke of Orléans, and that he was falsely reported to have been killed at the siege of Candia. Saint Foix, in 1788, wished to prove, in his turn, that it was the duke of Monmouth, who was said to have been beheaded at London, but who had been withdrawn as a punishment. Le P. Griffet, who held the office of confessor to the prisoners of the Bastille, on December 3, 1745, to 1764, has examined these different opinions in the Treatise upon the Proofs which serve to establish the Truth of History, chap. vi; and he adds that all the probabilities are in favour of the count of Vermandois. Voltaire has said (*Philosoph. Dict.*, art. *Anecdotes*) that the unknown prisoner could be no one of the persons just mentioned, but does not declare who he is. "The writer of this article," adds he, "knows,

perhaps, more of him than P. Griffet, and will not say more of him." Voltaire, doubtless, knew that the report was spread that the prisoner was a count Girolamo Magni, or Mattioli, first minister of the duke of Mantua, who had been removed from Turin in 1685, or rather 1679, by order of the cabinet of Versailles, because it was feared that his dexterity might defeat the negotiations entered into with the court of Piedmont. Delort, *Hist. du Masque de Fer*, published at Paris, 1825, likewise maintains this opinion. Dutens, nevertheless, reproduced it in 1789, in his *Intercepted Correspondence*, Lett. 6, and again in 1806, in the *Memoirs of a Traveller in Repose*, vol. ii. p. 204—210; and two other writers, in 1801 and 1802, endeavoured to establish this opinion, with a great array of evidence. The abbé Soulaire, editor of the *Memoirs of the Marshal de Richelieu*, inserted in them, vol. iii. p. 75, a History of the Iron Mask, written by his Keeper. This account was said to have been given by the regent to his daughter, who communicated it to the marshal. According to this account, the Iron Mask was a twin brother of Louis XIV. Before the birth of this prince, two herdsmen announced to Louis XIII., that the queen would give birth to two dauphins, who would occasion a civil war, which would convulse the whole kingdom; and this prince immediately formed the resolution of removing him who should be born second, in order to prevent these troubles. The opinion entertained by a certain party, that the unknown prisoner was the offspring of a criminal intercourse between the queen and the duke of Buckingham, has been sufficiently disproved. At the time of the destruction of the Bastille, in July, 1789, there were not wanting curious persons, who sought, in the archives of this fortress, to discover some notices which might throw light upon this historical problem. In the last number of the journal entitled *Leisure Hours of a French Patriot*, p. 386, dated August 13, 1789, is mentioned a note written upon a card, which a man, inspecting the Bastille, took up at random, with several papers. The card contains the number 64,389,000, an unintelligible cipher, and the following note—"Fouquet, arriving from the isle of Marguerite, with an iron mask." Afterwards X... X... X..., and below "Kersadwin." The journalist declares that he has seen this card. The romance of M. Regnault Warin, entitled *The Man with the Iron Mask* (in 4 vols., 12mo, published in 1804, and the fourth edition of which appeared in 1816), is preceded by a dissertation of twenty-eight pages, in which the author endeavours to prove that this mysterious personage was the son of Buckingham and Anne of Austria. He goes so far as to give the portrait of the prisoner. *The Mélanges d'Histoire et de Littérature* (Paris, 1817, 8vo) contains a Dissertation upon the Man in the Iron Mask, pp. 77—156, in which the various hypotheses are judiciously discussed, even that of the chevalier de Taulès, French consul in Syria, in the year 1771, who, in a memoir (published in Paris, 1825), seeks to prove that the man in the iron mask was a patriarch of the Armenians, named Awediks, removed from Constantinople at the instigation of the Jesuits, several years after the death of cardinal Mazarin. He has no difficulty in refuting this fable, and finishes by saying—"After an impartial investigation, and having weighed all the circumstances, I cannot doubt that he was the son of Anne of Austria, but without being able to determine at what period he was born." It has also been maintained that this prisoner was don John of Gonzaga, natural brother of Charles Ferdinand, duke of Mantua. A letter of Barbesieux, of November 17, 1697, in which he says to Saint Mars—"without explaining yourself to any

one whatsoever with regard to what your ancient prisoner has done,"—seems to overturn all the hypotheses, according to which this unhappy man owed his misfortune only to the accident of his birth.

MASKS, or LARVÆ (q. v.), were used in the most ancient times, particularly in the processions and ceremonies attending the orgies of Bacchus. As there were in the ceremonies three degrees, those of Satyrs, Sileni, and the bearded Bacchus, so each degree had its peculiar and characteristic mask. These are often found represented on ancient vases. On account of this religious signification, it is not strange that they were used in connexion with the Phallus, the symbol of fruitfulness, as an effectual defence against witchcraft. An old writer explains the power of the mask to protect against enchantment, in this way: that its ridiculous distortion, drawing upon itself the pernicious glance of the sorcerer, averts it from the person for whom it was intended. It was natural that the Greeks, whose highest aim was beauty, should elevate the character of the mask; thus, at length, there sprung from this fashion of misshapen masks the more pleasing Sileni and Satyr masks, and other sportive fancies of artists, which, in time, produced the grotesque and arabesque. As the origin of Grecian tragedy was closely connected with the worship of Bacchus, masks were used in it even in the beginning. Who first introduced them into comedy is unknown. We shall err if we consider the Grecian and Roman masks exactly like those of the modern Italian; these latter only cover the face; the former were a covering for the whole head, and represented, with the features, the head, hair, and eyes. The following cuts represent two Roman masks:—

They were, at first, made of the bark of trees, then of leather, afterwards of wood, which the artist fashioned according to the design of the poet. Tragic masks were distinguished by great, open mouths,

and a frightful appearance; comic by a highly countenance: there were, also, low masks or orchestric, or those with regular features or drama. They had mostly very large, open mouths, with which were metallic bars, or other strong means to strengthen the voice of the speaker: the immense size of the old theatres. Now men (as called), ignorant of the peculiarities of a comic stage, are unsparing in their comment: a reason for the introduction of masks into their plays. They say they, all imitation of nature, and even a necessity of voice necessary for the expression of a man, were thus rendered impracticable. They do remember, that the tragic imitation of a man aimed at the highest dignity and grandeur: it was ideal, and the close representation of a man's character, in which the moderns are so much in place the chief merit of the actor. What does it matter to them the last thing to be admitted in their theatre. "The Greeks preferred beauty to any of representation. The introduction of the mask was on account of this feeling, and merely because it was essential, as they would have considered a more than profanation for an actor, with common features, bearing the stamp of his individuality, to have played Apollo or Hercules. It may be added, that, from the custom, one of the Greek theatres, the minute imitation of nature, and countenance, which the moderns pretend to have been lost. As the Roman theatre was almost all its parts, formed upon the Greek, it offered little in the use of the mask. The very Francesco de' Ficoroni, upon the subject of comic personages of ancient Rome, is a most and highly interesting, from the copious illustrations.

The Italian popular theatre, called *Commedia dell'Arte*, which has a close resemblance to the Roman mime and pantomime, still retains the use of the mask; for these drolleries of the art demand only requiring no particular learning, or high cultivation, continued even under the government of the barbarians. As early as the twelfth century when Irnerius established a new school of law in Bologna, we find the Bologna doctor, also called *troubaire*. He has a mask with a black nose and forehead, and red cheeks; his character is that of a painter or tedious proser. The Pantaloon came upon the scene about the end of the fourteenth century. He is that of the father; he represents a rich, miserly trader; his dress, was, formerly, the *simarra*, a sort of mantle with short sleeves and a wide collar. The garment was worn by Venetian traders in that dress, and is still worn by lawyers. It was likewise a part of the costume of Pantaloon, that the breeches or stockings should be in one piece: hence the origin of the name *pantaloon*. They were of the old time, always red, and the *simarra* always black. When the republic of Venice lost the kingdom of Negropost to the Turks, the fashion of the dress was changed from red to black as a sign of mourning, and has remained the same since. In the mask there was nothing unusual: the beard was not worn, and the representation was that of a young old merchant. The beard of the new Pantaloon is different: it passes round under the chin, and terminates at a point in the middle. The coat is lengthened, and the full pantaloon were tightened to the knee. The *simarra* and dippers remained the same. The character of Pantaloon is usually that of a goodnatured, simple, old man. He is generally in love, and is continually imposed upon by a son, or a servant. In modern times, he is often a grandfather of a family, full of honour, and consequence.

observant of his word, and very strict to his children; but in the particular of being continually imposed on, he remains the same. He speaks in the Venetian dialect—the doctor in the Bolognese. Buffoons are likewise among the oldest masks of the Italian stage; one is Harlequin (q. v.), the other is Scapin, cunning and knavish servants of Pantalone and the Doctor. Brighella is not so old, as his garment, furnished with green ribands, and made in the fashion of the middle ages, proves. Sismondi gives the following account of his origin, from the Chronicle of Malvezzi: “1200 of the nobility of Brescia rushed to compel the citizens to take up arms against the people of Bergamo, and they resisted. A bloody battle ensued, in the streets of Brescia, in which the nobility were beaten; they fled to Cremona, where they formed a military band; the popular party formed a similar band, under the name of *Brugella* or *Brihella*.” The name has been preserved on the stage, in a mask, which represents a proud, bold, and crafty lebeian of Brescia. This derivation is opposed to the common account, according to which, Brighella sprung from Ferrara. The Doctor of Bologna, Pantalone of Venice, Harlequin of Bergamo, Brighella of Ferrara, and all the personages, who are best comprehended under the name *Zanneschi*, the captains Pavento, Tracasso, Tempesta (who call to mind the yrgopolynices of Plautus), Trufaldin the Bergamese, have, therefore, all been on the stage from the fifteenth century. Besides these, the Romans had the *on Pasquale* and the *Gelsonmi*; the Florentines, the *Pasquello*; the Calabrians, the *Giangurgolo*; the Sicilians, the *Travaglini*; the Messenians, the *Giovanelli*; the Neapolitans, the *Coviello*, *Pasquariello*; the Milanese, the *Girolamo*; the Piedmontese, the *Pianduja*. Of the female masks, the *Colombine* of the Italian theatre is to be mentioned. Of the other characters may be mentioned *Pedrolino*, *Bertolino*, *Trivelino*, *Mamolino*, and *D. Plione Balansoni*. Respecting the mask of *Pulcinella*, see this article.) *Trucante*, in 1530, is said to have introduced the masked characters into the higher comedy. Accurate representations of these masks are to be found in Jacoboni's History of the Italian Theatre (Paris, 1728, 2 vols. 8vo.) See professor Franc. Valenini's *Trattato sulla Commedia del Arte, ossia improvvisa, Maschere Italiane ed alcune Scene del Carnevale di Roma*, Berlin, 1826, 4to, with twenty coloured engravings. See, also, the article *Carneval*.

The mask used at masked balls, or masquerades, is a covering for the head and face made from a light stuff, in which a man may disguise himself and remain unknown, or perhaps represent some other character. There are whole and half masks; for example, masks of the nose and the eyes. The best are of wax and of linen; the poorer, of paper. The former are used very well in Berlin and Italy, particularly at Venice; the latter in France, at Paris and Rouen. There are natural masks, caricature masks (*maschere*), &c. Catharine of Medici is said to have first introduced masked balls. A similar mummery was in vogue at the court of Henry VIII. (1510—46), who used the disguise.

*Mask*; a species of drama. See *Masque*.

MASKELYNE, NATHANIEL, an eminent mathematician and astronomer, born in London, in 1732, educated at Westminster and Cambridge, was chosen a fellow of the royal society, and, in 1761, deputed to proceed to the island of St Helena, to observe the transit of Venus. During the voyage, he employed himself in making lunar observations, with a view to determining the longitude. In 1763, he went to the Barbadoes, to try the accuracy of Harrison's timekeeper. On the death of Mr Bliss, he became royal astronomer; and, in 1767, commenced the publica-

tion of the Nautical Almanac, for which he published a volume of accompanying tables. (See *Mason, Charles*.) In 1774, doctor Maskelyne was employed in making observations on the eclipses of Jupiter's satellites at Greenwich; and the same year he went to Scotland, to ascertain the gravitative attraction of the mountain Schehallien, in Perthshire, of which he published an account in the Philosophical Transactions. He died in 1811. He was the author of the British Mariner's Guide, containing complete and easy instructions for the discovery of the longitude at sea and land (1763, 4to); and Astronomical Observations made at the Royal Observatory at Greenwich (1784—88, 3 vols., fol.); besides many papers in the Philosophical Transactions.

MASON, CHARLES; an English astronomer, an assistant of doctor Bradley at the royal observatory at Greenwich. He was employed to examine the lunar tables of Mayer, and the result of his labours appeared in Mayer's Lunar Tables, improved by C. Mason, published by order of the Commissioners of the Board of Longitude (London, 1787). Mr Mason was sent to America with a grand sector, to determine the limits of the provinces of Maryland and Pennsylvania. He was accompanied by Mr Dixon, in conjunction with whom he measured a degree of the meridian; and an account of their operations was published by doctor Maskelyne in the Philosophical Transactions for 1768. Mason died at Pennsylvania, in February, 1787. He communicated to the royal society an account of observations on the transit of Venus, June 8, 1769, made at Cavan in Ireland, and other papers, which may be found in the Philosophical Transactions.

MASON, WILLIAM, an eminent English poet, was the son of a clergyman in Yorkshire, where he was born in 1725. He studied at Cambridge, where he received a fellowship. His first appearance in the literary world was by the publication of *Isis*, a poem (1748), in which he satirised the Jacobitism and high church principles which prevailed in the university of Oxford. This piece provoked a reply from Thomas Warton, entitled the triumph of *Isis*. In 1752, he published his *Elfrida*, a tragedy with choral odes on the ancient Greek model. Having taken orders in the church, he obtained the living of Astou in Yorkshire, and was appointed one of the royal chaplains. In 1759, appeared his *Caractacus*, a drama, on a kindred plan with the former. In 1762, Mr Mason was made precentor of York. One of his principal works, the *English Garden*, a poem, in four books, appeared in 1772, 77, 79, and 81 (4to); and a second edition, with a commentary and notes, by W. Burgh, was printed in 1785 (8vo). This work was translated into French and German. In 1775, he published the poems of his friend Gray, with memoirs of his life. His principal subsequent publications are, *Odes*; a translation of Du Fresnoy's *Art of Painting*, with Sir Joshua Reynolds's notes (1783, 4to); the *Life of William Whitehead*, with his poems (1789, 3 vols., 8vo); and an *Essay on Church Music*. Besides his acknowledged works, Mason is supposed to have been the author of the Heroic Epistle to Sir William Chambers, and other satirical pieces, which were published under the signature of M'Gregor. At the beginning of the American war, Mr Mason became so active an advocate for freedom as to give offence at court, and he was consequently dismissed from his chaplainship; but alarmed by the French revolution, his zeal cooled in the latter part of his life. He died April 7, 1797.

MASON, JOHN MITCHELL, D. D.; an American theologian and pulpit orator, was born in the city of New York, March 19, 1770. He entered Columbia College, in that city, and was graduated in May, 1789,

with the reputation he ever afterwards sustained, of a thorough classical scholar. Under his father, a learned and respectable clergyman of the Presbyterian denomination, he then prepared himself for the sacred ministry, until the year 1791, when he left his native country, in order to complete his education at the university of Edinburgh. Here he attended the most celebrated courses of lectures connected with divinity, and formed valuable and distinguished acquaintance. In the theological societies he made himself conspicuous by the vigour of his understanding, the energy of his elocution, and the rigour of his doctrines. Towards the end of the year 1792, he was obliged to return to New York, by the death of his father, whom he soon succeeded in the Scotch Presbyterian church in Cedar street. In this situation, he confined his attention almost entirely to the benefit of his immediate flock, until the year 1798, when he composed and published a series of Letters on Frequent Communion. In 1800, he conceived the idea of a public theological seminary, to be established by the authority, and to continue under the superintendence, of the general synod of the associate reformed church. The plan which he digested was carried into operation, by his own agency and influence, in 1801. The synod appointed him their professor, and with their sanction, he visited Europe for the purpose of procuring a library. After his return, he zealously discharged the duties of his office until he was constrained to leave it by the decline of his health. In 1810, he dissolved his pastoral relation with the Cedar street church, and formed a new congregation, with whom he took possession of the Murray street church, when it was opened, in 1812. In 1811, he accepted the appointment of provost of Columbia college—a station which he filled for five years. The variety and severity of his labours at length affected his health so seriously, that he resigned his provostship, and, in 1816, repaired to Europe to recruit his debilitated frame. He returned towards the end of 1817, in better condition, and preached and taught again with characteristic force and success. In 1821 he undertook the charge of Dickinson college, in Pennsylvania, but in this his strength soon failed. In the autumn of 1824, he returned to New York, where he died in 1829, in the sixtieth year of his age. The principal works of doctor Mason, besides his Letters on Frequent Communion, are a Plea for sacramental Communion on Catholic Principles (1816), Essays, Reviews, &c., which are to be found in the Christian's Magazine, together with a number of Sermons, Orations, &c., published at different times.

**MASON'S AND DIXON'S LINE.** See *Mason, Charles*.

**MASONRY, FREE;** a term applied to the organization of a society, calling themselves *free and accepted masons*, and all the mysteries therewith connected. The society, if we can treat as one a number of societies, many of which are unconnected with each other, though they have the same origin, and a great similarity in their constitution, extends over almost all the countries of Europe, many of America, and some other parts of the globe. According to its own peculiar language, it is founded on "the practice of social and moral virtue." Its character is charity, in the most extended sense, and "Brotherly Love, Relief, and Truth" are inculcated in it. Like every other society of any magnitude, it has been the object of hyperbolical encomium from its friends, and obloquy from its enemies. Like every other society of any duration, it has been subject to the influences of human frailties, among which vanity always takes a prominent part. Like any other society founded on general principles, and, at the

same time, well organized, it has, at particular times, been subservient to the production of much good, and at others of much evil, according to its different purposes for which it has been converted into every other society, which ever flourished, and out with the lapse of years and the change of its society. For about twenty years, such is now written for and against free-masonry, and history of its history, ritual tendency. Besides, we suppose from a view of which, many of the masons and themselves justified in maintaining that their order are secrets preserved in the society, nor as such principles inculcated, which are not of social obligation, particularly as several of such order have been published by seceded members themselves whilst most masons, on the other hand, maintain that the true secret was never yet divulged. Thus it is, however, even masonic writers, who neither join the society, and yet call the secret signs and tenets masonry accidental and unimportant.

No well informed mason will, however, that the history of his society begins with the covenant, as Dr W. Preston gravely asserts, any more than a religious Catholic of the present time will believe in a double power of the pope, spiritual and temporal, proved from St Peter's having two seats at a time of Christ's capture, or from the grant which it was put by Boniface VIII. that order begins "in the beginning," and not in the beginnings." Nor does the well informed mason tell the stories that his society originated with the mysteries, or even the Egyptians, or that it came from the Dionysian architects, from the Peloponnesian society, or from the Essenes. These notions are little of the character of a constituted and ordered whole, and nothing appears to indicate its immemoriality can be considered as descending from one of them. In Lawrie's History of Freemasonry (Edinburgh, 1804), more may be found on this point. As little can it be proved that the masons sprung from the Templars, or from the order of the middle ages, or, at a later time, from the Jesuits, or indirectly from the Rosicrucians. For these stories have been caused by the history of the order (*historie ordinis*), purposely written for the sake of the rites of the society, in which, however, is also concealed, under ciphers, the true history of the (so called) higher degrees. Nor is it to be said that the free-masons originated from the common corporation of masons, for long before the age of the corporations of the separate crafts in our modern Europe, there existed corporations or societies of artificers, who united all the crafts necessary for building (and we must keep in mind that the building of the middle ages was) under the control of one or more leaders, the architects. From the charters of the clerical and secular guilds, we find united in one great society for the construction of each great building, as the cathedrals, &c. the societies erected, in all countries of Europe, the gigantic monuments, generally termed Gothic, which excite our admiration, and, as has been remarked by Dr Henry, in his History of Great Britain, with a economy of time and expense truly surprising, to find these societies of architects everywhere. They were composed of members from Italy, Germany, the Netherlands, France, England, Scotland, and other countries (sometimes even from Germany) united under very similar constitutions: for instance, at the erection of the convent of Basle, in France, about 1400; of the minister of Strasburg, 1414-1439; that of Cologne, 930 and 1211 to 1230; the cathedral of Meissen, in the tenth century; the cathedral of Milan, the convent of Monte Cassino, and of the most remarkable buildings at the

British isles. That these societies of architects at last gave rise to one not occupied with actual building (*speculative* masonry, as it is called by some), appears, from a critical investigation of the history of free-masonry.

The first societies of antiquity with which free-masonry appears to stand in historical connexion are the corporations of architects, which, with the Romans, existed under the name of *collegia* and *corporata*. It is related that Numa established the first corporations (if we may so term them) of architects (*collegia fabrorum*), with many other societies of mechanics and artificers (*collegia artificum*), after the model of the Greek societies or colleges of artificers and priests: he also instituted for them proper meetings and certain religious rites. According to the laws of the twelve tables, the *collegia* had the right to make their own laws, and could conclude certain treaties with each other, if nothing was contained in either contrary to the public laws, which was conformable with Solon's legislation. Such corporations of all kinds, particularly the crafts connected with hydraulic, naval, and civil architecture, early became dispersed through all the provinces of the Roman state, went on continually increasing, and co-operated most powerfully in propagating the Roman customs, sciences, arts, and laws. They, as well as the useful arts, were cultivated the soil, which the sword had aided. The useful arts are, of course, among the most important gifts which a civilized race can confer on the rude tribes who may be dependent on it. When an Indian tribe first concludes a treaty with the United States, one of the points has often been a stipulation that the latter shall send a blacksmith among them. If we now remember that the Romans were pre-eminently an architectural race (like most conquering nations, who have already attained a considerable degree of civilization), and that the sciences and arts, connected with architecture, include a vast range, and are intimately connected with the other attainments of an advanced civilization, we shall easily comprehend that the colleges of architects must have been of great importance. As the *collegia* were established in those early times when states were formed after the model of a family, and the religious and political constitution confusedly mingled, they had, besides their character of a society of artificers, that of a civil and religious institution. This character was retained by the *collegia*, particularly the *collegium* of architects, to the end of the Roman empire, and transplanted into the corporations of architects of the middle ages, already mentioned, because the constant mingling of religion in politics, and science, by no means ceased in the middle ages; on the contrary, in some particulars, still closer union was effected. As the Roman *collegia* held their meetings with closed doors, nothing more natural than that they should become, in times of violent political agitation, the place of political parties and religious mysteries, secret friendship, and doctrines of all sorts. The Roman emperors of the first centuries limited the *collegia* as much as possible, but the later governments favoured them so much the more. In the *corpus juris* are contained several lists of the mechanic arts, legally existing, and free from taxation, in the third and fourth centuries, among which we find those of architects, ship-builders, machine-builders, builders of ballistæ, painters, sculptors, workers in marble,asons, stone-cutters, carpenters, &c. There was no town at all important, no province ever so distant, where some of the *collegia*, just mentioned, did not exist, to the downfall of the Western and Eastern empires, with their peculiar constitutions, and having more or less of a political and a religious character.

The corporations of artificers, whose occupations were connected with architecture, were called upon, by imperial orders, to come from all parts of the empire, to assist in the building of large cities, palaces, churches, &c. Similar artificers also accompanied each Roman legion. Such corporations also existed in Britain (where the Romans, during their conquests, built a great deal), both in the legions there stationed and in the cities. The same was the case in Spain, France, on the Rhine, and on the Danube. It is true that these *collegia* vanished in Britain, with most of their works, when the Picts, Scots, and Saxons devastated the country; but, in France, Spain, Italy, and in the Greek empire, they continued to flourish, and from these countries the Christian Saxon rulers of Britain, particularly Alfred and Athelstan, induced a number of artificers and architects to come to England in order to build their castles, churches, and convents. Although these foreign artists, and the few who had survived the ravages of the barbarous tribes, were Christians, and though most of their leaders or directors were clergymen, yet the corporations which they formed had no other constitutions than those transmitted to them from the Roman colleges, which were spread over all Christian Europe, and the character of which is still to be learned from the *corpus juris Romani*. As the members of these corporations of architects of the tenth century belonged to different nations, and at the same time publicly or secretly to sects, widely differing in their tenets, and often condemned as heretical; in short, as they were very different in faith, customs, and manner of living, they could not be induced to go to England, and to remain there, without receiving from the pope and king satisfactory liberties and letters of protection, especially jurisdiction over their own bodies, and the right of settling their own wages. They then united, under written constitutions, founded upon the ancient constitution of the Roman and Greek colleges, and the provisions of the civil law. The different tenets of the members, the scientific occupation and elevated views of their leading architects and clergymen, naturally gave rise to a more liberal spirit of toleration, a purer view of religion, and stricter morals, than were common in those times of civil feud and religious persecution. The lofty notions of Vitruvius (their constant manual), in regard to the dignity of an architect, may have contributed to ennoble their character. Their religious tenets being often objects of suspicion to the orthodox, they were obliged to keep them secret. Secrecy, moreover, was the character of all the corporations of the middle ages, and, down to the most recent times, the corporations of mechanics on the continent had what they called *secrets of the craft*—certain words, or sometimes absurd ceremonies, by which they pretended to know each other. To this we must add, that the corporations of architects, in the middle ages, were descended from the times of antiquity, so that their societies had received, in the times when Rome adored all gods, and listened to all philosophical systems, impressions derived from the Greek philosophical schools, particularly the Stoic, united with some fragments of the Greek and Egyptian mysteries, and subsequently modified by notions acquired in the early times of Christianity, particularly from the Gnostics, which led to certain doctrines and sacred ceremonies, clothed, according to the spirit of the time, in symbols, and constituting their esoteric mysteries. The watchful eye of the popes induced them to keep these doctrines closely concealed, in connexion with the real secrets of their art, and its subsidiary branches, their rude chemistry, their metallurgy, and natural philosophy, and to

preserve their knowledge in forms otherwise foreign to it, if they wished to escape persecution.\* The great importance which architecture assumed in those times, is to be accounted for from the enthusiasm for splendid houses of worship, in which the religious spirit of those times displayed itself to an unparalleled degree. The history of these corporations, as here given, and their connexion with the present society of free-masons, appears from what we know of antiquity, from the history of England, and from the agreement of the constitutions, symbols, and customs of the present free-masons with those of the above corporations.† Three documents have also been preserved, which further prove that historical connexion, as well as the doctrines and customs of those corporations of the middle ages, in great perfection, and which must be considered as valuable portions of the history of that period. See *Die drei ältesten Kunsturkunden der Freimaurerbruderschaft* (2 vols., Dresden, 1819.)

Before we speak of these documents, we may mention that some writers talk of the Culdees as having formed a Christian church in England for some centuries before the Saxon conquest (in 449), and sent bishops to the most ancient councils. This church was, together with the Roman civilization, suppressed by the Picts and Saxons. The Culdees were obliged to seek refuge in the wildernesses of Wales and Scotland, in Ireland, and in the small islands between Great Britain and Ireland, chiefly in Anglesey and Mona, where they continued their apostolic institutions and usages, related to those of the Oriental church. They tried in vain to convert the rude Saxon kings, but they had not the same means as Augustin, who was sent by the pope, with forty monks, in 597, to Britain. The Culdees were now again bloodily persecuted by the adherents of the pope. In their persecution, they maintained the spirit of Christianity, and studied in solitude. They at last found access to Alfred and Athelstan. The latter gave employment to many architects, in building convents, castles, &c., and the Culdees made use of their organization, and the independence guaranteed by the king, to teach them their truly apostolic principles. Usher, Ledwich, and Grose treat of this subject. The old writers on the papal side of the question, are said to have purposely avoided making mention of the Culdees. A further cause is thus assigned for the superior morals which distinguished the architectural societies in the middle ages.

The eldest of the documents above mentioned, is the constitution confirmed, in 926, to all the cor-

porations of architects, by king Athelstan, through his brother Edwin, at York, the original of which Anglo-Saxon, is still preserved in York. The legend reminds the reader immediately of the most ancient Oriental church. Then follow a history of architecture, beginning with Adam, and containing quotations from some rabbinical tales, respecting the building of Babel, the temple of Solomon, a relation of Hiram, limited, however, to the stories contained in the Bible; then passing on to the Greeks and Romans; mentioning particular philosophers, Euclid, and Vitruvius. Then the history of architecture, and the oldest corporations, as it is told, agreeably to the accounts of the historians, and, among other things, is mentioned as St Albanus, an honourable Roman knight, pursued the art about A. D. 300, settled the Masonic institutions of the masons, procured them exemption, wages, and a charter from the emperor Trajan, according to which they should form a society in Britain, under the government of architects. The devastation of the country, and the destruction of edifices by the northern tribes and the later Saxons, is related, and how the pious Athelstan resolved to restore the ancient and venerable art. After this follow the sixteen most ancient laws, which agree exactly with every thing the most accurate investigation can find in the *corpus juris* relating to the college of architects. Thus connected, as preserved in England and Scotland, it is a continuous series, until the fourteenth century, when the societies passed over into the stationary corporations in cities. It is proved by historical documents in Scotland and England, lodges, laboring according to these constitutions, existed in an unbroken series, and often admitted, as members, some of the most influential men, who were not architects, among even kings (*accepted masons*). The society of masons decreased, and sank more and more, as it changed. In 1717, we find four lodges existing, in which the old symbols and customs were preserved; most of their members were masons, and some were not. So far extends the first period of masonry. In 1717, an essential change was made by three members belonging to some of the four lodges just mentioned, Desaguliers, James Anderson, and George Payne. They changed the society into one which had nothing more to do with building; but it retained "brotherly love, relief, and truth" as its essential characteristics. By retaining the same customs of the ancient fraternity, the new lodge retained the privileges and charters of those societies. They further thought it well to establish a centre of union and harmony in one grand lodge, the eldest mason, who, at the same time, was master of a lodge; to constitute themselves, for the poor, one grand lodge; to renew the quarterly communications of the brethren; to hold the annual meeting and the festival; and to elect a grand-master from among them, until they should have a number of high rank at their head. In 1721, James Anderson was charged to remodel the old constitutions, and to form thus a general book of constitutions, which alone should be valid for all the masonic lodges in future to be established under the authority of the grand lodge. The constitution of York was left by him, the basis, though he compared a number of other constitutions. In 1721, his draft was accepted, with some changes, acknowledged, and printed in 1723. In 1738, a new edition was printed. In the editions of 1766, 1784, and in the latest book of constitutions of the grand lodge of old masons at the

\* It is by no means improbable that, in these barbarous ages, their secret doctrines may have degenerated, and become mixed with corrupt notions, as was the case with the Society of Templars.

† The architects, with their assistants and pupils, formed associations, called *Hutten*, or *lodges*. At an assembly held at Ratisbon, in 1430, it was agreed that a grand lodge should be formed at Strasburg, as the place of general assembly, and that the architect of that cathedral, for the time being, should be the grand-master. The society was composed of masters, companions, and apprentices, who had a secret word, with signs of recognition. In 1464 and 1468, there were general assemblies at Strasburg; but they were afterwards neglected for some time, until the emperor Maximilian I., being at that city in 1468, granted them certain privileges, by charter or diploma, which were renewed and confirmed by subsequent emperors. These diplomas, together with the regulations and statutes, were kept in the house of the architect of the cathedral, in a chest with triple locks, of which the two oldest masons kept the keys, so that it required the presence of all before the chest could be opened. These documents were in existence until the French revolution, when they were destroyed, with many other papers, to prevent their falling into the hands of the Jacobin commissioners. Their rules inculcated the necessity of leading moral lives; submission to the masters, whom the companions served for five or seven years; attention to their religious duties; and charity to the poorer brethren, &c. Among the symbols were the square, the plumb-rule, and the compasses, which are distinguishing marks of the officers of a free-mason's lodge at this day.

† Sir Christopher Wren was the last grand-master of the ancient fraternity.

don, united in 1813 (of which the second part appeared in 1815), the traits of the ancient York instrument are always to be recognised. The following are the most important duties (*charges*) of the masons, as they appear in the edition of 1784, and, with few alterations, in the constitutions of 1815: The mason is bound to obey the laws of morality, and if he understands the principles of the society, he will neither be an atheist nor a profligate. Though the masons of ancient times were obliged to profess the religion of their country, whatever that might be, it is considered now more beneficial to bind them to that religion alone in which all men agree, and to leave to each his peculiar opinions; they are to be men of probity and honour, whatever may be their differences in name or in opinion. By this, says the constitution, masonry becomes the central point of union, and the means of establishing friendship among persons who, without it, would live in continual separation. The mason is to be a peaceable subject or citizen, and never to allow himself to be involved in riots or conspiracies against the public peace and the welfare of the nation. No private hatred or feud shall be carried to the threshold of the lodge, still less political or religious disputes, as the masons, in this capacity, are only of the above-named general religion: masons are of all nations and tongues, and decidedly against political ends, which never have been favourable to the welfare of the lodges, nor ever will be.

The second of the above mentioned documents was written under Henry VI. of England, first printed in the Gentleman's Magazine, in 1753, p. 417 et seq., and, since then, has been repeatedly reprinted.

The last of the three documents is the ancient code of admitting masons, as it is still exercised by all the masons of the ancient English system. It contains some customs of the Roman colleges, and of the most ancient Christian monks and ascetics. From this ritual, that of the new English grand lodge, contained in Browne's Master Key (London, 1802), differs in some important particulars, though they agree in spirit.

The first lodge in France, after the English system, was established in Paris, in 1725; in Germany at Hamburg, in 1735; in America, 1730. The more the order was extended, the less intimate became the connexion of the lodges; secessions took place; new systems were established; rivalry often occurred; to the three first degrees, of apprentice, companion, and master, additional ones were added; in fact, it would be difficult at present to give a general character of masons, so numerous are their degrees, and so various their characters. They have, in many places, done much good, by assisting the poor, establishing schools, &c. In some countries, they have excited the suspicions of the government, and have been prohibited and persecuted, as in Spain. Pope Clement XII. excommunicated them. As we have already said, the society has been sometimes used for bad purposes. These, however, are disavowed, by the members, to be foreign from its spirit. According to some masons, the society requires a total renovation. During the time of Napoleon, there often existed lodges in the different regiments. The activity of the masonic societies, in the French revolution; the use of their forms by the Carbonari; their titles and ceremonies, which have too often been used as mere instruments of ostentation, we have not room to describe. Of late, the society has attracted peculiar interest in the United States of America, in consequence of the abduction of a certain William Morgan, attributed to some of its members. The opponents of masonry ascribe this act to the funda-

mental principles of the society, and therefore consider its existence as inconsistent with the security of the community. The subject has given rise to a violent contest. A brief statement of the facts of the Morgan case will be found in a note below.\* We refer the reader, for further information on the subject of Free Masonry to Preston's *Illustrations of Masonry* (8th edition, London, 1812); Lawrie's

\* William Morgan was a native of Virginia, but, for some time previous to the autumn of 1826, had been an inhabitant of the western part of the state of New York. As early as the month of August of that year, it became generally known that he was engaged in preparing for the press a work by which the obligations and secret proceedings of freemasonry were to be divulged. Some members of the fraternity in and about Batavia, where Morgan then resided, were alarmed, and eventually became much excited, on account of the contemplated publication. Remonstrances and inducements to dissuade him from such a course of conduct, were resorted to by his brother masons, but in vain. At length a conspiracy was formed, including in its origin, or at its subsequent stages, no inconsiderable number of persons, for the purpose of separating Morgan from those who had engaged him to undertake, and were encouraging him to go on with the development of the secrets of the masonic order. Given up to an unaccountable infatuation, they commenced the execution of this ill-advised project, by taking him, on the 10th or 11th of September, 1826, from Batavia, under the pretence of a charge for *petit larceny*, to Canandaigua. The criminal charge was abandoned, and a civil suit instituted against him. A judgment for a small amount was recovered, and he was committed, by virtue of an execution issued thereon, to the jail of Ontario county. On the evening of the 12th of September he was discharged by the interference of some of the conspirators, and, as he passed out of the door of the jail, was seized by them, taken a small distance, and then forcibly put into a carriage. He was carried, in the course of that night, on to the Ridge road, about two miles beyond the village of Rochester. During the next day and night, he was taken to Lewiston, a distance of seventy or eighty miles, and from thence to Fort Niagara, at the mouth of the Niagara river. Soon after his abduction, it was ascertained, to a reasonable degree of certainty, that he had been taken to Fort Niagara: but for some time at almost impensurable obscurity seemed to shroud the events subsequent to his arrival at that place. The disclosures which were at length made before grand juries, and on the various trials of those who were indicted for carrying him off, have, in a great measure, removed the veil which hid these events, and established, in a satisfactory manner, that his life was in a few days brought to a tragical end. He was secured in the magazine of that fort, which was at that time unoccupied by any of the forces of the United States. Soon after he was brought to that place, those who had him in charge were much embarrassed to devise what to do with him. Consultations were held on the subject, and some of the party proposed to take his life, which they alleged he had forfeited by violating the obligations he had voluntarily taken on himself when he became connected with the masonic fraternity, or in the subsequent stages of his advancement to its higher distinctions; but others protested against such a violent and wicked course. When all the circumstances are considered, and the evidence given on this point is well weighed, they seem to be sufficient to bring any candid mind to the conclusion that this proposition was finally adopted and executed; but it is not fully known who adopted it, or by whose hands it was executed. The number of those directly concerned in the final catastrophe is believed to be small; it is also believed that those who first formed the conspiracy to carry him off, and those who subsequently became connected with it by lending their aid in carrying him to Fort Niagara, did not intend or anticipate the termination to which this affair was brought. Indeed, it is reasonable to conclude that the design upon his life was suggested by the embarrassment which those felt who were called on to make a further disposition of him after his arrival at Fort Niagara. This outrage upon the liberty of a fellow-citizen, and contempt of the laws of the land, from the protection of which this citizen had been violently taken, roused the indignation of the community in the midst of which the offence was committed. They demanded their fellow-citizen: he was not produced, nor could he be found. They anxiously sought to know his fate, but they long sought in vain. The public excitement increased in intensity, and spread over a wider region of country. Those who partook of it largely did not stop to discriminate. The single circumstance that an individual had a high standing in the masonic order, was sufficient evidence, to their minds, of his participation in the crime. Finally, the whole fraternity were regarded as in some manner implicated in the transaction. It is believed by some, and perhaps alleged by more, to have been the natural consequence of the discipline of the masonic institution. A current of feeling so strong and so deep was soon turned to political purposes. An anti-masonic party was immediately formed; it predominated in several of the counties in the western part of New York, and has converts in every part of the state, and in many other parts of the Union. This party is numerous, active, well organized, and everywhere seeking political ascendancy, not only in the several states, but in the general government of the country.

MASORA; a collection of remarks, critical, grammatical, and exegetical, on the books of the Old Testament, by the Jewish doctors of the third and succeeding centuries. After they had long been transmitted orally (hence the name, signifying *tradition*), they were formed into this collection, at the beginning of the sixth century, in Tiberias, where there was a celebrated Jewish school, and, from time to time, additions were made. It is divided into the great and little: the former contains the whole collection, in separate books; the latter is an extract from the observations, which were written in the margins of the biblical manuscripts. It is important for the criticism of the Old Testament, on account of its indications of the various readings; and it contains many valuable explanations of difficult passages. It is to be regretted that the authors and collectors (the Masorites) spent their time in the most laborious and useless trifling,—counted the verbs and words, and even the consonants, in the Old Testament; found the middle word and letter of each book, and marked the verses which contain all the consonants of the Hebrew alphabet, &c. The Masora was gradually brought into a state of the greatest confusion by successive additions, and the errors of transcribers: but, in the beginning of the sixteenth century it was once more reduced to order by Rabbi Jacob Ben Chajim, for Daniel Bomberg, a printer in Venice (*Biblia rabbinica Hebr.*, Venice, 1518, 1521, 1525—28, folio); and, a century after, John Buxtorf the elder completed the work of his predecessor (Bale, 1618, folio).

MASQUE, or MASK; a theatrical drama, much in favour in the courts of princes, during the sixteenth and seventeenth centuries, in the latter particularly in England. They are the most brilliant and imaginative among the entertainments of our English ancestors, and are traced, with much probability, to the religious processions of the church of Rome, in which various scriptural characters were represented with some occasional tinge of burlesque solemnity. The masque, or, as we should rather call it, in its infancy, the *masquerade*, in order to distinguish it from the species of drama into which it ultimately ripened, early became a prevalent fashion among the princes and nobles of Europe. The court of Henry VIII., before the tyrant's sanguinary licentiousness had deluged it with blood, presented many of these gorgeous spectacles. According to Holinshed's chronicle, the first masque performed in England was in 1510, in the first year of Henry's reign. In 1530, a masque was performed at Whitehall, "consisting of music, dancing, and a banquet, with a display of grotesque personages and fantastic dresses." Shakspeare, Beaumont, and Fletcher have frequently introduced masques into their plays. The English masques bear some resemblance to operas, as they are in dialogue, performed on a stage, ornamented with machinery, dances and decorations, and have always music, vocal and instrumental. The parts in the masques of the sixteenth and seventeenth centuries were usually represented by the first personages of the kingdom: if at court, the king, queen, and princes of the blood often performed in them. James I. carried to its height the glory of the masque. It had hitherto consisted of music, dancing,

gaming, a banquet, and a display of grotesque personages and fantastic dresses: but a new assumed a higher character, and became "suited to musical verse." Previously, "their court was," says Warton, "seems to have been to serve by the ridiculous and exaggerated oddity of its own, and by the singularity and splendour of its own. Everything was out of nature and proper. Frequently the mask was attended with a vision of some gorgeous machinery, resembling the vision of a modern pantomime; for instance, in a great hall of the palace, the usual place of performance, a vast mountain, covered with tall trees, rose up, from whose opening caverns issued herons, swans, shepherds, knights, damsels, and gnomes, who were regaled with spices and wine, danced a morris, or morris dance. They were again received in a mountain, which, with a symphony of voices, a recorders, closed its caverns, and, tumbling to pieces, was replaced by a ship in full sail, or a castle besieged." (*History of English Poetry*, vol. ii.) The glittering chaos was reduced to order by the pen of Ben Jonson: not that he was the first who used poetry with music, dancing and scenery, but he was more largely employed than any other poet of his time in this branch of the drama. In his masques along with much that is frigid, overwrought, and fantastic, may also be found much fine poetry. In masques; though they make a great show in appearance, were probably not a little defective in reality. Sir Dudley Carleton, an eye-witness, writes of the wood as follows: "At night, we had the most maske in the banqueting-house, or rather the park. There was a great engine at the lower end of a room, which had motion, and in it were the images of sea-horses, and other terrible fishes, which were ridden by Moors. The indecorum was, that there was all fish and no water. At the further end was a great shell, in form of a scallop, where were the seats, on which sat the queen and her ladies. Their apparel was rich, but too light and unsuitable for such great ones. Instead of ruffs, their hair and arms, up to the elbows, were painted black, which was disguise sufficient, for they were not to be known; but it became them nothing to look at their red and white; and you could scarce see a more ugly sight than a troop of painted Moors." (*Winwood's Memorials*, II. 44.) Milton's *Comus* is the most beautiful of the productions which bear the name of masque. This exquisite specimen of thought, beautiful imagery, and splendid conception, is said, by Gifford, to be defective as a masque, and, by D'Israeli, not to be a masque at all, owing, probably, to the deficiency of music and machinery; but Warton says, with truth, "The elegant graces of its exquisite poetry disdained music, and, whether *Comus* be or be not deficient as a drama, I am of opinion that our author here is superior only to his own *Paradise Lost*." *Prometheus* banished the Muses, and the masque is the train.

MASS; properly speaking, the prayers and ceremonies which accompany the consecration of the eucharist. The word is used generally for all the part of the Catholic service in which the eucharist is offered. The Latin word is *missa*, which, since in early times, designated the public worship of the Christians, celebrated under the direction of a *leitourgos* (see *Liturgia*), generally the bishop himself, with the assistance of several priests of the altar (the elders, deacons, and others, a presence of the whole community. According to the example given in the Acts of the Apostles, ch. xxi. 41—42), and other passages, this service consisted of prayers, singing (chiefly psalms, and

ing of portions of the Bible, preaching, and the celebration of the Lord's Supper. The people not only understood what was done, but also sung, responded, prayed, and received bread and wine in the Lord's supper. Very early, however, through the so called *disciplina arcani* (see the Catholic part of the article *Lord's Supper*), it became customary, and, according to many, universal, during the first three centuries, to divide the divine service into two chief parts, by separating the rest of the service from the celebration of the eucharist. Only the faithful, who lived actually in communion with the church, were allowed to be present at the latter: at the former, also, the *catechumens* (q. v.), the penitents, and even unbelievers; but these classes were dismissed before the celebration of the eucharist was begun, by the words *Catechumeni, exite, missa est* (i. e. *concio, venit foras*). Thus they were dismissed (*dimissio, missa*), from which circumstance, in the sequel, the whole service received its name; hence, again, the division of *missa catechumenorum*, and *missa fidelium*. In the article *Lord's Supper*, the reader will find the Protestant and Catholic views respecting the eucharist, the sacrifice of mass, the holy mysteries of the mass, and the decrees of the Council of Trent respecting this, the most essential point of Roman Catholic service. It remains, therefore, to give here an account of the celebration of the mass only.

When the number of the faithful increased, and communities of Christians rose, not merely in the cities, but also in the villages, the celebration of divine service was intrusted also to priests, who at first officiated only before the whole community, and was afterwards appointed for the purpose; at a later period, so, on ordinary days, and even alone, for their own benefit, with the assistance of one altar-servant only. Mass was originated, with the high or solemn mass, also the low or private mass, performed by the priest, assisted by one altar-servant only. The Protestants consider this, even according to the Catholic doctrine of the mass itself, a great abuse; and many Catholic authors have concurred with them, while others maintain that it is indispensable, as it could be impossible otherwise to consecrate the host for the sick, &c.; and, besides, say they, the hermits in the deserts must have celebrated private mass. This, of course, is arguing on the ground that the mass, in the times of the early anchorites, was already developed. If the mass is of such supernatural efficacy as a great part of the Catholics consider it; if it is an actual and repeated sacrifice of Christ for our sins,—private masses may also be admissible, though in a form of the celebration, founded on the supposition of the presence of the people, may be inconsistent with them. The celebration of the eucharist or mass separate from the preaching, became more and more common, and the actual participation of the people in it gradually lessened. The responses, &c., were made by a servant of the altar, and the priest alone took the sacred elements,—changes to which the people accustomed themselves the more readily the knowledge of the ancient languages, in which the masses were performed (in the Oriental church Greek, and in the Latin church the Latin), became more and more limited. The choir of priests and servants, including, at a later period, the singers and musicians, took the place of the people, and the sole difference of the solemn and the private mass seems to consist in this circumstance only, the people being ceased to take any part in the mass, and the priest being delivered separate from this ceremony. The state of things has remained to this day, at least by far the greater number of Catholic countries.

The mass, then, at present consists of four or three chief parts: 1. the introduction, which forms its chief part, is called the *evangelium*, and formerly constituted, with the sermon, the mass of the catechumens; 2. the *offertorium*, or sacrifice; 3. the consecration, or transubstantiation; 4. the communion. These four chief parts, of which the latter three are considered the most essential, are composed of several small parts, each having its proper denomination; they are prayers, songs, shorter and longer passages of the Holy Scriptures, and a number of ceremonies, which, as the essential point of the mass is the sacrifice of the Lord, consist partly of symbolical ceremonies, commemorative of important circumstances in the Saviour's life, or signs of devotion and homage paid to the presence of the Lord in the host. The order of these ceremonies, and of the whole celebration of the mass, is given in the missal, or mass-book. The masses are modified according to many circumstances. Thus certain parts are changed according to the saint in honour of whom the mass is celebrated, or the seasons of the year connected with different events in the Saviour's life, or the purpose for which the mass is said, as the *missa pro defunctis* (mass for the dead), or that intended for the invocation of the Holy Ghost, and others. Deviations from the established rite gave rise to the *missa bifaciata, trifaciata, multifaciata*, formed by uniting two, three, and more masses under one canon. *Missa præsanctificatorum* is that in which the host has been consecrated one or several days beforehand, which is more common in the Greek church than in the Latin. *Missa sicca, or dry mass*, is that which was celebrated without wine; for instance, on board of vessels, in order to prevent the spilling of the blood. It is no longer in use. The *mass of the day* is such as is proper to the season, or to the feast which is celebrated. *Votive mass* is an extraordinary mass, besides that of the day, rehearsed on some extraordinary occasion. *High mass* is celebrated by a deacon and sub-deacon, and sung by the choristers. Besides these, there are different masses according to the different rites: the *Greek mass*, the *Latin mass*, the *Roman and Gregorian mass*, *Gallican*, *Gothic mass*, &c.

One of the greatest objections of the Protestants against the Catholic religion is the doctrine of the mass. They are offended with the doctrine that the sacrament of the Lord's supper is made in the mass, a sacrifice continually repeated for the reconciliation of sins, this appearing to them as the application of Jewish and heathenish ideas of sacrifice to the Lord's supper, while the Bible declares that Christ has offered himself by his death on the cross, once for all, for the atonement of sins, and the Lord's supper is no sacrifice to God, but the offering of God's grace to men. To this the Catholics reply that, according to Scripture and tradition, the eucharist is a sacrifice; that the body and blood of Christ are actually present in the eucharist (see *Lord's Supper*), and that "they do not offer a sacrifice different from that of the cross; that it is Jesus Christ himself, who offers himself through the hands of the priests; that he therefore is the principal priest or pontiff and victim, as he was likewise on the cross. Can, we," continues the Catholic *Dictionnaire de Théologie* (Toulouse, 1817), from which the foregoing passage is also taken—"can we testify our gratitude to God better than by offering to him the most precious of all the gifts which he has made to us—his only Son, whom he deigned to grant us, and who gave himself as a victim for our redemption? We then say, with David, 'For all things come of thee, and of thine own have we given thee.' (1 Chron. xxix. 14.) We therefore have full ground to hope that God, touched by this oblation, will grant us new grace," &c.

Intimately connected with the dogma that the mass is a sacrifice is the dogma of the masses for the dead, which is equally offensive to the Protestant. As the Catholic church maintains that the believers who depart from this world without having sufficiently atoned by suffering for their sins, are obliged to suffer in the other world a temporary punishment, it also believes that the sacrifice of the mass, that is, of Jesus Christ, may be made efficacious for the remission of this punishment. Catholics admit that the abuses which have been connected with the mass are enormous; but, say many of them, they have been abolished by the council of Trent. Protestants, however, cannot find that these abuses have been eradicated, though they may have diminished. If in Catholic countries—perhaps without exception—masses for the dead can be procured for a certain fee, so that the persons for whom they are said are either entirely released from purgatory, or many years of their pain remitted, this special application of the great offering of Jesus seems to them to deviate most essentially from the true meaning of the scriptures. In Italy, for instance, it was very common to find the power of releasing from purgatory a certain number of souls for a certain number of years, attributed to a number of masses, said at particular altars; and the cheapness of the price for which such great benefit could be procured for the souls of the departed was not unfrequently extolled.

The dispute relative to the mass is by no means restricted to the two parties, the Protestants and Catholics. Not a few of the Catholics are desirous of essential changes, particularly the disuse of a language which is not understood by the people, and of many masses connected with legends, evidently and acknowledgedly fictitious. Thus Mr von Reichlin Meldegg, professor of ecclesiastical history and dean of the (Catholic) theological department at the university of Freiburg, has lately advocated these and other changes, for which, of course, he has been violently attacked by the Roman party. (See a pamphlet entitled *Wider römische Verketterungssucht. Gutachten eines aufrichtigen Canonisten* (Against the Disposition of Rome to proscribe for Heresies. Opinion of a sincere Canonist), Leipsic, 1831.)—The advocates of the use of a language, in the mass, which is not understood by the people, maintain that the liturgy of the mass was not always foreign to the people; that it was translated into Ethiopian, Armenian, Coptic, Russian, Slavonic, Illyrian, &c., but that it has not been changed as the languages went on changing. "So that the Oriental Christians," they say, "understand the liturgy in use among them no better than the European nations the Latin liturgy."\* (See *Dict. de Théol.*, vol. v. p. 291.) Gregory I., or the Great (he died about 604), first settled the ceremonies and usages of the mass.

MASSA-CARRARA; a duchy of Italy, bounded principally by Tuscany and the duchy of Modena, celebrated for the production of the beautiful white Carrara marble, much used in sculpture. It is dependent on the duchy of Modena.

MASSACHUSETTS; one of the United States of America, bounded north by Vermont and New Hampshire, east by the Atlantic Ocean, south by the Atlantic, Rhode Island, and Connecticut, and west by New York; lat.  $41^{\circ} 15'$  to  $42^{\circ} 54'$  N.; lon.  $69^{\circ} 54'$  to  $73^{\circ} 30'$  W.; length, from east to west, 180 miles; breadth from north to south, ninety-six; area, 7800 square miles; population, in 1790, 388,727; 1800, 422,845; 1810, 472,040; 1820, 523,287; 1830,

610,014, viz. white males, 294,100; white females, 308,559; free blacks, 7006. The state is divided into fourteen counties, and 308 towns. The principal rivers are the Connecticut, which is navigable to steam-boats of small draught, the Merrimack, Concord, Blackstone, Miller's, Chocoma, Deerfield, Westfield, and Housatonic. It has many abundant falls, which afford valuable power appropriated to manufacturing operations. The mountains are a part of the Green mountain range, which extends from north to south through the eastern part of the state. The most elevated part of this ridge are Saddle mountain, near its western angle of the state, and Tabor's peak, at its western border. Mount Tom, and Mount Vernon, near the Connecticut river, are remarkable elevations, which afford, from their summits, a fine prospect of the surrounding country. A great ridge passes through the state near to north. The greatest elevation of this ridge is Mount Wachusett, in town of Princeton. The state abounds in lakes, which are usually called ponds. The largest of these are the Assawampset and Long ponds in Middleborough, Podunk, and Quabbin ponds in Uxbridge, and the Nauckag ponds, in Ashburnham. The named are situated more than 1100 feet above the level of the ocean; and several other ponds, in the western part of the state, have a still higher elevation. The soil, for the most part, is of a rich nature, and much of it is well, and some of it very highly, cultivated. In the south-eastern corner the soil is sandy, and not very productive. In the eastern and middle counties, it is in general rich, though not luxuriant. The same may be said of the western parts, with the exception of some tracts, which are mountainous and rocky. The state is in general hilly, but, in the eastern part, the hills are of moderate elevation. The soil is well adapted to the growth of grain and fruit trees. Nearly all the fruits of temperate climates are cultivated with success, and also Indian corn, &c., and other kinds of grain. The mountains of Berkshire afford an abundance of iron ore. It is found in Worcester and Plymouth counties, and is extensively worked. Anthracite coal is found in Worcester. There is a lead mine in Northampton, which a subterranean passage of 1000 feet in length has been opened, chiefly through sand rock. The cheapness of lead from the mines of Missouri and Illinois has suspended the works upon the marble and limestone are found in various varieties in West Stockbridge, Lenox, and in the vale. The middle and eastern parts of the state abound in quarries of granite of the best description for building stone. Quarries of soap-stone are found in Middlefield. The occupations of the state are agriculture, commerce, navigation, fishing, and manufacturing. Agriculture is pursued almost exclusively by owners of small farms, who have it in their own hands. The commerce of the state extends to all parts of the world. The shipping of the state is more numerous than that of any other in the Union, and, in the extent of its foreign commerce, is second only to New York. The value of imports in the state of Massachusetts in the year ending September 30, 1829, was 12,520,744 dollars, of which 12,500,000 dollars in value, were imported in American ships. The value of exports from the state, in the same year, was 8,254,937 dollars. The amount of shipping entered at the ports of the state from foreign ports in the same year, was 177,550 tons, and the amount departed from the same ports was 181,151 tons. The amount of shipping entered at, and departed from, the port of Boston. The amount of shipping owned in the state on the last day of the

\* The Catholics in Silesia have lately petitioned to have the mass said to them in the German language.

ember, 1828, employed in the foreign and coasting trade, and in the fisheries, was 424,507 tons. The fisheries are chiefly of three kinds, viz. the whale fishery, which is carried on in distant seas, by ships fitted out chiefly at Nantucket and New Bedford; the cod fishery, which is carried on partly on the north-eastern coasts of the United States, and those of Newfoundland and Labrador; and the mackerel fishery, which is carried on chiefly along the coast. A large number of vessels and men are employed in these fisheries, and the produce is very great. The manufactures of cotton and woolen cloths are carried on chiefly by large and pulent companies, with machinery which is moved by water power. The capital of the state, and of the New England states, is Boston. It has 1,392 inhabitants. The towns next in size, are Salem and New Bedford. They are rich towns, extensively engaged in foreign commerce, the former particularly in the India trade, and the latter in the whale fishery. Nantucket is a town also largely engaged in the whale fishery. The other chief commercial and fishing towns, are Newburyport, Marblehead, and Plymouth. The chief manufacturing towns are Lowell, Taunton, Springfield, and Waltham. There are many other handsome and flourishing inland towns, among which are Worcester, Northampton, and Pittsfield. The executive government of the state is vested in a governor, lieutenant governor, and council, who are chosen annually. The legislature consists of a senate, of forty members, chosen annually, and a house of representatives, of one or more members from each town (with the exception of a few of the smaller towns), consisting, in all, of 500 or 600 members, when the towns exercise their full privilege of choosing members. The judiciary consists of a supreme judicial court of four judges, and a court of common pleas of the same number of judges, who hold their appointments during good behaviour. Both courts are held, at stated periods, in each county. The university at Cambridge is the most liberally endowed literary institution in the United States, and has given to the country the greatest number of literary men. It has a president, eight professors, and six tutors and other teachers, besides four professors of the medical school, five of the theological school, and two of the law school. It has a library of 36,000 volumes of choice books. There are two other colleges in the state, Amherst college, near Northampton, and Williams college, at Williamstown, each of which has a president, three or four professors, and two tutors. There is a richly endowed and flourishing theological seminary at Andover. It has four professors, who are supported by the income derived from permanent funds, and has commodious buildings for the residence of the professors and students, and for other purposes. There are in the state forty-three incorporated academies, part for male, and part for female students. There are several well conducted private schools of considerable celebrity. The most distinguished of these is the Round Hill school, at Northampton, which has been highly successful, from the enlightened views and varied accomplishments of its proprietor, and the liberal provision which he has made for the best instruction in the various departments. The means of common education are provided at the public expense throughout the state. Public schools for instructing all children whose parents choose to send them, are supported in all towns. In the large towns these schools are of a high character. They are not regarded as charity schools, but as public institutions, where the rudiments of learning are acquired from the same sources by the children of the rich and of the poor. Many

public improvements of various kinds have been made, chiefly by companies incorporated by the state legislature. A great number of turnpike roads, bridges, canals, rail-roads, &c., have been made by such companies, and the means of communication in the state have been thereby greatly improved. For the history of Massachusetts, see *New England*.

**MASSACHUSETTS BAY**; a large bay, situated east of the central part of Massachusetts, and bounded on the north by Cape Ann, and on the south by Cape Cod. For the former province of this name see *New England*.

**MASSAGETÆ**; a collective name given by the ancients to the unknown tribes of Northern Asia, who dwelt to the east and south of the Caspian sea, as far as the frontiers of the Persian monarchy. This region is at present the residence of the Turkestans and Karakalpaks. The name often occurs in the Scythian and Persian histories; in the latter, particularly in the campaigns of Cyrus. The Alans were a tribe of the Massageteæ.

**MASSALIANS**. See *Messaliens*.

**MASSANIELLO**, properly **THOMAS ANIELLO**, the celebrated Neapolitan insurgent, was born at Amalfi, and gained a livelihood in Naples as a fisherman, and a dealer in fish and fruit. Although very poor, he had a proud and enterprising spirit. His love of freedom, and the boldness with which he expressed himself respecting the oppression which the kingdom of Naples had long endured from Spain, procured him a large faction among the common people, who admired his boldness. As he was destitute neither of eloquence nor courage, nothing but opportunity was wanting for him to appear as the head of the populace. Such an opportunity offered in 1647. Massaniello had brought a basket of fruit to the city, for which the collectors demanded the tax. He refused, and, they using force, he threw himself on the earth, and implored the people to aid him against their violence. An insurgent multitude immediately assembled, at the head of which he advanced to the tax-office, with the cry—"Long live the king, but down with the bad government." Thence the insurgents repaired to the castle of the viceroy, the duke of Arcos, and demanded that he should receive Massaniello as a colleague. In vain did the cardinal Filomarino, archbishop of Naples, seek to appease their fury; in vain did John of Austria, a natural son of Philip IV., appear in the harbour with twenty-two galleys; the insurrection only increased the more, and the nobility became the object of its rage. Massaniello, who had become governor of the city, caused sixty of the principal palaces to be reduced to ashes, without the least thing being saved. All marks of the royal government disappeared. Every body was suspected by Massaniello, and death followed immediately his slightest apprehension. Seven days elapsed amid these horrors, and men began to talk of capitulation. It was agreed that the taxes on fruit should be abolished, and the ancient liberties restored. The assent of the king of Spain was promised within a certain time. Massaniello, on this assurance, laid down his arms, and returned, without demanding any recompense or distinction, to his former station. But the great party, which he still possessed, making him appear dangerous to the viceroy, who was no ways disposed to fulfil his promises, this ruler resolved to get rid of him. He invited Massaniello to his own house, and probably mingled poison with his wine. This did not, indeed, kill him, but made him delirious, to which his passion for heating liquors may also have contributed. In this state the unfortunate man ran through the streets of Naples, shooting his best friends, and committing the

greatest excesses. The people, who now regarded their deliverer as a new oppressor, and were excited against him by his enemies, poured forth in crowds against him, shouted applause to the viceroy, and demanded Massaniello's death. He fled for safety to a Carmelite convent; but four conspirators, formerly his friends, shot him dead, with several balls, July 16, 1647. His body was shamefully maltreated by the populace. But the true sentiments of the viceroy were soon manifested; and the people, fearing a renewal of the former oppression, again became turbulent. The martyr of liberty was now remembered; Massaniello's murderers became victims to the popular rage, his body was buried with the highest marks of respect, and even, for some time, held as sacred. Naples remained still convulsed, but nothing further was effected by the people.

MASSENA, ANDRÉ, duke of Rivoli and prince of Esslingen, marshal of France, &c., was born in 1758, at Nice, and rose from a common soldier to the rank of commander. At the commencement of the French revolution, he was an inferior officer in the Sardinian troops; but, in 1792, when the warriors of the new republic had ascended mount Cenis, he joined their ranks, soon distinguished himself by his sagacity and courage, and was made a commissioned officer, and, in 1793, general of brigade. Here he learned, without a master, the science of war, in the skirmishes. In April, 1794, he was appointed general of division, and took command of the right wing of the Italian army. He was the constant companion in arms of Bonaparte, who, after the successful battle of Roveredo (1796), against Beaulieu, called him the favourite child of victory. The commander-in-chief sent him to Vienna to conclude the negotiations for peace, and, in 1796, to Paris, to procure the ratification of the treaty. While Bonaparte was in Egypt, Masséna and Moreau were the hope of France. In 1799, Masséna displayed his ability as commander-in-chief in Switzerland. After having opened the war with success, he was forced to fall back to the Albis, on account of the ill fortune of Jourdan on the Danube. Here he took a strong position, watching his opportunity, and, by the battle of Zurich (September 25), prevented the junction of Korsakoff and Suwaroff, who had already ascended mount St Gothard. This battle, the first that the Russians had lost in the open field for a century, decided the separation of Russia from Austria, and saved France. After Masséna had reconquered the Helvetian and Rhetian Alps, he was sent to Italy to check the victorious career of the Austrians. He hastened, with the small force which could be assembled, to the support of Genoa, his defence of which is among his most remarkable achievements. Ten days before the battle of Marengo, when all his resources were exhausted, Masséna obtained an honourable capitulation. The consul Bonaparte, who now returned to Paris, gave him the chief command of the army. Peace soon followed. Masséna was chosen member of the *corps législatif*, by the department of the Seine, and, in 1804, was created marshal of the empire. In 1805, he received the chief command in Italy, where he lost the battle of Caldiero. When the archduke Charles was compelled, by the ill success of the German arms at Ulm, to retire to Inner Austria, Masséna pursued him, but was unable to gain any advantage over him. After the peace of Presburg, Masséna was sent by Napoleon to take possession of the kingdom of Naples for Joseph, and captured Gaeta. After the battle of Eylau, in 1807, Napoleon summoned him to Poland, to take the command of the right wing of the French army. After the peace of Tilsit, war having broken out in Spain, Masséna took the field

with the title of duke of Rivoli. He still bore recalled to Germany. He was sent to the battle of Eckmühl, Ratisbon, Ebersberg, and Bayram. At Esslingen, his constant presence over the French army from total destruction. Napoleon rewarded him with the dignity of *marquis*. After the peace he hastened to take over Portugal from the hands of the British, who retired before him, and took a command at Torres Vedras, for the defence of Lisbon. Masséna's provisions made it impossible for him to hold out longer. Masséna was obliged to retire. Napoleon recalled him to his army in 1812, left him without a command. He was commanded at Toulon, declared traitor, and was created commander of the army of the Rhine. At the landing of Napoleon in 1815, at Toulon was by no means doubtful. When the emperor was re-established, he was again made peer and commander of the Legion of Honour, and contributed much to the restoration of tranquillity in the city, during the period which preceded the return of the emperor. He lived afterwards in retirement, but he was hastened by chagrin at the conduct of the emperor. He died April 4, 1817.

MASSILLON, JACQUES BAPTISTE, one of the most illustrious preachers of France, was born at St. Hières, in Provence, entered, in his youth, the congregation of the oratory, and became soon favourite by his pleasing manners, which drew excited envy. He was accused of immorality, and attempts were made to exclude him from the congregation, and it is said that he retired, to seek refuge to the abbey of St. Foy. The appearance of his funeral sermon on the archbishopric of Paris was received, induced the process of his condemnation. La Tour, to call him to Paris. He was obliged to obey, and, against his inclination, to accept of a position where his genius soon showed itself in a power and peculiarity. According to some accounts, a pastoral letter of the cardinal de Noailles, which Massillon drew up in the name of a convert, attracted the attention of the cardinal, a convert whose order he returned to the order of the oratory, which he met with in Paris, and a seat, almost without example. The *discours de la fête du petit Nombre des Elus* was about 1700. Massillon spoke with that power, simplicity, and can be resisted only by what was a unity, and he had preached the first time at Versailles, in 1714, who was famous for the happiness of his pliments, addressed him with the words, "I have often been disappointed of them, but having heard you, I was more content with myself." His delivery contributed to the effect of his eloquence. With great simplicity, even negligence, he produced a greater effect than others with studied art. The famous orator once exclaimed, after hearing one of his sermons, "There is an orator, we are not used to." On account of his amiable temper and simplicity, he was chosen to reconcile cardinal Noailles with the Jesuits; but he found that it was more difficult to convert sinners than to convert theologists. He regretted appointed him, in 1717, to the oratory, which he could not have accepted, but Massillon of his paid the expense of his conversion, and the year following, he was chosen to preach before Louis XV., then near his end, and gave a series of sermons, so famous for the simplicity of *Petit-Corinthe*, which are monuments of pure eloquence. They are remarkable also for the political truths which they contain, and show that the monarch is made for the people, and

appointed him, in conformity with the order of God ; that not the prince, but the laws, should rule, of which the monarch is but the minister and guardian. In 1719, Massillon was chosen a member of the academy. Cardinal Dubois procured him the pre-acy of Sevigny. His last discourse in Paris was the funeral sermon on the duchess of Orleans. From that time, he never left his diocese, where his virtues, particularly his charity, had procured him the reverence of all. He died in 1742. His sermons are distinguished for simplicity, knowledge of the human heart, an artless flow of eloquence, natural and lively imagery, richness of ideas, perspicuity and warmth. They awaken virtuous feeling, and not controversial rancour. The nephew of this distinguished man published a complete edition of his uncle's works (1745 4 seq. ; reprinted at Paris, in 1762, in 13 vols., 8vo ; and at Lyons, Leroy, and Lusand, in 15 vols., 12mo).

MASSINGER, PHILIP, a distinguished English dramatist, in the beginning of the seventeenth century, was the son of a retainer of the earl of Pembroke, and was born at Salisbury, in 1585. He studied at Oxford, but quitted the university without taking a degree, in consequence, perhaps, of his having become a Roman Catholic. Little is known of his personal history, yet he appears to have been intimately connected with the wits and poets of his time, in conjunction with some of whom, as Fletcher, Middleton, Rowley, and Dekker, he composed some of his dramas. He died in 1639. As a dramatist, Massinger is more natural in his character, and poetical in his diction, than Jonson or Cartwright, and some critics rank him next to Shakspeare. In tragedy, however, he is rather eloquent and forcible than pathetic ; and in richness and variety of humour, his comedy can by no means vie with that of his great master. His plays were published collectively, by R. J. M. Mason and Mr T. Davies, in 1779, 4 vols., 8vo ; but the best edition is that of Mr W. Gifford, with notes and a life of Massinger (4 vols., 8vo, 1805).

MAST. See *Ship*.

MASTER AND SERVANT. In legal acceptance, a servant is one who owes his services to another for a limited period, but not for life, or who, in other words, is not a slave. Servants consist of two classes, namely, those who receive wages, and apprentices. The contract for service, in the respective cases, is quite different : in each, the servant is bound to render service, but in one the master is bound to pay the stipulated wages ; in the other, to give instruction. The master is answerable for the acts of his servant, done by authority of the master. If the servant does an injury to another, directly consequent upon the employment about which he is set to work by the master, the latter, as well as the servant, is answerable in damages to the party injured, whether the injury arise from want of honesty, skill, or care. If the master is not answerable for any mischievous, fraudulent, or negligent act of one who is his servant, it is not done in the employment or by the authority of the master. Thus where a servant wilfully drove his master's carriage against another, and injured it, it was held, after much deliberation, that the master was not answerable, for it was stepping aside from employment about which the servant had been employed and was not authorized by the master. Where a master employs another, the master is answerable for the one so employed by his authority. The contract for hire gives the master or employer no authority whatever for the corporal punishment of his servant or person employed. If he is negligent, in any respect in fault, the remedy is on the contract. (As to the other description of servants above mentioned, see article *Apprenticeship*.) The terms

of apprenticeship entitle the master to the services of the apprentice for the time limited in the indentures of apprenticeship, and impose upon the master the duty of providing for and instructing the apprentice. The master has the right of moderately correcting the apprentice ; but, in case of ill treatment of the apprentice by the master, or neglect to instruct him in the trade or business proposed to be taught, the law ought to provide some immediate remedy, in case of the stipulations in the articles of apprenticeship being insufficient to meet the case ; and such provisions are introduced into many codes of laws, though other codes are deficient in this respect, and the apprentice is condemned to suffer years of bondage and cruelty, and arrives at manhood without instruction, or the habits likely to render him a useful or happy member of the community. On the other hand, the apprentice may be perverse, vicious, idle, and ungovernable ; and the laws of some states make provision that, in such case, the master may be discharged from his obligations. As to the liability of the master for the acts of the apprentice, they are the same as in respect to other servants.

MASTER IN CHANCERY. The masters in chancery are assistants to the lord chancellor and master of the rolls ; of these, there are some ordinary and others extraordinary : the masters in ordinary are twelve in number, some of whom sit in court every day during the term, and have referred to them interlocutory orders for stating accounts, and computing damages, and the like ; and they also administer oaths, take affidavits, and acknowledgments of deeds and recognisances : the masters extraordinary are appointed to act in the country, beyond ten miles' distance from London.

MASTER OF ARTS. In the German universities, the title of *magister artium* is an academical honour, conferred by the philosophical faculty, after a previous examination in the general sciences, particularly philosophy, philology, mathematics, physics, and history. The word *magister*, connected with a qualifying phrase, was used among the Romans as a title of honour ; as, for instance, *magister equitum* (see the next article), but its present meaning must be traced to the time of the establishment of the oldest universities. Regularly organized faculties were not then known, as they now exist in the universities of the continent. The whole circle of academic activity was limited to the seven liberal arts (see *Art*) : the teachers were called *artists* ; the body of teachers, the *faculty of artists* ; and they who received public honours on the completion of their course of studies, for their diligence and knowledge, and had already received the degree of *baccalaureus*, were called *magistri artium* (masters of the liberal arts)—a title with which that of doctor of philosophy was afterwards joined. As the origin of this dignity is more ancient than that of doctor, it is still placed before it in most of the German universities. The precise period of its introduction is not known ; but even in the twelfth and thirteenth centuries, the honour was so highly esteemed in France, that the most distinguished men were eager to obtain it. Since that time its dignity has been greatly diminished. This title is to be distinguished from the *magister legens*, that is, one who has obtained the right, by public disputations, to deliver lectures. In the English and American universities, the title of master of arts is intermediate between those of bachelor of arts and doctor.

MASTER OF THE HORSE (*magister equitum*) : the commander of the cavalry among the Romans. He was among the high extraordinary magistrates, and was appointed by the dictator immediately after his own election. He was next to the dictator in

rank, in the army, and had almost the same insignia with him. He was also permitted to mount his horse in the city.

**MASTER OF THE ORDNANCE;** a great officer, who has the chief command of the king's ordnance and artillery.

**MASTER OF THE ROLLS;** a patent officer for life, who has the custody of the rolls of parliament, and patents which pass the great seal, and of the records of chancery, &c. In the absence of the chancellor, he sits as judge in the court of chancery; at other times, he hears causes in the rolls chapel, and makes orders; he has a writ of summons to parliament.

**MASTER-SINGERS.** Between the slavery of the Eastern castes, which bind men immutably to the occupations of their fathers, and the perfect freedom of pursuit with us in the West, stand, as it were, the corporations of the middle ages. The lawlessness of the times compelled men of the same occupation to unite in societies for their mutual protection; and, being so united, their disgust at the wild disorder of the period led them to subject themselves to rules even of a minute and pedantic strictness. These habits of constraint extended their influence beyond the useful arts to the fine arts, and even to poetry itself. In the thirteenth century, poetry was a favourite occupation at courts and among the knights; but, with the beginning of the fourteenth century, this peaceable disposition ceased almost entirely, and incessant feuds almost everywhere ensued. Industry and the arts, however, grew up behind the walls of the cities (q. v.), and the corporations of citizens were established. During the long evenings of winter, the worthy burghers of the German cities assembled to read the poems of the minstrels. Some of the hearers were naturally led to try their own skill in verse; others followed; and the spirit of the age soon imbodied these votaries of the muse in corporations, or, at least, societies after the fashion of corporations. Like the other corporations, they laid claim to a very early origin. It is well settled that the emperor Charles IV. gave them a charter and a coat of arms. They generally called twelve poets, mostly of the time of the war on the Wartburg (q. v.) their *masters*; hence their name *master-singers*. They preferred, however, the more modest name of *friends of the master-song*. They met at certain days, and criticised each other's productions, in which external correctness seems to have appeared to them the chief object; few, indeed, had an idea of the difference between poetical and prosaical ideas or expressions. Their attempts in the lyric style were limited to spiritual songs; in the epic, to rhymed versions of the scriptural narratives. They were also fond of the didactic style. The rules by which the members of the societies were to be guided, as to the metre, &c., of their compositions, were written on a table, and called *Tabulatur*, for the sake of enforcing a strict observance of purity in language and prosody: the chief faults to be avoided were collected; they were thirty-two in number, and distinguished by particular names. He who invented a new metre, invented also a new tune; the names of which were the drollest, and sometimes the most senseless imaginable. Besides their stated meetings, they held public meetings, generally on Sundays, and festivals in the afternoon, in churches. In Nuremberg, where the master-singers flourished particularly, such meetings were opened with free-singing, in which any body might sing, though not belonging to the corporation. In this, the choice of the subjects was left comparatively uncontrolled; then followed the chief singing, when only those who belonged to the corporation were allowed to sing, and only on scrip-

tural subjects. The judges were called *Meister*, and sat behind a curtain. There were four: one watched whether the song was according to the text of the Bible, which lay open before him; the second, whether the prosody was correct; the third, criticised the rhymes; the fourth, the *Meister*. Every fault was marked, and he who had been warned the prize—a chain with medals. Whoever was a chain was allowed to take apprentices, a large number of whom was a great honour. None was ever taken from apprentices. After the term of his poetical apprenticeship, the young poet was admitted to the corporation, and declared a *Meister*, after having sung, for some time, with approval. These strange societies originated towards the end of the fourteenth century at Mentz, Strasburg, Leipsic, and lasted, in several free cities of the empire, until the seventeenth, in Nuremberg to the eighteenth century, where, probably, the names of Hans Sachs (q. v.), the famous shoemaker and poet, kept them longer in existence. Some of the most famous master-singers were Henry of Mentz, *der Frauenlob* (that is, *women-praiser*), doctor of theology at Mentz; master Regenbogen (Rainbow), a master Hadlaub and Musciblat.

**MASTIC;** a resinous substance obtained from incisions made in the branches of the  *Pistacia terebinthus*, a small tree, or rather shrub, growing in the Levant and other countries bordering on the Mediterranean. This tree belongs to the natural order *terebinthaceae*. It attains the height of about twenty feet; the leaves are alternate and pinnate; the flowers are small, inconspicuous, disposed in axillary racemes, and are succeeded by an oblong drupe, containing an osseous nut. It forms one of the most important products of Asia, and has been cultivated in this and some of the neighbouring islands from remote antiquity. Heat seems to exercise a great influence on the resinous product. Resin is consumed in vast quantities throughout the Turkish empire, and is there used as a masticatory by all of all denominations, for the purpose of cleaning the teeth and imparting an agreeable odour to the breath. It was formerly in great repute as a medicine throughout Europe, but at the present time is very little used.

**MASTIFF** (*canis*, fam. *villanius*). This variety of the canine race is distinguished by a very head, dependent lips and ears, and the strength of his form. Like most of the larger kinds of dogs, although extremely vigilant over any thing committed to his charge, he is by no means savage, and will not abuse the power with which he is invested, nor call it into action, unless provoked by insult. As early as the time of the Roman empire, mastiffs were held in high estimation at Rome, for their strength and courage, especially those from Britain, where an officer was appointed, for the purpose of breeding them, and transmitting to the emperor, such as he thought capable of sustaining the combat in the amphitheatre. Manwood, in his wood forest-laws, says this variety of the dog derives its name from the Saxon *masse thefec*, or the dog of the enser. See *Dog*.

**MASTODON;** an extinct genus of the order *pachydermata*, or thick-skinned animals, and was improperly confounded with the mammoth, a fossil elephant. It is found only in a few localities, several nearly entire skeletons having been discovered in the United States. Single bones have been early disinterred, but it was not until 1846 that a considerable portion of two skeletons was obtained by Mr Peale, near Newburgh, New York. Others have since been dug up in different parts of the country. There is one with the upper jaw

supplied in the Philadelphia museum, another at Baltimore, and another belonging to the New York lyceum. The mastodon in Philadelphia measures eighteen feet in length, and eleven feet five inches in height. The tusks are ten feet seven inches long. It seems to have been provided with a trunk, and in its food and manner of living to have much resembled the elephant. There are no traces within the period of tradition or history of the existence of these animals as a living genus. When and how they perished, if ascertained at all, must be revealed by geological data. See Godman's *American Natural History*, vol. 2d.

**MASTOLOGY** (from *μαστος*, breast); that branch of zoology which treats of the mammiferous animals.

**MASTRICHT**, or **MÆSTRICHT** (*Trajectum ad Mosam*); a strong place in the kingdom of the Netherlands, on the left bank of the Meuse, capital of the province of Limburg; fifteen miles north of Liege, and forty-six east of Brussels; lon. 5° 41' E.; lat. 50° 51' N.; population, 18,410. It is one of the most ancient towns of the Netherlands, and belonged formerly to the duchy of Lorraine. It contains ten Catholic and Protestant churches, and several literary and charitable institutions. It is tolerably well built, surrounded by walls and ditches, and is one of the strongest places in the Netherlands. Near it are large stone quarries, in which are subterraneous passages of great extent, where the farmers frequently store hay, corn, and other articles. It has hitherto carried on a brisk trade through its port on the Meuse, and regular packet-boats ran to Liege and other places on the river. (For the effects of the Belgian revolution on this navigation, see *Netherlands*.) **Mastricht** has been rendered famous by the numerous sieges which it has sustained. In 1673 and 1748, it was taken by the French, who bombarded it without success in 1793, and again captured it in 1794.

**MATADOR** (Spanish, *one who kills*). This word is used in some games with cards. In ombre and whist, it signifies one of the three principal cards, which are always the two black aces, the deuce in diamonds and clubs, and the seven in hearts and clubs. Its application is probably taken from the Spanish fights (q. v.), in which the man who gives the deadly blow to the bull is called *el matador*. Others give the name from a band of volunteers, who were established by the inhabitants of Barcelona, when they fought against Philip V., and whose duty was to punish with death those who murmured against the government.

**MATANZAS**; a seaport on the coast of Cuba, leagues from the coast of Florida, and twenty miles from Havana; lon. 81° 36' W.; lat. 23° 2' N.; population, 11,341, or, including the garrison and soldiers, 14,340; 1941 free blacks, 3067 slaves. It is situated on a bay of the same name, which affords one of the largest, safest, and most convenient harbours in America, having a good castle for its defence. It has considerable commerce, exporting sugar, molasses, and coffee. The situation is healthy.

**MATAPAN CAPE** (anciently *Tenarum*). This cape and Malea, or cape St Angelo are the two southern capes of the Morea, the former in lat. 36° 23' 20" N.; lon. 22° 29' 38" E.; the latter in lat. 36° 25' N.; lon. 23° 12' 8" E.

**MATERIA MEDICA**, are the materials with which physicians attempt to cure or alleviate the various diseases of the human body, and comprehend a great variety of substances taken from the mineral, animal, and vegetable kingdoms—such as silver, copper, bismuth, mercury, lead, iron, antimony, tin, arsenic, and zinc, from amongst the

metallic bodies; sulphur, lime, soda, nitre, magnesia, borax, and several salts from amongst the minerals; and nearly two hundred substances belonging to the animal and vegetable kingdoms. All these articles are susceptible of an infinite number of combinations, and upon the skill and promptitude with which these are made and applied, hinges the whole system of the practice of physic. In early times, the articles of the materia medica were still more numerous and complex than at present; but as many substances were then employed from fanciful and superstitious motives, modern physicians have discarded these, and adopted a few others, much more valuable and certain in their effects. Thus in ancient times, neither antimony, nor Peruvian bark, nor jalap, nor ipecacuan, nor sarsaparilla, were known to exist; but the progress of chemistry, and the discovery of America, have put us in possession of these simples, which have proved of the greatest value to mankind. Antimony, when formed into James's powder, and bark, in all its combinations, have preserved many thousands of lives annually from fevers. Jalap, next to senna leaves, is the most efficacious of purgatives, and ipecacuan is by far the best and safest emetic, which has been yet discovered. To chemistry also mankind are indebted for many valuable additions, such as the preparations of mercury, and the knowledge of the efficacy of acid gases in the destruction of the powers of contagion. The spirit of commerce, too, has added its share to the stock of valuable drugs. Egypt sends us senna, borax, and opium; Russia, rhubarb; from India we derive cinnamon, cloves, cajeput, ginger, gamboge, &c.; while from South America and the West Indies we import many of the most active vegetables employed in physic. Unfortunately, however, the wealthy inhabitants of Great Britain are too fond of taking drugs, and unwilling, generally, to employ abstinence and abstemiousness in the cure of their maladies; so that they are very frequently sick or ailing, and seldom give themselves that fair chance of living to an advanced age, which the salubrity of their climate would otherwise entitle them to expect. If it were more the fashion to fast, and use the warm bath, fewer persons would experience disease. See *Medicine*.

**MATERIAL** and **MORAL**; two terms used in military language, and derived from the French. The former means everything belonging to an army except the men and horses; the latter means the spirit of the soldiery, as to cheerfulness, courage, and devotion to their cause. Thus it is said: Though the *material* of the army was in a wretched condition, yet in respect to its *moral* it was superior to the enemy.

**MATERIALISM**, in philosophy; that doctrine which considers matter or corporeal substance the primitive cause of things. He who adopts this doctrine is called a *materialist*. In respect to psychology, in particular, materialism means the doctrine that the soul is a material substance. Materialism is opposed to the doctrine of the spiritual nature of the soul, or immaterialism. Both may be either empirical or transcendental. Materialism is of the first sort, if it founds all its positions and reasonings on experience derived from the sensual world, and therefore strives to explain the internal phenomena from the external; it is transcendental, if it looks beyond experience. Materialism differs according as it considers matter merely, or matter in an organized shape, as the original existence, and in the first case sometimes adopts an ethereal matter, an invisible fluid, sometimes the light, water, &c., as the primitive substance. It also differs according to the hypotheses by which it explains the origin of things.

In regard to the soul, the materialist maintains that matter produces in itself spiritual changes, or that the soul is a consequence of the whole bodily organization, by which matter is refined and ennobled into mind. Among the advocates of this doctrine we may mention Priestley. This theory, however, does not explain how matter can think, and how physical motion can produce mental changes, which we do not observe in so many organic beings; how, in particular, a notion of its own activity can originate. Numerous auxiliary hypotheses, therefore, have been devised, as that of the vibration of nerves by Hartley. In decided opposition, however, to materialism, is our consciousness of the identity and liberty of man, which would be annihilated by it, because matter is governed by the necessity of nature, and free will therefore excluded. Materialism is a very ancient view of nature, and the predominant one in the most ancient Greek philosophy, poetry, and mythology, surrounded, however, by all the graces in which the poetical spirit of this imaginative people could array it.

**MATHEMATICAL GEOGRAPHY** is the application of mathematics and astronomy to the measurement of the earth. The ancients had made no inconsiderable progress in this science. This science starts from two principles: 1. that the earth is to be considered as a sphere; and, 2. that the points and circles, imagined on the heavens, correspond with points and circles on the earth. See *Earth, Pole, Equator, Tropics, Meridians, Degree, Latitude*, &c.; see, also, *Geography*.

**MATHEMATICS.** If we call everything, which we can represent to our mind as composed of homogeneous parts, a magnitude, mathematics, according to the common definition, is the science of determining magnitudes, i. e. of measuring or calculating. Every magnitude appears as a collection of homogeneous parts, and may be considered in this sole respect; but it also appears under a particular form or extension in space, which originates from the composition of the homogeneous parts, and to which belong the notions of situation, proportion of parts, &c. Not only all objects of the bodily world, but also time, powers, motion, light, tones, &c., may be represented and treated as mathematical magnitudes. The science of mathematics has to do only with these two properties of magnitudes, the quantity of the homogeneous parts, which gives the numerical magnitude, and the form, which gives the magnitude of extension. This is one way, and the most common, of representing the subject: there are others more philosophical, but less adapted to the limited space which can be allowed to so vast a subject, in a work like the present. In investigating these two properties of magnitudes, the peculiar strictness of the proofs of mathematics gives to its conclusions and all its processes a certainty, clearness, and general application, which satisfies the mind, and elevates and enlarges the sphere of its activity.\* (See *Me-*

*thod, Mathematical.*) According to a magnitude considered merely in the respect above mentioned or in connexion with other circumstances, mathematics are divided into *pure* and *mixed*. *Pure* mathematics are again divided into *arithmetic* (q. v.), which considers the numerical quantity of magnitudes, and *geometry* (q. v.), which treats of magnitudes and their relations to space. In the *mixed* mathematics, the common mode of *arithmetic* is combined with *algebra* (q. v.), and *geometry* is employed. To the applied mathematics belong the application of arithmetic to *political*, *commercial*, and similar calculations; of *geometry* to *surveying* (q. v.), *levelling*, &c.; of *pure mathematics* to powers and effects, the gravity, the *elasticity*, the dry, liquid, and aërial bodies as a *statics* in equilibrium or in motion, in one word, *relation* to the mechanic sciences, (see *Mechanics, Hydrodynamics*, &c.); to the rays of light in the optical sciences (see *Optics, Dioptrics, Prism*, &c.); to the position, magnitude, motion, &c. of heavenly bodies in the astronomical sciences (*Astronomy*), with which the measurement and calculation of time (see *Chronology*); and the art of measuring sun-dials (see *Dial*) are closely connected. The name of applied mathematics has sometimes been so extended as to embrace the application of the science to architecture, navigation, the history of geography, natural philosophy, &c. but as the connexions it may more conveniently be considered as forming a part of the respective sciences. It is to be regretted that there is as yet no very satisfactory work, treating of the history of the science, so noble in itself, and so vast in its application: even Kastner and Montucla have much to be desired. The establishment of mathematics on a scientific basis probably took place among the Indians and Egyptians. The first appearance of the science we find among the Greeks. The great teachers of Europe in ancient times were Thales, and more particularly Pythagoras. Ptolemy, Eudoxus, investigated mathematics with a scientific spirit, and extended its domain. It was in geometry, in those ages, was more cultivated than arithmetic. The science was understood by the latter something above that which we understand by it. In fact, we have not a clear idea of the ancient arithmetic. The numerical calculation was limited and without sufficient ground for which might be even their imperfect way of writing numbers, if there be no other reason. Euclid's famous *Elements* is a work of unrivalled excellence, considering the time of origin, the ingenious discoveries of Archimedes, deep investigation of Apollonius of Perga, and the geometry of the ancients to a large extent, have been the admiration of all subsequent times. Then it has been made to bear more on *arithmetic* and has become more connected with *arithmetic*. Among the Greek mathematicians are *Euclid*, *Eratosthenes*, *Conon*, *Nicomedes*, *Hipparchus*, *Ptolemy*, *Diophantus*, *Theon*, *Proclus*, *Claudius Ptolemy*, and others. It is remarkable that the Romans showed little disposition for mathematics, but the Arabians, who learned mathematics almost all their science, from the Greeks, cultivated themselves much with it. *Algebra* and *trigonometry* owe them important improvements. Through the Arabians, mathematics found entrance into Europe, under Alfonso of Castile, a king who displayed for the cultivation of this science. In this, it found a fertile soil in Italy: and it was not long before a monk would sometimes follow out a problem without, however, adding to its territory. The science reserved for later ages. Mathematics even now

\* As a branch of intellectual culture, mathematics has great excellencies and great defects. Its certainty, the precision of its signs never conveying more nor less than the meaning intended,—its completeness in itself, and independence of all other branches, distinguish it from every other science, and nothing accustoms the young mind more to precision and exactness of thought and expression than the study of mathematics. But, on the other hand, these very excellencies render it liable to give a partial direction to the mind, to withdraw it from, and unfit it for pursuits of a different character. Hence so many great mathematicians have appeared to be wholly unfitted for other studies. On the whole, however, its advantages are so great that it can never be dispensed with in a liberal education. Nothing expands and elevates the mind more than the acquisition of a mathematical truth, a law which is obeyed throughout the universe. The study of the conic sections affords a fine illustration of this influence; and there are few instances in which there will be much danger of the pupil being unduly absorbed in the study.

Gmünden, Puerbach, Regiomontanus, Pacciolo, Tartaglia, Cardanus, Macrolycus, Vieta, Ludolphus de Ceulen, Peter Nunes, Justus Byrge, and others. To this period, however, all mathematical operations of any extent required a weary length of detail; when, in the seventeenth century, Napier, by the introduction of logarithms, immensely facilitated the process of calculation; and Newton and Leibnitz, by their infinitesimal calculus, opened the way into regions, to which, before them, no mathematician attempted to penetrate. From this time, the science obtained wonderful extension and influence, by the labours of such minds as Galilei, Torricelli, Pascal, Descartes, 'Hospital, Cassini, Huyghens, Harriot, Wallis, Barrow, Halley, James and John Bernoulli, and others. Thus it became possible for Manfredi, Nicoli, Nic. and m. Bernoulli, Euler, Maclaurin, Taylor, Bradley, Clairaut, D'Alembert, Lambert, Tobias Mayer, Kastner, Hindenburg (the inventor of the combinatory analysis) Lagrange, Laplace, Legendre, Gauss, Bessel, and the later mathematicians in the eighteenth, and in our century, to make great advances, and to give satisfactory conclusions, not only respecting our earth, but also the heavenly bodies, the phenomena and powers of nature, and their useful application to the wants of life, to establish firmly so many notions, previously vague, and to correct so many errors. (See the articles on these mathematicians, and the works mentioned in the articles on the various branches of mathematics.) The number of mathematical manuals increases daily, without, however, much surpassing the best of the earlier ones in perspicuity, novelty, and method, or rendering them unnecessary to the thorough student.

MATHER, INCREASE, D. D., one of the early students of Harvard college, was born at Dorchester, Massachusetts, June 21, 1639, and graduated at Harvard, in 1656. He was ordained a minister of the gospel in 1661; but had preached before with great success at the North church in Boston. In 1685, he was called to preside over Harvard college, which he continued to do until 1701. His energy, zeal, and general abilities were of great service to the institution. He distinguished himself as a very skilful and efficient political servant of the commonwealth. When king Charles II. signified his wish that the charter of Massachusetts should be assigned into his hands, in 1683, doctor Mather refused against a compliance. In 1688, he was sent to England, as agent of the province, to proredress of grievances. He held conferences with king James on the situation of the province, when William and Mary ascended the throne, and his suit with them in audiences and by memorandum.

In 1692, he returned to Boston, with a new commission from the crown, which some of his old friends resented; but the general court accepted it, with thanks to the reverend agent, for the industry and ability with which he conducted his negotiations with the government of the province. He died at Boston, August 23, 1723, in the eighty-fifth year of age, having been a preacher sixty-six years. He is said to have commonly spent sixteen hours a day in his study, and his sermons and other publications were proportionably numerous. During the craft delusion, which he laboured to mitigate, he wrote a book to prove that the devil might appear in the shape of an innocent man, "by means of a number of persons, convicted of witchcraft, and the execution of the sentence of death." By the biographers, he is styled the father of New England clergy. An octavo volume entitled *Tables of the Life of Doctor Increase Mather*, contains a catalogue of eighty-five of his publications, including "the learned and useful prefaces, which

the publishers of many books obtained from him, as a beautiful porch unto them, and which, collected, would make a considerable volume."

MATHER, CORRON, D. D., the eldest son of Increase, rivalled or surpassed his father in learning, influence, and the variety and multitude of his productions. It is recorded in his diary, that, in one year, he preached seventy-two sermons, kept sixty fasts and twenty vigils, and wrote fourteen books. His publications amount to 382, some of them being of huge dimensions. His reading was prodigious; his research exceedingly diversified and curious. He was born in Boston, Feb. 12, 1663, and graduated at Harvard college in 1678. In 1684, he was ordained minister of the North church in Boston, as colleague of his father. He died in 1728, aged sixty-five years, with the reputation of having been the greatest scholar and author that America had then produced. His piety and benevolence were almost commensurate with his learning. Credulity, pedantry, quaintness, eccentricity, are blended, in most of his works, with marvellous erudition, and instructive details of history and opinion. He was a fellow of the royal society of London. His largest and most celebrated work is his *Magnalia Christi Americana*, or the Ecclesiastical History of New England, from 1625 to 1698, in seven books, folio. His Life is extant in an octavo volume, written by his son and successor, Samuel Mather, D. D., also a learned divine and author.

MATHEWS, CHARLES. See *Mattheus*.

MATHIAS, THOMAS JAMES, a distinguished scholar, was educated at Eton, and at Trinity college, Cambridge, where he took the degree of B. A. in 1774, and, in 1775 and 1776, gained some academical prizes. His first publication was odes, chiefly from the Norse tongue (4to, 1781). This was followed by a pamphlet on the Evidence relating to Rowley's Poems (1783). For several years after the publication of the last of these works, he did not again come forward as an author. He was elected fellow of his college, but, after taking the degree of M. A., was called away from his fellowship, to be clerk to the treasurer of the queen. In time, he rose to be vice-treasurer—a place he held for many years—and afterwards, on the queen's death, he had a pension assigned him. In 1794 came out, anonymously, the first part of the Pursuits of Literature, attributed to Mr Mathias. The poetry does not often rise above mediocrity: the notes, however, prove great learning, with keen criticisms on public men and opinions. Three more parts were subsequently published, and a volume was added containing translations of the notes. Some of the persons assailed were so highly indignant, that it would scarcely have been safe for any man at that time to have avowed himself the author. In 1794, Mr Mathias gave to the press the Imperial Epistle from Kien Long to George III., and, in the following year, the Political Dramatist of the House of Commons—a satire on Mr Sheridan. In 1796, appeared his Letter to the Marquis of Buckingham; in 1797, a Pair of Epistles to Doctor Randolph and the Earl of Jersey, occasioned by the loss of some letters which the princess of Wales had addressed to her mother, and, in 1798, the Shade of Alexander Pope on the Banks of the Thames—a satirical poem, with notes. These works were all published without his name. Mr Mathias, in 1814, removed from England to Naples, where he resided until his death, which took place in August, 1835. He there made excellent Italian versions of the Lycidas of Milton, and the Sappho of Mason, and has published, in a uniform and elegant manner, the following valuable works:—*Componimenti Lyrici di più illustri Poeti d'Italia* (3 vols.); *Aggiunta ai Componimenti* (3 vols.); *Commentarij intorno all'*

*Istoria della Poesia Italiana, per Crescimbini* (3 vols.); *Tiraboschi Storia della Poesia Italiana* (3 vols.); *Canzoni e Prosa Toscane* (1 vol.); *Canzoni Toscani* (1 vol.); and *Della Ragion Poetica di Gravina* (1 vol.). He also edited (in 2 vols., 4to) the Works of Thomas Gray, with his Life and Additions, published at the expense of the university of Cambridge.

MATILDA, marchioness of Tuscany, famous for her connexion with Gregory VII., was a daughter of Boniface, marquis of Tuscany. She was born in 1046, and married Godfrey the Hump-backed, son of the duke of Lorraine, but always lived separate from him, being unable to exchange the mild climate of Italy for a northern sky. Being left a widow in her thirtieth year, she engaged devotedly on the side of Gregory VII. and Urban II., against the emperor Henry IV., her cousin. She was almost the inseparable companion of Gregory, always ready to assist him in every thing that he needed. This close connexion gave rise to many unfavourable suggestions, which were, however, groundless, although it is certain that their friendship was founded not only on policy, but also on mutual inclination and esteem. Matilda had been accustomed by her mother, to see in the pope a saint, while, at the same time, she revered the saint as a father. Gregory had, therefore, found much opportunity to influence the formation of her character. Her mind, moreover, was susceptible of a very high tension, and had been disciplined to manly firmness. There are, therefore, grounds enough for explaining how she should be able to dare and do so much for Gregory. The donation of all her goods and possessions to the Roman church (in 1077 or 1079, for the original records are lost), was, probably, but the least sacrifice. The sharing with him every danger that she could not avert, and her exhortations to him to encounter that which was unavoidable with steadfastness and courage, show her energy and resignation. She alone stood by him against the emperor in 1081, sustaining him with her treasures, while Rome was besieged; and, even after the death of Gregory, she prosecuted open war against the emperor. She died at Polirone, in 1115, in the Benedictine convent built by herself. Her death gave rise to new feuds between the emperor and pope, Pascal III., on account of the donation above-mentioned. These feuds, finally, resulted in the cession to the pope of a portion of the estates of Matilda. They consisted of Tuscany, Mantua, Parma, Reggio, Piacenza, Ferrara, Modena, a part of Umbria, the duchy of Spoleto, Verona, and almost all that constitutes the present patrimony of the church, from Viterbo to Oviedo, together with a part of the Mark of Ancona. See *Popes*, and *Gregory VII.*

MATSYS, QUINTIN; a painter, who was originally a blacksmith, born at Antwerp, in 1460. Different accounts are given of the occasion of his quitting the forge for the pencil; but most of his biographers agree that it was in consequence of becoming enamoured of the daughter of a painter, whose hand was to be obtained only by a master of the same profession. He chiefly painted portraits and half figures in common life, but sometimes undertook great works, of which a descent from the cross, in the cathedral of Antwerp, is a favourable specimen. His picture of the two misers, at Windsor, is also much admired. He died in 1529.

MATTER; that which occupies space, or that which the human mind considers as the substratum of bodies occupying space. As matter is perceived by us only in as far as it affects us, we must consider it as something effective in space, which, by its exten-

sion and motion, operates according to laws. From early times, the most various views have been maintained of the essence of matter and the mode of its operation on the mind. In the materialist conceptions, not unlike the soul, were considered to exist in matter, by means of which it operates on the mind. Leucippus and Democritus considered it to consist of empty space and atoms, maintaining all living nature by the influence of *vital atoms*. In later times, Descartes made a total division between the material and the spiritual, or immaterial, and conceived extension to be the essential property of matter. According to him, matter is simple, but composed of parts, which, it may be, are indivisible atoms, but, in idea, are still divisible and have still extension. Newton, who did not enter into metaphysical investigations on the subject, states that he considers matter as an aggregate of the smallest parts, which again are matter, extended, and, by an unknown power, are ever connected with each other; whereas it follows, as he also belongs to the atomists. The dualism of Descartes involved the metaphysical, as well as the union of the spiritual with the material, a great difficulties, and thus caused different metaphysical systems. One of the most remarkable is the *theory* (q. v.), which absolutely denies the existence of matter, and declares all our notions of material things to be but ideas or images, which the Lord implants in the soul of man; whereas, *Materialism* founded the opinion, that we see all things as they are, and that we are authorised to deny the existence of all things except God and the spiritus mundi. It considers the effect of matter on our mind as an influence of God. Spinoza and Hume went still further in the ideal theory. The former supposed a single substance, whose properties are infinite power, thought and extension, and explained all spiritual and material phenomena as states of the one power of thought and extension. Hume, who admitted other substances, nor subjects, nor any independent being, considers all things, spiritual and material, as a series of passing phenomena. Leibniz, who had not found it difficult to explain the influence of matter on the mind by dualism, idealism, or materialism, proposed the doctrine of *monads* (q. v.). From his doctrine further the opinion of Boscorich, that matter consists merely of physical points, which attract and repel each other, and said that matter is a mere manifestation of repulsion, which has a relation to certain mathematical points in space. Notwithstanding the many opinions which have existed, matter is still the great subject of mankind. It will always be asked, if matter is matter, are essentially different, how could they possibly influence each other? and, on the other hand, we cannot reason away the many phenomena which indicate such a difference. In philosophy, matter is also opposed to form. Material is that which refers to matter, as impenetrability, motion, extension, divisibility, and is opposed to spiritual.

MATTHEW (called also *Levi*), an apostle, son of Alphaeus; previous to his calling, an officer of the Roman customs, and according to tradition, a native of Nazareth. The apostle's life is imperfect and uncertain. Tradition represents him as having suffered martyrdom at Antioch. His Gospel has been supposed, by some, to have been originally written in Hebrew or Syriac, by converted Jews, about A. D. 40. In the latter case, we have now only a Greek translation, the original having been lost. His Gospel is according to the chronological order of the events in his report of the teachings of Jesus. It appears to give them not properly as they were delivered, but to arrange and group them

to the subject. The genuineness of the two first chapters has been called in question.

MATTHEW OF WESTMINSTER, an ancient English chronicler, was a Benedictine monk of the abbey of Westminster, who lived in the fourteenth century. He compiled a chronicle, commencing from the creation, and extending to the year 1307, which he entitled *Flores Historiarum*, whence he had the name of *Florilegus*. This work chiefly relates to English history, and is very freely transcribed from Matthew Paris. It was published in London, 1567, and at Frankfurt, 1601.

MATTHEWS, CHARLES, a celebrated comedian, was born, in London, June 23, 1776, and at the age of fourteen was bound apprentice to his father, James Matthews, a bookseller in the Strand, who died in 1804. By reading plays he imbibed a strong partiality for them, and his first performance was in a private play. At length, he resolved to make the stage his profession, and performed at Richmond and Canterbury. His father, from religious motives, wasaverse to his son's playing, and, being informed that he was at a certain town for that purpose, went there with the determination of hissing him off the stage; but, on his return, he told his friend, that, though he saw his name in large letters in the play-bills, and was resolved to check his career, yet the people so laughed at his performance, that he could not help laughing himself; and they so applauded that he was obliged to do the same. In 1803, he was engaged at the Theatre Royal, Haymarket, where he appeared in *Jabal*, in the *Jew*, and *Lingo*, in the agreeable *Surprise*, *Buskin*, *Old Wiggins*, *Sir Fretful Plagiary*, and other similar characters, with so much applause that he soon came to be considered one of the best mimics that ever appeared on the stage, and, in 1804, was engaged at Drury-lane. When that house was burned down, in 1809, the company performed at the Lyceum theatre, and Matthews took the parts in which Bannister had hitherto appeared. His success in *Somno*, in the *Sleep-walker*, at the Haymarket theatre, ensured him an engagement at Covent-garden theatre, where, however, he remained only three seasons. In 1817, he played his celebrated character of *Multiple*, in the Actor of all sorts, thirty nights, to full houses, in the London, and afterwards with equal success, in the provincial theatres.

Feeling conscious that he possessed within himself, individually, the power of attracting and entertaining the public, he now joined with Mr Arnold, of the ceum, in the establishment of a monodramatic entertainment, called "Matthews at Home;" Mr Arnold finding the house, and Matthews furnishing the amusement. Never, perhaps, did a project of this nature so decidedly succeed; night after night, one season after season, the theatre was thronged with the beauty, rank, fashion, and talents of the metropolis. Nor was this to be wondered at. Whatever merits Matthews possessed as an actor on the stage, his qualities of description, imitation, and illustration, off the stage, far transcended them; in the exercise he shared the talents and success of many, in the exercise he stood alone and unrivalled. His was not the mimicry of voice or manner; he possessed a peculiar power of copying the minds of the persons he imitated; and his greatest efforts were produced by gleaning conversations between men which had never taken place, but in which he depicted with a master hand their minds, characters, and dispositions. This power, added to a copious store of anecdotes, the quickest possible perception of the ridiculous, an unequalled talent for singing comic songs, a species which he himself originated, in which talking is combined with singing, and his gentle-

manly manners, naturally rendered him a popular member of private society. It was not surprising, therefore, that when the public were permitted to participate in the gratification which had been confined to his personal friends, they should eagerly avail themselves of the opportunity of witnessing an exhibition combining all the strength of his various and varied resources.

The names of his various entertainments were as follows:—

1818. Mall Coach Adventures.	1821. Earth, Air, Fire, and Water.
1819. Trip to Paris.	
1820. Country Cousins.	1822. Youthful Days.

After five years' success with these entertainments, Mr Matthews went to America, and arrived on the 6th of September, 1822, at New York, where he was extremely well received by the public. Being libelled in the Philadelphia Gazette, he brought an action, and was awarded 3000 crowns damages. He returned to England in July, 1823; and on the 25th of March following, produced his "Trip to America." This, and his "Jonathan in England," acted the same year in Mr Arnold's regular season, became the subject of much ill-natured remark here and across the Atlantic. Mr Matthews published an exculpatory letter in the "European Magazine."

When Terry's intellect began to fail, Yates (who owed his introduction to the stage to Matthews) applied to him; and the consequence was, the name of Matthews, instead of Terry, appeared as joint-manager of the Adelphi theatre. They entered into a partnership, the term of which expired just five days after Matthews's death. By the agreement, when either of them acted, he received ten pounds. There Matthews subsequently gave his entertainments, there he (in the dramatic season) performed; his first appearance being on the 29th of September, 1828, in "Wanted a Partner," and "My Absent Son." Latterly, a coolness arose between him and Mr Yates, and he declined acting there at all.

We continue the list of his entertainments:—

1824. Trip to America.	1830. Comic Annual.
1825. Memorandum Book.	1831. Comic Annual, Vol. 2.
1826. Invitations.	1832. Comic Annual, Vol. 3.
1827. (At Drury Lane.)	1833. Comic Annual, Vol. 4.
1828. Home Circuit.	1834. Youthful Days, and Home Circuit.
1829. Spring Meeting (with Yates).	

It was affirmed that Mr Matthews would not dare to cross the Atlantic again, after his vivid sketches of our American brethren; but he formed a juster estimate of his powers and their good sense; and in 1834, he paid America a second visit, and for the first time gave his "At Home" in the United States. He subsequently acted his round of theatrical characters; and was, as before, received with the greatest applause.

Circumstances, however, induced him to shorten his stay in America, and he returned to England. He became ill on the voyage, which was very stormy and dangerous; and when he reached Liverpool his weakness was such that he was unable to quit the town for some weeks. He then removed to the house of a friend, near Daventry, where he seemed to rally; but it was deemed advisable as speedily as possible to remove him to the West of England, where, in spite of the mildness of the air, and unremitting attention, symptoms of a fatal disorder exhibited themselves; and after several weeks of protracted suffering, on the 28th of June, 1835, being his fifty-ninth birthday, he expired; the immediate cause of his death being water in the chest.

As an actor, the rapidity with which Matthews seized upon all prominent and eccentric points of character, and the felicity with which he portrayed them, were wonderful. His field of observation was

human nature in all its endless variety, and no man ever observed it to greater advantage. The designs for all his "At Homes" were given by himself, though written by others; hence came, perhaps, in a great measure, the spirit of his performance, as in this respect Matthews might be compared to a great musician playing his own music. He was the satirist and rebuker—a gentle and an amusing one—of the vices, the follies, and the extravagances of the day. He did not distort his character, but his incidents. He chose those circumstances under which the peculiarities of his characters could be best displayed—a privilege which every novelist and dramatist has claimed from time immemorial; and within these bounds he was always true to nature. The finish of his sketches was as surprising as their vigour, and his extreme versatility more extraordinary than both. No man since Garrick ever went through such a range of character, whilst his occasional touches of exquisite tenderness and pathos mingled with his rich comic humour in strange yet harmonious combination. Matthews was the only actor of our day who could suffuse the eye with tears of emotion, and convulse the features with laughter at one and the same moment. Nothing could exceed the correctness of his ear; he spoke all the dialects of Ireland, Scotland, and Wales with a fidelity perfectly miraculous. He would discriminate between the pronunciation of the different Ridings of Yorkshire, and speak French with the Parisian accent, the patois of the South, or the guttural tone of the Flemish.

In person, Matthews was about five feet eleven inches in height; his countenance was pleasing on the stage, though a singular twist was always perceptible about the mouth, and seemed the latent token of his irresistible drollery.

**MATTHIAS CORVINUS**, king of Hungary, second son of the gallant Hunniades, a man of great ability, who, by his wars against the Turks, excited the interest of Europe, and in Hungary, was esteemed the first of her kings. The enemies of his father kept him imprisoned in Bohemia, but, in 1458, at the age of sixteen years, he was called to the throne of Hungary. Several Hungarian magnates opposed the election, and invited Frederic III. to accept the crown. The Turks, profiting by these dissensions, invaded and laid waste Hungary; but Corvinus, having compelled Frederic III. to resign to him the crown of St Stephen, hastened to meet the Turks, and drove them from the country. Between 1468 and 1478, he conquered Silesia, Moravia, and Lusatia; he was also victorious over the Poles, and took part of Austria, including Vienna, from Frederic III. These wars obliged him to lay heavy taxes on his subjects, and he governed arbitrarily, but must be allowed to have been a man of extraordinary powers. During the whole of his disturbed reign, he not only encouraged science, but cultivated it himself. It is much to be regretted, that the great library, which he collected at Buda, was destroyed by the Turks, twenty years after his death. At Buda, he reposed from the toils of war, and collected scholars around him. In 1488, at a diet at Buda, he established laws against duels, for the better administration of justice, &c. He died in 1490, at Vienna, when occupied with preparations for a new war against the Turks. He left only a natural son, Johannes Corvinus, who was not able to obtain the crown. The candidates for it were numerous. The Hungarians elected king Wladislaus VII. of Bohemia.

**MATTHIAS, JOHN VAN HARLEM.** See *Anabaptists*.

**MATURIN, CHARLES**; an ingenious but eccentric clergyman of the established church, curate of St

Peter's, Dublin, and author of several popular romances, many of which, especially *Family of Montorio*, evince great power of imagination, and a richness of language, but exhibit a most remarkable degree of carelessness in the application of facts. Besides the one just mentioned, the poems are the *Milesian Chief*; *Fatal Revenge*; *Wreck of the Island*, &c. *Bertram*, a tragedy, performed at the theatre, with Kean as the representative of its principal character, was the first production which, by singular success, brought him into notice as a writer. This effort is said to have produced him £2000, a subsequent dramatic attempt (*Mammi*) being so fortunate, and, having anticipated his views, without contemplating the possibility of a future contracted embarrassments, from which he was entirely free till his death, in October, 1821. He published, in 1821, a poem, in blank verse, entitled *Universe*, which brought him more profit than reputation; and, in 1824, appeared six of his *Catholic Sermons*, preached at St Peter's, during the last of that year. These exhibit him as a well-read scholar and an acute reasoner, and are, perhaps, the best foundation on which to rest his claims to the notice of posterity. He was remarkably frigid in his delivery, and attracted by his eloquence dependent congregations.

**MAUBEUGE**; a French fortress, on the left bank of the department Du Nord. The Sambre traverses the beuge, and becomes navigable here, seven leagues and a half east-south-east of Valenciennes. Maubeuge has considerable commerce in wine, &c.; manufactures,—arms, rails, soap, &c.; contains 6044 inhabitants. It dates its origin from the foundation of a chapter of canons, in 685, by Aldegonde. It was the capital of the former province of Hainault. Louis XIV. took it, in 1667, in the peace of Nimueguen, in 1678, confirmed to France. The Prussians took it in 1815.

**MAUBEUZE.** See *Mabuse*.

**MAUBREUIL, MARQUIS DE.** There are some circumstances, which have not yet been explained, which seem to reflect no great credit on the person what is denominated, in politics, the principle of intimacy. He was born in Brittany, of a noble family about the year 1780, entered into the imperial army in which he made several campaigns, and was frequently taken into the service of the king of Naples, who appointed him his equerry. Maubreuil was employed in Spain, as a captain of Westphalian light-horse, and his bravery gained for him the legion of honour. He, however, quitted the army to become a contractor; but the military having broken some of the contracts entered into with him, fell into embarrassments, and his property was seized by his creditors. His enemies say that, in 1812, he exulted beyond measure at the downfall of the imperial government, and rode through the streets, shouting out to the passengers the star of the legion of honour which he had tied to his horse's tail. If this was probably the cause of his being employed in conjunction with a M. Dasies, on a very extensive mission, by the provisional government. The visible purpose of this mission, for which he was authorized to call in the assistance of the army and the civil authorities, was to recover the jewels, which were said to have been carried off by the family of Napoleon. The marquis's companion took the route of Fontenoy, which place the emperor had just set out to visit, and they stopped the ex-queen of Westphalia, the wife of Jerome Bonaparte, who was travelling in many with a passport from the king. They found eleven chests, containing valuable jewellery, &c.

princess, and sent a part of them to Versailles, and a part of them to the king's commissioner at Paris. The chests were claimed by the princess; and, on their being opened a large quantity of diamonds, and a sum of 82,000 francs, were found to have been stolen from them. Maubreuil and Dasies were accused of the theft. Dasies was afterwards tried and acquitted, but Maubreuil was not allowed to escape so easily. One of the tribunals declared itself incompetent to try him, and he remained in prison till the 18th of March, two days before the arrival of Napoleon at Paris, when the minister at war set him at liberty. A few days after this he was arrested by the imperial government, but was soon discharged. He is said to have gone under an assumed name, to Brussels, and there he was arrested and conducted to Ghent, on suspicion of intending to assassinate Louis XVIII. It does not appear that a iota of proof existed against him. Driven to despair, perhaps, by the persecution which he endured, he opened his veins in prison, but was saved from death. He was next put into the custody of a party of gendarmes, and conducted to Aix-la-Chapelle, to be delivered to the Prussians. He escaped on the road; and it is a singular fact, that he went back to Paris at the same time that Louis arrived from Ghent, and remained unmolested in the French capital for nearly twelve months. In June, 1816, however, the police seized him, on a charge of having intrigued against the royal government, and formed the project of carrying off the French princes from St Cloud. This accusation, too, seems to have been calumnious, for it was dropped; but, on April, 1817, he was once more prosecuted for the theft of the money and diamonds. One of the subordinate courts having again refused to take cognizance of the cause, he was sent before the royal court. His patience was at length exhausted: he addressed the judges in strong terms, and disclosed the important secret, that he had not been employed to recover the crown jewels, but to assassinate Napoleon,—a mission which he accepted, he told them, only for the purpose of saving the emperor. From his prison he repeated this avowal, in a very severe letter to the ambassadors of the allied powers. The cause was now referred to the tribunal of Douai, and from thence to that of Douay. The latter tribunal is said to have been on the point of pronouncing sentence, when Maubreuil escaped from his dungeon for the fourth time. After he had made his escape, the tribunal sentenced him to five years' imprisonment, and a fine of 500 francs. He then went to Brussels, and then passed over to Britain, where he published a vindication of himself. In 1825, he returned to France, and was again imprisoned until 1827, when, having been released, he made an attack on Talleyrand, whom he beat severely. On his trial for this offence, he accused the prince of having been the cause of all his sufferings, by employing him to assassinate Napoleon. Maubreuil was condemned to five years' imprisonment. Talleyrand has never thought proper to clear up the mystery, and the matter still remains explained. Bourrienne, in his memoirs of Napoleon, has some remarks relating to the circumstances of this transaction.

**MAUMEE**, or **MIAMI OF THE LAKES**; a river it rises in the north-east part of Indiana, and flows through the north-west part of Ohio, into Lake Erie. It is formed by the confluence of St Joseph's, Mary's, and Great and Little Auglaize. It is navigable only eighteen miles, on account of rapids. At this distance, its breadth is from 150 to 200 rods.

**MAUNDAY-THURSDAY** is the Thursday in

the Passion week; called *Maunday*, or *Mandate Thursday*, from the command which our Saviour gave his apostles to commemorate him in the Lord's supper, which he this day instituted; or from the new commandment that he gave them, to love one another, after he had washed their feet, in token of his love to them. It was instituted by pope Leo, in 692.

**MAUPERTUIS**, **PIERRE LOUIS MOREAU DE**, a celebrated French mathematician and philosopher, was born at St Malo, in 1698, and studied at the college of La Marche, in Paris, where he discovered a strong predilection for the mathematics. At the age of twenty, he entered the army, in which he served four years. In 1723, he was received into the academy of sciences, and soon after visited England and Switzerland, where he became a pupil and admirer of Newton, and formed a lasting friendship with the celebrated John Bernouilli (q. v.) and his family. On his return to Paris, he applied himself to his favourite studies, with greater ardour than ever, and, in 1736, formed one of the scientific party appointed to measure a degree of the meridian at the polar circle. In 1740, he received an invitation from the king of Prussia to settle at Berlin. On his return to Paris, in 1742, he was chosen director of the academy of sciences, and, the following year, received into the French academy. He returned to Berlin in 1744, and, in 1746, was declared president of the academy of sciences at Berlin, and, soon after, received the order of merit. His unhappy restlessness of temper was a source of continued disquiet to him, and a controversy with Konig, which subjected him to the satire of Voltaire, completed his uneasiness. At this time, his health, injured by his northern expedition, and incessant application, began to give way, and he sought relief by repeated visits to his native country. His disorder, however, seems to have uniformly revived with his return to Berlin; and he at length died, on his return from one of these excursions, at the house of his friend Bernouilli, at Basil, in 1759, in the sixty-first year of his age. His works, collected in four 8vo volumes, were published at Lyons, in 1756, and reprinted in 1768. Among them are Discourse on the different Figures of the Stars; Reflections on the Origin of Languages; Animal Physics; System of Nature; On the Progress of the Sciences; Elements of Geography; Expedition to the Polar Circle; On the Comet of 1742; Dissertation upon Languages; Academical Discourses; Upon the Laws of Motion; Upon the Laws of Rest; Operations for determining the Figure of the Earth, &c.

**MAURA**, **SANTA**. See *Leucadia*.

**MAUREPAS**, **JEAN FREDERIC PHELIPPEAUX**, COUNT DE, born in 1701, was, at the early age of twenty-four years, minister of the French marine. At his suggestion, cardinal Fleury named Amelot minister of foreign affairs, and the latter undertook nothing important without the concurrence of Maurepas, who finally administered the foreign department himself. He was hasty in his decisions, without system or foresight, but quick in conception, amiable, flexible, artful, and penetrating. He made up in dexterity what was wanting in reflection, and was one of the most agreeable of ministers. An epigram on madame de Pompadour, of which he was accused of being the author, led to his banishment from the court. Louis XIV. recalled him in 1774, and placed him at the head of his ministry. Removed from public affairs for the space of thirty years, Maurepas had lost whatever requisite he had ever possessed for the administration of government. With the imprudence of his youth was now united the feebleness of age. He retained the confidence of the king till his death, Nov. 21, 1781; but he was desti-

tute of the vigour necessary to avert the troubles which soon after shook the kingdom. France was, however, indebted to him for some improvements in the marine. The *Memoirs of Maurepas*, composed by Sallé, his secretary, and edited by Soulavie, are amusing, but carelessly written. See *Louis XVI.*

**MAURI, and MAURITANIA.** See *Moors.*

**MAURICE**; count of Saxony, commonly known as marshal Saxe. See *Saxe.*

**MAURICE, Duke**, and, after 1548, elector of Saxony (of the Albertine line), born in 1521, displayed, from his early years, great talents, united with a restless, active, and ardent spirit. In 1541, the death of his father, Henry the Pious, placed him at the head of the government, at the moment when the religious disputes had divided the German princes. Although a favourer of Protestantism, he refused to join the Smalcaldic league of Protestant princes, for the defence of the new doctrines, either out of attachment to Ferdinand, king of Hungary and Bohemia, against whose brother Charles V. (q. v.) the league was organized, or because he foresaw that it could not stand. In 1548, he concluded a secret treaty with the emperor, and was obliged to execute the ban of the empire against John Frederic, elector of Saxony (of the Ernestine line), and take possession of his territories. In 1548, the emperor conferred on him the electoral dignity of Saxony, and the greater part of the hereditary estates of the late elector. Charles now thought the moment was come to execute his project of annihilating the rights and privileges of the German princes, and rendering himself absolute master of Germany; and, although he artfully maintained a show of protecting the Catholics, laboured only for his own selfish interests. Maurice was not slow to penetrate the crafty policy of the ambitious monarch. Convinced that a forcible resistance would become necessary, he made his preparations, in 1550, under the pretence of executing the decree of the diet against Magdeburg, concluded a secret treaty with Henry II. of France, and some of the German princes (1551), and behaved so warily, that he had nearly succeeded in making Charles, who lay sick with the gout at Innspruck, his prisoner (1552). In justification of this unexpected act of hostility, Maurice alleged the detention of his father-in-law by the emperor, contrary to solemn promises. The emperor upon this, set free the prince whom he held captive, and proposed terms of accommodation by his brother Ferdinand. The result of this negotiation was the famous treaty of Passau (q. v.), July 31, 1552. Maurice, who had thus recovered the favour of the Protestants, now thought proper to give the emperor likewise, a proof of his attachment, by serving against the Turks. Nothing, however, was effected, and he soon after returned to Saxony. July 9, 1553, he defeated Albert, margrave of Brandenburg-Kulmbach, who refused to accede to the treaty of Passau, at Sievershausen, and died of a wound received in that battle, two days after. Maurice possessed the talents of a great prince and general, with a prudence that enabled him to take advantage of circumstances. Notwithstanding the shortness of his reign, Saxony is indebted to him for many useful institutions.

**MAURICE OF NASSAU**, prince of Orange, the youngest son by a second marriage, of William I., prince of Orange, born at Dillenburg, 1567, was studying at Leyden, in 1584, when his father was assassinated. The provinces of Holland and Zealand, and, soon after, Utrecht, immediately elected the young prince stadtholder, and his talents, as a general, surpassed all expectations. In 1590, he took Breda by surprise, and delivered Guelderland, Overijssel, Friesland, and Groningen from the Spaniards.

With the chief command, by land and sea, of all the forces of the United Provinces, he was appointed stadtholdership of Guelderland and Overijssel, that of Friesland and Groningen being conferred on his cousin William, count of Nassau. Previous to the treaty of twelve years, concluded in 1609, about forty towns and several fortresses, had fallen into his hands. He defeated the Spaniards in three pitched battles. Besides the naval victories which were gained by the vice-admirals of the republic, on the coast of Spain and Flanders. Thus became the object of public affection and respect to his countrymen, his patriotic spirit now aimed at the sovereignty. To effect his purposes, he took advantage of the religious quarrels of the Arminians and Gomarists, the Remonstrants and Counter-Remonstrants. He supported the Gomarists in acts of violence (see *Barneveldt*), but, not abandoning all his efforts, he was compelled to abandon the project. He died at the Hague, April 23, 1625, was succeeded by his brother Frederic Henry. The life of this stadtholder was an almost unbroken series of battles, sieges, and victories. War he carried as a master, and conducted like a hero. His art was considered as the best school of the art. The generals educated under him have contributed to extend his fame. Like Mazarin, he possessed the rare art of conducting a march, pitching a camp; like Vaulan, the genius of tactics and defence; like Eugene, the skill to support the most numerous armies in the most unproductive and exhausted country; like Vaudemont, good fortune to obtain more from the enemy than he had a right to expect; like Condé, that *coup d'œil* which determines the issue of the battle, like Charles XII., the power of rendering the enemy insensible to cold, hunger, and suffering; like Turenne, that of sparing human life. In the opinion of Folard, Maurice was the greatest soldier general that had existed since the time of the Romans. He had learned the art of war from the ancients and extended it by the results of his own and others' experience.

**MAURITIUS.** See *France, his of.*

**MAUROKORDATOS.** See *Manichæism.*

**MAUROMICHALIS.** See *Manichæism.*

**MAURUS, RABANUS**, a German scholar, of the age of Charlemagne, who did much to promote the improvement of his nation, was a native of Meersburg, received his education in the Benedictine monastery at Fulda, and subsequently went to Tours, to complete his studies under Alcuin. After his death, in 804, he became superintendent of the monastery at Fulda, from which proceeded many distinguished scholars. After many adversities, which he overcame with the aid of his own industry and the influence of his literary school, and of the truly Christian church discipline, continued to increase. Dissatisfied with the turbulence of the times, he was desirous of finishing his life as a hermit. King Louis the German obliged him, in 822, to accept the archbishopric of Mayence. In the city he died in 856. His Latin writings, of a theological character, appeared at Cologne in 1476, in folio. In the diffusion and formation of the German language he was very active, and succeeded as to introduce preaching in German. He also compiled a Latin and German glossary of the Bible, preserved in several manuscripts, a monument of the old German language, which has been printed in Schilter's *Theatrum Lingue Germanicæ*. *Commentarii de Reb. Franc.*

**MAURY, JEAN SEVERIN**, born at Toulon,

Provence, in 1746, of obscure parentage, took holy orders, and soon received several benefices. His eulogy on Fénelon, and his talents as a preacher, attracted the public notice, and, previous to the breaking out of the revolution, had procured for him the place of a court-preacher, the priory of Lyons, the dignity of abbot of Frénade, and a seat in the French academy. He showed his gratitude for this patronage of government, by exercising his courage and his eloquence in defence of the throne. In 1789, the abbé Maury was chosen deputy of the clergy of Peronne to the States-General, and became a formidable antagonist to the opposition by his eloquence, his extensive and profound knowledge, and, particularly, by his presence of mind, and his imperturbable firmness. The union of the three estates in a national assembly met with the most vigorous resistance from him, and, after it was determined upon, he quitted the assembly and Versailles, but afterwards returned, and took an active part in that body. He defended the necessity of the royal veto, and opposed the conversion of the church property into national domains. When the latter subject was discussed for the third time, November 9, 1789, Maury produced a violent excitement in the assembly by his speech, and, on leaving the house, was saluted by the crowd with the cry, *A la lanterne l'abbé Maury*. *Eh bien*, replied he coolly, *le voilà, l'abbé Maury; quand vous le mettriez à la lanterne, y verriez-vous plus clair?* This reply produced a general laugh, and the abbé was saved. On the dissolution of the assembly, in 1792, he retired to Rome, and received a bishopric in *partibus* from the pope, who sent him to Frankfort as apostolic nuncio at the coronation of Francis II. He was soon after (1794) created bishop of Montefiascone and Corneto, and cardinal. During the revolutionary storm, Maury remained at Rome, devoted to the duties of his charge and to study. His pastoral letters contained expressions of his abhorrence of the cruelties committed in France, and of his adherence to the Bourbons. Thus far he had displayed a consistency of character, as even his declared enemies acknowledged. But when Napoleon usurped the imperial dignity, in 1804, Maury considered the cause of the Bourbons as hopeless, and thought it an act of prudence on his part to submit to the government, which was recognised by the French nation, and by nearly all the powers of Europe. He might justify this measure by his previous adherence to monarchical principles, and might hope to be useful in extending the royal prerogatives in France, which had been much limited by the concordate of 1801. Perhaps, also, his ambition was flattered with the prospect of thus reaching the highest spiritual dignity in Catholic Christendom. However this may be, he wrote in terms of the highest admiration to Napoleon, and proffered his allegiance as a French subject. In 1804, he accompanied the pope to Paris, and was present at the coronation of the emperor. In 1806, he was created archbishop of Paris, and was thenceforward the most devoted servant of his master. All his pastoral letters, and his discourses, recommended the most unconditional obedience to the decrees of Napoleon, and his addresses to the emperor abounded in the most abject terms of adulation. In 1814, he was obliged to leave the archiepiscopal palace in Paris, and the capital would no longer recognise him as archbishop, since he had no papal brief to produce. He hastened to Rome, but there was thrown into the castle of St Angelo, for having accepted the archbishopric without the consent of the holy see. After subjecting himself to various humiliations, he was again acknowledged as cardinal, but died at Rome, in 1817, without recovering his archbishopric, or his former consideration.

**MAUSOLEUM** (*μαυσωλειον*), from Mausolus, a king of Caria, to whom a sumptuous sepulchre was raised by his wife Artemisia. King Mausolus is said to have expired in the year 353 B. C.; and his wife was so disconsolate at the event, that she drank up his ashes, and perpetuated his memory by the erection of this magnificent monument which became so famous as to be esteemed the seventh wonder of the world, and to give a generic name to all superb sepulchres. (See an essay of count Caylus, in the 26th volume of the *Mem. de l'Académie des Belles Lettres*; and Auluisio, *De Mausolei Architectura*, in Sallengre, *Thes.* III.) Other famous mausoleums are the mausoleum of Augustus, built by him in the sixth consulate, on the Campus Martius, between the Via Flaminia and the Tiber. The ruins are still seen near the church of St Roque, and one of the obelisks which stood before this superb building was found in the reign of pope Sixtus V., and placed before the church of St Maria Maggiore. This mausoleum contained the ashes of Augustus, Marcellus, Agrippa, Germanicus, and of some later emperors. The *Mausoleum Hadriani* is now the castle of St Angelo.

**MAXEN**; a village in the circle of Meissen, kingdom of Saxony, famous for the surrender of the Prussian general Fink, with 12,000 men, to the Austrian general Daun, Nov. 21, 1759, in the seven years' war.

**MAXIMIANUS**, **HERCULIUS**; the colleague of Diocletian. See *Diocletian*.

**MAXIMILIAN I.**, emperor of Germany, son and successor of Frederic III., born in 1459, married, in 1477, Mary of Burgundy, heiress of duke Charles the Bold, the son of which marriage (the archduke Philip) was the father of Charles V. and Ferdinand I. Maximilian was elected king of the Romans, in 1486, and ascended the imperial throne in 1493, under very unfavourable circumstances. Germany, under the reign of his predecessor, had become distracted and feeble. Maximilian's marriage had, indeed, brought the territories of Charles to the house of Austria, but he had been unable to maintain them against Louis XI. (q. v.), who had stripped him of Artois, Flanders, and the duchy of Burgundy, while Charles VIII. obtained the hand of Anne of Brittany, whom Maximilian had married by proxy. In 1494, the latter was married, a second time, to Bianca Sforza of Milan. Maximilian was enterprising, politic, brave, and of a noble and generous temper; yet his best plans often failed through his excessive ardour and his want of perseverance, and the miserable administration of his finances often deprived him of the fruits of his most fortunate enterprises. In 1493, he defeated the Turks, who had invaded the empire, and, during the remainder of his life, he was able to repel them from his hereditary territories; but he could not prevent the separation of Switzerland from the German empire, in 1498 and 1499. His plans for limiting the power of Louis XII. in Italy, and compelling him to renounce his claims on Milan, involved him in perpetual wars, without securing to him the possession of Milan. Not less unsuccessful was the league of Cambray against Venice, which he concluded (1508) with the pope, Spain, France, Mantua, and Modena. (See *League*.) Maximilian afterwards took the field against France, and, for the purpose of raising money, ceded Verona to the Venetian republic for 200,000 ducats. His measures in the domestic affairs of the German empire which, for 300 years, had been the theatre of barbarism and anarchy, were more creditable. What his predecessors had so long vainly attempted, Maximilian successfully accomplished. In 1495, he had put an end to internal troubles and violence, by the perpetual peace of the empire, decreed by the diet of Worms.

(See *Germany, History of*.) To supply the defects of the German laws and prevent the gross abuses of justice, he adopted, at the same diet, the Roman and canon laws, as subsidiary authorities, in the decision of differences, and instituted the imperial chamber (see *Chamber, Imperial*), as the supreme tribunal of the empire. He put a stop to the monstrous abuses of the Westphalian *Fengerichte*, although he was unable entirely to abolish those secret tribunals. (See *Feme*.) The institution of the German circles, which were intended to secure internal peace and safety, originated from him, as did many other useful institutions for the improvement of the government, and the promotion of science and art. Maximilian was himself a poet, and was the author of a circumstantial but romantic account of his own life, first published in 1775, under the title *Der weiss Künig*, by M. Treitschurwein (his private secretary), with *Food-cuts by Hanns Burgmair*. He was, for a long time, considered the author of the *Theuerdank* (q. v.), of which he is the hero; but his secretary Pfinning is now known to have been the writer. Maximilian died in 1519, and was succeeded by Charles V.

**MAXIMILIAN II.**, German emperor, son of Ferdinand I., born at Vienna in 1527, was chosen king of the Romans in 1562, and succeeded his father in the imperial dignity in 1564. He was a pattern of a wise, prudent, and good prince. Although he did not join the Lutherans, yet he favoured some of their opinions, and granted to his subjects, in his hereditary dominions, a greater religious freedom than they had previously enjoyed. His toleration was extended to all his territories, and led him to promote the religious peace of 1566. Soliman II., the Turkish sultan, made war upon him, in support of the claims of John Sigismund, prince of Transylvania, to Hungary, but the death of the sultan put an end to the war in 1567, his successor, Selim, having agreed to a truce of eight years. The latter renewed the war in 1576, in which year Maximilian died. He left two daughters and six sons, the eldest of whom (Rodolph) succeeded him, not only as emperor, but also in the Austrian hereditary estates. See *Austria*.

**MAXIMILIAN THE GREAT**; elector of Bavaria. See *Bavaria*.

**MAXIMILIAN I.**, JOSEPH, late king of Bavaria, was born May 27, 1756, in Schwetzingen, a village not far from Mannheim. His father was the palatine Frederick, Austrian field-marshal. In 1777, Maximilian was made colonel of a French regiment in Strasburg. In 1795, his brother Charles died, and he became duke of Deuxponts. In 1799, when the Sulzbach palatine line became extinct by the death of the elector Charles Theodore, the succession passed to the line of Deuxponts. Thus Maximilian became elector. By the peace of Presburg (1805), he became king. (See *Bavaria*.) In 1818, he gave a constitution to his kingdom, after having improved it in many respects. He died October 13, 1825. Maximilian, who, when young, little expected to rule over Bavaria, retained always the frankness of a soldier. He had a good heart, and was beloved by his subjects. Education, agriculture, the finances, and the administration in general were improved under his reign. His daughter Augusta Amalia, born June 21, 1788, is the widow of the duke of Leuchtenberg, (Eugene Beauharnais); his daughter Charlotte Augusta, born February 8, 1792, was married, in 1816, to Francis I., emperor of Austria. Maximilian was succeeded by his son Louis I., born August 25, 1786.

**MAXIMINUS**, CAESAR JULIUS VERUS, the son of a peasant of Thrace, was originally a shepherd, and, by heading his countrymen against the frequent attacks of the neighbouring barbarians and robbers, incurred himself to the labours and to the fatigues of

a camp. He entered the Roman army, when it gradually rose to the first offices. In the reign of Alexander Severus, slain in a battle, he was excited by Maximin, he caused him to be proclaimed emperor, A. D. 235, and many were his son's colleagues. The popular vote had gained when general of the army was out when he ascended the throne. He reigned with acts of barbarity, and no less than 60,000 lost their lives on the false suspicion of having conspired against the emperor's life. Sentenced to wild beasts; others expired by having been nailed on crosses; while others were cut off the bellies of animals just killed. The persons peculiarly the objects of his cruelty, as a more conscious than others of his mean origin: an expedition in Germany, he cut down to the laid waste about 450 miles, with the last of Such a monster of tyranny at last proved to a people of Rome. The Gordians were chosen emperors; but their pacific virtues were unable to resist the fury of Maximin. After the Roman senate invested twenty of their number with the imperial dignity, and intrusted to them the care of the republic. These measures were irritated Maximin, that at the first attack he howled like a wild beast, and almost drove to self by knocking his head against the wall of a palace. When his fury was a little subsided, he marched to Rome, resolved on slaughter as a soldiers ashamed of accompanying a man so cruelly had procured him the names of *Amor-clopes*, and *Phalaris*, assassinated him as he sat before the walls of Aquileia, A. D. 238. He was then in the sixty-fifth year of his age. The news of his death was received with the greatest joy in Rome; public thanksgivings were offered, and hecatombs flamed on the altars. Maximin was represented by historians as of a giant stature: he was eight feet high, and the bones of his hand served as rings to adorn the fingers of his hand. His voracity was as remarkable as his courage: he ate forty pounds of flesh a day, and drank copiously of wine. His strength was proportionate to his gigantic shape: he could draw a sword with a blow of his fist he often leapt to with a horse's mouth, and cleft young trees with his hand.

**MAXIMUM** (the greatest): in general, the greatest number above which no augmentation or increase exists or is allowed to exist. Thus in the case of the French revolution, all the numbers of life had a price set upon them, above which they were not allowed to be sold: this was called the maximum. This regulation was soon seen to be a principle in agriculture and trade, that it was admitted, but mathematics, where an extensive application could be made of the notion of greatest and smallest numbers (minimum), by the greatest or smallest value of a variable quantity is understood that value which is greater or smaller than any preceding or following one in the series of the values of the quantity, however near either may be taken to the greatest or least value. The question of the conditions of the maximum and minimum, the determination of which belongs to the differential and in some cases difficult cases to the integral calculus, is of the highest importance. In order to illustrate the subject by an example, let it be required to divide a number, 10, for instance, in such a manner that the product of the parts shall be a maximum: the method of maxima and minima shows that the number must be divided into two equal parts, for 4 times 4 are equal to 3 times 5 are only 15, twice 6 only 12, &c. according to our above definition, 16 is the maximum in the series of numbers successively obtained.

a treatise on the differential calculus, and Tomma's treatise *De Maximis et Minimis ad Institutiones geometricas accommodatis Specimen*, Pisa, 1774.

MAXIMUS TYRIUS, a celebrated philosopher of the second century, was a native of Tyre in Phœnicia, whence he took his name. It is generally supposed that he flourished under Antoninus. He appears to have adopted the principles of the Platonic school, with an inclination to scepticism. He left twenty-one Dissertations on various philosophical topics, all extant, and written with extreme eloquence. They were published in Greek, by Stephens, in 1557, and in Greek and Latin, by Heinsius, in 1607.

MAY, the fifth month in the year, has thirty-one days (in Latin, *Maius*, from which May has been generally derived; the names of the other months being also of Latin origin). Several etymologists maintain, however, that the German *May*, or *Mai*, is derived from the Latin, but that *May* and *Maius* both belong to one original root. As early as in the Salic laws, this month is called *Meo*, and it would appear that the idea of youthful beauty and loveliness, so naturally connected by northern nations with the month of May, gave rise to its name. In the Saxon, *Maj*, in Dutch, *Mooy*, is beautiful, agreeable; in Swedish, *Mio*, in Icelandic, *Mior*, small, pretty, agreeable; in ancient Swedish, *Mó*, a virgin connected with *maid*, *maiden*). In Lower Brittany, *me* signifies green, flourishing, and *Maes*, a field, meadow; German, *Matte*; in Lorraine, *Io Mai* and, in ancient French *Mets*, *Més*, signify a garden. Whether all these must be referred to one Teutonic root, and whether this, again, is connected with the Indian *Maya* (see *Magic*), the goddess of nature, cannot be investigated here.

MAY, CAPE; on the coast of New Jersey, at the mouth of the Delaware bay, on its northern coast, eighteen miles N. E. of cape Henlopen on the eastern shore. Lon. 74° 52' W.; lat. 38° 57' N. MAY FLY. See *Ephemerides*.

MAY, THOMAS, a poet and historian, the eldest of Sir Thomas May, was born about 1595. He died at Cambridge, and was afterwards admitted a member of Gray's Inn; but never seems to have followed the law as a profession. His father having left nearly all the family estate, he enjoyed but a petty inheritance. May was much noticed by Charles I., and the wits of his early courts. He was author of three tragedies and two comedies, also several poetical translations, as Virgil's *Georgics*, with annotations; Lucan's *Pharsalia*; to the latter of which he supplied a continuation of his own, both in Latin hexameters and in English. Of his original works, the principal are *Reign of Henry II.*, and the *Reign of Edward III.*, each in seven books. According to lord Clarendon, disgust at being denied all pension, induced him, on the breaking out of civil war, to enter into the service of parliament, which he was appointed secretary; and his well-known *History of the Parliament of England*, which on November 3, 1640, became extremely obnoxious to the royal party, who vilified both the work and his production, without measure. He afterwards made an abstract of this history, under the title of a *Breviary of the History of the Parliament of England* (1650, 8vo), and died a few months after publication, aged fifty-five, 1650. He was buried in Westminster abbey, by the order of parliament, and also erected a monument to his memory. This was removed at the restoration, and his body disinterred, and thrown with many others, into a pit, dug at purpose, in St Margaret's churchyard.

MAYENCE. See *Mentz*.

MAYER, JOHN TOBIAS, a celebrated astronomer, at Marbach in Wurtemberg, February 17, 1723,

passed his early years in poverty at Esslingen. By his private industry, without attending any academy, he made himself a mathematician, and became known by several original essays in this department, such as *Allgemeine Methode zur Auflösung Geometr. Probleme* (Esslingen, 1741); after which, he went to Nuremberg, and entered the establishment of Humann, where he distinguished himself by his improvement of maps. At the same time, he did not neglect to improve himself in other branches of study: he acquired, for instance, an elegant Latin style, which, in his circumstances, did him much honour. These various merits procured him an invitation to Göttingen, as professor of mathematics, in 1750, and the royal society of sciences of that place chose him a member. About this time, astronomers were employed on the theory of the moon, to assist in finding the longitude at sea. Mayer overcame all difficulties, and prepared the excellent lunar tables, by which the situation of the moon may at any time be ascertained to a minute, for which tables, after his death at Göttingen, February 20, 1762, his heirs received £3000 sterling, as a part of the reward proposed by the British parliament for a method of finding the longitude at sea. These tables have immortalized him. To the same department belong his *Theoria Lunæ juxta Systema Newtonianum* (London, 1767, 4to) and *Tabula Motuum Solis et Lunæ* (London, 1770, 4to). He also rendered other services to astronomy, especially by his improvement of instruments for measuring angles, and the introduction of the multiplication circle (which was afterwards made more perfect by Borda, so as to be adapted to the most delicate operations of astronomy), by the theory of refraction and eclipses, by catalogues of the fixed stars, &c. The manuscripts left by him are preserved in the observatory at Göttingen. A part only of them have appeared, *Opera inedita*, ed. Lichtenberg (Göttingen, 1774, fol.).

MAYER, or MAYR, SIMON, a distinguished German composer, born near Ingolstadt, in 1764, resided a long time in Italy. He was liberally educated, but his inclination for music seduced him from the sciences, and, at the age of twenty-five years, he went to Bergamo, where count Pesenti assisted him, and enabled him to study at Venice, under the chapel-master Bertoni. The death of his patron obliged him to connect himself with the theatre, and in 1802 the place of chapel-master in Bergamo was given him. He composed a great number of serious and comic operas, oratorios, cantatas, &c. His principal operas are *Lodoiska*; *Misterj Eleusini*; *La Ginevra di Scozia*; *Medea in Corinto*; *La Rosa bianca e la Rosa rossa*; and *Adelasio ed Aleramo*.

MAYHEW, JONATHAN, D. D., son of a distinguished clergyman and successful missionary among the Indians, was born at Martha's Vineyard, in the year 1720, and educated at Harvard college, of which he received the honours in 1744. In youth he manifested talents, and great proficiency in his studies: he was ordained the minister of the West church in Boston, June 17, 1747. In this station he continued during the rest of his life. He died suddenly July 9, 1766, in the forty-sixth year of his age. He published a number of sermons and some controversial tracts, by which he gained as high a reputation as was possessed by any American writer or clergyman of his time. His style is nervous and chaste; he displayed on every occasion critical and extensive learning, and singular independence of spirit. Most of his writings passed through several editions in England. The university of Aberdeen sent him a diploma of doctor of divinity. He entered frequently into politics, and was termed a whig of the first magnitude, or rather a principled republican.

The transaction in Doctor Mayhew's life which attracted most attention to him was his controversy with the reverend Mr Aphorpe, respecting the proceedings of the British society for the propagation of the gospel in foreign parts. He condemned their proceedings in a masterly pamphlet, and contended that the society were either deceived by the representations of the persons whom they employed, or governed more by a regard to Episcopacy than to charity. Several members of the society in America wrote replies, and even doctor Secker, archbishop of Canterbury, embarked in the dispute, in favour of the society. Doctor Mayhew rejoined with much cogency, vivacity, and wit.

MAYNE, JOHN, a Scottish poet, was a native of Dumfries, which place he left in early life for Glasgow, where he passed through a regular term of service with the celebrated printers, Messrs Foulis. He afterwards removed to London, and was, for a long series of years, the printer and a co-proprietor of the *Star* daily newspaper. He died on the 14th of March, 1836, at an advanced age. His principal poems are "Glasgow," a panegyric on that city, which has gone through several editions; and "The Siller Gun," a poem descriptive of an ancient festivity held at Dumfries, in which there is a shooting match for a small silver gun. This latter poem has also gone through several editions, the latest and best being that of London, 1836. Mr Mayne was also author of several beautiful lyrics, among which may be mentioned "Logan Braes" and "Helen of Kirkconnell Lea."

MAYPU, BATTLE OF, sealed the independence of Chile. It was fought April 5, 1817, Osorio commanding the royalists, and San Martin and Las Heras the patriots. Of the five thousand men commanded by Osorio, two thousand fell on the field, and two thousand five hundred were made prisoners; and the victory not only gave liberty to Chile, but enabled the Chileans to send a liberating expedition against Peru. See *Chile, Peru, San Martin*.—Stevenson's *South America*, vol. iii., p. 183.

MAZARIN, JULES, first minister of Louis XIV., and cardinal, was born of a noble family, at Piscini, in Abruzzo (according to Flassan, at Rome), in 1602. He studied law at the Spanish university of Alcalá de Henares, after leaving which, he entered the military service of the pope. He was a captain in a corps in the Valteline, when he was commissioned by general Torquato Conti to negotiate the truce at Rivalta, Sept. 16, 1630, between the French, Spanish, and imperial generals. The nuncio Bagni represented him as a distinguished man to Louis XIII. and cardinal Richelieu. When the war broke out respecting the succession of the duchy of Mantua, Mazarin, as papal minister, repaired to Louis XIII. at Lyons, and had a long conference with cardinal Richelieu. Having failed in his attempts to effect a peace, he returned to Italy. The French stationed before Casal were on the point of renewing hostilities, when Mazarin effected a truce of six weeks between them and the Spanish forces. On the expiration of the truce, he proposed to the French to consent to a peace, which they refused, except on the hardest conditions. He induced the Spanish general, however, to agree to them, and returned on horseback, at full speed, between the two armies, who were already engaged, waving his hat, and exclaiming "Peace! peace!" while the bullets were whizzing round his head. The action was suspended and peace established. By this negotiation, Mazarin gained the friendship of Richelieu, and, in 1641, Louis XIII. induced Urban VIII. to create him cardinal, immediately whereupon he was appointed a member of the council of state. Richelieu,

on his death-bed, recommended him a step to the king, that, in his will, Louis should be a member of the council of regency. After the death of Louis XIII., in 1643, queen Anne of Austria, regent, gave him the post of first minister. Mazarin was, at that time, generally reputed to be over the queen, and, from this instance, we have attempted to derive the origin of the maxim. He at first conducted with much success, notwithstanding this moderation, which was not long, a powerful party was formed against him, he was hated as a foreigner, and his proud, haughty pronouncement, were made subjects of ridicule. The people, moreover, groaned under the weight of taxes. These circumstances resulted in a revolution (See *Fronde*). The queen was obliged to fly to Germain with the king, and the minister, who a parliament regarded as a disturber of the public tranquillity. Spain took part in the commotion, the archduke, governor of the Netherlands, assembled troops. This obliged the queen, who was neither able nor desirous to wage war, to have recourse to a compromise with the parliament. The parliament retained the liberty of carrying on, of which it had been attempted to deprive it. The court kept its minister, whom parliament people had attempted to overthrow. But on the death of Condé, to whom the state was indebted for a reconciliation, showed little moderation to the party. Mazarin was ridiculed by him, he was treated with disdain, and the government would Mazarin, forced to be ungrateful, therefore presented the queen to give orders for the arrest of his son, his brother, the prince of Conti, and the duke of Longueville. But, in 1651, the parliament issued an edict, banishing Mazarin from the kingdom, and obliged the court to release the prince. He entered Paris as if in triumph, while the army fled, first to Liege and then to Cologne. He was from thence did this minister rule the court of France. In February, 1652, the king was arrested at age, recalled Mazarin, who, at that time, was to France "less like a minister than a ruler than like a ruler taking possession again of his state." He was accompanied by a small army of 1000 men, which he kept on foot, at his own expense, but with the public money, which he appropriated to his own use. On the first information of his return, Gaston d'Orleans, brother of Louis XIII., who had demanded the removal of the cardinal, arrived in Paris, and the parliament resolved to banish Mazarin, and set a price on his head. At the same time, the prince of Condé, a leader of the Spaniards, put himself in motion against the king, whose army was commanded by Turenne, who he left the Spaniards. Several indecisive battles were fought: the war ceased and was renewed at Sedan. The cardinal found it necessary again to flee to court, and repaired to Sedan, in 1652, where the king again took possession of Paris. To secure entire tranquillity, Louis had issued a proclamation in which he dismissed his minister, while he paid his services, and lamented his banishment. In quiet having returned, the king invited him to his father, the people like a master. The pope, the ambassadors, and the parliament, listened to him. The disturbances in the provinces were soon entirely quelled, and Condé, who had been in Spanish Netherlands, was declared guilty of treason. Mazarin now prosecuted the war against Spain with redoubled zeal, and, for that end, formed an alliance in 1656, with Cromwell. By this means, he secured for France an honourable peace. He signed himself, in 1659, with the Spanish minister Don

isle of Pheasants. This peace of the Pyrenees was followed by the marriage of the king with the infant. Both negotiations did great honour to Mazarin's policy. He was now more powerful than ever: he appeared with regal pomp, being regularly attended by a company of musketeer guards, in addition to his body-guard. The queen mother, on the contrary, lost her influence. During this time of peace, nothing was done by Mazarin for the administration of justice, for trade, naval power, and finances. Neither were his eight years of unlimited union marked by a single honourable institution. The *collège des quatre nations* was first established by his testament. The finances he administered as the steward of an involved master. He accumulated above 200,000,000 livres, in doing which, he made use of means unworthy of an honourable man.

According to Flassan, he had an income of 6,000 livres, and a property of twenty-two millions, equivalent to about double the sum of the money in time. This disquieted him, when he perceived it was approaching. Colbert therefore advised him to make the king a present of all his treasures, who would infallibly return them to him. The king accepted the present, and the cardinal had already begun to feel uneasy, when the king returned it to him after the lapse of three days. Mazarin died on the 9th, 1661. He left as his heir the marquis de La Ferté, who married his niece Hortensia Mancini, assumed the title of duke of Mazarin. He had, besides, a nephew, the duke of Nevers, and four nephews, who were married to the prince of Conti, the constable Colonna, the duke Mercœur, the duke of Bouillon. Charles II. (Stuart), in the time of his embarrassments, had sued for one of his daughters; his affairs having improved, Mazarin offered her to him, but now received a negative answer.

Mazarin and Richelieu have often been compared together: "Mazarin," says Hénault, "was as mild as Richelieu was vehement. One of his greatest talents was his accurate knowledge of men. His policy was characterized rather by finesse and forbearance than by force. The last he made it a rule to use only when other means were inadequate; and understanding gave him the courage which circumstances required. Bold at Casal, quiet and reserved at Cologne, enterprising, as when he accomplished the arrest of the princes, but insensible to the ridicule of his enemies and the boastings of his successes—he heard the murmurs of the people as he passed the shore he would have heard the ragings of a storm. In Richelieu there was something more comprehensive, less constrained; in Mazarin, more adroitness, more caution, and less passion. The one was hated; the other was desired; but both ruled the state." Mazarin flattered his enemies whom Richelieu would have ordered to be beheaded. His talents were not sufficiently proud to conceal his ambition, cupidity, timidity, jealousy, and meanness. His greatest merit was in diplomacy. For this he possessed all the necessary finesse, pliancy, and knowledge of human nature, and exhibited them in the peace of the Pyrenees and that of the Pyrenees. He added to France, and perhaps anticipated that he might some day give laws to Spain. The appearance of the cardinal was very prepossessing: with the finest countenance, he united a most agreeable tone in conversation, which won him to please. He allured men with his promises, but public treaties he con-

scientiously observed, in order to restore the influence of France, which Richelieu had neglected. Mazarin's letters respecting the negotiations of the peace of the Pyrenees have been several times printed. (See Aubrey's *Hist. du Card. Mazarin* (Amsterdam, 1751, 4 vols.); and *Parallèle du Card. de Richelieu et du Card. Mazarin*, by Richard (Amsterdam, 1716); also Retz's *Memoirs*.)

MAZEPPA, JOHN; hetman of the Cossacks, born in Podolia, of one of the many poor noble Polish families, who were obliged to seek for employments in the houses of the more wealthy. He was page to John Casimir, who was fond of pleasure, but at the same time, a lover of the arts and of literature. Mazeppa had therefore an opportunity of acquiring various useful accomplishments. An intrigue was the foundation of his future elevation. A Polish nobleman, having surprised Mazeppa with his wife, bound him, naked, in revenge, upon a wild horse, and committed him to his fate. The horse was from the Ukraine, and directed his course thither. Some poor peasants found him, half dead, and took care of him. He remained among them, and their warlike, roving life suited his disposition. He made himself conspicuous and beloved by his dexterity, bodily strength, and courage. His knowledge and sagacity procured him the posts of secretary, and adjutant to the hetman Samoilowitz, and, in 1687, he was elected in his place. He gained the confidence of Peter the Great, who loaded him with honours, and he was finally made prince of the Ukraine. His restless spirit now made him resolve to throw off the yoke of subordination. He joined with Charles XII., who had just given a king to Poland, and aimed, by his assistance, to withdraw himself from his allegiance to the czar, and to unite the Ukraine, under certain conditions, to the crown of Poland. These and other intrigues of Mazeppa against Peter were at last revealed to the latter by Kotchubey, general of the Cossacks, and Isra, governor of Pultawa. Peter put no confidence in these charges, but sent both the accusers to Mazeppa himself for punishment. He had the audacity to cause them to be executed. At length the eyes of Peter were opened: many partisans of Mazeppa were arrested and executed, and he himself was hung in effigy. He then went over, with a few adherents, to Charles XII., and took an active part in the unfortunate campaign in the Ukraine. After the defeat at Pultawa, Mazeppa fled to Bender, where he died in 1709. Lord Byron has made Mazeppa the hero of a poem.

MAZZOLA, or MAZZUOLI, FRANCESCO (called *Il Parmegiano*), one of the most distinguished painters of the Lombard school, born at Parma, in 1503, was the son of Filippo Mazzola, a painter, surnamed *Dall' Erbetto*. In his sixteenth year, he executed a Baptism of Christ, which displays his remarkable talents. Correggio's presence in Parma, in 1521, gave him an opportunity of becoming acquainted with the style of that master. In 1522, Mazzola painted, among other works, a Madonna, with the holy Children, a St Jerome, and a St Bernardin of Feltri, a celebrated oil painting, which is preserved in the monastery Della Nunsziata, but which has suffered from time and unskilful hands. In Rome, which the young artist visited in 1523, with the hope of attracting the notice of the pope Clement, the works of Raphael made a deep impression upon him, the influence of which is perceptible in his subsequent paintings, in which he aimed at a union of Correggio's grace with Raphael's expression. On the capture of Rome, in 1527, he suffered great losses, and, after that event, went to Bologna. Among his most celebrated paintings, executed in that city, are

his St Roch, the *Madonna della Rosa*, now at Dresden, and St Margaret. He soon returned to Parma, and there executed the Cupid making a Bow, and painted several works for the church Della Steccata. But his health was feeble, and he was imprisoned by the overseers of that building, who had advanced him the money for works which he neglected to finish. Being set at liberty, on condition of completing them, he fled to Casalmaggiore, where he died, in 1540. His works are not numerous, much of his time having been wasted in the search after the philosopher's stone. With a thorough knowledge of his art, Mazzucchi united great correctness of drawing. Algarotti and Mengs accuse him of being sometimes guilty of affectation in his attempts at grace, and Fiorillo objects to his too great use of curved lines, and to his involving the limbs. His fire, grace, correct drawing, boldness of touch, and ease of composition, are undeniable.

**MAZZUCHELLI**, GIAMMARIA, count, a nobleman of Brescia, who flourished in the early part of the eighteenth century, was the author of *Notizie istoriche e critiche intorno alla Vita, alle Invenzioni ed agli Scritti di Archimede Siracusano*; *La Vita di Pietro Aretino*. He also commenced a large and valuable biographical work, *Gli Scrittori d'Italia*, of which he only finished the two first letters of the alphabet, leaving a large collection of materials for the subsequent parts. Mazzucchi died in 1765. During his life, was published his *Museum Mazzucchellianum, seu Numismata Virorum Doctrina præstantium* (1761, folio.)

**MEACO**, or **KIO**; a city of Japan, in Niphon, 160 miles south-west Jeddo; lon. 153° 30' E.; lat. 35° 24' N. It was once the metropolis of the whole empire: it is still the ecclesiastical capital, the residence of the dairi, or spiritual sovereign, and is the centre of the literature and science of the empire, the imperial almanac being published here, and most of the books that circulate through Japan. It is situated near the middle of the south coast, in a fertile and spacious plain, surrounded by high mountains, for the most part covered with stately temples, monasteries, burying-places, and pleasure-houses. Three rivers unite their streams in the centre of the city, whence the place is divided into upper and lower towns. This twofold city appears to have been about twenty miles in length, and nine or ten in breadth, when in its full splendour, besides its large suburbs, and imperial palace, which is a city by itself, and divided from the rest. The streets are generally narrow, but straight. Population, near 500,000, exclusive of several thousands that compose the dairi's court, and the bonzes and nuns, who amount to above 52,000. Its temples are numerous, and some of them very magnificent. Meaco, though much decayed, in consequence of the civil wars, is the grand storehouse of the manufactures of Japan, and of foreign and home merchandise, and the principal seat of its commerce. See *Japan*.

**MEAD**, **RICHARD**, a celebrated English physician, was the son of a dissenting minister, and born at Stepney, near London, in 1673. He studied at the universities of Utrecht and Leyden, and became an intimate with his fellow-pupil Boerhaave. He afterwards travelled in Italy. He returned to England in 1696, and became very distinguished in his profession. In 1702, he published *Mechanical Account of Poisons*, which he, long after, re-published in an improved form. On the alarm occasioned by the plague at Marseilles, in 1719, he published a Discourse concerning Pestilential Contagion, which passed through many editions. He interested himself much in the introduction of inoculation for the small-pox and assisted in the preliminary experiments made on condemned criminals. In 1727,

he was appointed physician to King George I. Among his later writings are his *notae de hum. Solis ac Luna*, in *Corpora humanæ et horum orionidis* (1746); *De Morbis Bilio* 1749; and *Monita Medica* (1750). He died in 1754.

**MEADOW LARK** (*sturnus vulgaris*, La. *alauda magna*, Wils.) This well-known autumnal species is found in pasture fields and meadows, especially the latter, from which circumstance its name is derived. The meadow lark is seldom or never seen in woods, except where there is open ground, and, instead of underwood, the ground is covered with grass. After the building season is over, the birds collect in flocks. When they sing, they usually on the highest part of the tree or shrub, they pour forth a clear but melancholy note. Their nests are generally built in or below a tuft of grass, and are composed of dry grass. They are four or five in number, white, marked with green and several blotches of reddish-brown, passing to the larger end. Their food consists of various grub-worms, beetles, &c. The meadow lark is ten inches and a half in length. The throat, breast, and belly, are of a bright yellow, ornamented with an oblong crescent of a deep velvety black, as in the part of the throat.

**MEAL-TUB PLOT.** See *Populæ Plot*.

**MEAN**; the middle between two extremes. We say, the "mean motion of a planet," as we distance," &c., to signify a motion, or distance, as much exceeds the least motion or distance as it exceeded by the greatest. The mean, or average proportion, is the second of any three proportions in an arithmetical proportion, the mean is a half of the extremes; in a geometrical, the mean is the square root of the product of the extremes. The time is the mean or average of apparent time, Time, and Equation of Time.

**MEASLES** (*rubeola*, from *rubeo*, red) is a zymothematic disease, which appears to have been known to the ancient physicians. The first of its appearance in Europe is uncertain. It is communicated by the touch of infected persons or things. It is sometimes epidemic. Persons of all ages are subject to its attacks; but it is more common to children. It rarely affects an individual a second time. The symptoms are hoarseness, cough, and a small eruption about the fourth day, an eruption of small red spots (hence the name *measles*: German, *Masern*, and which, after three days, end in scabs. The fever is more or less of fever, attended with the same kind of affections. The measles, even when violent, are often of a putrid tendency, although such a disposition sometimes prevails. In the case of the measles, the best treatment is abstinence from food and the use of mild, mucilaginous, and cooling remedies. Bleeding is only proper in the inflammation of the brain. Some writers have treated the measles as an inflammation of the skin; but this is a mistake. It is of the disease, and not the disease itself.

**MEASURES.** The general principle of simplicity and uniformity are the result of progress in civilization, is strikingly exemplified in the measures of measures. Formerly, every province, and every place of importance, had its own measures, which proved a most perplexing hindrance to commercial intercourse. In modern times, attempts at uniformity have been made. To this most naturally suggested themselves, to declare the measures of one place or province to be universal measure (as has been done in Venice, where, by an act of parliament, in June 1836, the standard London measures and weights were declared to be the standards for weights and measures throughout the realm, and in France, &c.

the Berlin weights and measures were made the rule for the whole kingdom), or to establish new measures, founded upon unalterable principles, upon the laws of nature, as has been done in France. The latter is obviously the most rational and most just, because it is arbitrary to make a whole country follow the measures of the capital, or of a province, if these measures themselves have nothing in particular to recommend them. In the article *France*, division *Decimal Measures*, is given a brief account of that admirable system, the philosophical character of which brings it more and more into use among the learned of the European continent. (For more information respecting it, see Delambre's *Base du Système métrique*; *Géodésie*, by Puissant; and *Manuel des Poids et Mesures*, by Tarbe.) The British yard is terminated by oscillations of a pendulum at London. This is still an arbitrary standard, as the oscillations vary in different parallels of latitude. It is not, indeed, so arbitrary as the taking the foot of Louis XIV. for a measure, yet it is not so philosophical as the French. In the United States of America the British system of measures and weights has been followed.

Measures are either of

1. length;
2. surface;
3. solidity or capacity;
4. force, or gravity, or what is commonly called *weight*;
5. angles;
6. time;

their respective standards are, in Britain, a yard, an acre, or the  $\frac{1}{16}$  of an acre, a cubic yard, a gallon weight, degree, minute. The British act lately alluded to, for establishing uniform measures throughout the realm, and called the *act of uniformity*, took effect Jan. 1, 1826. The system thus established called the *imperial* system. Its rationale is as follows: Take a pendulum which will vibrate seconds at London, on a level of the sea, in a vacuum; divide all that part thereof which lies between the centre of suspension and the centre of oscillation into 393 equal parts; then will 10,000 of those parts be an imperial inch, twelve whereof make a foot, and 756 whereof make a yard. The standard yard is that distance between the centres of the two iron studs in the gold rod in the straight brass rod, in the custody of the clerk of the house of commons, whereon the words and figures 'Standard 1760' are engraved, which is declared to be the genuine standard of the measure of length called *yard*; and, as the expansibility of the metal would produce some variation in the length of the rod in different degrees of temperature, the act determines that the brass rod in question shall be of the temperature 62° (Fahrenheit). The measure is to be denominated the *imperial standard yard*, and to be the standard whereby all other measures of lineal division shall be computed. Thus the foot, the pole, the furlong, and the mile, shall bear the proportion to the imperial standard yard as have hitherto borne to the yard measure in actual use." The act also makes provision for the correction of the standard yard, in case of loss, action, or defacement, by a reference to an able natural standard, which is to be that prism which the yard bears to the length of a pendulum vibrating seconds of time in the latitude of London, in a vacuum at the level of the sea; which rod to be as thirty-six inches (the yard) to 393 (the pendulum); thus a sure means is established to supply the loss which might by possibility befall. Take a cube of one such inch of distilled water, at 62° of temperature, by Fahrenheit's thermometer; let this be weighed by any weight, and the weight be divided into 252458 equal parts,

then will 1000 of such parts be a troy grain; and 7000 of those grains will be a pound avoirdupois, the operation having been performed in air. Ten pounds, such as those mentioned, of distilled water, at 62° of temperature, will be a gallon, which gallon will contain 277 cubic inches, and  $\frac{1}{16}$  parts of another cubic inch. The standard pound is determined to be that standard pound troy weight, made in the year 1758, in the custody of the clerk of the house of commons; such weight is to be denominated the *imperial standard troy pound*, and is to be "the only standard measure of weight from which all other weights shall be derived, computed, and ascertained; and one twelfth part of the said troy pound is to be an ounce, and one twentieth part of such ounce a pennyweight, and one twenty-fourth part of such pennyweight a grain; so that 5760 such grains shall be a pound troy, and 7000 such grains a pound avoirdupois, and one sixteenth part of the said pound avoirdupois an ounce avoirdupois, and one sixteenth part of such ounce a drachm." If the standard pound shall be lost, destroyed, or defaced, the act directs that it shall be recovered by reference to the weight of a cubic inch of water; it having been ascertained that a cubic inch of distilled water, weighed in air by brass weights, at the temperature of 62° (Fahrenheit), and the barometer at thirty inches, is equal to 252.458 grains; and, as the standard troy pound contains 5760 such grains, it is therefore established that the original standard pound may be at any time recovered, by making another weight to bear the proportion just mentioned to a cubic inch of water. The standard gallon is determined by the act to be such measure as shall contain ten pounds avoirdupois of distilled water, weighed in air, at the temperature of 62° (Fahrenheit), and the barometer at thirty inches; and such measure is declared to be the *imperial standard gallon*, and the unit and only standard measure of capacity to be used, as well for wine, beer, ale, spirits, and all sorts of liquids, as for dry goods not measured by heaped measure; and all other measures are to be taken in parts or multiples of the said imperial standard gallon, the quart being the fourth part of such gallon, and the pint one eighth part, two such gallons making a peck, eight such gallons a bushel, and eight such bushels a quarter of corn, or other dry goods, not measured by heaped measure. The standard for heaped measure, for such things as are commonly sold by heaped measure, such as coal, culm, lime, fish, potatoes, fruit, &c., is to be "the aforesaid bushel, containing eighty pounds avoirdupois of water, as aforesaid, the same being made round with a plane and even bottom, and being nineteen and a half inches from outside to outside;" and goods thus sold by heaped measure are to be heaped "in the form of a cone, such cone to be of the height of at least six inches, the outside of the bushel to be the extremity of the base of such cone." Three such bushels are to be a sack, and twelve such sacks a chaldron.

*Stricken Measure.* The last-mentioned goods may be sold either by the heaped measure, or by the standard weight, as before-mentioned; but for every other kind of goods not usually sold by heaped measure, which may be sold or agreed for by measure, the same standard measure is to be used, but the goods are not to be heaped, but stricken with a round stick, or roller, straight, and of the same diameter from end to end. Copies and models of the standard of length, weight, and measure, are to be made and verified under the direction of the treasury, and every county to be supplied with them for reference whenever required. Existing weights and measures may be used, being marked so as to show the pro-

portion they have to the standard measures and weights; tables of equalization of the weights are to be made by the treasury; tables, also, for the customs and excise, by which the duties will be altered so as to make them equal to what they are at present, in consequence of the alterations in the weights and measures.

The measures now in use in Britain are as follows:—

#### 1. MEASURE OF LENGTH.

12 inches	= 1 foot
3 feet	= 1 yard
5½ yards	= 1 rod, or pole
40 poles	= 1 furlong
8 furlongs	= 1 mile
69½ miles	= 1 degree of a great circle of the earth.

An inch is the smallest lineal measure to which a name is given, but subdivisions are used for many purposes. Among mechanics, the inch is commonly divided into eighths. By the officers of the revenue, and by scientific persons, it is divided into tenths, hundredths, &c. Formerly, it was made to consist of twelve parts, called *lines*; but these have properly fallen into disuse.

#### PARTICULAR MEASURES OF LENGTH.

1 nail	= 2½ inches	} used for measuring cloth of all kinds.
1 quarter	= 4 nails	
1 yard	= 4 quarters	
1 ell	= 5 quarters	
1 hand	= 4 inches	} used for the height of horses.
1 fathom	= 6 feet, used in measuring depths.	
1 link	= { 792-100 inches	} used in land measure, to facilitate computation of the content, 10 square chains being equal to an acre.
1 chain	= 100 links	

#### 2. MEASURE OF SURFACE.

144 square inches	= 1 square foot
9 square feet	= 1 square yard
30¼ square yards	= 1 perch or rod
40 perches	= 1 rood
4 roods, or 160 perches	= 1 acre
640 acres	= 1 square mile

#### 3. MEASURES OF SOLIDITY AND CAPACITY.

##### DIVISION I.—SOLIDITY.

728 cubic inches	= 1 cubic foot
27 cubic feet	= 1 cubic yard

##### DIVISION II.

Imperial measure of capacity for all liquids, and for all dry goods, except such as are comprised in the third division:—

4 gills	= 1 pint	= 34½ cubic in., nearly
2 pints	= 1 quart	= 69 " " "
4 quarts	= 1 gallon	= 277½ " " "
2 gallons	= 1 peck	= 354 " " "
8 gallons	= 1 bushel	= 2218½ " " "
8 bushels	= 1 quarter	= 104½ cubic feet, nearly
5 qrs.	= 1 load	= 51½ " " "

The four last denominations are used for dry goods only. For liquids, several denominations have been heretofore adopted, viz, for beer, the firkin, of nine gallons, the kilderkin, of eighteen, the barrel, of thirty-six, the hogshead, of fifty-four, and the butt, of 108 gallons. These will probably continue to be used in practice. For wine and spirits, there are the anker, runlet, tierce, hogshead, puncheon, pipe, butt, and tun; but these may be considered rather as the names of the casks in which such commodities are imported, than as expressing any definite number of gallons. It is the practice to gauge all such vessels, and to charge them according to their actual content.

##### DIVISION III.

Imperial measure of capacity, for coals, culm, lime,

fish, potatoes, fruit, and other goods commonly sold by heaped measure:—

2 gallons	= 1 peck	= 7½ cubic inches, nearly
6 gallons	= 1 bushel	= 2218½ " " "
3 bushels	= 1 sack	= 6655½ " " "
12 sacks	= 1 chaldron	= 252 " " "

For measures of weights, see *Weights*.

#### A. ANGULAR MEASURE.

##### OR, DIVISIONS OF THE CIRCLE.

60 seconds	= 1 minute
60 minutes	= 1 degree
30 degrees	= 1 sign
90 degrees	= 1 quadrant
360 degrees, or 12 signs	= 1 circumference

Formerly, the subdivisions were called *minutes* and *seconds*; thus the second was divided into sixths, the third into sixty-fourths, &c. At present, the second is more generally divided decimally into tenths, hundredths, &c. The degree is frequently divided.

#### 6. MEASURE OF TIME.

60 seconds	= 1 minute
60 minutes	= 1 hour
24 hours	= 1 day
7 days	= 1 week
28 days	= 1 lunar month
28, 29, 30, or 31 days	= 1 calendar month
12 calendar months	= 1 year
365 days	= 1 common year
366 days	= 1 leap year.

In 400 years, ninety-seven are leap years, and 303 common. The second of time is subdivided into parts of angular measure.

We shall now give a table of *linear measures* of different countries, exhibiting the number of each answering to 100 English miles; also the length of a single measure of each sort in English feet —

Country	Measure	Length in English feet

1 kilogramme	2.68027 pounds troy
	2.20548 pounds avoirdupois.

For more particular information on the subject of weights, see the article *Weights*.

**MEATH;** called also East Meath, in contradistinction to West Meath, a maritime county of Ireland, in the province of Leinster, bounded on the north by the counties of Cavan and Louth; on the east by the Irish sea; on the west by the county of West Meath; and by Dublin and Kildare counties on the south. It is the most fertile county in Ireland, the soil being a deep, rich loam, resting upon limestone, or limestone gravel. Bog is of rare occurrence, in consequence of which there is a scanty supply of fuel. The Boyne river rises in the county Kildare, but the most valuable portion of its course lies within this county; it falls into the sea below the town of Drogheda. The Nannywater has its source in the centre of the county, and after a short passage, empties itself into the sea below Nineh. The Blackwater flows out of Lough Ramor, and falls into the Boyne, at Navan. The breeds of cattle in this county are excellent, and agriculture is in a state of great forwardness. The chief towns are Trim, where the assizes are held, Navan, Kells, Slane, Duleek, Oldcastle, Dunboyne, Crossakeel, Athboy, Summerville, Longwood, Dunshaughlin, and Ratoath. The only manufactures belonging to the county are coarse woollens and stockings for domestic use, tickens, dowlas, sackcloth, and some fine linens. Timber, butter, and cheese are exported or conveyed to the metropolis, but not in any great quantities. Inland navigation might readily be extended in a region naturally so level, and the abundant produce of the soil would quickly repay the expense of its construction, by the transport of produce to the sea-side, and back carriage of fuel. Population in 1821, 159,183.

**MECENAS.** See *Mæcenas*.

**MECCA,** or **MEKKA;** a city of Arabia, capital of Hedsjas, about fifty miles from Jidda, its port, on the Red sea, 180 south of Medina; lat. 21° 18' N.; lon. 40° 15' E.; population, formerly, 100,000; according to Burckhardt, who visited it in the character of a devout Mussulman, now about 30,000, with accommodations for as many pilgrims. It was known to the Greeks by the name of *Macoraba*, and is called, by the Mussulmans, *Omm-Alcora*, or *Mother of Cities*, because it was the birth-place of Mohammed. It is situated in a dry, barren and rocky country, in a narrow valley, enclosed by mountains. The water is brackish, and the pastures distant, and every thing unfavourable for the support of a large population. It is two miles long, and one broad; the streets regular and handsome, being sanded, level

and convenient; the houses of stone, of three or four stories, built in the Persian or Indian, rather than the Turkish style, having neat fronts, ornamented externally with paintings and mouldings. Many quarters are now abandoned to ruins, and of the houses that remain, two-thirds are unoccupied. Mecca is a city of the greatest celebrity among the Mohammedans, and contains the three holiest things in the Mohammedan world,—the well *Zemzem*, the *Caaba* (or house of God), and the Black Stone. *Zemzem* is believed, by the followers of Mohammed, to be the identical spring which gushed forth in the wilderness for the relief of Hagar and Ishmael; and marvellous efficacy is ascribed to its waters, in giving health to the sick, imparting strength of memory, and purifying from the effects of sin. The *Caaba*, or *Kaaba*, is of great antiquity. (See *Kaaba*.) The Black Stone, the principal wonder of the place, is said to have been brought by the angel Gabriel, and to have been originally of a dazzling whiteness. The grand ceremony through which the pilgrims pass is that of going seven times round the *Kaaba*, kissing each time the sacred stone. It is generally supposed to be a meteoric stone. Forty eunuchs are at present maintained there, by the revenues of the temple and the gifts of the pious. Mecca is entirely supported by pilgrims from every part of the Mohammedan world; but the number is now much less than formerly, owing partly to the decay of religious zeal, and the decline of power and wealth of the Mohammedan states; and partly, also, to Mecca's being subject to the incursions of the Wahabees. The commerce, now greatly diminished, consists chiefly in the productions and manufactures of India. Notwithstanding the sacred character of the city, it has now little reputation for learning, and Burckhardt found no book shops in the place. No Christian is allowed to enter Mecca, and its territory is regarded as sacred to a certain distance round, which is indicated by marks set up. The male Meckaways are all tattooed at the age of forty days, to prove their origin in the holy city. Mecca was taken by the Wahabees, in 1804, but soon after recovered by the sheriff Galib. It was again captured in 1807, and again delivered by Mohammed Ali, pacha of Egypt, in 1818. For the ceremony which takes place on the arrival of the pilgrims, see *Arafat*.

MECHAIN, PIERRE FRANÇOIS ANDRÉ, an astronomer, born Aug. 16, 1744, at Laon, went to Paris in 1772, and was there favourably received by Lalande. His discovery and calculation of two comets, in 1781, rendered him generally known; and he was among the first to delineate the probable orbit of the comet of 1661 was awarded to him; and, when it appeared again, eight years afterwards, his calculations were proved to be correct. In the course of eighteen years, Méchain discovered fourteen comets, the orbits of which he calculated. No important celestial phenomenon escaped his notice, and his observations were recorded in the *Connaissance des Temps*, which was edited by him from 1788 to 1794. When the constituent assembly ordered the preparation of a new system of measures, based on the meridian of the earth, Méchain was one of the astronomers appointed to measure the arc of the meridian between Dunkirk and Barcelona. He received, for his part of this difficult operation, the portion of country lying between Barcelona and Rhodéz, where no measurements had previously been made. Political causes also contributed to embarrass his progress; and the Spanish government not only interrupted his triangulation, but detained him for some time prisoner. He was enabled to resume his labours in 1803, with the intention of extending them to the

Balearic isles. He died at Valence, in 1804, of a yellow fever, a victim of his exertions in the cause of science. Besides his treatises on the *Connaissance des Temps*, and his memoirs on the subject comets, we find, also, the results of his observations on the *Base du Système métrique* &c. &c. (Paris, 1806—10, 3 vols.).

MECHANICS (from *μηχανή*, a machine or contrivance) is the science which treats of the laws of motion. (See *Force*.) It had, probably, a large share in the construction of machines, and is a most important branch of it, practical mechanics, however, being the construction and effects. Forces, acting upon a body, may either produce rest or motion. In the first case, they are treated of under statics, or the science under dynamics (q. v.). Hydrostatics (q. v.) is hydraulics (q. v.) respectively treat of fluids at rest or in motion.

When a body is acted on by two or more forces, which counteract each other, so that no motion is produced, the body and the forces are said to be in a state of *equilibrium*. The conditions of equilibrium form the subject of statics. 1. A body acted upon by two equal and opposite forces will remain at rest. In this case, either of the two opposite forces may be made up of several parallel forces. It is then said to be the *resultant* of those forces. 2. If two forces act, with reference to each other, obliquely upon a body, they may be counteracted by a third force, also their *resultant*. If the two forces be represented, in direction and intensity, by two adjacent sides of a parallelogram, their resultant can be represented, in direction and intensity, by the diagonal. This is called the *parallelogram of forces*. Thus, if a body, A, be acted upon by two forces, one of which would cause it to move from A to B in any given time, and the other would cause it to move from A to C in the same time: then if two

forces act upon the body at one point, it will remain in neither of the lines AB, AC, but in the line AD, which is the diagonal of the parallelogram of which the two lines AB and AC are containing sides; and by the action of the two forces, the body will be moved at D, at the end of the time that it would have been found at B or C, by the action of either of the forces singly. If the two forces which urge the body, but produce a uniform motion, the resulting motion will be in a straight line; but if one of them act by impulse, which would produce a uniform motion, and the other act constantly so as to produce an accelerated motion, the resulting motion will be in a curve. Thus, if the ball of a cannon were sent in a horizontal direction, it would never deviate from the straight line unless acted on by some external force. The force of gravity acts on the ball constantly, so as to draw it to the earth, by an uniform accelerated motion; and the result is, that the ball will move in a curve, and this curve may be easily shown to be that of the parabola. The resistance of the air being taken into account together with these circumstances, constitute the bases of the science of gunnery. 3. If several forces, acting at one point on a body, can be represented, in direction and intensity, by several sides of a polygon, they may be counteracted by a single force, acting in a direction and with an intensity represented by the side which would be necessary to complete the polygon.

All the changes which come under our observation, are the consequence of motions produced by the action of a few great elementary laws. The consideration of the motions which take place and

the particles only of one or of several bodies, comes within the department of chemistry. Those motions which affect masses are the appropriate subject of the second part of mechanics.

All motions are found to take place in conformity with a few universal principles. Deduced from observation, and confirmed by experiment, these principles have often been placed at the beginning of treatises on mechanics, under the name of the *laws of motion*. Not expressed in this manner, the truths they declare, making an essential part of the principles of science, are necessarily introduced under some other form. Their comprehensiveness suits them to their purpose, and they are here quoted in the language of Newton.

I. "Every body perseveres in its state of rest, or of uniform motion in a right line, unless it is compelled to change that state by forces impressed thereon." This is called the law of *inertia*, and expresses the entire indifferency of matter to motion or rest. The proposition that a body will never begin to move of itself needs no proof. It is a conclusion of universal observation. Wherever we observe motion, we conclude that there is a power in action to produce it. The other part of the law, that motion is, in its nature, as permanent as rest, and that it is in a right line, is far from being self-evident, or even an obvious truth. Limited observation would lead to the conclusion that all matter has a tendency to rest, and such has long been, and still is, a common error. The same limited observation led some of the ancient astronomers to imagine that all bodies, when forced into a state of motion, naturally moved in curved lines. There is, however, abundant proof of the permanence of motion; and if friction and the resistance of the air, the two most universal obstacles to the motion of bodies near the surface of the earth, could be entirely removed, instances of permanent motion would be still more numerous. In proportion as they are removed, or as bodies are beyond their influence, we observe a tendency in motions to become more and more permanent. A marble, rolled over the grass, soon stops; on a carpet, it moves longer; on a floor, still longer; and on smooth, level ice, where the wind is not unfavourable, it continues long in motion. In a vacuum, where the resistance of air is not felt, two windmills, whose pivots are equal friction, and which are set in motion by equal forces, continue to move equally long, whatever be the position of their vanes. In the air, the motion whose vanes cut the air, will move much longer than the one whose vanes are opposed to it. A pendulum in a vacuum, having only the stiffness of the cord by which it is suspended to overcome, will vibrate for a whole day. A spinning top, in the same situation, retarded only by the friction of its feet, continues spinning for hours. In all these cases, the continuance of the motion is proportioned to the diminution of friction and resistance. We hardly avoid the conclusion, that a body once set in motion, would, if left to itself, continue to move with undiminished velocity. The heavenly bodies, moving in free space, subject to no opposing influence, keep on in their path with a velocity which has remained unabated since first they were launched from the hand of the Creator. They move not, indeed, in straight lines, but in circles, as they are drawn towards each other, and towards a centre, by the universal force of gravity. (*Gravity*.) This force does not diminish their velocity, but deflects them continually from the right in which they tend to move. If this central force were suspended, they would all shoot forward in straight space, and the harmony of their motions would

cease. Some force similar to this central tendency is always in action, whenever we see bodies move in curve lines. The stone, to which a boy gives accumulated force by whirling it round in a sling, is, for a time, kept in its circle by the central force represented by the string; when let loose, it darts forward in the air, turning not to the right or left, until the atmospherical resistance destroys its motion, or the force of gravity bends it to the ground. A full tumbler of water, placed in a sling, and made to vibrate with gradually increasing oscillations, may, at last, be made to revolve in a circle about the hand, each drop tending to move out in a straight line from the centre, and therefore remaining safe in the tumbler, whose bottom is always farthest from the centre. In a corn mill, the grain is poured gradually into a hole in the centre of the upper mill-stone. The weight of the stone pulverizes the corn, while its circular motion throws it out, as fast as it is ground, into a cavity around the stone. When a vessel, partly full of water, is suspended by a cord, and made to turn rapidly round, the water, in its tendency to move out in a straight line, recedes from the centre, and is gradually heaped up against the sides of the vessel, sometimes even leaving a portion of the bottom dry. Water, moving rapidly in the stream of a river, or the tide of the sea forced violently through a narrow passage between opposite rocks, not unfrequently forms a whirlpool on the same principle. Bent out of its course by a projecting ledge, it departs, as if reluctantly, from a straight line, and heaps itself up towards the circumference of the circle in which it is compelled to move. To this cause, too, it is owing, however little we might expect such a consequence, that a river, passing through an alluvial soil, and once turned from its onward channel, continues to pursue a meandering course to the sea. Driven, by any cause, to one side, it strikes the bank with all its violence, is repelled, and rebounds with the same force to the opposite side, continually wearing the two banks, and leaving a larger space on the inner side of the bends. The force with which a body constrained to move in a circle, tends to go off in a straight line, is called the *centrifugal force*. Advantage is taken of it in many processes of the arts, and in all circular motions of machinery. The clay of the potter is placed on the centre of a swiftly revolving table, and while his hand shapes it, the centrifugal force causes it to assume the desired dimensions. A globe, or sheet of molten glass, is in a similar manner made to expand itself. The legs of a pair of tongs, suspended by a cord, and made to revolve by its twisting or untwisting, will diverge in proportion to the velocity of the revolution. The *steam governor* of Watt is constructed and acts on this principle. Weights are attached to two rods, to which circular motion is communicated by the machinery which is to be governed. If the motion be so rapid as to cause these rods to diverge from each other beyond a certain angle, they act upon a valve which partly closes, and diminishes the supply of steam. With a slower motion, the rods collapse, and the valve is opened. In consequence of the centrifugal force occasioned by the rotation of the earth, the weight of bodies at the equator is diminished the 289th part. If the earth revolved on its axis in 84 minutes, the loose parts near the equator would be projected from the surface.

Another consequence or particular of the law of inertia, is, that motion is communicated gradually. A force which communicates a certain quantity of motion in one second, will impart double the quantity in two seconds. A ship does not yield at once to

the impulse of the wind, when the sails are set; its motion increases as new portions are successively imparted. A horse does not start at once with a carriage into his utmost speed; his force is at first spent in giving motion to the inert mass. Afterwards, with far less exertion, he keeps up the motion, being required to supply that portion only which is destroyed by the obstacles of the road. The motion communicated to a body, if not destroyed by some force, is accumulated. Thus a nail is driven in by all the force of the hand, accumulated through the whole time of the descent of the hammer. The knowledge of this fact gives the means of increasing the effective force of a moving power in a very great degree. A force of fifty pounds communicated every second to a loaded wheel, will, if not diminished by friction, or other cause of waste, enable it to overcome a resistance of 500 pounds once in every ten seconds. Such a wheel is called a *fly wheel*. (q. v.)

II. "The alteration of motion is ever proportioned to the motive force impressed, and is made in the direction of the right line in which that force is impressed." This is only a statement, that a double force generates a double motion; that motion cannot increase or diminish itself, nor turn to the right or left, without cause. In consequence of this, two or more forces acting at once on a body in different directions, cause it to take a direction different from that of either force, and, if one of them is a variable or constantly acting force, to move in a curve line. This is called the *composition of forces*; the single motion impressed upon the body being considered as composed of the several motions which the forces acting separately would have produced. A boat rowed, at the rate of three miles an hour, directly from the bank of a river which runs at the rate of two miles an hour, is acted on at once by the force of the rowers and that of the current, and will be found, at the end of an hour, three miles from the bank, and two miles below the point from which it started, having moved in a diagonal line between the directions of the two forces. (See *Forces*.) The *resolution* of forces is the reverse of this. A single force is considered as resolved into two or more others. A ship, sailing on a side wind, is sent forward by a part only of its force. The other part has no effect, or that only of driving her out of her course.

III. "To every action there is always opposed an equal reaction; or the mutual actions of two bodies on each other are equal and in opposite directions." If you press a stone with your finger, the finger is equally pressed upon by the stone. A horse drawing a load, is drawn backward by its whole weight, and if he succeed in moving it, it can only be with a velocity proportioned to the excess of his strength over the reaction of the load. A magnet and piece of iron attract each other equally; and if, when in the sphere of mutual attraction, one is fixed and the other free, whichever is free will be drawn to the other. Two equal boats, drawn towards each other by a rope, act in the same manner; if both are free, they meet in the middle. When a gun is discharged, it recoils with a force equal to that with which the ball is propelled, but with a velocity as much less as its weight is greater. If, in the side of a vessel of water, hanging perpendicularly by a cord, a hole be opened, the vessel will be pushed back from the perpendicular by the reaction of the jet of water, and will remain so while it flows. A consequence of this law is, that the earth is attracted by each body on its surface as much as it attracts, and that when a stone falls towards the earth, the earth rises to meet it.

The force with which a body acts is measured by its velocity and mass conjointly, and is called a *momentum*. Thus, if two balls, of one and two pounds weight, respectively, be moving with the same velocity, the larger has twice as much of the smaller, since each pound of it acts with the same velocity as the ball of a one pound. A body of small weight may therefore be made to produce the same mechanical effect as a large one by sufficiently increasing its velocity. The arsenal of modern times is not less effectual in destruction than the massy battering ram of the ancients.

The forces which may be employed to give motion to machines are called *mechanical powers* or *first movers*. They are water, wind, steam, gun powder, and the strength of man and other animals. They may be indirectly referred to three independent sources—gravity, heat, and mass. See these several articles.

*Gravity*. A body falling from a state of rest descends sixteen feet, nearly (16-085), in one second, but, as all the motion which is communicated by gravitation remains in it, and it receives no more of motion every indefinitely small portion of time second, it is moving more rapidly at the end of the second than at any previous time, and with its motion alone, if it continued uniform, would descend through twice 16, or 32 feet, in the next second; during this next second, as much motion is communicated as during the first, and consequently it descends through three times 16, or 48 feet, in the next second. The whole of this accumulated motion would, alone, carry it through four times 16, or 64 feet, in the third second, and the continued action of gravitation carries it once 16; so that it actually descends five times 16, or 80 feet, during the third second. In the fourth second, it would, in the same manner, descend seven times 16 feet; in the fifth, nine times 16, &c., the series of odd numbers expressing the distances passed through in the successive seconds. By adding these numbers, we find that, at the end of one second the body will have descended four times 16 feet; at the end of the third, nine times 16; at the end of the fourth, 16 times 16, &c.; the whole distance fallen through at the end of any number of seconds being found by multiplying the square of the number of 16 feet. Such is the simple and remarkable law of the descent of bodies by the uniformly accelerated velocity produced by gravitation. The velocity acquired in one second is sufficient, if continued, to carry a body through twice 16 feet; that acquired in two seconds would carry it four times 16 feet; that acquired in three seconds, through six times 16 feet, &c.; the velocities possessed at the end of any number of seconds being represented by even numbers multiplied by 16 feet. The following table exhibits, 1. the space fallen through in the successive seconds; 2. the whole space fallen through at the end of a number of seconds; and, 3. the velocity:

Time,	1	2	3	4	5	6	7	8	9	10
1. Successive Spaces,	16	32	48	64	80	96	112	128	144	160
2. Total Spaces,	16	64	144	256	400	576	784	1024	1296	1600
3. Final Velocity,	16	32	48	64	80	96	112	128	144	160

By means of this table, a traveller descending the summit of a cliff, might ascertain to how plain or torrent below, with considerable accuracy, by letting fall a stone, and observing its fall. It would only be necessary to add for the resistance of the air, which, however, is not very great. (See *Proportions*.) The cause which communicates motion to a body would gradually destroy that of a body. A ball projected upwards with the usual feet per second, would, therefore, not a formally retarded motion to the height of

body must fall to acquire that velocity. The phenomena of accelerated and retarded motion are beautifully exhibited by Atwood's machine for that purpose.

In moving down an inclined plane, a solid body is urged by a portion of the force of gravitation, which is continually smaller as the plane is nearer to horizontal position. (See *Inclined Plane*.) When the plane is horizontal, the whole weight of the body is sustained by the plane. The velocity acquired by bodies moving down any plane, is the same as they would have acquired by falling freely from the perpendicular height of the plane. If a body be allowed to fall down the inclined plane C A, the velocity it acquires when it arrives at B, having moved from C, will be the same as it would have acquired, had it fallen freely from the perpendicular line C B, from C.

It is necessary, in the construction of machines, cranes, buildings, bridges, and ships, and in many other cases, to ascertain exactly the centre of gravity of the whole and of each part; since, if the centre of gravity, in any body or system of bodies, be supported, the whole must remain firm, and in a state of rest, in every possible position. (See *Gravity, Centre of*.) The various problems arising from this necessity have been solved with great accuracy, and on fixed principles. In all regular solids, of uniform density, either bounded by straight or curve lines, the line of gravity coincides with the centre of magnitude. If a body of any shape be suspended, freely, from any one point of its surface, the straight line ending from that point to the centre of the earth will pass through the centre of gravity. This line is called the *line of direction*. The centre of gravity, therefore, sometimes be found practically, by suspending a body successively from two of its points.

Observing the point where the lines of direction intersect each other. The centre of gravity of a triangle is one third the distance from the middle of the base to the vertex; that of a cone and of a pyramid, one fourth the same distance. Stability, in every body, depends upon the position of the centre of gravity in reference to the base. The nearer it is to the base, and the farther the line of direction falls from the part of the perimeter of the base, the greater is stability. The sphere rests equally in every position, because the centre of gravity is at the same distance from every part of the surface. It is unstable in every position, as it rests on a single point of the surface; and it yields to the smallest force, as the line of gravity does not rise when the sphere revolves.

In order that the pyramid or cone may be turned, the centre of gravity must rise almost perpendicularly, and move for a great distance before it ceases to tend to fall back to its place. Hence the stability, and hence the propriety of giving to obelisks, monuments, and other buildings of great weight, a pyramidal or conical figure. Those cars are most secure which are hung low, and have their wheels far apart. Whatever raises the centre of gravity or narrows the base, allows the line of direction to move more easily to pass without it, and diminishes its stability. Hence we see the imprudence of rising cranes or boats which are in danger of being upset, and hence the danger of high loads on narrow roads, where the roads are not perfectly level.

The force of gravity is not often employed directly as a mechanical agent, or prime mover. Those most commonly employed to give motion to machinery are the steam, wind, heat, and the strength of animals. Water works by its weight and by the velocity which it acquires in falling, in consequence of its weight. Wind works by its volume or mass and its velocity. Both agents are variable, and both act in a straight line. Heat, as given out by combustible materials,

produces steam, or gas, or gives motion to air by making it lighter, and thus causing it to rise. The steam, or gas, when formed, has a tendency to expand itself, presses against the sides of the vessel which contains it, and endeavours to escape with a force proportioned to the heat and pressure to which it was exposed. When allowed to escape in only one direction, it necessarily generates motion in a straight line. Steam, as usually employed, generates motion, which is alternately in one direction and the opposite. The strength of animals is commonly made to act upon some centre of resistance, by drawing, pushing, or pressing, and produces variable motions, naturally in a straight line, but often in a curve. The motions or pressures produced by all these agents are capable of being compared with those produced by weights. They might all be referred to a common standard, the unit of which should be the force required to raise a given weight a certain number of feet in a given time.

The mechanical agents are employed to measure time, to move ships and carriages, to raise weights, to shape wood and work metals, to overcome the resistance of air, of water, and of cohesion, to draw out and form materials, and to combine them into new fabrics. To apply them to accomplish any one of these effects requires the intervention of some mechanical contrivance. Such a mechanical contrivance, whether consisting of a few or of many parts, is called a *machine*. A machine has been defined, "a system of bodies, fixed or movable, so connected together that a movement impressed on one of them shall be transmitted to the others." The object of a machine is often vaguely supposed to be to produce or augment power. It can never have this effect. The resistance of the fixed and the friction of the movable parts will always consume a part of the power of the prime mover. The real object of every machine is to increase or diminish the velocity of the moving force, to change its direction, to accumulate its action and expend it at a single effort, to distribute the force among a great number of small resistances, or to divide the force of a resistance so that it may be overcome by a series of actions, or by the continued action of the moving power. A machine may combine the action of several movers, and employ one to regulate the others, so that the final effect shall be perfectly uniform. The pendulum, the governor, and the fly-wheel are employed for this purpose.

By the *mechanical powers*, are signified the simple machines, to which all machines, however complex, may be referred. They are essentially three in number, but usually considered seven: 1. The *lever*, the *wheel and axis*; 2. the *inclined plane*, the *screw*, the *wedge*; 3. the *rope* and the *pulley*.

The *Lever* is a bar, resting on a support, called a *fulcrum*, or prop, for the purpose of raising, by a power applied to one end, a weight at the other. An iron crow used by workmen to raise heavy stones, affords a good instance of a lever. The stone is the weight; the block on which the crow rests is the fulcrum; the strength of the men, the power. To gain any advantage by its use, the fulcrum must be nearer to the weight than to the power. If the distance from the power to the fulcrum be five times greater than the distance from the weight to the fulcrum, a force of one pound in the power will balance a pressure of five pounds in the weight. But in this case the end of the long arm of the lever will, as it turns on the prop, pass through a space five times greater than that of the short arm. By such a lever a man could raise 1000 pounds with the same exertion as would be required to raise 200 without a lever, but he could raise it only a fifth part so high in the same time. What he would gain therefore in power,

would be lost in time. In theory, a lever is considered inflexible and without weight. There is an equilibrium when the power and weight are inversely as their distances from the fulcrum.—*Leverage* is the distance of the power from the fulcrum. The *mechanical advantage* or *purchase* is proportional to this distance, compared with that of the weight from the fulcrum. Levers are of three kinds, according to the relative position of the power, the prop, and the weight. In the first, the prop is between the power and the weight. To it belong scissors, snuffers, pincers (in which the pivot or joint is the prop,) the handspike, the brake of a pump, &c. A hammer with its claw, is a bent lever of this kind. In the second, the weight lies between the fulcrum and the power. This includes the oar, where the boat is the weight to be moved; the door, of which the hinge is the fulcrum; the wheelbarrow, nut-crackers, bellows, and the knife attached at one end, used to chip dyewoods. In a lever of the third kind, the resistance is at one end and the fulcrum at the other. To this belong the pitchfork and spade, the one hand being the power, and the other the fulcrum, sheep-shears, with a bow at one end, giving a greater facility of motion. The bones of animals are levers of this kind, and are moved by muscles so attached as to give rapidity of motion at the expense of power. The ox-yoke is of this kind; the neck of each ox being the fulcrum with reference to the exertion of the other. The stronger of two oxen must have the short arm of the lever, that they may be able to pull together. So a load supported on a pole and borne by two men, must divide the pole unequally, if either is to be favoured.—Let *W* represent the weight, *P* the power, and *F* the Fulcrum, this diagram will show their relative positions in the three different kinds of levers.

The *Wheel and Axle* is a kind of lever, so contrived as to have a continued motion about its fulcrum, or centre of motion, where the power acts at the circumference of the wheel, whose radius may be reckoned one arm of the lever, the length of the other arm being the radius of the axle, on which the weight acts. If the power acts at the end of a handspike fixed in the rim of the wheel, then this increases the leverage of the power, by the length of the handspike. The wheel and axle consists of a wheel having a cylindric axis passing through its centre. The power is applied to the circumference of the wheel, and the weight to the circumference of the axle. In the wheel and axle, an equilibrium takes place when the power multiplied by the radius of the wheel, is equal to the weight multiplied by the radius of the axle; or  $P : W :: CA : CB$ . For the wheel and axle being nothing else but a lever so contrived as to have a continued motion about its fulcrum *C*, the arms of which may be represented by *AC* and *BC*, therefore, by the property of the lever,  $P : W :: CA : CB$ . If the power does not act at right angles to *CB*, but obliquely, draw *CD* perpendicular to the direction of the power, then, by the property of the lever,  $P : W :: CA : CD$ . It will be easily seen, that if two wheels fastened together and turning

round the same centre, be so joined, that when they turn round they will coil either continuous strings to which weights are suspended, or those wheels being larger than the other, the larger wheel will coil up a greater length of string than the smaller one will do in the same time and the will depend either on the radii or circumferences of the two wheels. The velocity of the weight will be in proportion to the length of string coiled in a given time; therefore, the velocity of the weight will be greater as the wheel is larger. Now, as it was seen that a small weight required a great velocity to balance a large weight with a small velocity, we infer, that the rules given for levers will apply to the wheel and axle; since the velocity of a weight on a lever depends upon its distance from the fulcrum.

The efficacy of the wheel and axle may be increased either by enlarging the diameter of the wheel, or diminishing that of the cylinder. The *Chinese system* furnishes the means, without resorting to the alternative, of increasing the mechanical effect in any degree. It consists of two cylinders of unequal diameters, turning upon the same axis, a weight being supported by the loop of a very in cord, one end of which unwraps from the small cylinder, while the other end is coiled upon the larger. The elevation of the weight by each revolution is equal to half the difference of the two circumferences, the mechanical advantage depending upon the smallness of this difference. In the ship's *capstan*, movable bars or handspikes are substituted in a wheel. The *capstan* is a vertical wheel and axle used on board ships to weigh the anchor.—The wheel and axle may turn on different centres, and as their circumferences connected and made to act on each other, by means of a strap or belt, or by a set of cogs or teeth. This arrangement is called a *train and pinion*. See *Wheel-Work*.

Wheels acting on each other by teeth or bands may be easily calculated in the same way as a wheel and axle. Thus, if a wheel which has 10 teeth, drives another of ten teeth, it is evident, that as the larger wheel has three times as many teeth as the smaller, the smaller wheel will revolve three times for once that the larger one does round; so that the velocities of the wheels will be inversely as their number of teeth. In like manner if the larger wheel drives the smaller one by a band, but by a band, their revolutions will be as their circumferences.

The larger wheel is usually called the *driver*, or *leader*, and the smaller one a *driven pinion*, *driven wheel*, or *follower*. When there is a number of wheels *A, B, C, D, E*, acting on the respective pinions, *a, b, c, d, e*, as then the effect of the whole may be found thus: if the letters which represent the wheels and pinions be understood to signify the number of each,

$$\frac{\text{power} \times A \times B \times C \times D \times E}{a \times b \times c \times d \times e} = \text{weight}$$

If the velocity of the first wheel be used instead of the power applied, then this rule will give the resulting velocity instead of the weight. Thus,

If the numbers of the teeth of the wheels are 9, 10, 12, and those of the pinions *a, b, c, d, e* be the power applied be 14 lbs., we have

$$\frac{14 \times 9 \times 6 \times 9 \times 10 \times 12}{6 \times 6 \times 6 \times 6 \times 6} = 100 \text{ lbs.}$$

And, by the remark under the rule, if the first make 14 revolutions in the minute, the speed of the last will be 105 in the same time. The same rule will apply to the case where the wheels act on each other by ropes or straps, if the circumferences of the wheels and pinions are used for the number of teeth.

**Inclined Plane.**—When a drayman lays a plank from the street to the higher level of the floor of a storehouse, that he may be able to roll in a heavy cask, he employs the principle of the *inclined plane*; and the more gradual the inclination of the plank, the more easily will he effect his purpose. That is, the advantage gained by the inclined plane is greater, the more the length of the plane exceeds its height. A road which is not level, is an inclined plane. When a road mounts over a hill, instead of winding round its foot, a team of horses with a load of a ton weight, must exert strength sufficient to lift the load perpendicularly into the air, to a height equal to that of the top of the hill, instead of that moderate exertion which is necessary to overcome the friction of the axis of the wagon, and the slight inequalities of a level road. Hence the absurdity of constructing roads in hilly countries to pass directly over the tops of hills, instead of winding, by small circuits, along their base.

When a power acts on a body, on an inclined plane, so as to keep that body at rest; then the weight, the power, and the pressure on the plane, will be as the length, the height, and the base of the plane, when the power acts parallel to the plane; that is,

The weight  
The power  
The pressure on the plane

will be as  $\left\{ \begin{array}{l} AC \\ BC \\ AB \end{array} \right.$

The force with which a body endeavours to descend down an inclined plane, is as the height of the plane. When the power does not act parallel to the plane, then from the angle C of the plane, draw a line perpendicular to the direction of the power's action; then the weight, the power, and the pressure on the plane, will be as AC, CB, BA. When the line of direction of the power is parallel to the plane, the power is least.

If two bodies, on two inclined planes, sustain each other, by means of a string over a pulley, their weights will be inversely as the lengths of the planes.

The space which a body describes upon an inclined plane, when descending on the plane by the force of gravity, is to the space which it would fall freely in the same time, as the height is to the length of the plane; and the spaces being the same, the times will be inversely in this proportion. If the elevation were one sixteenth of the length, the body would roll down one foot in the first second, and four in two. It is on this principle that the equality in the vibrations of a pendulum may be explained. A long vibration takes no more time than a short one, because the body begins to fall, in this case down a steep plane, and acquires great velocity. In a short vibration, the beginning of its path is a very gradual descent. A short pendulum vibrates more rapidly than a long one, because it has a shorter distance to move in a path of the same steepness. A body moving down an inclined plane, moves four times as far in two seconds as in one. A pendulum, to vibrate once in two seconds, must be, therefore, four times as long as one which beats seconds. The most remarkable application of the inclined plane is in the construction of the *marine railway*, on which, by the power of a few horses, a ship of 600 tons is drawn,

with all its cargo, out of the water, high enough to allow workmen to pass under its keel.

**The Screw.**—Imagine an inclined plane to pass round an immense building, like the tower of Babel, affording means of ascending to the top, and you have the first idea of the *screw*. It is an inclined plane, wrapped spirally round a solid cylinder. The advantage gained by it depends on the slowness of the ascent, that is, on the number of turns or *threads*, as they are called, in a given distance. It is always used in combination with a lever. It is a machine of great power, commonly employed to produce compression or to raise heavy weights. Hunter's screw is a compound of two screws, with threads of different degrees of fineness, one moving within the other, the end advancing, at each revolution, through a distance equal to the difference of the threads.

The *Wedge* is a double inclined plane, used commonly to cleave wood or stone, and sometimes to elevate a large mass, as part of a building, or ship. The effect of a wedge depends, apparently, upon friction, elasticity, and the slowness with which motion is communicated to a mass of matter. When a wedge is driven in, the particles immediately in contact with it are, for a moment, displaced, the friction against it prevents it from receding, and when the displaced particles endeavour to resume their relative position, the rift is lengthened. To the wedge may be referred various cutting tools, such as axes, knives, swords, chisels; and nails and spikes to be driven into wood, as well as pins, needles, awls, &c. The saw and the file and rasp are modifications still more remote. The colter of a plough, the blade of a spade, and other instruments to penetrate the earth, are in the shape of a wedge.

The *Rope* is considered, in theory, as destitute of weight, and perfectly smooth and flexible. In this case, as in that of the other mechanical powers, the allowances to be made in practice for weight, rigidity, friction, &c., are ascertained by experiment, and combined with the results of theory. If a rope be stretched horizontally between two fixed points, by equal weights attached to the ends, any very small weight applied to the rope between these points will bend the rope, and thus raise the weights. If we suppose the rope to have been perfectly horizontal, the weight applied acts upon those at the ends with a mechanical advantage which may be considered infinite, as it acts at right angles to the directions of the opposite actions of those weights. This is a necessary consequence of the principles of the resolution of forces. The action of one or two forces can have no effect in counteracting a third, unless they act in such a direction, that their action can be resolved into two, one of which is opposite to the direction of the third force. While the rope is horizontal, the two weights counterbalance each other, but produce no further effect, until the rope is bent into an angle. A bending of the rope must, therefore, take place, in consequence of the action of any force, however small. By bending the rope, it must raise the weights, and support them at a point above their former position, thus producing an equilibrium with them, however great they may be. This arrangement is one form of what is called the *funicular machine*. A necessary consequence of the principle on which it depends is, that when a rope or chain, of any material whatever, is stretched horizontally, its weight alone will prevent its being perfectly straight, and no force is sufficient to straighten a rope unless it hangs perpendicularly. Advantage is often taken of this power by seamen in tightening ropes, which have previously been drawn as closely as possible by the direct action of their strength.

The *Pulley* is a small wheel, moving on an axis or

pin, which is fixed in a frame called a *block*. The circumference of the wheel has a groove for a rope to move in. The pulley is said to be *fixed* or *movable*, according as its block admits of motion or not. A fixed pulley gives no mechanical advantage, but it enables us to apply force more conveniently, by changing its direction. A man standing on the deck of a ship is able, by means of one fixed at the top of the mast, to raise a weight to that point by drawing downwards. In the same manner, ore is raised from mines, and water from deep wells. The wheel, in the grooved circumference of which the rope passes, gives facility to its motion by preventing the necessity of its bending suddenly round a sharp edge, and diminishes the friction by transferring it from the rope to the axis of the wheel. One or more grooved wheels, called *sheaves*, set in a block, and moving freely round an iron axis, constitute a pulley, and the combination of pulley and ropes, a *tackle*. If the rope, instead of being attached to the weight, passes through a movable pulley attached to the weight, and terminates in a hook or ring in the upper block, the tackle becomes an engine by which another advantage is gained. As, in this case, the weight is supported by two parts of a rope, each part sustaining one half, the power necessary to support one of these parts, is equal to only one half the weight supported, and, by drawing upon one end of the rope, with a power a little greater than one half of the weight, the whole weight will be raised. It is on this principle that advantage is gained by the pulley. If the weight were supported by the four parts of a rope, which passed through two fixed and two movable pulleys, each part sustaining one fourth of the weight, a power equal to one fourth part of the weight, attached to the free end of the rope, would balance the whole weight, and something more than one fourth would raise it. This advantage is purchased by the space through which the power must move, and the time occupied by the motion. To raise a weight fifty feet, by the combination last mentioned, the power must move over a space of 200 feet.

The nature of the different kinds of pulley will be better understood by the aid of the following illustration, taken from *Grier's Mechanic's Calculator*.

The accompanying engraving exhibits various forms of the pulley. A B is a beam from which they are suspended.

No. 1, is the fixed pulley in which there is no other advantage gained than that the power P and weight W move in a contrary direction. No. 2, is a movable pulley, in which the power P by moving upwards raises the pulley, to the block of which the weight W is attached; but the one end of the string being attached to the beam A B, the power must move twice as fast as the weight, and there will be a gain of power proportional. No. 3, is a combination of two movable pulleys, in which the gain of power will be four; and No. 4 is a combination of two fixed and two movable pulleys, in which the gain of power will be the same as in No. 3. If in a system of pulleys, where each pulley is embraced by a cord, attached

at one end to a fixed point, and at the other to the centre of the movable pulley next above it, and the weight is hung to the lowest pulley, the effect of the whole will be = the number of strings by itself, as many times as there are movable pulleys in the system: thus, if there be 4 movable pulleys, then  $2 \times 2 \times 2 \times 2 = 16$ ; wherefore, it is equal to one lb. it will be sustained by a power of one ounce avoirdupois.

When there are any number of movable pulleys in one block, and as many on a fixed block, the wheels are called *Sheaves*, and the system a *sheave Muffle*; and the weight is to the power as one is to twice the number of movable pulleys in the system.

In all the above cases of the pulley, the cords, or ropes, are supposed to act parallel to each other; when this is not the case, the reason of power and weight may be found by appeal to principle of the *parallelogram of forces*; thus, let *ab* in the direction of the power's action and of that length, taken from a scale of equal parts, which expresses the quantity of the power; next draw *bd* a perpendicular to the horizon, and from *e* draw *ad* parallel to *bc*, the direction of the string, which is fastened at *c*: then the power is to the weight, as *ba* is to *bd*; and the strain on the cord at *c*, is as *ad* to *db*,—these lines being all measured on the same scale of equal parts. It may be further observed that the pulley is a species of lever of the second kind; where the point at which the string is fastened may be called the fulcrum; the axis of the pulley the place of the weight, and the place of the power the other end of the lever; or, the diameter of the pulley may be reckoned the length of the lever, the weight being in the middle.

A great many experiments made by Ranslet, have shown that, for most purposes, the best proportions for the wheel of a pulley are, 1. that its diameter should be five times its thickness; 2. that the diameter of the pin should be one-eighth of the diameter of the wheel; 3. that the wheel should have about one-twelfth of its thickness on each side for a play to the block.

Additions might be made to the list of mechanical powers, with as much propriety as ever of the enumerated are retained. The course of deep action, usually called the *haggle joint*, might be called a mechanical power. It is, however, not properly, a combination of levers, acting on the principle of the funicular machine.

**MECHANICS' ANIMAL.** *Mechanics of the Human Skeleton.* There is scarcely a part of the animal body, or an action which a part of it is accident that can befall it, or a piece of profound assistance which can be given to it, that does not furnish illustration of some truth of natural philosophy; but we shall here only touch upon a few particulars as will make the understanding of other easy.

The *cranium*, or *skull*, is an instance of the solid form, answering the purpose of giving strength to the brain, in its nature, is so tender, or susceptible of injury, that slight local pressure disturbs its state. Hence a solid covering, like the skull, was supplied with those parts made stronger and thicker that are most exposed to injury. An archæologist does not construct to resist one kind of force only, but acting in one direction, namely, gravity; and therefore its strength increases regularly towards the bottom, where the weight and horizontal thrust of the whole are to be resisted; but, in the skull, the

city of the substance is many times more than sufficient to resist gravity, and therefore aids the form to resist forces of other kinds, operating in all directions. When we reflect on the strength displayed by the arched film of an egg-shell, we need not wonder at the severity of blows which the cranium can withstand.

Through early childhood, the cranium remains, to a certain degree, yielding and elastic; and the falls and blows so frequent during the lessons of walking, &c., are borne with impunity. The mature skull consists of two layers or tables, with a soft diploe between them, the outer table being very tough, with its parts dovetailed into each other, as tough wood would be by human artificers; while the inner table is harder, and more brittle (hence called *vitreous*), with its edges merely lying in contact, because its brittleness would render dovetailing useless.

A very severe partial blow on the skull generally fractures and depresses the part, as a pistol bullet would; while one less severe, but with more extended contact, being slowly resisted by the arched form, often injures the skull by what is correspondent to the horizontal thrust in a bridge, and causes a crack at a distance from the place struck, generally half way round to the opposite side. Sometimes, in a fall with the head foremost, the skull would escape injury, but for the body, which falls upon it, pressing the end of the spine against its base.

In the *lower jaw*, we have to remark the greater mechanical advantage, or lever power, with which the muscles act, than in most other parts of animals. The temporal and masseter muscles pull almost directly, or at right angles to the line of the jaw; while in most other cases, as in that of the deltoid muscle lifting the arm, the muscles act very obliquely, and with power diminished in proportion to the obliquity. An object placed between the back teeth is compressed with the whole direct power of the strong muscles of the jaw; hence the human jaw can crush a body which offers great resistance, and the jaws of the lion, tiger, shark, and crocodile, &c., are stronger still.

The *teeth* rank high among those parts of the animal body which appear almost as if they were merely the fruits of distinct miraculous agencies, so difficult is it to suppose a few simple laws of life capable of producing the variety of form so beautifully adapted to purposes which they exhibit. They constitute an extraordinary set of chisels and wedges, arranged as to be most efficient for cutting and tearing the food, and, with their exterior enamel, so hard that, in early states of society, teeth were made to answer many purposes for which steel is now used.

It seems, however, as if the laws of life, astonishing as they are, had still been inadequate to cause teeth, used in their hard enamel, to grow as the softer bones grow; and hence has arisen a provision more extraordinary still. A set of small teeth appear soon after birth, and serve the child until six or seven years of age: these then fall out, and are replaced by larger ones, which endure for life; the number being completed only when the man or woman is full-grown, four teeth, called *wisdom teeth*, because they come so late, which rise to fill up the then spacious jaws.

The *spine*, or *back-bone*, has, in its structure, as much of beautiful and varied mechanism as any single part of our wonderful frame. It is the central pillar support, or great connecting chain of all the other parts; and it has, at the same time the office of conning within itself, and of protecting from external injury, a prolongation of the brain, called the *spinal marrow*, more important to animal life than the outer part of the brain itself. We shall see the

spine uniting the apparent incompatibilities of great elasticity, great flexibility in all directions, and great strength, both to support a load and to defend its important contents.

*Elasticity.* The head may be said to rest on the elastic column of the spine, as the body of a carriage rests upon its springs. Between each two of the twenty-four vertebrae, or distinct bones, of which the spine consists, there is a soft elastic intervertebral substance, about half as bulky as a vertebra, yielding readily to any sudden jar; and the spine, moreover, is waved, or bent a little, like an italic *f*, as seen when it is viewed sideways; and, for this reason, also, it yields to any sudden pressure operating from either end. The bending might seem a defect in a column intended to support weight; but the disposition of the muscles around is such as to leave all the elasticity of the bend and a roomy thorax, without any diminution of strength.

*Flexibility.* The spine may be compared to a chain, because it consists of twenty-four distinct pieces, joined by smooth rubbing surfaces, so as to allow of motion in all directions; and a little motion, comparatively, between each two adjoining pieces, becomes a great extent of motion in the whole line. The articulating surfaces are so many, and so exactly fitted to each other, and are connected by such number and strength of ligaments, that the combination of pieces is really a stronger column than a single bone of the same size would be.

The strength of the spine, as a whole, is shown in a man's easily carrying upon his head a weight heavier than himself, while each separate vertebra is a strong irregular ring, or double arch, surrounding the spinal marrow. The spine increases in size towards the bottom, in the justest proportion, as it has more weight to bear.

*The Ribs.* Attached to twelve vertebrae, in the middle of the back, are the ribs, or bony stretchers of the cavity of the chest, constituting a structure which solves, in the most perfect manner, the difficult mechanical problem of making a cavity with solid exterior, which shall yet be capable of dilating and contracting itself. Each pair of corresponding ribs may be considered as forming a hoop, which hangs obliquely down from the place of attachment behind; and so that, when the fore part of all the hoops is lifted by the muscles, the cavity of the chest is enlarged.

We have to remark the double connexion of the rib behind, first to the bodies of two adjoining vertebrae, and then to a process or projection from the lower, thus effecting a very steady joint, and yet leaving the necessary freedom of motion; and we see the fore part of the rib to be of flexible cartilage, which allows the degree of motion required there, without the complexity of a joint, and admirably guards, by its elasticity, against the effects of sudden blows or shocks.

The muscles which have their origin on the ribs, and their insertion into the bones of the arm, afford us an example of action, and reaction being equal and contrary. When the ribs are fixed, these muscles move the arm; and, when the arm is fixed, by resting on a chair or other object, they move the ribs. This is seen in fits of asthma and dyspnea.

The *shoulder-joint* is remarkable for combining great extent of motion with great strength. The round head of the shoulder-bone rests upon a shallow cavity in the shoulder-blade, that it may turn freely in all ways; and the danger of dislocation from this shallowness is guarded against by two strong bony projections above and behind. To increase the range of motion to the greatest possible degree, the bone called the shoulder-blade, which contains the

socket of the arm, slides about itself upon the convex exterior of the chest, having its motion limited only by a connexion, through the collar bone, or clavicle, with the sternum.

The *scapula*, or *blade-bone*, is extraordinary as an illustration of the mechanical rules for combining lightness with strength. It has the strength of the arch, from being a little concave, and its substance is chiefly collected in its borders and spines, with thin plates between, as the strength of a wheel is collected in its rim, and spokes, and nave.

The bones of the arms, considered as levers, have the muscles which move them attached very near to the fulcrum, and very obliquely; so that, from working through a short distance comparatively with the resistances overcome at the extremities, the muscles require to be of great strength. It has been calculated that the muscles of the shoulder-joint, in the exertion of lifting a man upon the hand, pull with a force of two thousand pounds.

The *os humeri*, or bone of the upper arm, is not perfectly cylindrical; but, like most of the other bones which are called cylindrical, it has ridges to give strength.

The *elbow-joint* is a correct hinge, and so strongly secured, that it is rarely dislocated without fracture.

The *fore-arm* consists of two bones, with a strong membrane between them. Its great breadth, from this structure, affords abundant space for the origin of the many muscles that go to move the hand and fingers; and the very peculiar mode of connexion of the two bones, give man that most useful faculty of turning the hand round, into what are called the positions of pronation and supination, exemplified in the action of twisting, or of turning a gimlet.

The *wrist*. The many small bones forming this, have a signal effect of deadening, in regard to the parts above, the shocks or blows which the hand receives.

The *annular-ligament* is a strong band passing round the joint, and keeping all the tendons which pass from the muscles above to the fingers, close to the joint. It answers the purpose of so many fixed pulleys for directing the tendons: without it, they would all, on action, start out like bow-strings, producing deformity and weakness.

The *human hand* is so admirable, from its numerous mechanical and sensitive capabilities, that an opinion at one time commonly prevailed, that man's superior reason depended on his possessing such an instructor and such a servant. Now, although reason, with hoofs, instead of fingers, could never have raised man much above the brutes, and probably could not have secured the continued existence of the species, still the hand is no more than a fit instrument of the godlike mind which directs it.

The *pelvis*, or strong irregular ring of bone, on the upper edge of which the spine rests, and from the sides of which the legs spring, forms the centre of the skeleton. A broad bone was wanted here to connect the central column of the spine with the lateral columns of the legs; and a circle was the lightest and strongest. If we attempt still further to conceive how the circle could be modified to fit it for the spine to rest on, for the thighs to roll in, for muscles to hold by, both above and below, for the person to sit on, we shall find, on inspection, that all our anticipations are realized in the most perfect manner. In the pelvis, too, we have the thyroid hole and ischiatic notches, furnishing subordinate instances of contrivance to save material and weight: they are merely deficiencies of bone where solidity could not have given additional strength. The broad

ring of the pelvis protects most securely the organs placed within it.

The *hip-joint* exhibits the perfection of the bone and socket articulation. It allows the leg to move round in a circle, as well as to have the great sweep of backward and forward motion required in the action of walking. When we see the smooth cartilage which lines the deep ends of the joint, and the similar glistening covering of the end or head of the thigh bone, and the lubricating oil poured into the cavity by appropriate vessels, and the strong ligaments giving strength to it, we feel how far the most perfect of man's works is short of the mechanism displayed by nature.

The *thigh-bone* is remarkable for its process called *trochanters*, to which the moving muscles are fixed, and which lengthen considerably the lever which the muscles work. The shaft of the bone is not straight, but has a considerable forward curvature. Short-sightedness might suppose this needless, because the bone is a pillar supporting weight; but the bend gives it, in reality, the strength of an arch, to bear the action of the mass of muscle called *vastus*, which lies and reveals upon its part.

The *knee* is a hinge joint of complicated structure and it claims the most attentive study of the surgeon. The rubbing parts are flat and shallow, and hence the joint has little strength from form; but derives security from the numerous and intricate strong ligaments which surround it. The ligaments are inside of the knees resemble in two circumstances the annular ligaments of joints, namely, a strong constant and great strain to bear, and yet a bending stronger always as the strain increases. The bone of the leg, even in the most perfect shape, bends inward a little at the knee, requiring the support of the ligaments, and in many persons, it bends very much; but the inclination does not increase with age. The legs of many weakly men bend double become straight by exercise alone. The inclination at the middle joint of the leg, by throwing a strong strain on the ligaments, gives an increase of elasticity to the limb, in the actions of jumping, &c. In the knee, there is a singular provision of two cartilages, which have been called *menisci* or *wheels*, from a supposed relation in use to brass wheels; but their real effect seems to be to moderate, in the different positions of the joint, the surfaces of the rubbing bones to each other.

The great muscles on the fore part of the leg are contracted into a tendon a little above the knee and have to pass over, and, in front of the knee, to reach the top of the leg, where their attachment is. The tendon, in passing over the joint, becomes hard and forms the *patella*, or *knee-cap*, often called the *pulley* of the knee. This peculiarity enables the muscles to act more advantageously, by increasing the distance of the rope from the centre of motion. The patella is, moreover, a sort of shield or protection to the fore part of this important joint. The leg below the knee, like the fore-arm above described, has two bones. They offer equal surface of origin for the numerous muscles required for the feet, and they form a compound shaft of greater strength than the same quantity of bone one shaft would have had. The individual bones also are angular instead of round, hence deriving greater power to resist blows, &c.

The *ankle-joint* is a perfect hinge of great strength. There is in front of it an annular ligament, by which the greater part of the tendons, passing downwards to the foot and toes, are kept in their place. One of these tendons passes under the *heel-joint* of the inner ankle, in a smooth sheath,

groove, exactly as if a little fixed pulley were there.

The *Aecl*, by projecting so far backwards, is a lever for the strong muscles to act by, which form the calf of the leg, and terminate in the *tendo achillis*. These muscles, by drawing at it, lift the body, in the actions of standing on the toes, walking, dancing, &c. In the foot of the negro, the heel is so long as to be ugly in European estimation; and, its great length rendering the effort of smaller muscles sufficient for the various purposes, the calf of the leg in the negro is smaller in proportion than in other races of men.

The *arch of the foot* is to be noticed as another of the many provisions for saving the body from shocks by the elasticity of the supports. The heels and the balls of the toes are the two extremes of the elastic arch, and the leg rests between them.

Connected with elasticity, it is interesting to remark how imperfectly a wooden leg answers the purpose of a natural leg. With the wooden leg, which always remains of the same length, the centre of the body must describe, at each step, a portion of a circle of which the bottom knob of the leg is the centre, and the body is therefore constantly rising and falling; while, with the natural legs, which, by gentle flexure at the knee, are made shorter or longer in different parts of the step, as required, the body is carried along in a manner perfectly level. In like manner, a man riding on horseback, if he keep his back upright and stiff, has his head jolted by every step of the trotting animal; but the experienced horseman, even without rising in the stirrups, by letting the back yield a little at each movement, as a bent spring yields during the motion of a carriage, can carry his head quite smoothly along.

In a general review of the skeleton, we have to remark, 1. the nice adaptation of all the parts to each other, and to the strains which they have respectively to bear; as in the size of the spinal vertebrae increasing from above downwards; the bones of the leg being larger than those of the arm, and so on. 2. The objects of strength and lightness combined; as by the hollowness of the long bones; their angular form; their thickening and flexures in articular places where great strain has to be borne; the enlargement of the extremities to which the muscles are attached, lengthening the lever by which these act, &c. 3. We have to remark the nature and strength of material in different parts, so admirably adapted to the purposes which the parts serve. There is a bone, for instance, in one place, nearly as hard as iron, where, covered with enamel, it has the form of teeth, with the office of chewing and tearing all kinds of matter used as food. In the cranium, again, bone is softer, but tough and resisting; in the middle of long bones, it is compact and little bulky, to leave room for the swelling of the muscles lying there; while, at either end, it is large and spongy, with the same quantity of matter, to give a broad surface for articulation; and, in the joints, the bodies of the vertebrae, which rest on an elastic bed of intervertebral substance, are light and spongy, while their articulating surfaces and processes are very hard. In the joints, we see the tough, elastic, smooth substance, called *cartilage*, covering the ends of the bones, defending and padding them, and destroying friction. In infants, we find all the bones soft or gristly, and therefore calculated to bear, with impunity, the falls and blows unavoidable at their age; and we see certain parts remaining cartilage or gristle for life, where their elasticity is necessary or useful, as at the anterior extremities of the ribs. About the joints, we have to remark the ligaments which bind the bones to-

gether, possessing a tenacity scarcely equalled in any other known substance; and we see that the muscular fibres, whose contractions move the bones, and thereby the body,—because they would have made the limbs clumsy even to deformity had they all passed over the joints to the parts which they have to pull,—attach themselves, at convenient distances, to a strong cord called a *tendon*, by means of which, like a hundred sailors at a rope, they make their effort effective at any distance. The tendons are remarkable for the great strength which resides in their slender forms, and for the lubricated smoothness of their surfaces. Many other striking particulars might be enumerated; but these may suffice. Such, then, is the skeleton, or general frame-work of the human body—less curious and complicated, perhaps, than some other parts of the system, but so perfect and so wonderful, that the mind which can attentively consider it without emotion, is in a state not to be envied.

The living force of man has been used as a working power in various ways, as in turning a winch, pulling at a rope, walking in the inside of a large wheel to move it, as a squirrel or turn-spit dog moves his little wheel; &c. Each of these has some particular advantage; but that mode in which, for many purposes, the greatest effect may be produced, is for the man to carry up to a height his body only, and then to let it work by its weight in descending. A bricklayer's labourer would be able to lift twice as many bricks to the top of a house in the course of a day, by ascending a ladder without a load, and raising bricks of nearly his own weight over a pulley each time in descending, as he can by carrying bricks and himself up together, and descending again without a load, as is still usually done.

Reflection would naturally anticipate the above result, independently of experiment; for the load which a man should be best able to carry, is surely that from which he can never free himself—the load of his own body. Accordingly, the strength of muscles and disposition of parts are all such as to make his body appear light to him.

The question which was agitated with such warmth some time ago, as to the propriety of making men and women work on the tread-mill, receives an easy decision here. They work by climbing on the outside of a large wheel or cylinder, which is turning by their weight, and on which they must advance just as fast as it turns, to avoid falling from their proper situation. There are projections or steps for the feet on the outside of the cylinder, and the action to the workers is exactly that of ascending an acclivity. Now, as nature has fitted the human body for climbing hills, as well as for walking on plains, the work of the tread-mill, under proper restrictions as to duration must be as natural and healthful as any other. Its effects have now proved it to be so.

As animal power is exhausted exactly in proportion to the time during which it is acting, as well as in proportion to the intensity of force exerted, there may often be a great saving of it by doing work quickly, although with a little more exertion during the time. Suppose two men of equal weight to ascend the same stair, one of whom takes only a minute to reach the top, and the other takes four minutes; it will cost the first but a little more than a fourth part of the fatigue which it costs the second, because the exhaustion has relation to the time during which the muscles are acting. The quick mover may have exerted, perhaps, one twentieth more force in the first instant, to give his body the greater velocity which was afterwards continued; but the sloth supported his load four times as long.

A healthy man will run rapidly up a long stair,

and his breathing will scarcely be quickened at the top; but, if he walk up slowly, his legs will feel fatigued, and he will have to wait some time before he can speak calmly.

For the same reason, coach-horses are much spared by being made to gallop up a short hill, and being then allowed to go more slowly for a little time, so as to rest at the top.

The rapid waste of muscular strength, which arises from continued action, is shown by keeping the arm extended horizontally for some time; few can continue the exertion beyond a minute or two. In animals which have long horizontal necks, there is a provision of nature in a strong elastic substance on the back, or upper part, of the neck, which nearly supports the head, independently of muscular exertion.

MECHELN, or MECKENEN, ISRAEL OF; two artists, father and son, the former of whom appears to have been a painter, the latter a goldsmith, and one of the earliest and most distinguished engravers. They lived between 1450 and 1503. The son was born at Mecheln, near Bocholt. From his drawing, we may conjecture that he was a scholar of Van Eyk. Of the circumstances of his life, little else is known than that he lived, during his latter years, at Bocholt, and died there in 1503. His engravings are rare, and much sought after; yet they bear the marks of a rude taste and imperfect drawing, incorrect perspective, and other traits which characterise the period. They are chiefly valuable for the minute accuracy of their execution, and as monuments of the history of the art.

MEHLIN, or MECHELN (in French, *Malines*); a city lately belonging to the kingdom of the Netherlands, in the Belgic province of Antwerp, five leagues south of the city of Antwerp, and four and a half north-east of Brussels, on the Dyle and the Louvain canal; archiepiscopal see; population, 18,000. The streets are broad and well paved, and the buildings handsome: the cathedral, with a tower 348 feet high; the Beguine house, which serves as an asylum for 800 widows or aged women; the arsenal, with a cannon foundry; the archbishop's palace, &c., are the principal. The lace, woollen, calico, and hat manufactures are extensive, and the tanneries and breweries are considerable. Its commerce by the Dyle, which is navigable for large ships, is important in grain, oil, flax, and hops. The time of its foundation is not known: it is an old city, and was surrounded by ramparts in the tenth century. It has been repeatedly inundated by the Dyle, and captured by the Spanish, Dutch, British, and French. The latter destroyed its fortifications in 1804. See *Netherlands*.

MECHOACAN, or VALLADOLID; one of the states of the Mexican republic, formed, in 1824, of the former province or intendency, of Mechoacan or Valladolid, bounded by the states of Guanajuato and Mexico, and the Pacific ocean; lat. 18° to 20° 30' N.; lon. 104° 20' to 108° 50' W. Its productions are cotton, corn, sugar-cane, indigo, gold, silver, copper lead, &c. Mechoacan was an Indian kingdom at the time of the arrival of the Spaniards in Mexico, and was conquered by one of the generals of Cortes, in 1524. There are, at present, three tribes of Indians, forming the greatest part of its population, within its limits—the Tarascos, the Otomites and Chichimeks. The population was estimated by Humboldt, in 1803, at 376,400. (See *Mexico*.) Capital, Valladolid (q. v.).

MECKLENBURG-SCHWERIN; a grand-duchy in the north of Germany, lying between the Baltic, the kingdom of Hanover, and the Prussian territories; a member of the Germanic confederation. The

population is 430,927, principally Latins (Germ. Jews); the superficial extent of the grand-duchy 4833 square miles; revenue of the tax, 1,500,000 guilders; debt, between eight and ten millions capital, Schwerin, with 11,230 inhabitants. The grand-duke has two votes in the plenipotentiary diet of the grand-duchy of Mecklenburg-Schwerin, in the fourteenth vote in the diet. The two duchies have a common supreme court of appeal at Rostock. The population of Mecklenburg-Schwerin is principally agricultural; the manufactures are considerable; the foreign commerce is carried on chief from the ports of Rostock and Wismar on cattle are the principal articles.

MECKLENBURG-STRELITZ; a grand-duchy in the north of Germany, divided into two parts by the grand-duchy of Mecklenburg-Schwerin. It has 75,500 inhabitants on a superficial area of 1590 square miles. It has one vote in the *Confederation*. The capital is Neustrelitz, with 1000 inhabitants. The productions, and the commerce and employment of the inhabitants, are the same as Mecklenburg-Schwerin.

MEDALLIONS. The term *medallion* is applied to those productions of the mint which, if of gold, exceed the *aureus* in size; if silver, the *denarius*; and if copper, the first, or large brass. Antiquaries have long differed as to the purposes for which they were designed; they are generally, however, supposed to have been struck, like the medals of our time, to commemorate some remarkable event. The circumstances are not wanting to render it probable that they were intended for circulation as money. Perhaps both objects were united, at least in some instances, a large number of pieces, of a definite value, being coined in memory of a great event, and thus adapted, at the same time, for use as medals. Medallions are not numerous. The *Genetrix* struck in the Greek provinces of the Roman empire are more common than the Roman, but of inferior workmanship. A gold medallion existed Augustus and one of Domitian; but few, in my mind, or found prior to the reigns of Adrian and Constantine those in brass are the largest, many of them less than several inches in diameter. See *Nomenclature*.

MEDALS. See *Nomenclature*.

MEDEA; daughter of Aetes, king of Colchis. By some, her mother is said to be *Iphigeneia*, daughter of Oceanus; by others, Hecate. Mythology attributes her a profound knowledge of the secret virtues of vegetables, by means of which she practiced witchcraft. She saved the lives of many foreigners by her prayers and the aid which she rendered them, but thereby incurred the suspicions of her father and was thrown by him into prison, from which she escaped to the temple of the sun. Her union with Jason (q. v.), the leader of the Argonauts, was celebrated. For ten years she lived with her husband, after having supported him in every danger till the charms of Glauce, or Creusa, the daughter of king Creon, kindled a new passion in him, and he discarded the unhappy Medea. According to one account Jason separated from her, because of the sorceries heaped on him for having a foreign sorceress for his wife. Under the semblance of patient resignation she brooded on revenge. With this purpose she sent the bride, as a wedding gift, a garment with which when she put it on, enveloped her in a consuming flame, so that she died a death of the utmost anguish. Another account is, that she sent her rival a golden crown of gold by her stepsons. She razed the Colchian palace to ashes by a shower of fire, murdered her own children by Jason, and then mounted her dragon chariot, and escaped. Some say that she was killed by Hercules, others to Athens, to king Aegeus, by other

she had Medos. From Athens, also, she was banished as a sorceress. She finally returned to her home, where she reinstated her father, who had been dethroned by his brother Perses, after which, she died. According to later accounts, she became reconciled with Jason, and was deified by the Colchians. Medos is said to have taken possession of the kingdom of his grandfather, and to have called it, from himself, *Media*. The story of Medea has often been a subject of poetry, especially of tragic poetry. The tragedies of this name, by Æschylus and Ovid, have perished, as well as the Colchides of Sophocles. The Medæas of Euripides and Seneca are alone extant. The story has lately been made the subject of a tragedy by Grillparzer.

**MEDIA**; the largest and most important province of the ancient Persian empire, bounded east by Hyrcania and Parthia, south by Persis and Susiana, west by Assyria and Armenia, and north by the Caspian sea; so that it comprised the modern Iran, Aderbidhan, Gilan, and the western half of Mazanderan. According to Hammer, it belonged to Aria, or Ariana, of the Zend, the land of the Medes, in its widest extent. This Aria is bounded by the ancient Bactria, the centre of the great national intercourse of Asia, of the religion of the Magi, and of the ancient Persian civilisation. (See *Zoroaster*.) Media, on account of its mountains, was not easily accessible, was inhabited by warlike people, and, in part, well cultivated. Even before the Persian period, it was an independent kingdom. Its history begins with Dejoces, who, according to Herodotus, collected the people in villages and towns, and accustomed them to laws. He is said to have conquered Ecbatana. Ninus, the founder of the Assyrian monarchy, conquered this country. After the downfall of the Assyrian empire, the governor of the province of Media succeeded in rendering it once more independent, and it soon became the most powerful of the states which had arisen from the ruins of the Assyrian monarchy. According to tradition, as given by Herodotus, another Dejoces begins a series of Median kings at Ecbatana, which continues uninterrupted from 700 B. C. to 550 B. C. The last were Phraortes, Cyaxares, and Astyages. Respecting the then existing connexion of Media with Bactria and India, nothing certain is known. Cyrus (q. v.) subjected the Medes to the Persians. This latter people had, till then, been considered by the former as of little importance, on account of their poverty. The conquered soon became the teachers of the conquerors, not only in the arts and manners of private life, but also in their public policy. After Cyrus, Media remained connected with the other parts of the Persian empire, excepting the north-western parts, which, before the reign of Cyrus, seem to have belonged to Assyria, and were separated, for a time, from the Persian monarchy. When Alexander had conquered the Persian empire, he gave to Media a native governor, named Artabazus, who maintained himself in the northern mountains, even after the death of Alexander, when Media had received a Macedonian governor. His territory inherited his power, and, in spite of their numerous neighbours, the Parthians, Armenians, and Romans, maintained possession of it, partly by prudence, partly by arms. In the time of the first Roman emperors, Media was still independent; at a later period, it came under the yoke of the Parthians. Media consisted of Southern, or Proper Media, also called *Great Media*, whose capital was Ecbatana; of the country of Atropates, (Atropatene), and of the northern parts, along the shores of the Caspian sea, called *North Media*.

**MEDIAN WALL**, in ancient geography, also called *Wall of Semiramis* (not built, however, by

Semiramis), is reported to have been 300 feet high, about 140 miles long, and twenty feet thick, in Mesopotamia, running north-west from the Tigris, about thirty miles distant from the present Bagdad; erected against the invasions of the Medians. It was built of brick and asphaltum.

**MEDIATION, MEDIATOR**. In international politics, a power which endeavours to prevent, by peaceable interference, an approaching war, or close one which has broken out, is called a *mediator*. Mediation is essentially different from *arbitration*, which takes place if two powers submit points in dispute between them to the decision of a third power, which is to confine itself strictly to the points at issue, —a proviso which often affords a dissatisfied party a pretext for rejecting the decision. Mediation generally takes place in consequence of a request. In 1818, Spain asked the mediation of the powers assembled at Aix-la-Chapelle in her quarrel with her American colonies, which, however, was refused, on the ground that the aid desired would amount to assistance in making a re-conquest. The Poles, in 1831, sought for the mediation of Britain between themselves and Russia. France has been, very often, the mediator between Russia and Turkey, or Austria and Turkey, from interested motives, to prevent Russia or Austria from becoming too powerful. Several powers may act jointly as mediators. Mediation, particularly of late, has often been performed by congresses, as, for instance, in the case of the treaty of London (July 6, 1827) for the pacification of Greece, or the late mediation of the congress at London between Holland and Belgium. This kind of mediation, however, was introduced by a most arbitrary declaration at Aix-la-Chapelle, that the five great powers of Europe, Austria, France, Great Britain, Russia, and Prussia, would be the mediators in all disputes between minor powers. Their ministers in Paris, Frankfurt, and Vienna were provided with the necessary authorities. This led to the adoption of the principle of *armed intervention* at Laybach and Verona. (See *Intervention*.) Napoleon took the title of mediator of Switzerland. (See *Switzerland*.) By a law of the German empire, disputes between the members were left to the decision of a third member—a proceeding called *Austragialinstanz*. (See *German Empire*.) The same rule has been established in the Germanic confederacy.

*Mediator*, in theology, is an appellation which is given in a peculiar sense to Jesus Christ, the Instructor and Saviour of mankind. Divines, however, have differed in their sentiments in respect to the nature and extent of this office, and the mode of its accomplishment.

**MEDIATISATION**. When the German empire, whose unity and power had been long before destroyed, was formally dissolved (in 1806), it would have been impossible to suffer such a number of small sovereignties to exist by the side of each other as remained in Suabia, Franconia, Bavaria, and on the Rhine, even after the secularisations of the ecclesiastical governments in 1803. It was a work of necessity and of duty to the subjects, to aggregate them in large masses; and, in the previous history of the empire, good precedents were found for changing smaller estates from immediate members of the empire to mediate, that is, to dependencies on the larger governments. The number of the estates of the empire formerly exempted in this manner was very considerable, especially in the Austrian countries. But what made this proceeding odious in 1806 was, partly, the want of a principle; for large possessions, like Furstenberg, with 74,000 inhabitants, Leiningen, with 83,000, were mediatized, while much smaller ones retained their sovereignty;

partly the manner in which the legal relations of the former sovereigns towards their new superiors were settled. The proceeding itself, however, was unavoidable, as appeared in 1815, when it was not only found impossible to restore the sovereignty of the mediatised princes, but new ones were added to the number (Salm, Ilsenberg, von der Leyen). But, by the fourteenth article of the German act of confederation, provision has been made to fix the legal relations of the mediatised sovereignties.

MEDICI. It is not uncommon for families, from the common ranks of society, to attain to great opulence by industry and good fortune. But wealth imparts influence, and this, rank and distinction. In democratic states, then, it is not wonderful that we find families of originally little importance, after some generations, appearing among the rulers of the state, and even at the head of it. The histories of the Grecian and Italian republics are full of such examples. But, owing to the fluctuating nature of wealth and popular favour, such houses generally decline as rapidly as they rise into consequence. If, therefore, a family from the class of commoners flourishes for centuries amidst the continual vicissitudes of conflicting parties, if its influence during this time gradually becomes supreme, and it maintains this power for centuries, we can confidently conclude that the heads of the family must have been distinguished for wisdom and good fortune. Such is the case with the family of the Medici. The Medici, when they first appeared in Florentine history, in the beginning of the fourteenth century, were already rich and important, having recently acquired affluence by commerce. Corso Donato, the head of the party of the Neri, had expelled the Bianchi from Florence, but found himself neglected by his former friends, the chiefs of the nobility; he therefore attached himself, for the purpose of forming a new party, to some wealthy families belonging to the commoners. Among these, the Medici are the first named, although, according to some, they were in favour of the recall of the banished Bianchi. However that may be, they behaved with so much sagacity, that they soon became one of those families from which the popular oligarchy of Florence was composed. They principally contributed to the elevation of Walter of Brienne, duke of Athens, to the head of the state, who, however, made use of his power to humble the ruling families, and caused Giovanni de' Medici, who had not defended Lucca against the Pisans with sufficient firmness, to be beheaded. The Medici, therefore, with some other families, entered into a conspiracy against him, which was discovered to him by Matteo di Marozzo; but, luckily for the Medici, the tyrannical duke, in a fit of caprice, to appear magnanimous, did not investigate the case. This proved his ruin; for when the dissatisfaction at last broke out into open rebellion, the Medici were among the leaders. Thenceforth we find them always in public affairs. After the banishment of the duke, the old nobility were again admitted to participate in the government, from which they had been excluded for fifty years; but abusing their new liberty, they were guilty of such violence and excesses, that Alamanno de' Medici, the oldest of the family, called the people to arms, and drove out the nobles. During the next ten years, when Florence was disturbed anew by the Ricci and Albizzi factions, and distracted by the Ammonizioni (as the exclusion of certain individuals and families from public honours under the pretence of Ghibelinism, was called), the Medici joined the Ricci, which was the weaker party. A son of Alamanno, named Bartholomew, entered into a conspiracy against the Albizzi about the year 1360, but

escaped, on its discovery, from the list of his accomplices, by placing himself in the order of protection of his brother Salvestro, who was a magistrate. Salvestro himself, when publisher of justice, in 1378, procured a law by which the Albizzi were humbled, and the Ammonizioni discontinued. The party of the Albizzi being shorn, being annihilated, and the popular party having gained the supremacy, Salvestro attained the position which laid the foundation for the greatness of his house. The moderation of Salvestro and his family preserved them from falling, even when, a few years later, the party which had risen to prepared its own ruin by its arrogance. The Medici, undisturbed in their greatness and affluence, saw the Albizzi, Strozzi, Scali, Albizzi, but none; for they did not, like the latter, aspire to the supreme power of the state. Yet they soon, for a period, became the victims of republican spirit. In an insurrection of the people against the principal citizens and the revived party of the Albizzi, 1393, the furious populace obliged Verro Medici, Salvestro's son, and at that time head of the family, to be their leader, and to consent to grant their demands. Verro might easily have then become the master of Florence, but he made use of his influence with the people only as a mediator, and calmed the disturbance. But the people failing to fulfil their promises to the people, his adherents loudly expressed their dissatisfaction. The suspicious government took advantage of the threats, uttered by a friend of the Medici, to banish all those members who were loudly demanded by Salvestro, with their friends. Some of these men, and among them Antonio, in concert with the friends in Florence, attempted, in 1397, to seize the government. They found their way into the city, but found no assistance, and were obliged to take refuge in the church of S. Spiritus, where a part of them were killed, and a part were prisoners and executed. After the failure of another conspiracy, excited by the duke of Milan, in 1400, among the Florentine exiles a Lombard, and in which inhabitants of Florence were also co-operated, the Medici were again banished, with the exception of a few. But these few continued to enrich themselves by mercantile commerce, restored the distinction of their house as a basis. Giovanni de' Medici was, in 1402, 1403, or 1417, member of the *signoria*, in 1414 he was elected to the council of the Ten, and, finally, when the republic was convinced of his moderation and of his impartiality, became, in September and October, 1434, gonfalonier of justice. The people turned again from him the formation of an opposition party, but he was too prudent to attempt; and the other party was honestly devoted to the Albizzi. He died in 1469. Of his sons, Cosimo (Cosmo) and Lorenzo, the latter begins the splendid series of the celebrated Medici, the latter was the ancestor of the grand duke of Tuscany. Cosmo had already a seat on the *signoria*, in 1416. Though he made little direct opposition to the ruling party, yet the great liberality with which his immense wealth allowed him to exercise, collected numerous party around him, which, even if the Albizzi neglected no means to weaken them. He does not, indeed, appear to have been directly instigated by Cosmo, and his party was not called after him, but after a certain Puccio Braccio, who, with Averardo de' Medici, was mentioned to gain him partisans; yet he was considered by the Albizzi the chief of the party and their most dangerous enemy. He was finally seized and imprisoned, on being proved guilty of no crime, except a popular affability, and succeeded only by his

gonfalonier Bernardo Guadagni in having the sentence of death, which was preparing for him by Rinaldo Albizzi, converted into banishment to Padua (1433). Yet his friends were so numerous, that a year after, a *signoria*, which consisted wholly of them, recalled Cosmo, and banished Rinaldo and his adherents. By this victory, the party of the Medici acquired the ascendancy. Nevertheless, Cosmo scorned to use force against his enemies; but some suspected persons were banished in 1442. The worthy Neri Capponi endeavoured to oppose the policy of Cosmo, who was a friend of Francesco Sforza. But Cosmo was contented with protecting himself against his enemies by the number of his friends, and was able to check the arrogance of the latter, which he most feared, by inspiring them with a dread of the former. The ruling party in Florence was accustomed to obtain for some of their number, from the people, the grant of full powers (*balia*) to appoint the magistrates or some years. Cosmo himself caused Neri to be appointed one of these commissioners, and thus attached him to his own party, which hazarded nothing in receiving the weaker one of Neri. When, after the death of Neri, the term of the *balia* was expired, he did not make use of his power to effect a prolongation of it, as heretofore some less sagacious chiefs had done, but waited quietly, until the great mass of those, who vainly expected honours from the people, but might have hopes of receiving them from him, effected the renewal of the former oligarchy for eight years, in 1458. Indeed, it was always his policy to let others work for his advantage, while he remained in apparent indifference and inactivity himself. As Puccio Pucci was formerly called the head of his party, so, at present, Cosmo ruled the republic, from 1458, through Luca Pitti, he himself remaining in the back ground. From thence he observed his friends and his enemies, and endeavoured to keep the former within the bounds of moderation, which are essential to the existence of a constitutional aristocracy, and much more to that of an insecure oligarchy. He was less successful in this, in his later years, particularly on account of the imperious character of Luca Pitti. He therefore laid it down as a rule, never to distinguish himself in his mode of living by expense or by a splendour that would excite envy. His superfluous wealth he expended upon public buildings, with which he adorned Florence, and in a splendid munificence, not only towards his adherents, but especially towards artists and learned men; among whom Argyropylus, Marcilius Ficinus, &c., enjoyed a liberal share of his favours; for he himself was a cultivated and accomplished friend to science, without being a less active merchant, or a less sagacious statesman. It would have been easy for him, who in Europe was considered as the prince of Florence, to ally himself with princes; but he married his eldest and his grand-daughters to the daughters of sons of Florentine citizens. With equal wisdom he managed the foreign affairs of the republic, in difficult relations with Naples, Milan, and Venice, in which his commercial connexions with all countries and his vast credit firmly supported him. He learned Pignotti is more rigid and impartial than Roscoe in his judgment upon Cosmo.) After Cosmo had done everything which he could to establish his house in the popular favour, he died in 1464, with anxious thoughts respecting the future; for his kinsman, the sagacious Bernardo de' Medici, who had gained so much honour in the war against Milan and Naples, and his son Giovanni, had both died before him; his other son, Piero, on account of ill health, seemed little capable of being at the head of the state; the sons of Piero, Giuliano and Lorenzo, were still minors. Piero, in the com-

mencement of his course, lost much of the favour which the Florentines would readily have transferred to him from his adored father, in consequence of following the evil suggestion of a false friend, Diotisalvi Neroni, who advised him, in order to restore his finances, which had suffered from the munificence of his father, to exact the payment of many sums of money, which his father had lent to citizens. The growing dislike of the people towards him on account of this measure, and also the betrothment of his son Lorenzo with Clarice (of the noble house of Orsini), were eagerly taken advantage of by Neroni and the ambitious Luca Pitti, in conjunction with the true patriot Nicolo Soderini, and Agnolo Acciajuoli, the personal enemy of the Medici, to effect his downfall. They prepared a list of names personally subscribed by the enemies of the Medici. Piero, to whom this was made known, procured a similar list of the names of his friends and partisans, which many subscribed under the influence of fear, who had already enrolled themselves among his adversaries. After unsuccessful attempts, by moderate measures, to change the government, the malcontents resolved to put Piero to death in his own house at Carreggi, and to take possession of the government, with the assistance of the marquis of Ferrara. But the design was revealed to Piero, whereupon, in August, 1466, with a numerous body of armed men, he went to Florence. Guarded by these, he kept quietly in his own house. His enemies also armed themselves, but were discouraged by the defection of Luca Pitti. Piero having professed his moderation to a deputation of eminent citizens, and declared that he did not desire the renewal of the expired *balia*, the people would undertake nothing against him; his enemies therefore dispersed, and their leaders fled from Florence. The *balia* was then renewed to the party of the Medici, and they became from this time supreme. But the other members of the *balia* abused this power in the most arbitrary manner, and Piero, being almost constantly confined to his bed, was unable to prevent them; he was, therefore, on the point of recalling his banished enemies, in order, by their means, to check the violence of his friends, when death prevented him (1469). The secret enemies of the Medici, on account of the youth and inexperience of his sons, Lorenzo and Giuliano, thought the time favourable for a new attempt to overthrow that powerful house. In conjunction with pope Sixtus IV. and the archbishop of Pisa, Francesco Salviati, the Pazzi, the family next in consequence to the Medici, formed the plan of an assault on Lorenzo and Giuliano, which, after many disappointments, was carried into execution April 26, 1478, in the church S. Reparata. They failed, indeed, in their attempt on Lorenzo; but Giuliano was murdered. The people immediately armed themselves in the cause of the beloved Medici, his assassins were put to death, and the house of Pazzi was overthrown. Lorenzo, now the only head of his house, and more than ever confirmed in the government of the republic, ruled it in a manner worthy of his grandfather, whom he surpassed in wisdom and moderation, as in magnanimity and munificence; but particularly in his active zeal for the arts and sciences. By alliances with Venice and Milan, he protected Florence against the machinations of the pope and the king of Naples. He then made a journey to Naples, and induced the king, the bitterest enemy of himself and his country, to become his warmest friend, and an ally against the attacks of the implacable pope and the faithless Venetians. By his honourable and wise policy, he placed the balance of power in Italy on

a footing, which, until his death, insured to her full security and ample scope to extend and confirm her prosperity. Great losses induced him to give up commerce, which the Medici had always carried on, though, indeed, by agents who were frequently treacherous or inefficient. These losses had reduced him to such a want of money, that he was often compelled to borrow large sums from the public treasury; yet, when he withdrew his property from trade, he was sufficiently wealthy to purchase princely domains, and not only to adorn them with palaces of regal splendour, but also to ornament Florence with elegant edifices. In the long peace, which his wisdom procured for the republic, he entertained the Florentines with elegant and splendid festivals himself, with the society of the most distinguished literati of his age, whom (as, for instance, Demetrius Chalcondylas, Agnolo da Montepulciano, Christopher Landini, and, above all, the great John Pico of Mirandola) his fame and his invitation had attracted to Florence, and his princely munificence rewarded. He increased the Medicean library, so rich in manuscripts, founded by Cosmo in 1471. He also opened a school of the arts of design, in a palace adorned with ancient statues and excellent paintings. All, who in this age had gained a reputation in Florence for great talents, shared his patronage. Lorenzo was therefore surnamed the *Magnificent*. Honoured by all the princes of Europe, beloved by his fellow-citizens, he died in 1492, and with him the glory of his country.—See Fabroni's *Vita Laur. Medicis* (Pisa, 1784, 2 vols. 4to), and William Roscoe's *Life of Lorenzo de' Medici*. The *Opere di Lorenzo de' Medici, detto il Magnifico*, were published at Florence in 1826, in a splendid edition, at the expense of the grand duke Leopold II., and contain the first complete collection of his poems (4 vols. quarto).

Lorenzo left three sons, Piero, married to Alfonsina Orsini; Giovanni, at the age of fourteen cardinal, and afterwards pope Leo X.; and Giuliano, duke of Nemours. Piero, the new head of the state, was wholly unqualified for the place. In two years, he had alienated the duke of Milan and the king of France from the republic, and, by his imprudence and weakness, but particularly by the disgraceful peace of Serres, had made himself despised and hated by the Florentines, who would willingly have honoured his great father in him. He was, in consequence, divested of the government, and banished, with his whole family. After several attempts, by fraud, or force, to return, Piero lost his life (1504) in the battle of the Garigliano, being drowned in this river, where he was with the French army. In 1513, his brother, the cardinal Giovanni, by an insurrection raised by the popular preacher Hieronymus Savonarola, obtained a re-establishment in his native city, and when he became pope, in 1514; he elevated his family again to its pristine splendour. Piero's son, Lorenzo, created by the pope duke of Urbino, was the head of the state, though always without the princely title, and with the preservation of the republican forms. He died in 1519. Julius, a natural son of the Giuliano who was murdered in 1478, ascended the papal throne, in 1523, under the title of Clement VII., and, in 1533, Catharine, Lorenzo's daughter, became the wife of Henry II., king of France; after which events, the speedy dissolution of the semblance of liberty at Florence was readily foreseen. The Florentines, indeed, seemed on the point of recovering their ancient freedom, when they banished, in 1527, the vicious Alessandro; but this was the last ebullition of republican spirit. At the persuasion of Clement II. Charles V. besieged Florence in 1531, and after its capture reinstated

Alessandro, made him duke of Florence and gave him his natural daughter, Margherita, in marriage. At first, the nation loved him for his abilities; but finally he gave himself up to a licentious course of life. He was the first independent duke of Florence. When Alexander, the last descendant of the previous line, had been murdered by Lorenzo de' Medici, a kind descendant from Cosmo's brother Lorenzo, a L.R., the Florentines made a weak attempt to re-establish the republic; but Charles V. again attacked them, and his power promoted Cosmo I. (who belonged to another branch) to the dukedom of Florence. Cosmo I. possessed, as did his successors, the art to use the virtues of the great Medici to whom he owed power. To confirm his greatness, he made it his chief object to exterminate the foreign and military enemies of his house, in 1554. To prevent commerce of the Levant against the Turks, he founded a new religious order, that of the Sante. He was a great amateur and collector of statues and pictures, and founded the extensive collection of statues of celebrated men, and constantly increased the collection of statues in the garden of Lincei the Magnificent. The foundation of the Florentine academy, and of the academy of design, is due to him. After he had made himself master of Sienna, with the assistance of Spain, in 1555, and several other acquisitions had extended the dominions of Florence, he obtained from pope Pius IV. the title of grand duke of Tuscany; but he was not a successor, Francis, first procured, from the emperor Maximilian II., whose sister Joanna he married, the confirmation of this title, in 1575, for a large sum of money. Francis's second wife, the celebrated Italian, Bianca Capello, was declared, by the senate of her country, daughter of the republic, to make her worthy of this alliance. His daughter Maria became the wife of Henry II. of France. This branch of the Medici had not, like the other, become extinct with Alessandro, gave up commerce; even when prince, Cosmo I. himself, and his brother Ferdinand I. (at that time cardinal), who succeeded him, likewise an ardent lover of the arts, as also Cosmo II., the son of the last, who reigned in 1609, continued engaged in it, and from then continued the retail traffic, which had been given up. Under these grand dukes the arts and commerce flourished at Florence, and, in this connection, as well as in the artful policy of the government, especially in the delicate situation of affairs between France and Spain), was recognised the spot of the great Medici of the fifteenth century. But the state of things was changed under Ferdinand II., as Cosmo II., who, in 1621, came to the government at the age of eleven years. During his minority, the clergy, and through it the papal see, acquired a very pernicious influence in the administration, and persuaded him, contrary to the policy of his father, to throw himself into the arms of Spain and Austria—an alliance made use of by those courts to draw immense sums of money from the treasury of the Medici, which was thought to be inexhaustible. He governed forty-nine years, and his son, Cosmo III., austere brought up, and destitute of all public capacity, fifty-three years, from 1670 to 1723, a century in which Tuscany was reduced to the most deplorable state, by an enormous national debt, as by an exhaustion of all the sources of national wealth. Fortunately for this country, John, son of Cosmo III., was the last of his family; a glorious, but now degenerated beyond hope of recovery. He died in 1737, after an arduous reign, and, in compliance with the terms of the peace of Vienna (1735), left his duchy to the house of Sardinia. Francis Stephen, duke of Lorraine and

duke of Tuscany (afterwards the emperor Francis I.), made a contract with the sister of John Gasto, the widowed electress of the Palatinate, the last of the name of Medici, by which he acquired the various allodial possessions of her house, and also the celebrated works of art and antiquities collected by her ancestors. Under the twenty-six years' reign of his son, the wise and virtuous Leopold, Tuscany recovered from a decline which had lasted for more than a century. See *Tuscany*, and Clayton's *Memoirs of the House of Medici*.

MEDICI, LUIGI, DON, minister of the king of Naples, descended from the ducal house of Ottobiano, as duke of Sarto, high steward of the king of Naples, and, for some time, president of the ministry. He succeeded Acton, and rendered service, in 1805, in improving the state of the finances. During the reign of Joseph Bonaparte and Joachim Murat, he resided in England, and returned with the Bourbons to Naples, where he was minister of the police, when Murat, induced by false reports, purposely spread in order to lead him to his ruin, passed from Corsica to the Neapolitan territory. Medici ordered the coasts be watched, and Murat was taken and shot. The sister's report on this event is contained in the papers of that time (1815). In 1818, Medici concluded a concordat with the pope. He now improved the system of coinage, &c. In 1819, the king, on his proposal, ordered "that all judges should decide causes according to the literal meaning of the laws, and, wherever this was not clear, should follow reasonable interpretations, and not the commentaries of jurisconsults; after which, the reasons of the sentence should be printed." To clear the prisons, filled with captive robbers, Medici sent 10 criminals to Brazil, according to a treaty concluded with the court of Rio Janeiro. Yet his administration, particularly the re-establishment of vents, in 1819, met with much censure. The people were dissatisfied with the new tax on landed property (*fundaria*). The revolution broke out at night, July 2, 1820. The ministry of the police had previously been given to the prince of Canosa, who, like Medici, united with the secret society of the *Carbonari*, in order to suppress the *Carbonari*, whilst Medici had sent the most ardent members of these societies to the insane hospitals. Medici gave in his resignation, and retired to Rome, where he remained some time after the return of the king to Naples.

When the violent measures of the prince of Canosa appeared to be ill adapted to restore order, the king, on the advice of Austria, resolved to form a new ministry (June, 1822), the president of which was prince Alvaro Ruffo, and the finances were once again given to Medici: milder measures were now adopted. To cover the deficit in the revenue, a loan was contracted with the house of Rothschild. In the king, with prince Ruffo, went to the congress of Verona, and afterwards to Vienna, Medici appointed president of the council of ministers. He saw himself obliged to contract a new loan with the house of Rothschild, for two millions and a half millions sterling, for which, customs and other indirect taxes were pledged. Under the reign of Francis I., Medici retained his high post. He went with his king to Madrid, and is said to have been allowed respecting the regulation of the embarrassed finances of Spain. He died in 1830.

MEDICINE; the science of diseases, and the art of healing or alleviating them. It is founded on the study of man's physical and moral nature, in health and in disease. Created by necessity, the offspring of instinct, observation, time, and reflection, it has in ages previous to the records of history; it struggled at all times, and continues to

struggle, with favourite theories; has been influenced by all systems of philosophy and religion, by truth and superstition; and has, with the slowness which marks all the important advancements of mankind, but lately emerged from some of the prejudices of thousands of years, and will long continue subject to others. Like other sciences, medicine has gained more from the single discoveries of close observers than from centuries of theory. For the few hundreds of years in which men have begun to apply themselves more to actual observation, and the human body has been carefully studied, medicine, like all the natural sciences to which it is so near akin, has made great progress. The higher kinds of skill and knowledge, in the earlier stages of nations, are in general exclusively appropriated by the priests, and this has been the case with medicine and the other branches of natural science. In the sacred writings, mention is occasionally made of the external application of oil and wine, and of the effects of warm bathing in the treatment of the sick. Amongst the Assyrians it was usual to carry those afflicted with diseases to the gates of the temples, where they might have an opportunity of imploring the advice and assistance of those who passed by. Machaon and Podalirius are mentioned in the *Iliad* of Homer, as having been "good physicians," and their skill in the cure of wounds is recorded with great praise. They were the sons of a physician named Esculapius, who, after his death, had been placed amongst the demigods of Greece, and to whom the Romans, many centuries afterwards, erected a temple upon the island of the Tiber. Hippocrates is the earliest author on medicine whose writings have been preserved. He lived about the middle of the fifth century before Christ, and was a man of very superior talents and great medical acquirements. His writings maintained an unrivalled authority over the minds of his successors for many centuries, and by the consent of posterity, he has been styled the Father of Medicine. The remedies which he employed were principally evacuations, more especially purgatives, and he also prescribed diuretics and sudorifics. He was accustomed to draw blood both by the lancet and scarifications, employed cupping-glasses, inserted issues, and used injections. Most of the active drugs of the present day were unknown to him, all the powerful metallic preparations, for instance, as well as the spirituous and ethereal compositions; and anodyne and narcotic remedies were but little valued.

The doctrine of Hippocrates may be called the *empiric rationalism*; and, numerous as are the systems that have flourished since, in ancient and modern times, mankind have always returned to his principle of making observation the only rule in the treatment of diseases. The doctrine of Hippocrates was blended, by his immediate successors, with the Platonic philosophy, whereby was formed the (so called) *ancient dogmatic system*. In Alexandria, which was, from 300 B. C., the seat of learning, medicine was one of the branches studied, but soon degenerated into mere dialectics and book learning. Hence we find it soon followed by the empiric school (286 B. C.), the methodic school (100 B. C.), the pneumatic school (68 B. C.), and, at length, by the eclectic school (81 A. D.), which took from all the others. A philosophical and great mind was required to put an end to so confused a state of medical science, and such a mind appeared in Galen (q. v.) of Pergamus. His system acquired an almost undisputed pre-eminence during the middle ages, and down to the sixteenth century. For some time (in the seventh century), the intellectual Arabians cultivated the sciences, and with them medicine. They also founded their medicine on that of Galen, but fashioned the

science according to their notions, and left it not unimproved in respect of practical application and pharmacology. Arabian medicine reached its highest point under Avicenna (born 980), who, for some time, was esteemed even higher than Galen; the opinion of the latter's superiority, however, eventually revived. The Western medicine begins with the medical school of Salerno, perhaps existing as early as in the ninth century, but well established in 1143 and 1238, where medicine was taught according to the principles of the Greeks. During the rest of the middle ages, there existed a Galeno-Arabian science of medicine, mostly fostered by ignorant monks, and only gradually struggling on, after suffering, perhaps, more than any other science, from every superstition and every misconception of nature. In the fourteenth century, anatomy was improved by Mondini; later, the knowledge of medicaments, by the discovery of new and distant countries, practical medicine, by the appearance of new diseases, and not a little by the frightful syphilis. The love of Greek literature was revived by the scholars driven from Greece by the conquest of Constantinople (in 1453), and men having begun to read the Greek medical writers, especially Hippocrates, in the original language, a more scientific and liberal spirit of investigation took the place of slavish adherence to antiquated prejudice. Thus the fall of the Galenic system was prepared, which was completed in the sixteenth century, and forms the essential part of the reformation produced by Theophrastus Paracelsus (1526). The chemico-theosophical system of this enthusiast was refuted and arranged by J. B. von Helmont (who died in 1644), until, deprived of its theosophical character, it passed over into the chemico-material system of Francis Sylvius (who died in 1672), and, at length, into the psychiatric system (from *iatrica*, cure) of Stahl (who died in 1734). Yet, soon after Harvey's great discovery of the circulation of the blood (in 1619), the iatromathematical doctrine, under Alphonso Borrelli (who died in 1679), developed itself, which finally took the shape of the dynamic system of Fr. Hoffmann (died 1742), from which the dynamic schools of modern times proceeded. Hoffmann, who may be called the morning star of the reformation of medicine, feeling the insufficiency of all the opinions of his predecessors, and clearly perceiving that the animal body was influenced by laws quite different from those presiding over inanimate matter, dedicated himself to a careful examination of the nature of the operations of the respective parts of the body, whereby he perceived that certain organs possessed specific actions, and that those of the brain and nerves were of all others the most remarkable, and unlike what was to be observed in the other objects of nature. To the nervous system, therefore, he referred the effects of vitality, and to the nervous influence he attributed the production of two diseased states of the system, dissimilar and opposite to each other, to which he applied the terms of spasm and atony—the first expressing the condition of increased, the second, of diminished activity.

Upon this doctrine, Dr Cullen of Edinburgh laid the foundations of his system. Discarding, in the most positive manner, the merely mechanical powers of matter as accounting for the phenomena of vitality, and resting all his opinions upon the specific properties of the living body, he taught that the great agents in all the operations either of health or disease are the minute fibres of the nerves and muscles, which, he says, are the immediate cause, not only of sensation and motion, but of all the changes gradually effected in the internal economy of the system; that the most important of these changes are produced through the medium of the minute terminations of

the arteries, and that the action of these vessels was perfectly competent to produce all the changes that occur, both in the state of the fluids and solids. He adopted the spasm and atony of Helmont, but added so far upon their nature, as to conceive a possibility for the two conditions to exist at the same time in different parts of the system.

Soon after the promulgation of the views of John Brown, also of Edinburgh, appeared another equally novel and striking. He taught that every living being possesses a specific power of excitability, from which all its appropriate functions arise in every circumstance, either external or internal, that can affect a living animal in an excitement or calm, and contributes to expend a portion of its excitability; that upon the proper action of these elements depends the due development of its powers; so that, whenever they are applied to an immoderate degree, the excitability is too quickly expended, the animal becomes exhausted, and falls into a state of indirect debility. But if, on the contrary, there should be a deficiency of stimulus, the powers of life become languid, and want of being called into play, and a certain coarcescence or direct debility, ensues, and the excitability becomes preternaturally accumulated. Thus, when an animal suffers from the want of food, it falls into a state of direct debility; whereas, if the system be inordinately excited by a large quantity of wine, or a state of languor follows from a cold, the condition induced is that of indirect debility—due the latter from defect, and the latter from excess of excitement. That the state of the body, as to excitability, is the same in kind, and can only vary in degree, but always invariable in the same individual, except it may depend upon the smaller or greater quantity of excitability called into action at different periods. Moreover, that the portion of excitability allotted to each individual was allotted to him at birth, and that this original stock cannot by any means be increased, but that it cannot be expended at more than a given rate without producing a diseased condition of the body, and that, if, from any cause, the rate is exceeded, a certain portion of time is requisite to restore the balance between the supply and demand; as the excitability resides both in the nervous system, and that its quantity in the different parts of the body exists always in the same proportion to each other, whereby whenever it becomes excessive or defective, in any one organ, it likewise affects every other part, owing to the harmony existing between them. Hence, he concluded, that all diseases may be divided into two great classes, either of excess or defect—or, in other words, sthenic or asthenic—of which the principal difference in each class consist in the parts which the disease is modified by peculiarities in the temperament, or age, habits of life, &c., &c.

The system of the celebrated Brown is characterized by many respects, to that of Brown. He commenced by assuming the existence of a certain permanent faculty attached to the living body, which he called the immediate cause of all the phenomena of life, and he gives the name of *spirit of animation*, or *vital power*. This resides both in the nervous system, and is equally the origin of motion and sensation. It is called forth by the action of various external powers, and is capable of accommodation and retention, upon which states of excess or defect of a diseased train of action depend. There are two kinds of debility, either from defect or from excess of excitement. But he differs from Brown in not dividing the portion of excitability, for he conceives that the sensorial power may be generated, but not time, by the nervous system, exactly as it is in

the purposes of life, by a process resembling evolution. Darwin divides diseases into four great classes depending upon certain functions of the sexual power, which are irritation, sensation, volition, association.

One of the latest train of medical reasoning, or system of medicine, which has been proposed, is that of the doctrine of plethora, and which we shall attempt to describe. In this all the derangements of the animal economy are attributed to general partial fulness of the blood-vessels or *plethora*. The system is founded more upon the results of practical experience than from any imaginary views of the nature of the animal economy. The great extent to which the system of depletion has been carried, first by Dr Rush and other practitioners in America and the West Indies, and latterly by others in different parts of Europe, has had a very powerful effect upon local opinions on all subjects, and has tended to reduce the whole of the practice of medicine to little more than a succession of evacuations, or an alternation in the different methods of abstracting the fluids from the human body. By this means a most beneficial effect has been produced both in the theory and practice of physic. The work in which this doctrine is presented in the most methodical and connected manner, is written by Dr Parry of Bath, and entitled "Elements of Pathology;" and the points he attempts to illustrate and establish are these:—That the system of the blood-vessels is that which is most entirely deranged, and from which nearly all disorders originate. That partly from the natural condition of the body, partly from the present acquired state of civilized society, these derangements generally proceed, in the first instance, from an excess in quantity, or the moving force of the blood: added to which, that our blood-vessels are peculiarly liable to a state of local plethora, or fulness—a state of parts may occur even when there is a general deficiency in the quantity of the fluids. That this plethora may have its origin from two distinct causes; either from an increased force of the heart, or from the resistance of the vessels—but that, although the mechanical nature of these causes be nearly the same, and the mode of treatment be also in a great measure similar, that the state of the vital powers of the system, at least of the part affected, are totally opposite to each other. Lastly, Dr Parry endeavours to prove that the affections of the nervous system are entirely primary and subservient, and that these likewise arise from an excessive determination of the blood to the substance of the nerves themselves, and that the distinction between diseases arises principally from the parts that are affected; and that the character of their symptoms is determined, either by the particular structure of the organ, by the nature of the cause producing the disease, or by the peculiar constitution of the individual.

Of the newest systems, as the homœopathic system of Hahnemann (see *Homœopathy*), or that of M. Broussais, a Frenchman, who strives to trace all diseases to inflammation of the bowels, we must refer to publications of the authors, and to the medical dictionaries.—See Kurt Sprengel's *Geschichte der Heilkunde* (third edition, Halle, 5 volumes, 1827; translated into French, Paris, 1816); J. F. K. Ker's *Geschichte der Heilkunde* (Berlin, 1822, 1); Hamilton's *History of Medicine* (London, 2 vols., 8vo, &c.).

Of various medical sciences, or those closely connected with them, and more or less requisite for a thorough knowledge of medicine, may be thus enumerated:—the whole range of natural sciences, including comparative anatomy and physiology, mineralogy, geology, botany, natural philoso-

phy, chemistry, &c.: psychology, which teaches the various phenomena of soul and mind: anatomy, which teaches the form and situation of the organs by the examination of dead bodies, and is divided into osteology, treating of the bones; syndesmology, of the ligaments; myology, of the muscles; splanchnology, of the intestines; angiology, of the vessels; neurology, of the nerves; and adenology, of the glands: organic physics, treating of the mechanical operations of the human body, the power, gravity, &c., of its parts: physiology, which treats of all the phenomena of life in connexion.\* Such is the basis of all those branches of science which may be more particularly called *medical*, and which we will now enumerate. The science of health, that is, of that in which it consists, its conditions, and its signs, is called *hygiene*, or as far as it relates to the regulation of the diet, *diætics*. *Pathology*, on the other hand, is the science of disease, of that in which it consists, its origin, &c. *Nosology* treats of the various sorts of diseases, their origin and symptoms, and strives to arrange diseases into one whole. *Pathological anatomy* teaches the mechanical alterations and changes of structure. *Semiotics* teaches to infer from the various symptoms, the nature of the disease; *diagnostics*, to distinguish the symptoms of different diseases; and *prognostics*, to infer, from the past and present state of a disease, its future course. *Therapeutics* is the science of the cure of diseases, often divided into *general*, treating of the subject of cure in general, its character, &c., and *special*, of the cures of the particular diseases. *Surgery* treats of mechanical injuries, and the mode of relieving diseases and derangements by mechanical means. *Obstetrics* treats of the modes of facilitating delivery. *Materia medica* is the science of medicines, their external appearance, history, and effects on the human organization. *Pharmacy* teaches how to preserve drugs, &c., and to mix medicines. *Clinica* (q. v.), or medical practice, applies the results of all these sciences to real cases. We should mention, in this connexion, the history and literature of medicine, the history of diseases, a very interesting branch, political medicine, which is divided into medical police and forensic medicine, that branch which enables the physician to give to courts and other legal authorities proper explanations in regard to personal injuries, particular appearances of the body, &c., as whether a wound was mortal, how inflicted, whether a child was dead before born, &c. In many countries, physicians are appointed by the government for this purpose. We must last mention *midwifery*, as taught, in many countries, to women, who make a regular study and business of it. A student of medicine ought to be well versed in the two learned languages, and cannot dispense with a respectable knowledge of English, French, German, and Italian. Among the works which treat of medicine at large are *Dictionnaire des Sciences Médicales par une Société de Médecins et Chirurgiens* (Paris, Panckoucke, containing 60 vols., 1812 to 1822), and *Journal complémentaire du Dict. des Sciences Med.* (from 1818 to 1824, 17 vols., still continued); *Encyclop. Wörterbuch der Medicin. Wissenschaften* (edited by the professors of the medical faculty at Berlin—Graf, Hufeland, Link, Rudolphi, von Siebold, Berlin, vol. i., 1827); also Good's Book of Medicine.

*Medical Geography* is geography applied to medicine, treating all the subjects of geography which have any influence upon the health, the bodily structure, activity of mind, and the diseases of men. It is

\* Some add here, anthropochemie or the chemistry of the human body, the chemical composition of all its parts—a most important branch, but usually treated under general chemistry.

a science of great interest.—See *Geographical Nology* in (German), Stuttgart, 1823, by Schnurrer.

*Medical Topography* is the description of single places or tracts of country as to the circumstances which make them interesting in a medical point of view—the winds, rivers, springs, mountains, the sea, woods, plains, structure of the houses, way of living of the people, their amusements and customs; in short, every thing which affects the health of the inhabitants. Geographical situation, elevation, &c., belong to a complete medical topography. See *Metsler's Guide for the drawing up of Medical Topographies*, in German.

MEDIETAS LINGUÆ; a jury or inquest, whereof the one half consists of denizens, the other strangers, in pleas wherein the one party is a stranger.

MEDINA, or MEDINA EL NEBI (the city of the prophet); before the days of Mohammed, *Jathreb*, anciently *Iatrippa*; a city of Arabia, in Hedjas, 70 miles E. of Jembo, its port on the Red sea, 180 N. of Mecca; lon. 40° 10' E.; lat. 25° 13' N.; population about 8000. It is regarded by Mohammedans as sacred, from its containing the tomb of Mohammed. Most of the houses are poorly built, and the place is of no importance, except from its containing the sepulchre of Mohammed. This sepulchre is held in high veneration by Mohammedans, yet the visiting it is not considered necessary or highly meritorious, and Medina is much less visited by pilgrims than Mecca. Neither the tomb nor the mosque in which it is enclosed, is distinguished by any magnificence; but it was remarkable for an immense treasure of pearls, precious stones, &c., accumulated for ages by the contributions of rich Mohammedans, until it was pillaged by the Wahabees, a few years since. See *Mohammed*.

MEDINA SIDONIA, ALFONSO PEREZ GUZMAN, duke of; admiral of the armada. (q. v.) Philip II. received him, after his disaster, with unexpected favour. Medina died in 1615.

MEDITERRANEAN SEA (*Nostrum Mare, Internum Mare*, with the Romans); the large mass of waters between Europe, Asia, and Africa, which receives its name from its inland position, communicating with the great ocean only by the straits of Gibraltar. Its northern shore is irregular, forming large gulfs which have received separate names; between the western coast of Italy and the islands of Corsica and Sardinia, it is called the *Tuscan*, or *Tyrrhenian sea* (*Mare Inferum*); between Italy and Illyria and Dalmatia, the *Adriatic*, or *Gulf of Venice*; farther south to the west of Greece, the *Ionian sea* (the two latter formed the *Mare Superum* of the Romans); to the north-east of Greece, between Turkey in Europe and Nalolia (Asia Minor), the *Archipelago*, or *Ægean sea*. Its southern shore is less indented. It receives the waters of the Black sea, by a current which sets constantly through the Dardanelles, and thus mingles the waters of the Danube, the Po, and the Nile, with those of the Dnieper and the Ebro. Its length from east to west is about two thousand miles; its general breadth varies from 7—800 to 4—500 miles; between Genoa and Biserta it is about 375 miles; between the southern part of Italy and cape Bon, not quite 200 miles. The principal islands of the Mediterranean are the Balearic isles, Corsica, Sardinia, Sicily, Elba, the Lipari islands, Malta, the Ionian isles, Candia (Crete) and Cyprus. (See these articles.) The winds are irregular, the tides variable and slight, rarely exceeding two feet of rise and fall, and the sea is generally short and rough. A strong central current sets into the Atlantic through the straits of Gibraltar; on each shore are superficial counter currents setting in from the ocean into the sea; but a

rapid under current sets out. In a common point of view, the Mediterranean is of the greatest importance, its shores contain numerous celebrated ports, and its waters are covered with the ships of all the western nations. The different maritime powers maintain a naval force in the sea, which has been too long infested with pirates. Its coasts were in ancient times some of the earliest civilized nations the Phoenicians, Carthaginians, Greeks and Romans. See *Steel's Chart of the Mediterranean*, London 1801.

*Mediterranean Pass*. In the treaty between Britain and the Barbary states, it used to be agreed, that the subjects of the former should pass to or from the coast of the latter unmolested by the cruisers of those states, in order better ascertaining what ships and vessels belonged to British subjects, it was provided, that they should produce a *pass* under the hand and seal of the high admiral, or the lords commissioners of the admiralty. The passes were made out at the admiralty, containing a very few words, written on parchment with ornaments at the top, through which a scalloped indenture was made; the scalloped part was sent to Barbary, and being put in possession of the cruisers, the commanders were instructed to allow all persons to pass who had passes thus made: these scalloped tops.

MEDIUM (Latin, *middle* or *inter*); a cover the space or substance through which a body moves or acts. Thus air is the medium through which sound is transmitted, light passes, &c. A *transparent medium* is that which allows the free passage of light; a *refracting medium* is one which turns them aside in their course.

*Medium*, in logic. See *Syllogism*.

MEDIUM, CIRCULATING. See *Circulating Medium*.

MEDLAR (*æspilus Germanicus*): a small European tree, allied to and somewhat resembling the quince, and belonging to the natural family roseæ. The flowers are moderately large, white, and occur at the extremities of the branches; the fruit on peduncles are cottony; the fruit, in the cultivated varieties, is large, and, before it is perfectly ripe, is an excessively austere and astringent fruit. The medlars do not ripen naturally on the tree, but are collected in the autumn, and spread upon a flat position. They have now a sweet, ruddy taste which, however, is not to the taste of most people.

MEDOC; formerly a country of France, in a western part of Guenne, between the Garonne and the sea, in the present department of the Gironde. A great part of it is covered with woods and marshes, along the Garonne, the soil is fertile, and produces excellent wines. See *Bordeaux Wine*.

MEDULLA, in anatomy; the fat substance which fills the cavity of a long bone. See *Bone* and *Marrow*.

*Medulla*, in vegetable physiology; the pith of plants, is lodged in the centre or heart of the vegetable body. In the parts most cultivated with respect to the root, or especially young growing stems or branches, the medulla is usually of a pulpy substance, tolerably firm, though rather brittle. In some plants, pale green, or yellowish, with a watery transparency, the substance being very juicy. Its juice is green but little, or not at all, of the peculiar flavour of the plant, they being more of the nature of sap, in the branches or stems more advanced in growth, the medulla is found of a drier, more white, and more cellular texture. In this state, it is well known in the full grown branches of elder, the stems of rose &c. In these, it is dry, highly cellular, and extremely light and compressible, though but slightly elastic. In the greater number of plants, as in

are perceptible in the pith, but in some, entire vessels, conveying proper juice, are present, as in the gum elastic fig-tree, the proper juice of which is seen exuding from different points of the pith, in an horizontal section of the stem. Little is yet known, with certainty, concerning the functions of the pith. It appears, on the whole, to be a mere reiteration of the cellular envelop, and subservient to the vessels which surround, and occasionally pass through it.

**MEDUSA.** See *Gorgons*.

**MEERMAN, JOHN**, a Dutch scholar and statesman, born at the Hague, in 1753, was the only son of Gerard Meerman, known as the author of a *The-saurus Juris civilis et canonici*, and *Origines Typographice*, and who had been created baron of the German empire. The son received his early education at the Hague and at Rotterdam, and while hardly ten years old, translated and published, without the knowledge of his father, Molière's *Mariage Forcé*. He then studied at Leyden, at Leipsic under Ernesti, and at Gottingen under Heyne. After travelling through England, Italy, and France, he took the degree of doctor of laws, at Leyden. The number of his writings, on different subjects, proves his extensive knowledge, and his zeal for virtue and piety. In 1786, in company with his wife, he visited England, Scotland, and Ireland, Germany, Italy, and Northern Europe, and published full and accurate accounts of his travels, in eleven volumes. His time and labours were also employed in the service of the state, the church, and literary institutions. Under the reign of Louis Bonaparte, he was director of the fine arts and of public instruction in the kingdom of Holland. Some years before his death, the dignity of senator of France was conferred on him, and he was called to Paris. After the Restoration, he returned to his own country, and died in 1816. Besides his *Travels*, his *History of William, count of Holland*, and an edition with notes, of the *Histoire des Voyages faits par l'Empereur Charles V.*, by J. Vanden-esse, deserve mention. As director of the arts and sciences, he also rendered important assistance in the preparation of the *Jaarbaken van Wetenschappen en Kunsten in het Konigryk Holland over de Jaren 1806—7*. His widow, an esteemed poetess, has written his life. His valuable library, the catalogue of which is a literary curiosity, was sold by auction, at the Hague, in 1824, and brought 171,000 Dutch guilders, 32,000 of which were paid for the manuscripts. The prices have been printed.

**MEERSCHAUM.** See *Magnesite*.

**MEGERA**; one of the Furies. See *Eumenides*.

**MAGALONYX.** See *Megatherium*.

**MEGALOPOLIS** (i. e. *large city*); a city of Arcadia, one of the largest cities of Greece, on the Helis-sion, containing many temples, a stoa, &c. The theatre of Megalopolis was the largest in Greece. The city was built at the suggestion of Epaminondas, after the victory of the Thebans at Leuctra, about 368 B. C., as a city of the Boeotian league, and was peopled from thirty-eight cities. It is, at present, the considerable place Sinano. Philopœmen, Polybius, and other distinguished men, were born here.

**MEGALOSAURUS** (Greek, *giant lizard*); an extinct species of lizard, of an enormous size, which, according to Cuvier (*Recherches sur les Ossements Fossiles*, vol. ii. part 2, p. 343), would be as large as a whale, if we assign to it the proportions which its characters indicate. It was discovered in England, by Mr Buckland, and has also been found in France and Germany.

**MEGARA**; a daughter of Creon, king of Thebes, given in marriage to Hercules, because he had delivered the Thebans from the tyranny of the Orchome-nians. When Hercules went to hell, by order of

Eurysthens, violence was offered to Megara, by Ly-cus, a Theban exile, and she would have yielded to her ravisher, had not Hercules returned that moment and punished him with death. This murder dis-pleased Juno, and she rendered Hercules delirious, so that he killed Megara and the three children he had by her, in a fit of madness, thinking them to be wild beasts. (See *Hercules*.) Some say that Megara did not perish by the hand of her husband, but that he afterwards married her to his friend Iolas.

**MEGARA.** See *Megaris*.

**MEGARIS**, a small state of ancient Greece, west of Attica, occupied the upper and wider part of the isthmus of Corinth. The capital city, Megara, was rendered illustrious, not only by the firmness with which it maintained its independence, but also by a school of philosophy, founded by one of its citizens, Euclid, a disciple of Socrates. Pausanias (i. 40—44) enumerates its many splendid public buildings. See Reinganum's *Das alte Megaris* (Berlin, 1825.)

**MEGATHERIUM**, or **GIANT SLOTH**; an extinct genus of the sloth family, of which fossil remains have been found only in America. Two species have been discovered, the *M. Cuvieri* and the *M. Jeffersonii*; the latter was first described by president Jefferson, under the name of *megalonyx*, or *great claw* (Transactions of the Americ. Phil. Soc., iv. 246). The megatherium unites some of the generic character of the armadilloes with some of those of the sloth; its size must have been equal to that of the rhinoceros. Three specimens of the first species have been discovered in South America, and one in Georgia. The only fragments of the second species hitherto discovered, were found in Green Briar county, Virginia, in a saltpetre cave. See Godman's *Am. Nat. History*, vol. ii. 173—201.

**MEGRIM**, a species of headache; a pain gener-ally affecting one side of the head, towards the eye, or temple, and arising, sometimes from the state of the stomach, sometimes from rheumatic and gouty af-fections. In French it is called *migraine*, derived from *hemicrania*, from the Greek *ἡμι* (signifying, in com-pound words, *half*) and *κρανιον* (the *skull*). It affects chiefly persons of weak nerves.

**MEHUL, STEPHEN HENRY**, a celebrated musical composer, and member of the institute of France, born at Givet, in 1763, received his first lessons from a blind organist at his native place, and became such a proficient that, at the age of twelve, he was ap-pointed joint organist to the abbey of Valledieu. The desire of improving his talents attracted him to Paris in 1779. He there studied under Edelmann, and afterwards, under Gluck; and, after the depart-ure of the latter for Vienna, Méhul presented to the royal academy of music the opera of Cora and Alon-so; but his Euphrosine and Coradin was first per-formed at the comic opera, in 1790. This was fol-lowed, at different periods, by Stratonice, Irato, Joseph, and many other operas, besides the ballets of the Judgment of Paris, Dansomanie, and Perseus and Andromeda. Méhul was one of the three inspectors of instruction at the conservatory of music, from its creation, in 1795, till its suppression, in 1815. He was then appointed superintendent of music at the king's chapel, and professor of composition at the royal school of music. He was chosen a member of the institute in 1796, and of the academy of fine arts in 1816, and was also a knight of the legion of honour. He died at Paris, 1817. Méhul read before the in-stitute two reports *Sur l'Etat Actuel de la Musique en France*, and *Sur les Travaux des Elèves du Con-servatoire à Rome*.

**MEIBOM, JOHN HENRY** (in Latin *Meibomius*), a celebrated physician, was a native of Helmstadt,

where he was born in 1590. After travelling in Italy, and taking his doctor's degree at Basil, he returned home, and occupied a medical chair in the university of Helmstädt. In 1626, he was appointed physician of Lubeck, where he died in 1655. His works are *Aurelii Cassiodori Formula Comitum Archiatrorum* (1668, 4to); *De Usu Flagrorum in Re medica et venerea*; *Jurjurandum Hippocratis, Gr. et Lat.*, with commentaries relative to the history of Hippocrates, his disciples, &c. After his death appeared his treatise *De Cerevisiis, Potibusque et Ebriaminibus extra Vinum aliis*.

His son, *Henry Meibom*, also a physician, was born at Lubeck in 1638, and became professor of medicine in the university of Helmstädt. In 1678, he was made professor of poetry and history. He was the author of numerous medical and anatomical dissertations, and distinguished himself by his investigation of the sebaceous glands and ducts in the eyelids, the valves of the veins, and the papillæ of the tongue. His principal historical publication, *Rerum Germanicarum Tomi tres*, is a collection of writers on German history. He also wrote many pieces concerning the dukes of Brunswick and Lunenburg, and, in 1687, he published *Ad Saxoniam inferioris Historiam Introductio*. Henry Meibom died in 1700.

MEIBOMIUS, MARCUS, a learned philologist, born at Tonningen, in the duchy of Holstein, in 1630. Settling at Stockholm, he acquired the favour of queen Christina, whom he inspired with much of the same enthusiasm, with respect to the ancients, which possessed himself. Having prevailed upon his royal mistress to be present at a concert, which he proposed to conduct entirely upon the plan of the ancient Greeks, and at which professor Naudaus was to dance a Greek dance, the ridicule of some of the courtiers at the absurdity of the performance, excited his anger so violently, that, forgetful of the presence of the sovereign, he struck M. Bourdelot, a physician, who, as he fancied, encouraged it, a violent blow in the face. This indiscretion induced him to quit Sweden for Denmark, where he obtained a professorship in the college established for the education of the young nobility at Sorø, was eventually advanced to the rank of a royal counsellor, and made president of the customs. His inattention to the duties of his post soon caused his removal, on which he removed to Amsterdam, and became historical professor there, but lost this appointment, also, by his petulance in refusing to give lessons to the son of one of the principal burgomasters. After visiting France and England, Meibomius returned to Amsterdam, and died there, in 1711. His principal work is an edition of the seven Greek musical writers Aristoxenus, Euclid, Nicomachus, Alypius, Gaudentius, Bacchius, and Aristides Quintilianus, with an appendix, containing the *De Musica* of Martianus Felix. His other writings are *Dialogues on Proportions*, *On the Construction of the Trireme Gallies of the Ancients*, and an edition of *Diogenes Laertius* (2 vols., 4to).

MEINAU; a charming island in the beautiful lake of Constance, belonging to Constance, with fifty inhabitants and an ancient castle. It is much resorted to by travellers in Switzerland.

MEINERS, CHRISTOPHER, born at Ottendorf, kingdom of Hanover, in 1747, studied at Göttingen from 1767, and afterwards became one of the most valuable teachers there. His works are very numerous, on various subjects, and of unequal merit. As an academical teacher, his activity in organizing and promoting the prosperity of his university was untiring, and it is much to be regretted that his history of the university was left incomplete. His favourite study was the history of human civilisation, and particularly of religion, to which some of his earliest writings,

among them his *Historia Doctrinae de Deo*, are relate. His latest work on this subject, *Agrorum Critische Geschichte der Religion* (Helmst. 1791; 2 vols.), is, however, more defective a manner of criticism and clearness of arrangement than his previous writings. Some of his earlier works bear the impress of a judicious, calm, and sagacious thinker. From his writings on the south sea, and particularly from his learned treatise of the nature of learning in the fifteenth and sixteenth centuries, a new Bayle may find materials for study of defence. A French translation of his work of the Origin, Progress, and Decline of Learning in Greece and Rome procured him election into the national institute. He died in 1810.

MEININGEN, SAXE (an German. *Erzherzogthum Meiningen-Hildburghausen*); a duchy in the western confederation, belonging to the ducal house of two Meiningen, of the Gotha branch of the Ernestine line. (See *Saxony*.) The population of the duchy is 130,500, on an area of 870 square miles, but one half of which was acquired in 1825 by the extinction of the male Saxe-Gotha line. The duchy, in conjunction with the other princes of the Ernestine line, has the twelfth vote in the diet, as has by himself one vote in the *plénium*. The religion is Lutheran. In 1824, a new constitution was granted by the duke to the part of the province then under his government, advancing the prince to the ducal diet as a third estate. The contingent to the army of the confederacy is 1150 men, 750,000 guilders; debt, 2,500,000. The capital is Meiningen, with 4500 inhabitants, containing a large and handsome ducal palace, with a library of 24,000 volumes and the state archives. (See *Germany*. Long. 10° 24' E.; lat. 50° 35' N.

MEIONITE. See *Scapulate*.

MEISSEN, the oldest city in the kingdom of Saxony, was built by the emperor Henry I. as a bulwark against the incursions of the Slavonians. It lies on the left bank of the Elbe, population, 4100. In the vicinity is a school, established by the elector Maurice, in 1543, in the building of the ancient Albrecht monastery. Lon. 12° 11' E., lat. 51° 19' N. The cathedral, an old monument of German art, is a remarkable building. The porcelain manufacture has been carried on here since 1710.

MEISSNER, AUGUSTUS GOTTLIEB, born at Meissen, in 1753, studied law and the belles-lettres at Leipzig and Wittenberg from 1773 to 1778, and died at Fulda, where he was director of the high seminaries of education, in 1807. He was also, for some time, professor of aesthetics and classical literature at Prague. His works were, at one period, very popular in Germany. A glowing imagination, an easy style, grace, wit, and a brilliant manner, united with a delicate tone of gallantry, were the causes of his success. His principal productions are comic operas in the French style; Sketches, a miscellaneous collection of anecdotes, tales, &c.; several humorous romances, as *Alcibiades*, *Bianca Capello*, &c. He also translated Hume's History of England.

MELA, POMPONIUS; a geographer, who flourished during the first century of the Christian era. Little more is known of him than that he was a native of Spain, and the author of a treatise, in three books, in the Latin language, *De Sine Orbis*, containing a concise view of the state of the world, so far as it was known to the ancient Romans. Among the best and best editions of this work are that of A. de Novius, (Lugd. Bat. 1782, 8vo), and the very complete one of C. H. Tschirckius (Leipzig, 1807, 2 vols., 8vo), and the more complete one by G. Schertz (Leipzig, 1816).

MELAMPUS; the son of Amphyon and Demeter.

brother to Bias. Fable relates many wonderful things of his skill in the healing and prophetic arts. serpents which, when a youth, he had taken under his protection and brought up, having licked his ears while he was sleeping, he found that they opened in such a manner that he was able to understand the voices of birds and insects, and could do almost to mankind every thing that these voices intimated concerning the future. Bias fell in love with his fair sister Pero, daughter of Neleus, king of Pylos, the elder of the two brothers, but he required as a nuptial present for his daughter, the herd of oxen belonging to Iphiclus, a Thessalian prince. Melampus took to steal the herd for his brother, but was detected and imprisoned. He, however, succeeded, in his prophetic art, in gaining the favour of Iphiclus, who gave him his liberty, and sent the oxen as a nuptial gift to Bias. Melampus married Iphianassa, daughter of Proetus, king of Argos, and received her, as a dowry, a third part of the kingdom. The time in which he lived is unknown; he is generally considered, however, as having been a wise man who was well skilled in all the ancient mythology, and who introduced the worship of several of the gods, together with the Eleusinian mysteries, into Greece, on which account he received divine honours.

MELANCHTHON, PHILIP, Luther's fellow labourer in the reformation, was born February 16, 1497, at Bretten, in the palatinate of the Rhine. His father, George Schwartzerd, was keeper of the treasury of the count palatine, and died in 1507, and his mother, Barbara, was a near relative of the famous Reuchlin. He was distinguished at an early age by his intellectual endowments. His rapid progress in the ancient languages, during his boyhood, made him a peculiar favourite with Reuchlin. On his advice, he changed his name, according to the custom of the learned at that time, from Schwartz-blackearth, into the Greek name Melanchthon, of the same signification, and, in 1510, went to the university of Heidelberg. Here he was preeminent in logical and philosophical studies, so that, in the year, he was deemed qualified for the degree of bachelor of philosophy, and was made instructor of the young counts. But as this university denied him the dignity of master, on account of his youth, he went to Tübingen, in 1512, where, in addition to his studies, he devoted himself particularly to geometry, and, in 1514, after obtaining the degree of doctor, delivered lectures on the Greek and Latin languages. His profound knowledge is proved by his grammar, which he published about this time. The popularity of his lectures soon gained him universal esteem, and the great Erasmus himself gave him, in the praise of uncommon research, correct knowledge of classical antiquity, and of an eloquent style. When he had to lament the loss of its chief ornament, Melanchthon, being invited, on Reuchlin's recommendation, to Wittenberg, appeared, in 1518, at the university, in his twenty-second year, as professor of the Greek language and literature. His enlightened mind soon decided him in favour of the evangelical truth; and his judgment, ripened by classical study, his acumen as a philosopher and the uncommon distinctness and order of his views which spread light and grace over whatever he touched, the caution with which he advanced from doubt to certainty, and the steadfast zeal with which he held and defended the truth when found,—a combination of great qualities and merits, at all times rare, contributed greatly to the progress and success of the reformation, in connexion with Luther's activity, spirit, and enterprise. Melanchthon's rise as a scholar, his mild, amiable character, his moderation and candour with which he treated

the opposite party, made him peculiarly suitable for a mediator. No one knew better than he how to soften the rigour of Luther, and to recommend the new doctrines to those who were prepossessed against them. His *Loci theologici*, which appeared first in 1521, opened the path to an exposition of the Christian creed, at the same time scientific and intelligible, and became the model to all Protestant writers of dogmatics. He urged decidedly, in 1529, the protest against the resolves of the diet of Spire, which gave his party its name. He drew up, in 1530, the celebrated Confession of Augsburg. This and the apology for it, which he composed soon after, carried the reputation of his name through all Europe. Francis I. invited him to France, in 1535, with a view to a pacific conference with the doctors of the Sorbonne, and he soon after received a similar invitation to England. Political reasons prevented him from accepting either of the invitations. He went to Worms in 1541, and, soon after, to Ratisbon, to defend the cause of the Protestants, in the conferences commenced there with the Catholics. But, unfortunately, the wisdom and moderation, which he there manifested, failed, on account of the opposition of the papal legate, to produce the peace which he so earnestly desired; and while the reasonable part of the Catholics learned, on this occasion, to respect him more highly; he had to endure, from his own party, bitter reproaches, for the steps for effecting a compromise, upon which he had ventured after mature deliberation. The same thing happened to him, when, having been invited to Bonn, in 1543, by the elector Hermann of Cologne, he tried to introduce the elector's plans of reformation in a conciliatory spirit towards the Catholics. Meanwhile, neither Luther, nor any other of his friends, who knew his noble heart and upright piety, ever entertained a doubt of the purity of his intentions, or his fidelity to the gospel.

Much as Melanchthon had to suffer from Luther's vehemence, the friendship of these two noble-spirited men, agreeing in sentiment and belief, remained unbroken till Luther's death, whom Melanchthon lamented with the feelings of a son. A great part of the confidence which Luther had enjoyed, now fell to him. Germany had already called him her teacher, and Wittenberg revered in him its only support, and the restorer of its university, after the Smalcaldic war, during which he fled hither and thither, and spent some time in Weimar. The new elector, Maurice, also treated him with distinction, and did nothing in religious matters without his advice. But some theologians, who would fain have been the heirs of Luther's glory, could not forgive him, that love to Wittenberg had induced him to submit to this prince, who had rendered himself suspected by the whole Lutheran church, and that the Protestants nevertheless persisted in regarding him as one of the pillars of their faith. They attacked his dogmas, and raised suspicions of his orthodoxy. Melanchthon had indeed shown, in his negotiations with the Catholics, that many an ancient usage, and even a conditional acknowledgment of the papal authority, did not seem to him so dangerous as to Luther. Moreover, the gradual approach of his views (respecting the presence of Christ in the supper) to the Swiss reformers, was known, and the alteration which he had, in consequence, made in the article of the Augsburg confession concerning the supper, was censured by friend and foe. He also explained the doctrine of justification more definitely, and according to his convictions, more scripturally, both in the later editions of his *Loci theologici*, and in other public writings, and explicitly avowed his deviation from the Augustine system, by the assertion that the free

will of man must and could co-operate in his improvement,—as all will perceive who read his works with attention. His habit of continually advancing in his researches, and correcting his opinions, had, unquestionably, a greater share in this change than his natural timidity and love of peace; although, from the last cause, he often used milder language than was agreeable to the rigid Lutherans; but that from fear of man, or a weak spirit of compliance, he ever yielded in any essential point of evangelical truth, cannot be maintained. The introduction of the Augsburg Interim into Saxony, in which, after long deliberation, Melanchthon acquiesced in 1549, under conditions which averted the danger of a relapse into ancient abuses, seemed, to the more zealous, the most fitting occasion of assailing him. The vexatious disputes respecting the greater or less importance of indifferent matters, considered in religious ceremonies, in which he was involved by Flacius; the complaints which Osiander urged against him, in 1557, on account of his doctrine of justification; and, finally, the controversies respecting the co-operation of free will in man's improvement, in which Flacius engaged him shortly before his death, brought great trouble on his over-laboured and sensitive spirit. The investigation of his orthodoxy, which was instituted at Naumberg, in 1554, resulted in his entire justification; but the reconciliation which took place there with his enemies, was, nevertheless, merely apparent; and their opposition frustrated the last attempt, which he made in 1557, at a convention at Worms, in the name of his party, to produce a compromise with the Catholics. The unity of the church was, therefore, Melanchthon's last wish, when he died at Wittenberg, April 19, 1560, sixty-three years of age.

A son survived him, who inherited the virtues but not the genius of his father, and a daughter, married in Wittenberg. His eldest daughter died in 1547; his wife, in 1557. The over-anxious mind of this good and amiable woman had often saddened his domestic peace; but he was nowhere more amiable than in the bosom of his family. Modesty and humility were exhibited in his bodily appearance. No one, who saw him for the first time, would have recognised the great reformer, in his almost diminutive figure, which always continued meagre, from his abstemiousness and industry. But his high, arched, and open forehead, and his bright, handsome eyes, announced the energetic, lively mind, which this slight covering enclosed, and which lighted up his countenance when he spoke. In his conversation, pleasantries were intermingled with the most sagacious remarks, and no one left him without having been instructed and pleased. He loved to see society at his table, and was so liberal towards the needy, that he sometimes involved himself in embarrassments. His ready benevolence, which was the fundamental trait of his character, embraced all who approached him. Open and unsuspicious, he always spoke from the heart; piety, a dignified simplicity, and innocence of manners, generosity and candour, were to him so natural, that it was difficult for him to ascribe opposite qualities to any man; often deceived and abused, he was long in learning the arts and ignoble passions which so often stood in the way of his best intentions. But this unsuspecting, benevolent character, gained him the devoted love of his disciples. From all the countries of Europe, students flocked to Wittenberg, in order to assemble around him; and the spirit of profound and impartial investigation which he inculcated, had a beneficial influence long after his death; and his exertions to promote education in general are never to be forgotten. If, therefore, stronger energies and greater

deeds must be allowed to other distinguished men of his age, he will always be considered as the most amiable, pure, and learned.

MELANGES (French, *variety*), a collection of miscellaneous works, as *Melanges de la bibliothèque* (70 vols., Paris, 1773—78).

MELANTE. See *Garnot*.

MELAS (Greek, *black*); a word which was abbreviated, appears in many compounds and in English, as *melancholy*; chiefly, however, in scientific terms, botanical, zoological, mineralogical, and medical names.

MELAS; an Austrian general, who, in 1794, was employed as major-general, and as a lieutenant field-marshal on the Staff, at the country of Treves. In 1793, he was named to the army of the Rhine, and, in March, 1794, to the army of Italy, which he commanded for a short time, and afterwards served under different generals, who succeeded him. In 1799, he was at the head of the Austrian army, which acted in concert with the Russians under Suwarrow. He distinguished himself at the battle of Cassano; was present at the battle of Trebia and Novi; beat Championnet at Ulm (November 3), and took Com. In 1800, he was at the battle of Marengo. He died in 1817.

MELASSES. See *Melassar*.

MELCARTHUS. See *Herradus*.

MELCHISEDEK (i. e. *king of righteousness*), called, in Genesis (xiv. 18), *king of Salem, and priest of the Most High God*. He is there said to have offered Abram bread and wine, after the victory of the latter over the four kings, to have received him, and to have received tithes of the booty. He is called (Heb. vi. 20; vii. 1—22) a *type* of Christ, the order of Melchisedek. The meaning of the expression, and the dignity, *kingdom*, &c. of Melchisedek, are not satisfactorily explained by others.

MELCHITES (Syrian, *Royalists*), were the name given, in the sixth and seventh centuries, to those Oriental Christians who, in compliance with the imperial orders, submitted to the decree of the council of Chalcedon. (q. v.) It was in a later period, given to the Jacobites in Mesopotamia, and to the Copts in Egypt, who were separated from the Roman church.

MELCHTHAL, ARNOLD OF (14th cent.), the place of his residence in the canton of Lucerne, one of the founders of the freedom of the country. The governor of the district, under Albert of Austria, having caused a yoke of oxen to be placed on the plough of Arnold's father, a rich peasant, the tyrant added the words, "They may drag the plough themselves, if they will." Arnold, exasperated by the insult, went to the tyrant, and saved himself by flight, but he experienced the vengeance of the tyrant, who deprived him of sight. Arnold now came to two friends, Furst and Stauffer, who bound themselves by an oath, on a night of the year, 1307, at Grutlin (Roth), on the lake of Waldstetter (see *Lucerne*), to deliverance of their country. They put in their own canton to defend the cause of the people, and, with the assistance of the commons, it, at every sacrifice, to the enjoyment of the country, was expressly agreed not to injure the nobles in their possessions and their rights, and to free them from the German empire, and not to do homage to the abbots, or the nobles. They were as far as possible, shedding the blood of the tyrants, since their only object was to deliverance to themselves and their posterity from the tyranny of their forefathers. See *Lucerne*.

**MELEAGER**; the son of Ceneus, king of Calydon; according to some, of Mars and Althæa. After the birth of the child, the Parcæ came to Althæa, and determined his fate. Clotho said that he would be magnanimous, Lachesis that he would be valiant, and Atropos that he should not die until the brand which lay upon the hearth was consumed. Althæa immediately snatched the brand from the fire, and reserved it with the utmost care. Meleager soon distinguished himself as a hero. He accompanied the Argonautic expedition, gained the prize for rowing the discus at the funeral games established by Acæstus, and distinguished himself particularly in the Calydonian hunt. (See *Calydon*.) He killed the boar, and gave the skin of the animal, as the highest token of regard, to his beloved Atalanta, who had given the beast the first wound. The others of his mother, Idrus, Plexippus and Lynceus, conceiving themselves to have been injured, robbed Atalanta of the skin, while she was returning home to Arcadia. Meleager, unable to persuade them to restore the skin, slew them all three. Althæa, furious with grief for the death of her others, seized the fatal brand, and cast it into the fire; upon which Meleager died in great agony. His story is differently told by other writers. Two excellent statues of Meleager have come down to us from antiquity.

**MELEAGER**, a Greek poet, in the first century before the commencement of the Christian era, a native of Gadara in Syria, and a resident at Tyre, died in the isle of Cos, whither he had removed in the latter part of his life. His compositions, consisting of short pieces, or epigrams, are among the most beautiful relics preserved in the Grecian Anthology (v.), and, in the simple elegance of their style and diction, are finely contrasted with the productions of more recent bards in the same collection. Some of the verses of Meleager have been translated into English by the reverend R. Bland and others, in editions from the Anthology.

**MELEDA**, or **MELITA**; a small island of the Adriatic, on the coast of Dalmatia; lon. 17° 30' E.; 42° 45' N. From 1822 to 1825, loud explosions were repeatedly heard on the island, attended with considerable agitation, and supposed to be occasioned by the shocks of an earthquake, or by discharges of some kind of gas formed in the interior of the earth. (See Partsch's *Account* (in German, Vienna, 1826).) Some writers consider it the place of Paul's shipwreck. See *Melita*.

**MELETIAN**S; the followers of Meletius, bishop of Lycopolis, in Egypt, who, in the year 306, during the persecution under Diocletian, had a dispute with Peter, bishop of Alexandria, on the subject of the re-admission of some lapsed Christians, which (Meletius) rejected. Meletius was deposed by Peter, but paid no attention to the sentence, even assumed the right of consecrating priests, which, by the laws of Egypt, belonged to the bishop of Alexandria. His gravity and piety drew many to his party. The dissensions by caused among the Egyptian clergy lasted, after the council of Nice had forbidden Meletius to exercise the episcopal duties, till almost the end of the fourth century. The Meletians joined with the Arians against the party of the orthodox Athanasius, bishop of Alexandria, but without adopting their heresy. Schismatics of the same name arose at Antioch, when Meletius of Melitene, in Armenia, chosen bishop (360) by the Arians, and afterwards driven out, on account of his orthodoxy, who considered him as the true bishop, and adhered to him alone, when he returned in the reign of Julian, were called *Meletians*. At his death,

which took place in the year 381, this name was discontinued; yet the dissensions of the church at Antioch did not cease till a later date. The Roman and Greek churches reckon this Meletius among their saints.

**MELICERTA**, **MELICERTES**, or **MELICERTUS**; son of Ino, or Leucothea, who, being persecuted by Juno, leapt into the sea. (See *Ino*, and *Athamas*.) Melicerta was changed into a sea-god, and received the name of *Palæmon*. Sailors revered him as their protector, who carried their shattered ships safely into port, whence he was called *Portumnus* (q. v.) by the Romans. He is commonly represented with a large blue beard, a key in his hand, or hanging over his shoulder, and swimming. The chief deities of the sea are described riding in a chariot. In many seaport towns, temples were erected in honour of him, and, on the island of Tenedos, children were offered to him.

**MELILOT** (*melilotus officinalis*); a leguminous plant, somewhat resembling clover, and formerly referred to that genus. It is a native of Europe, and is now naturalized in some parts of the United States. The root is biennial, and gives out one or several stems, which attain the height of one or two feet, and are provided with trifoliate leaves; the leaflets are serrated on the margin; the flowers are small, numerous, pale yellow, and are disposed in long racemes in the axils of the superior leaves; they are succeeded by an almost globular pod, containing a solitary seed. When fresh, the plant has a slight odour, which becomes stronger, and very pleasant, after it has been dried. It seems to render hay more agreeable to the taste of cattle, who, in general, and more especially sheep and goats, are very fond of it. It is adapted to every kind of soil, but, in general, is not cultivated separately. The celebrated Gruyère cheese is said to owe its excellence partly to the flowers and seeds of this plant, which are bruised and mixed with the curd.

**MELINDA**; a kingdom of Zanguebar, on the eastern coast of Africa, in the Indian ocean, having the kingdom of Magadoxo on the north, and that of Zanzibar on the south. Little is known of the country, except its sea-coast. The mass of the population is composed of native negroes, but the rulers and principal people are Arabs. *Melinda*, the capital, is situated on the Indian ocean, in lat. 3° 15' S., lon. 40° 5' E. It is large, well built, and contains a great number of mosques. Its commerce is considerable, and is in the hands of Asiatics, being rarely visited by Europeans. The exports are gold, copper, iron, and wax; provisions are abundant, and easily obtained. Vasco de Gama was well received here, but the arrogance of the Portuguese soon became insupportable to the inhabitants; a war ensued, and the city was captured by the Portuguese, who retained possession of it till 1698, when it was retaken by the Arabs.

**MELISSUS**, son of Ithagenes, and a native of Samos, flourished about 444 B.C. He is distinguished in the history of his country as a statesman and naval commander. As a philosopher, he is considered as belonging to the Eleatic (q. v.) school; he differed from Parmenides in many points, by developing the Eleatic system with still stricter consistency. Parmenides allowed credit to experience obtained through the senses; Melissus represented all existence as one eternal, unlimited, and immutable, yet material being, and rejected the experience obtained through the senses; he also maintained that nothing could be known, with certainty, respecting the gods.

**MELITA**. It is related in the Acts of the Apostles, that Paul, on his voyage to Rome, was cast

away on the island of Melita. This has generally been considered to be the island of Malta, the ancient name of which was *Melita*; but some critics have attempted to prove that it was an island on the coast of Dalmatia, in the Adriatic. See *Paul, Meleda*, and *Malta*.

MELLITE, or HONEYSTONE, in mineralogy, takes its name from its yellow colour, like that of honey. Its primitive figure is an octahedron. The crystals are small; their surface is commonly smooth and shining. Internally, it is splendid. It is transparent, passing into the opaque, and possesses double refraction. It is softer than amber, and brittle. Specific gravity 1.5, to 1.7. It becomes electric by friction. It occurs on bituminous wood and earthy coal, at a single locality in Thuringia. It consists of 46 mellitic acid, 16 alumine, and 38 water.

MELLITIC ACID; discovered by Klaproth in the mellite, or honey stone. It is procured by reducing the mellite to powder, and boiling it with about seventy-two times its weight of water; the alumine is precipitated in the form of flakes, and the acid combines with the water. By filtration and evaporation, crystals are deposited, in the form of fine needles, or in small, short prisms. It is composed of carbon, hydrogen and oxygen. In combination with the earthy alkalies and metallic oxides, it forms compounds called *mellates*.

MELMOTH, WILLIAM, son of an eminent advocate, author of a work entitled *The Great Importance of a Religious Life*, was born in 1710, and received a liberal education, but does not appear to have studied at either of the universities. He was bred to the law, and, in 1756, received the appointment of commissioner of bankrupts, but passed the chief part of his life in literary retirement at Shrewsbury and Bath. He first appeared as a writer about 1742, in a volume of *Letters*, under the name of *Fitzosborne*, which have been much admired for the elegance of their style, and their calm and liberal remarks on various topics, moral and literary. In 1757, this production was followed by a translation of the *Letters of Pliny the younger* (in 2 vols. 8vo), which has been regarded as one of the happiest versions of a Latin author in the English language, although somewhat enfeebled by a desire to obliterate every trace of a Latin style. He was, also, the translator of Cicero's treatises *De Amicitia* and *De Senectute*. These he enriched with remarks, literary and philosophical, in refutation of the opposing opinions of lord Shaftesbury and Soame Jenyns, the first of whom maintained that the non-existence of any precept in favour of friendship was a defect in the Christian system, while the second held that very circumstance to form a proof of its divine origin. His last work was memoirs of his father, under the title of *Memoirs of a late eminent Advocate and Member of Lincoln's Inn*. Mr Melmoth died at Bath, in 1799, at the age of eighty-nine.

MELO-DRAMA (from the Greek *μελος*, song, and *δραμα*), a short, half-musical drama, or that species of drama in which the declamation of certain passages is interrupted by music. It is called *monodrama* if but one person acts, *duodrama* if two act. It differs from the opera and operetta in this, that the persons do not sing, but declaim, and the music only fills the pauses, either preparing or continuing the feelings expressed by the actors. Generally, the subject is grave or passionate. The German melo-drama is of a lyrical character, with comparatively little action. Objections have been made to it on this ground, that it affords too little variety; that the music only renders it more monotonous, because it expresses only the feeling or passion already expressed in words; that the course of feeling is interrupted

by the music; and that the actor is embarrassed during the music, being obliged to fill the pause by a recitation by pantomimic action. The first idea of a melo-drama was given by J. J. Lamm, in his *Pygmalion*. The proper inventor of German melo-dramas, however, was a German law student Brandes, who wished to prepare a living part for his wife, who excelled in the declamation of free poetry. Brandes arranged a *caste of feeling*, after the fashion of *Pygmalion*. G. Schütz composed the music for it. This kind of pleasure met with great applause, and Götter was to *Medea*; others followed. But the music of these pieces was not of long continuance, because it wanted of action. In modern times, some French (instance, of Schiller) have been not to meet the melo-dramatic way. Parts of operas have been, likewise, composed in this way, as, for instance, the scene of incantation in Weber's *Freischütz*, and some scenes in the *Precious*, by the same Schütz. In his *Lectures on Dramatic Art and Literature*, on "Under melo-drama, the French do not understand like the Germans, a play, in which music alternates with instrumental music as the music in drama in high-flown prose, representing some romantic scene, with suitable decorations and a chinery." Such was its character from 1750 to 1800 and this sort of exhibition became popular in other countries. On the inclination for a still better might be built, for most melo-dramas were less and extravagant. The new melo-dramas, which have proceeded from the boulevard, are full of rude dramas, in which music is interposed, and then, in order to heighten the effect.

MELODY; in the most general sense of the word, any successive connexion or series of tones, in a more narrow sense, a series of tones which pass from one to another by their succession and variety; and, in a narrower sense, the particular art or use of a vocal piece. By melody, in its general sense, the composer strives to express particular feelings or disposition, which, in pieces of music, is chiefly effected by the principal melody, chief voice, to which the other voices, with the melodies, are subordinate. The elements by which the composer is enabled to express beautiful feelings of sentiments and feelings, by means of the vocal connexion of tones, are the variety of tones in themselves, and the variety of transitions from one to another, to which is still to be added the variety of the movements in which music proceeds. Melody and rhythm are the true sources of delight, and where they are wanting, the purity of harmony remains without effect. The very essence of melody consists in expression. It always to express some internal emotion, and one who hears it, and is able to understand language, must understand the feeling which it expresses. But as melody, in the hands of the composer, is a work of art and taste, it is necessary that, wherever other work of art, it should form a whole, in which the various means are combined to produce

\* In regard to the relative importance of melody and harmony, we may observe, that it is in vain to talk of melody as harmony and melody as more or less important, without impartial judgment acknowledging the superiority of melody. Though Rousseau, in the beginning of the century, and the melodists and harmonists, declared harmony to be the basis of music, what thought is for poetry, or drawing for painting, rhythm is, in music, what metre is in the art of versification. In drawing, as in music, the variety of its elements, the freedom of its combinations, and of its rests at the end of phrases, and otherwise, are of great use which it alone can give to instruction, in the final and essential requisite of the enjoyment of the sense of the logic of the art of music.

effect. This whole must be such that the hearer is kept constantly interested, and can give himself up, with pleasure, to the impressions which he receives. The particular qualities of a good melody are these :—It is indispensable that it should have one chief and fundamental tone, which receives proper gradations of a variation adapted to the expression. This can be effected only by letting the tones proceed according to a certain scale ; otherwise there would be no connexion between them. The chief tone, again, must be appropriate to the general idea to be expressed, because every kind of tone has its own character, and the finer the ear of the composer is, the better will he always discover the tone wanted. A very short melodies, or tunes, consisting merely of a few brief passages, the same fundamental tone may maintain throughout, or perhaps pass over into its *dominante* ; but longer pieces require change of tone, and the harmony also may receive modifications according to the feeling. Thirdly, a good melody requires rhythm. A regular advance from one part to another, whether in music or motion (dancing), affects the mind agreeably, whilst irregular progress tires. The love of rhythm is one of the most general feelings of human nature. We find rhythm everywhere, and to music it is quite indispensable, its tones without regularity of measure would be distinct and weary. Hence music is divided into motions or bars ; these, again, are divided so as to avoid monotony, without disturbing the general regularity. Accents are given to certain parts, and it is possible greatly to assist the expression of feeling, by slow or quick, gay or solemn movements, and by the variety of accents, and the even or uneven measure. Much might be said respecting the skill of the composer to adapt his music, not only, in general, the idea to be expressed, but also, in song, to the single words, to the pause, which the hearer wishes for, or the speedy movement, which he desires in other places ; the necessity of the repetition of words, the feeling is long and varied, while the word is short ; the childish impropriety of representing, as we do, by imitative sounds, the ideas presented by particular words, which is much the same as if a claimer, every time that he pronounces the word *an*, were to endeavour to represent the roaring of waves ; the parts where dissonances are admissible, &c. ; but it would carry us much beyond our limits.

**MELÖE.** These insects have the elytra, or wing covers, short, extending about half the length of the body ; the antennæ, or feelers, are jointed, of which the middle divisions are the largest. They are slow and heavy in their motions, and have a large head. They feed on the leaves and flowers of different vegetables. They do not occur in as large numbers as some of the genera closely allied to them, as *cantharis* and *lytta*, but have in common with these insects, the property of blistering the human skin. Linnæus included the well-known and valuable Spanish fly in this genus ; but it was very properly separated from it by Fabricius, and placed in the genus *cantharis*, of which it forms the type. (*Cantharides*.) These insects emit an oleaginous, viscid, or reddish liquid, from some of the joints of their feet. In some parts of Spain, they are used in place of the cantharides, or mixed with them. Mr Reille is of opinion that these are the insects spoken of by ancient writers, under the name *buprestes*, and which they considered as very injurious to the vine, and as often causing their death when swarmed with their food. The *M. proscarabæus*, which is native of Europe, exudes a large quantity of a oily matter, which has been highly recommended as a stimulating application to poisoned wounds.

There are many species of this genus found in the United States of America, the largest of which is the *M. purpureus*. Mr Say has described many of them in the Journal of the Academy of Natural Science, to which we refer for detailed accounts of them. As these insects possess the vesicating property to a considerable degree, they might, where they occur in sufficient quantities, form a very good substitute for the cantharides of the shops.

**MELON.** The musk-melon is the product of the *cucumis melo*, a rough, trailing, herbaceous plant, having rounded, angular leaves, and yellow, funnel-shaped flowers. Though originally from the warmer parts of Asia, its annual root and rapid growth enable it to be cultivated in the short summers of northern climates ; but the flavour of the fruit is much heightened by exposure to a hot sun. The form of the fruit is, in general, oval, but varies exceedingly in the different varieties, which are very numerous. In some, the external surface is smooth ; in others, rugged or netted, or divided into segments by longitudinal grooves. The odour of the fruit is delightful. The flesh is usually yellow, and has a sugary and delicious taste. It has been cultivated in Europe from time immemorial.

The water-melon is the product of the *C. citrullus*, a vine somewhat resembling the preceding, but having the leaves deeply divided into lobes. It is smooth, roundish, often a foot and a half in length, and has a thin, green rind. The seeds are black or red. The flesh is usually reddish, sometimes white, icy, and has a sugary taste ; it melts in the mouth, and is extremely refreshing. It is cultivated, to a great extent, in all warm countries of both continents, and even in high northern latitudes. It serves the Egyptians for meat and drink, and is the only medicine used by them in fevers. These two plants, together with the cucumber, gourd, &c., belong to the natural family *cucurbitaceæ*.

**MELOS** (now *Milo*) ; an island of the Ægean sea, about sixty square miles in extent, with about 500 inhabitants. The island has a wild, uncultivated appearance, sulphureous springs abound, and volcanic exhalations burst from the rocky and sterile soil. Oil, wine, cotton, and fruits, such as oranges, melons (which derive their name from the island), figs, &c., are produced. Lon. 24° 22' E. ; lat. 36° 40' N. The chief town, Milo (formerly Melos), is now occupied by only forty families. In 1814, baron von Haller discovered on the site of the ancient city, an amphitheatre of marble, with numerous fragments of statues and columns, which were bought by the present king of Bavaria. In the vicinity, a Greek peasant has since found (1820), a statue of Venus, with three Hermes, figures three feet high, which were bought by the marquis de la Rivière, French ambassador at Constantinople, and are now in the royal museum at Paris. The Venus is of the finest Parian marble (*Grechetto*), to which the colour of ivory has been given ; it is called by the Parisian amateurs, *la Femme du Torse*. Though much injured, the head is not separated from the body. As she held the apple, she was a *Venus victrix* ; and she appears to have been modelled after the naked Venus of Praxiteles. See Clarac's and de Quincy's Descriptions (Paris, 1821) ; others have supposed it to be a statue of Electra. See *Venus*.

**MELPOMENE** ; one of the Muses, daughter of Jupiter and Mnemosyne. She presided over tragedy. Horace has addressed the finest of his odes to her, as to the patroness of lyric poetry. She was generally represented as a young woman with a serious countenance. Her garments were splendid ; she wore a buskin, and held a dagger in one hand, and in the other a sceptre and crowns.

MELROSE, the name of a parish and village in Roxburghshire, Scotland. The parish is about seven miles in length, and five in breadth, and is distinguished for its beauty and fertility. Population in 1831, 4,339. The village (distant from Edinburgh thirty-five miles south), is small, and derives its main importance from the ruins of the celebrated abbey of Melrose, situated in its vicinity. Melrose abbey is, on all hands, admitted to be the most beautiful of all the ecclesiastical ruins in the island. It was built by king David, in 1136. The public attention was first particularly drawn to it by Sir Walter Scott, in his *Lay of the Last Minstrel*, and it has since become a favourite subject of the poet, the painter, and the tourist.

MELUN (*Melodunum*); an ancient city of France, on the Seine, nine leagues from Paris; lat.  $48^{\circ} 32'$  N.; lon.  $2^{\circ} 39'$  E. It has some manufactures, and three annual fairs; population, 7,250. The Seine, here forms an island, and is crossed by two stone bridges, one of which has an arch of 159 feet ten inches span, and fourteen feet ten inches high. Louis XIV. and his court resided here some time during the war of the Fronde. Abeillard established his school here in the twelfth century.

MELUSINA; a well known personage in the fairy world; according to some, a kind of female sea-demon, according to others, the daughter of a king of Albania, and a fairy. Paracelsus makes her a nymph. She is generally considered a powerful fairy, who married a prince of the house of Lusignan. She was, like most fairies of her time, obliged, on certain days of the month, to take the shape of a fish, at least in respect to half her body; she had, therefore, strictly enjoined the prince, her husband, with whom she lived most happily in the castle of Lusignan, to leave her alone on such days, and not to dare to look at her. The prince, however, like other mortals, was curious, entered her chamber on one of the forbidden days, and saw her in her state of metamorphosis. She immediately uttered a shriek, and disappeared; but ever after, when an important death was about to take place in the family of Lusignan, and when they became related to the kings of France, also in the royal family, she appeared in a mourning dress, on a lofty tower of the castle, until, at last, this tower was demolished, in 1574, by order of the duke de Montpensier, which she strove in vain to prevent, by frequent apparitions. Various versions of this story exist.

MELVIL, SIR JAMES, a statesman and historian, was born at Hall-hill, in Fifeshire, in 1530; and, at the age of fourteen, became page to Mary, queen of Scots, then wife to the dauphin of France. After having travelled and visited the court of the elector palatine, with whom he remained three years, on the accession of Mary to the throne of Scotland, Melvil followed her, and was made privy counsellor and gentleman of the bed-chamber, and continued her confidential servant until her imprisonment in Lochleven castle. He was sent to the court of Elizabeth, and maintained correspondences in England in favour of Mary's succession to the English crown. He died in 1606. He left a historical work in manuscript, which was published in 1683, under the title of *Memoirs of Sir James Melvil*, of Hall-hill, containing an impartial Account of the most remarkable Affairs of State during the last Age.

MELVILLE ISLAND, in the Polar sea; one of the north Georgian group, between  $74^{\circ}$  and  $76^{\circ} 50'$  N. lat., and  $105^{\circ} 40'$  and  $113^{\circ} 40'$  W. lon. It is surrounded with enormous masses of ice, and the only vegetation is moss. Captain Parry discovered it in 1819, and passed the winter of 1819—20 there. Its only inhabitant in winter is the white bear. See *Polar Seas*.

Melville is also the name given to a kind of the Indian ocean, near the northern end of New Holland; lat.  $11^{\circ} 20' 8''$ ; lon.  $120^{\circ} 0' 1''$ . It was discovered by captain King, in 1810, and, in 1819, the British government formed a company for the purpose of establishing commercial relations with the Malays. The settlement received the name of *King's Cove*, and the harbour that of *Port Canton*.

MEMEL; the most northern town of Prussia, at the mouth of the Dange, on the banks of a.  $55^{\circ} 42'$  N.; lon.  $21^{\circ} 3'$  E.; population 10,000. The harbour is good, safe, and strongly fortified. About 600 ships enter and leave it yearly. Its exports are corn, hemp, skins, which first used not out from Lithuania.

MEMEL. See *Niemem*.

MEMNON, according to fable, was the son of Tithonus and Aurora, and the brother of Memnon. According to some, he was king of Egypt, according to others, of the Assyrians. He had a splendid palace and a labyrinth at Babylon, a lion and another palace at Susa, in Persia, which he received from him the epithet of *Memnonius*. From king of Troy, induced him, by the promise of a golden vine, to come to his assistance against the Greeks. He performed many valiant exploits, and was slain by Achilles himself, by whom he was finally taken to Jupiter, being requested by Aurora to honour her with some peculiar mark of distinction, and a numerous crowd of birds to arise from his side (Memnonides), which annually returned to his grave and fought with each other, thus celebrating his memory, funeral games in honour of his memory. At his death, he was worshipped as a hero. At Thebes on the left bank of the Nile, in the ruins of the Memnonium (palace of Memnon), are still to be seen the remains of colossal statues of Memnon. One of these uttered a joyful sound when the sun rose and shone upon it, but when the sun set, it uttered a mournful. It is also related, that it had oracles, and gave out oracular responses in seven voices. The sound was heard till the fourth century after Christ. Descriptions of this sounding stone, or accounts of the sounds heard, are to be found in the works of Pausanias and Strabo, and among many authors, in those of Porphyry and Lucian. There have been many hypotheses concerning its nature and also concerning the story of Memnon. Bion in his *Amalthæa*, (vol. ii. page 174, above) Memnon and Phænomenos were the same, and the statue of Memnon represents a hero worshipping the sun, a king or priest saluting the god. Bion deposited in the British museum, in 1810, the fragment of such a statue of Memnon, which is called a younger Memnon.

MEMOIRS, HISTORICAL, are writings in which a person sketches the events experienced as witnessed by himself to furnish matter for his own reflection. They differ from a complete history, or chronicle in the limited nature of their subject, and in only of particular events or persons. The authors, too, have either taken part personally in the scenes described, or have been connected with the actors so intimately as to have derived thorough information from the most trustworthy sources. We do not to expect from them the same precision of arrangement and style which is required in a regular historical work. They are, however, more valuable in proportion as this license is not abused, and the relation is easy without being negligent. They furnish the inquirer with interesting materials, and often expose the most secret motives, disclose the whole character of events, which are either totally mentioned, entirely omitted, or merely hinted at in

timid circumspection, in books of general history, develop details of secret plots and projects, of which he result only is noticed in history, and, under certain limitations, they are entitled to a high degree of credit. They are no less interesting on account of showing the individual character of the writer in his manner of relating events, even supposing his views to be partial, limited, and affected by party prejudices. These qualities give them an advantage over other kinds of historical writings, since they satisfy the mere reader for amusement, as well as the student; they are by the pleasing negligence of their manner, and the other by the value of their materials; although they must be acknowledged, that to the latter, the historical criticism of them is a difficult task. Xenophon's *Anabasis*, and Cæsar's accounts of his campaigns (*Commentaries*) are generally considered as the oldest memoirs. But France is the native soil of *memoires*, in the historical literature of which country they form a national peculiarity, and where, since the end of the fifteenth century, they have been continually becoming more numerous. The memoirs of Philip de Comines, Brantôme, Sully, Joinville, and Cardinal de Retz (see these articles, and *French literature*) deserve particular notice. The memoirs of Martin du Bellay, which relate to the period from 1513 to 1516 (Paris, 1569, folio, edited in a modern form, by Lambert, Paris, 1753, 7 vols.), are distinguished for vigorous delineation and the national feeling which they display. Blaise de Montluc, in his memoirs, 1521—69, called, by Henry IV., *the dier's bible* (Paris, 1746, 4 vols., 12mo), is no less frank in revealing his own faults than in commending his own virtues; lively and striking description blended with the verbosity of an old soldier. Michel de Castelnau is distinguished for the highest intellectual honesty, for the soundness, maturity, and firmness of his judgment, as much as for his dignified and tranquil manner (Memoirs, 1559—70, 4 vols., 1731, 3 vols. folio). Margaret of Valois, wife of Henry IV., relates the history of her life (1561—81) with much, although somewhat superficial elegance and feminine adroitness, but at the same time, evident good nature (Hague, 1715, 2 vols.). Richelieu (1550—1600, Amsterdam, 1623, 3 vols. fol.), avows all his partiality, his effrontery, his freedom borrowing on calumny, and his far-fetched and often intelligible expressions, is an author of great importance for the history of his times, but must be read with caution. Rochefoucauld, a nobleman of acute wit, and a deep knowledge of human nature, who described the disturbances of the Fronde (1648—52) with the hand of a master, has, notwithstanding his obvious partiality, great clearness and sagacity in narrating and developing events, and shes admirable portraits of the principal persons described, and is distinguished for animation and natural colouring. His style (which is often, little propriety, compared to that of Tacitus) is manly, and sententious, and his language measured, and concise (Trevoux, 1754, 2 vols., 12mo; Paris, 1804, 18mo). Among the numerous French memoirs, those of D'Étrées, Marquis de Torcy, and Montyon are of especial interest for diplomatists. We may mention also those of St Simon, Duclos, and madame D'Épinay. These may be added also the works of the Abbé de La Rivière, the Confessions of Jean Jacques Rousseau, the Correspondence of Grimm and of La Harpe; the Diary of Bachaumont; the *Considérations sur la Révolution* of Madame de Staël; Garat's *Journal* on Suard and the eighteenth century; the *Mémoires* of Madame Laroche Jacquelin, &c. In a few years there have been begun in Paris great collections of memoirs, which are of high

importance for libraries and collectors; the first is *Collection complète des Mémoires relatifs à l'Histoire de France depuis le Règne de Philippe Auguste jusqu'au Commencement du dix septième Siècle; avec des Notes sur chaque Auteur et des Observations sur chaque Ouvrage, par Monsieur Petitot*. This collection consists of forty-two volumes, and is completed. The second is a sequel and continuation of the preceding, under the title of *Collection. etc. depuis l'Avènement de Henri IV. jusqu'à la Paix de Paris, conclue en 1763*, and is also arranged and edited by Petitot. The twenty-third volume of this second series appeared in April, 1823. Foucault has published these two collections with the greatest typographical accuracy. The third is a collection of memoirs, published and unpublished, relating to the French revolution. This collection, edited by Berthier and Barrière, may be regarded as a *chef d'œuvre* of its kind. Each work is preceded by a life of the author; the very correct text is accompanied by emendatory, explanatory, and supplementary notes, and at the close are generally the *pièces justificatives*, selected and arranged with great judgment and accuracy. This collection is to consist of the memoirs of Madame Roland, the marquis of Ferrières, Linguet, Dusault, the marquis of Bouillé, baron Besenval, Bailly, Rabaut de St Etienne, Mounier, the marquis of Lally-Tollendal, the marquis of Rochambeau, Riouffe, Rivarol, Louvet, general Puits, the marquis of Montesquiou, Camille Desmoulins, St Just, Necker, Cléry, Mallet du Pan, Barbaroux, Fréron, Garat, general Dophe, Beaumarchais, Ramel, Aymé, Marmontel, Pélissier, Antonelle, Courtois, Dumouriez, madame Campan, Morellet, and many others. The fourth collection contains memoirs of the British revolution, translated and edited by Guizot. This collection is also conducted with great judgment, accompanied with introductions, notes, and documents, and deserves a place in every large library. It consists of twenty-five volumes, containing the memoirs of Thomas May, or the history of the Long Parliament, those of Sir Philip Warwick, who flourished in the reign of Charles I., Sir John Berkley, Thomas Herbert and Price, Hollis, Fairfax, Huntington, Mrs Hutchinson, Ludlow, lord Clarendon, Burnet, Temple, Reresby, and others. In German, works of this description are very rare. Among the most interesting of these are memoirs of the margravine of Bayreuth, the sister of Frederic the Great, originally written in the French language; and among the most important are those of Frederic the Great himself, *Histoire de mon Temps* (History of my own Times), &c. Dohm's highly valuable Memoirs are of a different class from those of which we treat here, consisting of a series of historical treatises upon the events of our times, in which Dohm has taken more or less part, or respecting which he has made investigations. The banishment of Napoleon to St Helena, and his subsequent death, have given rise to the publication of many works of this sort, from which we have obtained valuable accounts of the most important occurrences and most prominent characters of our times. (See the works mentioned in the article *Napoleon*.) Among the British works of this description, we may mention Burnet's Memoirs of his own Times; Pepys's Memoirs, comprising his Diary, from 1659 to 1689; Evelyn's Memoirs, comprising his Diary from 1641 to 1705—6; Horace Walpole's Memoirs of the last ten Years of George II.; Calamy's Life and Times (1671 to 1731); Life of Edward, Lord Herbert of Chesham; Melvil's Memoirs relating to the Reigns of Queen Elizabeth, Mary, Queen of Scots, and James I.; Lilly's Life and Times, from

1602 to 1681; Memoirs of Gilbert Wakefield; Clarendon's Life; Life of Richard Watson, Bishop of Llandaff; Memoirs of William Hayley,—all written by the men whose names they bear. Among the American works of this class are Winthrop's Journal; Mather's Magnalia; Memoirs of R. H. Lee; of Josiah Quincy, Jun., &c.; Jefferson's posthumous works contain much information respecting the writer's times. Short literary treatises, especially those papers read before literary societies, are also called *memoirs*. The *Mémoires de l'Académie des Inscriptions et Belles-lettres* (Memoirs of the Academy of Inscriptions and Belles-lettres), and other collections of this description, are well known.

MEMORIAL; in general, whatever serves to preserve the memory of any thing; also a written representation; e. g. state papers, in which the usual forms, or most of them, especially sealing, are wanting. They are much used in the negotiations of ministers, sometimes in the replies and resolutions of sovereigns, for the purpose of avoiding all disputes in regard to rank and ceremonials. There are three sorts: 1st. those containing an address, date, and signature, in which the writer speaks in the first person, and the second person is used of the individual addressed (memorials in the form of letters); 2d. those which also contain an address, date, and signature, but in which the writer speaks of himself in the third person (memorials proper); 3. those which have no address, and often no signature, and in which the writer and the person addressed are both spoken of in the third person (notes). These papers are either written and delivered by the court or by the minister. To the former belong (a.) circulars to the diplomatic corps, that is, to the foreign agents residing at a court, communicating or requesting information, commonly with the signature of the secretary or minister of foreign affairs; also (b.) the answer of a court to the memorial of an ambassador; (c.) notes to a foreign cabinet, or to a foreign ambassador, to be transmitted with a memorial to his cabinet. The communications of ambassadors to the courts at which they reside, are generally memorials, but sometimes mere notes; letters are no longer in use.

MEMORY; that faculty of the mind which receives ideas presented to the understanding, retains them, and exhibits them again. Its power of recalling ideas is sometimes exercised with, sometimes without, an act of volition. Its strength may be greatly increased by judicious culture. Memory is so prominent a faculty of the human mind, so necessary, both in the most common transactions and the highest pursuits of life, so curious in its phenomena, and, at times, so capricious, that it formed, even at a very early period, a subject of philosophical research; and, to a certain degree, more is known about it than about any other faculty; but, beyond this point, it is as incomprehensible as the other powers. It is easy to talk of the memory in metaphors, to speak of impressions on the mind, storehouse of ideas, recalling ideas, &c.; but what is this impression? where is it made? and what does the word signify, as applied to the mind? It is only a metaphor, taken from the physical world, to illustrate an act of the mind, which we can only represent figuratively, and reasoning on this assumption is but a *petitio principii*. Without memory, the whole animal world would be reduced to a kind of vegetative life, such as we observe in the lowest classes of animals, because any variety of action presupposes memory.\* Memory embraces all ideas received

from the senses, as well as those of an abstract character; all feelings and emotion. The power of memory, in regard to ideas received from the senses, appears to be strongest as regards the sense of sight. We are able to remember a map, a picture, a landscape, a face, with great exactness and truth. The ideas of sounds are, on the contrary, less retained, the memory of them being in proportion as the sense of hearing is less acute. Music may be remembered very distinctly, as well as with the three other senses, music being not taste. The ideas received through the sense of touch would appear, cannot be remembered with the same distinctness. It is difficult to recall, with exactness, the pain of a wound; we usually are little more than the general idea of feeling; particular tastes are not easily recalled. These, indeed, may give the memory considerable power even over these ideas. The taste of his best dishes dwells in the mind of the gourmet, as without making pretensions to gourmandise, we may remember, with some distinctness, the taste of a canvass-back deck. The impressions of our sense are still more difficult to be recalled, but, nevertheless, though the unaided memory does not recall ideas received from the senses, yet this external means of comparison are presented, and are immediately revived. If we smell a flower in the spring, we recollect, at once distinctly, the smell of the same in the last spring, and are able to distinguish confounding flowers of different kinds, to our taste. These phenomena are easily explained from the fact that the ideas presented by sight or hearing, the two nobler senses, admit most easily of abstraction, and are, therefore, most easily reproduced in the mind, without the physical aid of comparison. Ideas received from objects of sense are sometimes curiously associated with ideas, as the recurrence of the first immediately suggests the second. The cases are more striking, in proportion as the organs are more acute. In instance, any thing very agreeable, or disagreeable, happens to a man at the very moment of hearing a peculiar sound, or eating something of a peculiar taste, the recurrence of the smell or taste, involuntarily awakens, in some instances, an agreeable or disagreeable feeling. We can testify from experience, that the ideas of sense times so instantaneous as to prevent the case from being recognised till after considerable reflection. Considering how many ideas, or actions, we meet through the senses, and how necessary it is that we should readily remember them, to avoid the necessity of moving constantly in the same circle, it is of the greatest importance that our senses should be cultivated

which would seem most naturally to be so. The instinct, as the feeling of frolic birds at the approach of danger, appears not to be instinctive. Captain Cooke tells the cranes in the interior of Africa to leave the land the slightest fear. Mr. de Boscawen tells us that the foxes devoid of all fear when he was in the island of St. Helena, and the birds allowed themselves to be taken with similar facts are reported by Anthonie Ponsard a writer of the Dolphin, New York, 1831, and also other writers. It would appear, then, that the fear of man is not in many animals is not so, but that, finding themselves that they have remembered the fact at the first approach of an enemy, and, by degrees, constructed their means of escape, which their young, being accustomed to observe, are imitated. Indeed, observation would seem to be necessary attributing to them, not merely the power of memory, but even the power of combining ideas to produce such. For instance, my dog sees, from my motion, that I am about to take a walk, and, having been often prohibited to follow me, steals quietly out of the room, and goes to a corner which I generally pass on my walks, and sits down. This animal, not only memory, but also the power of drawing conclusions from what he recollects.

\* Pain, indeed, when accompanied with the sense of its return, is retained with remarkable distinctness, as the pain which attended a surgical cut, or the sharp prick of a pointed steel pencil on a skin, which almost never is

\* It often seems necessary to refer to the memory certain acts of animals, which most people sweepingly refer to that unsatisfactory principle termed *instinct*. Even those actions of ani-

ice, and discriminating, which, undoubtedly, depends, in a great measure, upon their original organization;\* but they are susceptible of great improvement by exercise; and it is to be lamented that this point is so much neglected in the case of most children educated in populous cities. How dull are their senses allowed to grow, and how dull are the impressions they give! The importance of strengthening the memory, by direct exercise of its powers, undoubtedly great, and we may be allowed to say few words respecting what we conceive to be a popular error at the present time. It is constantly repeated that the highest aim of education is the development of the intellect, and that mere learning of heart tends to benumb the active powers; the consequence of which has been that the strengthening of memory is, generally speaking, much neglected. The suggestion is undoubtedly true, to a certain extent, and it would be well if it were acted on, in the particulars, more consistently than it is. The item of recitation, for instance, whereby the retention of the words of an author is substituted for understanding of his meaning, is carried to an enormous extent in the United States of America and Britain. In all branches of study where the great object is that the pupil should form clear conceptions himself, as in history, geography, natural philosophy, &c., the mere committing and reciting stated ones cannot fail to be injurious; but, on the other hand, memory is a most important instrument both in the business of life and for self-improvement; certainly, it is one of the chief objects of education to perfect an instrument which is capable of being strengthened by exercise almost beyond conception. Such exercise, however, is greatly neglected in the present systems of education. The books of reference which now abound make strong powers of memory apparently less necessary than formerly, it should be remembered that the circle of knowledge is expanding every day, that the connexion of various branches of science becomes more intimate every day, and that every day more knowledge is required for a given standing in society. Classification is the great basis of memory. From early childhood, we involuntarily classify: but effort is used to give the memory the full advantage which it may derive from this process. It would be possible for a shepherd to remember every one of his sheep, as is so commonly the case, had not his separated the generic marks from the special, by similarities and differences (*classification*), and used the means of giving each animal a particular character. A similar process takes place in the case of the learned historian. How could such a man remember without classification, the wide range of facts which he must embrace? He has acquired the habit of giving to every remarkable fact its proper place in the series of his knowledge, where it is firm-ly maintained by the relations in which it stands to, as affirming or contradicting them. This process of classification takes place, in different degrees, in every step of the intellectual scale, from the wisest philosopher to the lowest labourer; and the memory of every one, in any branch, is the better for more he classifies. A sailor, who cares not for politics, and hears of a change of ministry, has no idea, perhaps, the next day, because it was an isolated fact, totally unconnected with the

general train of his ideas; whilst the same sailor, perhaps, would recollect with the greatest distinctness, how one of his brother sailors off such an island, made himself the laughing-stock of his comrades by his clumsy way of handling a rope. A courtier will remember for life a smile from his monarch, or an unfortunate sneeze which befell him at court when taking a glass of wine. It is all-important, then, that instructors should habitually accustom their pupils to this process of classification; but, at the same time, the process of committing to memory is also one which should be steadily pursued. The poets and orators afford the pupil abundant materials for such an exercise.—The caprices of memory are often curious. How strange are the associations of ideas which often take place in spite of us! Every one must have experienced such. The writer recollects a melancholy instance in the case of an insane boy in an hospital, whose derangement was referred to an irreverent association with the name of God, which occurred to him while singing a hymn in church, and of which he could not divest himself, the painfulness of the impression making it occur to him more forcibly every time he sung in church, till his reason became unsettled. We might observe, in this connexion, that, though man can recall past impressions by a voluntary act of recollection, yet he has not the same power to divest himself of the impressions which the memory presents, by a voluntary forgetfulness. This effect he can produce only by fixing the attention on some other subjects, which may withdraw the attention from the disagreeable idea. Another caprice of the memory is, that we often try to think of a name, or fact, for days and weeks, without success, and, after the lapse of some time, when we have given up the attempt, it all at once suggests itself, when we are occupied with something totally different. To say that the mind continued its action unconsciously suggests no idea. We cannot compare the process to that of a dog separating itself from the chase in which the rest of the pack are engaged. We have no conception of such divided action of the intellect. Any metaphorical explanation of this sort conveys no more idea than Plato's explanation of weak and strong memories, comparing them to wax tablets, the one harder, the other softer. The progress of philosophy has been much hindered by mistaking illustrations for arguments. Another circumstance worthy of remark is, that old people lose their memory for recent events, but retain a lively impression of the events of their earlier years, which shows how much remembrance is influenced by the liveliness of the original impression. It is remarkable, also, how some people, in consequence of diseases, mostly nervous fevers and apoplexies, lose the memory of everything which happened before their sickness, as if it were erased from the Platonic tablet. The editor found his memory seriously impaired after a wound which had severed several nerves in the neck, but by degrees, though slowly, he recovered it. Instances have been recorded in which some sudden and violent derangement of the system has produced a state in which a person would remember everything which happened the day before yesterday, &c., but nothing which happened yesterday, &c. The next day, the relative periods of memory and forgetfulness continuing the same, he would remember what, the day before he had forgotten. We might add to those views of the importance of memory which naturally suggest themselves to every one, that nations, as well as individuals, often suffer from a deficiency of recollection. How often must the historian exclaim, Oh, if they would but remember! —For the various modes of considering this faculty,

\*diversity is obvious to all, in the different sensibility of persons to the pleasures of music and the beauties of nature. The same diversity undoubtedly exists in the smell, taste, &c.; and perhaps it is not uncharitable to say that the indulgences of the table are, in some individuals, less from philosophical moderation, than from weakness of the organ of taste.

see the popular treatises on intellectual philosophy. Locke's chapter on Retention is not very satisfactory. Dugald Stewart's treatise is principally valuable as a practical elucidation of its operations. For instances of persons distinguished for memory, see *Mnemonics*.

**MEMPHIS**; an ancient city of Egypt, whose very situation has been a subject of learned dispute. According to Herodotus, its foundation was ascribed to Menes, the first king of Egypt. It was a large, rich, and splendid city, and the second capital of Egypt. Among its buildings, several temples (for instance, those of Phtha, Osiris, Serapis, &c.) and palaces were remarkable. In Strabo's time (A. D. 20) it was, in population and size, next to Alexandria. Edrisi, in the twelfth century, describes its remains as extant in his time. "Notwithstanding the vast extent of this city," says he, "the remote period at which it was built, the attempts made by various nations to destroy it, and to obliterate every trace of it, by removing the materials of which it was built, combined with the decay of 4000 years,—there are yet found in it works so wonderful as to confound the reflecting, and such as the most eloquent could not describe." Among the works specified by him, are a monolithic temple of granite thirteen and a half feet high, twelve long, and seven broad, entirely covered within and without with inscriptions, and statues of great beauty and dimensions, one of which was forty-five feet high, of a single block of red granite. These ruins then extended about nine miles in every direction, but the destruction has since been so great, that, although Pococke and Bruce fixed upon the village of Metrahenny (Moniet-Rahinet) as the site, it was not accurately ascertained until the French expedition to Egypt, when the discoveries of numerous heaps of rubbish, of blocks of granite covered with hieroglyphics and sculpture, and of colossal fragments scattered over a space three leagues in circumference, seem to have decided the point. See Jacotin's account of the ruins in the *Description de l'Egypte*.

**MEMPHIS**; a town in the north-west angle of Mississippi, upon a high bluff, which used to be called *Fort Pickering*. This bluff is a fine, commanding elevation, rising more than 100 feet above the level of the river. At the lowest stages of the water, strata of stone coal are disclosed in the bank. The situation of Memphis seems very favourable to the growth of a town, and is now rapidly increasing. Opposite, in Arkansas, is the uncommonly high, rich, and extensive bottom land of Wappanocka. Back of the town, is a fertile, rolling country, heavily timbered, and abounding in springs. The bluffs extend three or four leagues above and below the town. Here is the great road for crossing from Tennessee and Alabama to Arkansas. These facts indicate that the local situation of Memphis is peculiarly favourable to health, and to extensive commerce.

**MEMPHREMAGOG**; a lake in North America; the greater part of it lies in Canada, and the rest in Vermont. It is thirty-five miles long and three miles wide, and communicates with the river St Lawrence by the St Francis. It receives the rivers Black, Barton, and Clyde from Vermont. Lat. 45° N.; lon. 72° 8' W.

**MEN**; an abbreviation of the Italian *meno*, less, used in music, as *men. presto*, less rapid; *men. allegro*, less lively.

**MENACHANITE**. See *Titanium*.

**MENAGE**, GILLES, a distinguished man of letters of the seventeenth century, was born at Angers, 1613, in which city his father was king's advocate. After finishing his early studies with great reputation, he was admitted an advocate, and pursued his occu-

pation for some time at Paris: he quitted that profession, he adopted the ecclesiastical order, so far as to be able to hold some votes, without cure of souls. From this time he turned himself solely to literary pursuits: and we meet into the house of cardinal de Retz, we see he self known by his wit and erudition. He took apartments in the cloister of St Louis, he held weekly assemblies *Mercure* of talent, where a prodigious memory resided in conversation entertaining, although pedantic. He was ever, overbearing and opinionative. He passed his life in the midst of petty dissipation. He saved himself from being chosen to the French academy by a witty satire, entitled *Requete des Docteurs* directed against the Dictionary of the academy, died in Paris, 1692, at the age of seventy-nine. His principal works are *Dictionnaire de l'Academie*; *Origines de la Langue Francaise*; *Langue Italienne*; *Miscellanea*, a collection of poems in prose and verse; an edition of *Laqueurs* with valuable notes; *Remarque sur la Langue Francaise*; *Anti-Baillet*, a satire, *Historia Mulierum Philosopharum*; *Annales Italiennes, Grecques, et Francaises*. He has also a *Ménagiana* was compiled from notes of conversation, anecdotes, remarks, &c., which are his most lively works of the kind.

**MENAI STRAIT**, and **BRIDGE**. This is a strait about half a mile across, between the island of Anglesea and the coast of Wales. It is the account of the celebrated bridge over the strait.

**MENANDER**, the most celebrated of the writers of the new comedy, born at Athens. He is said to have drowned himself in the sea, at the success of his rival Philomenus. He lived to the age of fifty-two years, though some ascribe his death to accident. The superior excellence of his comedies, the number of which number thirty, acquired him the title of prince of the poets. We have, unfortunately, nothing but fragments remaining of them. See *Les Fragments de Menandre et Philomenis Reliquiae*. Aristotle. They are also contained in *Plutarch's* *Life of Terence* imitated and translated him. In his comedies, we may form some idea of the character of Menander. See *Drama*, and *Greek Literature*.

**MENASSEH BEN ISRAEL**, a celebrated rabbi, was born in Portugal, about 1604. He was a rich merchant, who, suffering cruel persecutions, and person, from the inquisition, fled to Amsterdam. At the age of eighteen, the son was sent to and expounder of the Talmud, at Amsterdam. In 1632, he published, in the Spanish language, the first part of his work entitled *Ma'amar*. The next year, a Latin version was printed by J. Vossius, entitled *Chabad*. In 1643, he published *Locorum S. Scripturae pars prima*, *Opus ex rebus et revelationibus magna Industria ac Fide*. He has published three editions of the Hebrew Bible, the first in 1651, the second in 1661, and the third in 1671. In the time of Cromwell, he went to England, and for his nation more privileges than they enjoyed there. He died at Amsterdam, in 1680. His other works are the *Talmud*, *Commentarii de Resurrectione Mortuorum*. His works are dedicated to the parliament of England, the object of which is to prove that the Jews are settled in America: and an *Apology* for the Jews in the English language, printed in 1680.

**MENDELSSOHN**, Moses, a celebrated philosopher, was born Sept. 12, 1728, at Berlin.

Germany. His father, Mendel,\* a schoolmaster, though very poor, gave him a careful education. He himself instructed the boy in Hebrew and the rudiments of Jewish learning; others instructed him in the Talmud. The Old Testament also contributed to the formation of his mind. The poetical books of these ancient records attracted the boy particularly. The famous book of Maimonides, *More Nebuchim* (Guide of the Erring), happening to fall into his hands, excited him first to the inquiry after truth, and to a liberal way of thinking. He studied this work with such ardent zeal, that he was attacked by a nervous fever, which, carelessly treated, entailed upon him for the rest of his life a crooked spine and weak health. His father was unable to support him any longer, and he wandered, in 1742, to Berlin, where he lived several years in great poverty, dependent on the charity of some persons of his own religion. Chance made him acquainted with Israel Moses, a man of philosophical penetration, and a great mathematician, who, persecuted everywhere on account of his liberal views, lived also in utter poverty, and became a martyr to truth. This man often argued with Mendelssohn on the principles of Maimonides. He also gave him a Hebrew translation of Euclid, which thus awakened in the youth a love for mathematics. A young Jewish physician, named Kisch, encouraged him to study Latin, and gave him some instruction in this language; doctor Gumpert made him acquainted with modern literature. Thus he lived without any certain support, all the time occupied with study, until a silk manufacturer of his name, at Berlin, Mr Bernard, appointed him tutor of children. At a later period, he took him as a partner in his business. In 1754, he became acquainted with Lessing (q. v.) who had a decided influence upon his mind. Intellectual philosophy became now his chief study. His *Letters on Sentiments* were the first fruit of his labours in this branch. He became now also acquainted with Leibniz and Abbt, and his correspondence with the latter is a fine monument of the friendship and familiarity which existed between these two distinguished men. Mendelssohn contributed to several of the first periodicals, and now and then appeared before the public with philosophical works, which acquired him fame, not only in Germany, but also in foreign countries. He established no new system, but was, nevertheless, one of the most profound and patient writers of his age, and the excellence of his character enhanced by his modesty, uprightness, and amiable disposition. His disinterestedness was without limits, and his beneficence ever ready as far as small means would allow. He knew how to combine with delicacy the zealous efforts of Lavater to convert him to Christianity; yet his grief being himself so unexpectedly assailed, brought on a severe sickness, which long incapacitated him for scientific pursuits. In his *Jerusalem, oder religiöse Macht und Judenthum*, he gave to the world, in 1783, many excellent ideas, which were misunderstood, partly because they attacked prejudices of centuries. In some morning lessons he expounded to his son, and other Jewish scholars, the elements of his philosophy, particularly the doctrine of God. He therefore gave the name *Morning Hours (Morgenstunden)* to the work naming the results of his investigations, of which his death prevented him from completing more than a volume. F. H. Jacobi having addressed to him his *On the Doctrine of Spinoza*, he thought

himself obliged to defend his deceased friend Lessing against the charge of having been an advocate of Spinoza's doctrines. Without regarding the exhausted state of his health, he hastened to publish his piece entitled *Moses Mendelssohn to the Friends of Lessing*, and became, in consequence, so much weakened, that a cold was sufficient to put an end to his valuable life, in 1786. The German language is indebted to him, in part, for its development. In the philosophical dialogue, he made the first successful attempt among the writers of his country, taking for his models Plato and Xenophon. Besides the works already mentioned, he wrote *Philosophische Schriften* (Berlin, 1761 and 1771, 2 vols.); his masterpiece, *Phædon*, or *On the Immortality of the Soul*, which has gone through several editions since 1767, and has been translated into most modern European languages; and his translation of the five books of Moses, the Psalms, &c.

MENDEZ-PINTO, FERDINAND, a celebrated traveller, was a native of Portugal. In 1537, he embarked in a ship bound for the Indies; but, in the voyage, it was attacked by the Moors, who carried it to Mocha, and sold Ferdinand for a slave. After various adventures, he arrived at Ormus, whence he proceeded to the Indies, and returned to Portugal in 1558. He published a curious account of his travels, which has been translated into French and English. Mendez-Pinto, from his excessive credulity, has been classed with the English Sir John Mandeville, and both are now chiefly quoted for their easy belief and extravagant fiction.

MENDICANT ORDERS. See *Orders, Religious*.

MENDOZA, DON DIEGO HURTADO DE; a Spanish classic, distinguished, likewise, as a politician and a general, in the brilliant age of Charles V. He was descended from an ancient family, which had produced several eminent scholars and statesmen, and was born at Granada, in 1503. As a poet and historian, he contributed to establish the reputation of Castilian literature; but his public life displayed nothing of the finer feelings of the poet, the impartial love of truth of a philosopher, or the clear discernment of the experienced statesman. Stern, severe, arbitrary, haughty, he was a formidable instrument of a despotic court. When don Diego left the university of Salamanca, where his talents, wit, and acquirements had rendered him conspicuous, he served in the Spanish army in Italy, and, in 1538, Charles V. appointed him ambassador to Venice. In 1542, he was imperial plenipotentiary to the council of Trent, and in 1547, ambassador to the court of Rome, where he persecuted and oppressed all those Italians who yet manifested any attachment to the freedom of their country. As captain-general and governor of Sienna, he subjected that republic to the dominion of Cosmo I. of Medici, under Spanish supremacy, and crushed the Tuscan spirit of liberty. Hated by the liberals, held in horror by Paul III., whom he was charged to humble in Rome itself, he ruled only by bloodshed; and, although constantly threatened with the dagger of assassins, not only for his abuses of his power, but also on account of his love intrigues in Rome, he continued to govern until 1554, when he was recalled by Charles V. Amidst the schemes of arbitrary power, Mendoza employed himself in literary labours, and particularly in the collection of Greek and Latin manuscripts. He sent learned men to examine the monastery of Mount Athos, for this purpose, and took advantage of his influence at Soliman's court for the furtherance of the same object. After the abdication of Charles V., he was attached to the court of Philip II. An affair of gallantry involved him in a quarrel with a rival, who turned his dagger upon him. Don Diego threw

\* a very customary among the German Jews to add the *son* (son) to the name of the father. A similar usage among many Asiatic tribes, and among nations in their early stages.

him from the balcony of the palace into the street, and was, in consequence, thrown into prison, where he spent his time in writing love elegies. He was afterwards banished to Granada, where he observed the progress of the Moorish insurrection in the Alpujarra mountains, and wrote the history of it. This work is considered one of the best historical writings in Spanish literature. He was also engaged till the time of his death (1575) in translating a work of Aristotle, with a commentary. His library he bequeathed to the king, and it now forms one of the ornaments of the Escorial. (For a criticism on his writings, the reader may consult Bouterwek and Sissoni.) His poetical epistles are the first classical models of the kind in the literature of his country. They are mostly imitations of Horace, written in an easy style, and with much vigour, and show the man of the world. Some of them delineate domestic happiness and the tenderer feelings with so much truth that we can with difficulty recognise the tyrant of Sienna. His sonnets are deficient in elevation, grace, and harmony. His *canzons* are often obscure and forced. In the Spanish forms of poetry, *redondillas*, *quintillas*, and *villancicos*, he surpassed his predecessors in elegance of diction. His satires, or *burlescos*, were prohibited by the inquisition. As a prose writer, he forms an epoch; he has been called the father of Spanish prose. His comic romance, written while he was yet a student,—*Vida de Lazarillo de Tormes* (Tarragona, 1536, continued by Luna, Saragossa, 1652),—has been translated into foreign languages. The hero is a cunning beggar, and the life of the various classes of the people is described in it with great spirit and truth. The numerous imitations of Lazarillo de Tormes produced a peculiar class of writings in Spanish literature—*gusto picaresco*, so called. (See *Spanish Literature*.) His second great work, the History of the War of Granada, may be compared with the works of Livy and Tacitus. Though Mendoza does not pronounce judgment, yet it is easy to see, from his relation, that the severity and tyranny of Philip had driven the Moors to despair. The Spanish government would not, therefore, permit the printing of it till 1610, and then only with great omissions. The first complete edition was published in 1776. His complete works also appeared at Valencia, in 1776.

**MENEDEMUS OF ERETRIA**, in Eubœa; founder of the Eretrian school of philosophy, which formed a branch of the Socratic. He was a pupil of Plato and Stilpo, and ascribed truth only to identical propositions. Diogenes Laertius wrote his life. He is said to have starved himself to death because he could not engage Antigonus to restore freedom to his country.

**MENELAUS**; son or grandson of Atreus, and brother of Agamemnon. From his father-in-law, Tyndareus, whose daughter Helen he married, he received the kingdom of Sparta. He was at Crete, for the purpose of dividing the inheritance left by his paternal grandfather, Cretus, when Paris carried off his wife Helen, with a part of his treasures, and some female slaves, and conveyed them to Troy. On learning this, Menelaus, with Palamedes, went to Troy, to demand satisfaction; and this being refused, he summoned the Greek princes to revenge the affront, according to their promise. He himself led sixty ships to Troy, and showed himself a brave warrior. Homer gives him the title of *Boar ayado*, on account of the loudness of his cry in battle, and describes him as mild, brave, and wise. After the conquest of Troy, Menelaus took Helen, to return with her to his native land. Eight years he wandered before he reached home. He first went to Tenedos,

then to Lesbos and Eubœa but, being saved there by storms and tempests, he last sailed to Phœnicia, Egypt, and Libya, and on several instances, detained for a long time. He was then of Pharus, on the Egyptian coast, a cruel Proteus asleep, by the aid of Eidothea, a sorceress, was compelled him to disclose the means to take to reach home. Proteus likewise said that he should not die, but would be translated into Elysium, as a demigod and the husband of Menes.

**MENES**. See *Hieroglyphics*, *ancient Egyptian Periods of Egyptian History*.

**MENGES**, ANTHONY RAPHAEL, one of the distinguished artists of the eighteenth century, was born at Aussig in Bohemia, 1728, was the son of a talented Danish artist, who had settled in Vienna. In the sixth year of his age, the young Raphael was compelled to exercise himself in drawing daily an hour, and a few years later was directed by his father in oil, miniature, and enamel painting. His father hardly allowed him a moment for play, or idle tasks, which he was required to accomplish within given time, and severely punished him if he failed. In 1741, the young artist accompanied his father to Rome, and studied the remains of ancient times the works of Michael Angelo, in the Vatican, and finally, the inimitable productions of the Raphael in the Vatican. He was not permitted to dine there with bread and water, and as the water studies were examined with the greatest care. In 1744, his father returned with him to Bohemia, and Augustus soon after appointed him painter. A second visit to Rome was occasioned by some of his former studies, studying anatomy, &c. In his great compositions appeared in 1748 and so on, universal admiration. A holy family was particularly admired; and the young painter considered him as a model became his wife. In 1750, Dresden the king appointed him painter and painter. In 1751, he was engaged to paint a piece for the Catholic chapel, with some of the Raphael's School of Athens for the duke of Saxe-Berndorf. The seven years' war deprived him of his pension, and, in 1754, he received the decree of the new academy of painting in the capital. In 1755, the Celestines employed him to paint the altar of the church of St. Eusebius, his first work. After painting, for cardinal Albani, the fresco of his villa, and executed various other paintings, in 1761, Charles III. invited Menges to Spain, and his principal works at this time were on the gods and a descent from the cross. When he returned to Rome, he executed a great altar-piece for painting for the pope, in the church of St. Peter, after three years, returned to Madrid. In 1763, he executed the apotheosis of Trajan, a most fine work. He died in Rome, in 1778, and left seven children, thirteen having died previous to him. He was of an expensive manner of living, and he collected drawings of masters, vases, &c. &c. He absorbed all his gains, although during his eighteen years he had received 100,000 and a splendid monument was erected to his memory. His friend the cavalier d'Amara, at the wish of Raphael, and another by the empress of Russia, in 1778, Menges's composition and grouping were studied; his drawing correct and clear, his expression, in which Raphael was his model, in colouring, in every respect, are excellent. His works are finished with the greatest care. His works in different languages (published in Berlin, by G. 1783), particularly his *Remarks on Canova*, Raphael, and Titian, are highly interesting. He was the celebrated Winckelmann, rendered his name

assistance in the preparation of them. See Goethe's *Wackelmann und sein Jahrhundert*.

**MENILITE.** See *Opal*.

**MENINSKI**, or **MENIN**, FRANCIS (*Francis a'egnien*), a celebrated Orientalist, was born in Lorine, in 1623, and studied at Rome, under the named Jesuit Grattini. At the age of thirty, he accompanied the Polish ambassador to Constantinople, applying himself to the study of the Turkish language, became first interpreter to the Polish embassy at the Porte, and, soon after, was appointed ambassador plenipotentiary to that court. He was naturalized in Poland, and added the termination *ski* his family name of Menin. In 1661, he became interpreter of the Oriental languages at Vienna, and is intrusted with several important commissions. 1669, going to visit the holy sepulchre of Jerusalem, he was created a knight of that order, and, on return to Vienna, was created one of the emperor's council of war. His principal work was his *Essaurus Linguarum Orientalium*, published at Vienna in 1680. A new edition of this valuable work begun in 1780, but remains still unfinished. Meniski died at Vienna in 1698.

**MENIPPUS**, a cynic, and disciple of the second Socrates, was a native of Gadara, in Palestine. His writings were chiefly of a satirical kind, inasmuch as Lucian styles him "the most snarling of cynics," and, in two or three of his dialogues, introduces him the vehicle of his own sarcasms. It appears that satires were composed in prose; on which account some of Varro were denominated *Menippean*; and, for the same reason, that of *satire Menippée* was written in France, to the celebrated piece written against the league.\* Menippus is said to have flattered himself, in consequence of being robbed of a great sum of money. He had been originally a slave, purchased his freedom, and was made a citizen of Athens. None of his works is now extant.

**MENNO**, SIMONS (i. e. the son of Simon), born in Friesland, in 1505, joined the Anabaptists in 1537, having been previously a Roman Catholic priest. After the suppression of the disturbances at Münster, he collected the scattered remnants of the sect, and organized societies, for which he secured the patronage of the government. His peregrinations during many years, in Holland and the north of Germany, as far as Livonia, contributed to increase the number of his followers, and to disseminate his doctrines among those who were not satisfied with the progress of the Protestant churches in reform. Except in his opinions concerning the incarnation of Christ, which he was probably led by the controversy concerning the bodily presence of Christ in the eucharist, he was in the administration of baptism to adults only, tenets agreed, in general, with those of the Calvinists. Menno died at Oldeslohe, in Holstein, 1561. His followers are called *Mennonites*, an account of whom has been given in the article *Anabaptists*.

**MENOLOGIUM** (from *μήνη*, the moon, and *λογος*, course, report, &c.), in the Greek church, has at the same signification as *martyrologium* (q. v.) in the Roman church. The *Menologium* is a book in which the festivals of every month are recorded, with names and biographies of the saints and martyrs, in the order in which they are read in the masses, the monies of the day, &c.

**MENOMONIES**, **MENOMENIES**; a tribe of

Indians, residing in the North-West Territory, to the south of Lake Superior and west of Green bay, called by the French *Mangeurs de Folle-Avoine* (or Eaters of Wild Oats). They belong to the great Chippeaway family. See *Indians, American*.

**MENOU**, JACQUES FRANÇOIS, baron de, born in Touraine in 1750, entered the military service at an early age, and rose rapidly to a high rank. In 1789, the noblesse of Touraine chose him their deputy to the states-general, where he was one of the earliest to unite with the third estate. Menou turned his attention particularly to the new organization of the army, and proposed to substitute a general conscription of the young men, in the room of the old manner of recruiting. His subsequent votes and propositions, in favour of vesting the declaration of war in the nation, of arming the national guard (1791), &c., were generally on the revolutionary side; but when the more violent opinions began to prevail, he joined those who endeavoured to moderate the excitement. In 1792, he resumed his military duties, and was second in command of the troops of the line, stationed near Paris. In this capacity, he accompanied the king to the assembly, and was afterwards repeatedly denounced to the convention as an enemy to the revolution. He, however, escaped condemnation, and, in May (2 *prairial*), 1795, commanded the troops who defended the convention against the insurgents of the faubourg St Antoine. On the 13th Vendémiaire, he was likewise in command, but would not allow his troops to attack the section opposed to the convention, and Bonaparte first gained celebrity by undertaking that attack. Menou afterwards accompanied general Bonaparte to Egypt, and distinguished himself by his courage on several occasions. After the return of Bonaparte, he married the daughter of a rich bath-keeper of Rosetta, submitting to all the ceremonies of the laws of Mahomet, and adopting the name of Abdallah. On the death of Kléber (q. v.), he took the chief command, and, after a gallant defence in Alexandria, was obliged to capitulate to the English. Bonaparte received him favourably, on his arrival in France, and appointed him governor of Piedmont. Menou was afterwards sent to Venice in the same capacity, and died there in 1810.

**MENSCHIKOFF**, ALEXANDER, the son of a peasant, born near Moscow, in 1674, was employed by a pastry-cook to sell pastry in the streets of Moscow. Different accounts are given of the first cause of his rise. According to some statements, he overheard the project of a conspiracy by the Strelitz, and communicated it to the czar; other accounts represent him as having attracted the notice of Lefort (q. v.), who took him into his service, and, discerning his great powers, determined to educate him for public affairs. Lefort took the young Menschikoff with him on the great embassy in 1697, pointed out to him whatever was worthy of his attention, and instructed him in military affairs, and in the maxims of politics and government. On the death of Lefort, Menschikoff succeeded him in the favour of the czar, who placed such entire confidence in him, that he undertook nothing without his advice; yet his passion for money was the cause of many abuses, and he was three times subjected to a severe examination, and was once also condemned to a fine. The emperor punished him for smaller offences on the spot; but much of his selfishness and faithlessness was unknown to his sovereign. He was much indebted for support, to the empress Catharine. He became first minister and general field-marshal, baron and prince of the German empire, and received orders from the courts of Copenhagen, Dresden, and Berlin. Peter also conferred on him the title of duke of Ingria. On the death of Peter, it was chiefly through the in-

The title of this ingenious and amusing satire is *Satyre sur la Vertu du Catholicon d'Espagne, ou de la Tenue d'Etat à Paris en 1592, par M. de la Ste. Union* (Paris, 1711). The title is a satire on Philip II., king of Spain, head of the league, who masked his projects under pretext of zeal for Catholic religion. It is the work of several hands, and was, according to Voltaire, of not less advantage to Henry IV. than the battle of Ivry.

fluence of Menschikoff that Catharine was raised to the throne, and that affairs were conducted during her reign. (See *Catharine I.*) When Peter II. succeeded her on the throne, Menschikoff grasped, with a bold and sure hand, the reins of government. In 1727, when his power was raised to the highest pitch, he was suddenly hurled from his elevation. Having embezzled a sum of money which the emperor had intended for his sister, he was condemned to perpetual exile in Siberia, and his immense estate was confiscated. He passed the rest of his life at Bereznov, where he lived in such a frugal way, that, out of a daily allowance of ten roubles, he saved enough to erect a small wooden church, on which he himself worked as a carpenter. He sunk into a deep melancholy, said nothing to any one, and died in 1729. Menschikoff was selfish, avaricious, and ambitious, implacable, and cruel, but gracious, courageous, well informed, capable of large views and plans, and persevering in the execution of them. His services in the promotion of civilization, commerce, the arts and sciences, and in the establishment of Russian respectability abroad, have been productive of permanent effects.

**MENSES.** See *Catamenia*.

**MENSURATION**, is the art of ascertaining the contents of superficial areas, or planes; of solids, or substantial objects; and the lengths, breadths, &c., of various figures, either collectively or abstractedly. The mensuration of a plane superficies, or surface, lying level between its several boundaries, is easy: when the figure is regular, such as a square, or a parallelogram, the height multiplied by the breadth, will give the superficial contents. In regard to triangles, their bases, multiplied by half their heights, or their heights by half their bases, will give the superficial measure. The height of a triangle is taken by means of a perpendicular to the base, let fall from the apex or summit. Any rectangular figure may have its surface estimated, however numerous the sides may be, simply dividing it into triangles, by drawing lines from one angle to another, and taking care that no cross lines be made; thus, if a triangle should be equally divided, it may be done by one line, which must, however, be drawn from any one point to the centre of the opposite face. A four-sided figure will be divided into two triangles, by one oblique line connecting the two opposite angles; a five-sided figure (or pentagon) by two lines, cutting, as it were, one triangle out of the middle, and making one on each side; a six-sided figure (or hexagon) will require three diagonals, which will make four triangles; and so on, to any extent, and however long or short, the several sides may be respectively. The most essential figure is the circle, of which mathematicians conceive it impossible to ascertain the area with perfect precision, except by the aid of logarithmic and algebraic demonstration. It may be sufficient in this place to state, that  $8\frac{1}{8}$  of the diameter will give the side of a square, whose area will be correspondent with that of a circle, having ten for its diameter. Many circular or cylindrical figures come under the measurer's consideration—mirrors, arched passages, columns, &c. The contents of a pillar are easily ascertained, even though its diameter may be perpetually varying; for if we take the diameter in different parts, and strike a mean between every two adjoined measurements, and multiply that mean area by the depth or interval between the two, the solid contents will be found. The contents of pyramids are measured by multiplying the areas of their bases by half their lengths, or their lengths by half the areas of their bases. Cones, whose sides are straight, are equal to one third the contents of cylinders, equal to them in base

and altitude. Solids having a round degree of regularity, may be easily measured, and are computed by multiplying first the area of the base, then their product by its height, and dividing the result by four feet each way. This is the meaning of what is called the rule of the cube. (See *Cube*.) Parallelopipedons, or solids of the same form, such as squared timbers, are measured by the same means. For the measurement of pyramids, various modes have been devised. The area of the base has been felled, its girth is usually also measured, and at the middle, when there is no perpendicular, or the top extremity does not measure true. But where the irregularity is great, it is better to take many more girths, and summing them to divide their amount by the number of girths, so as to establish a mean measurement. Trees are measured by four, to find the area of a square to which the tree will be equal, or prepared for the sawyer. If the tree is measured at four, and taking the third part, the product is the diameter, proceed in the way already mentioned, to the side of a square, equal to the area of the tree; that ascertained third part is the diameter of the bodies, or areas, such as hay-stacks, mounds of granaries, &c., come under the rule of the cube, &c. When any sides fall in square, garrets, &c., the inclined part is measured as a pyramid, or as a quoin (or wedge), and is summed up together. The contents of canals, &c., are found by the process of gauging, &c. part of the subject which appertains to the measurement of lands, as also to the contents of &c., of remote objects, accessible to a surveying.

**MENTAL DERANGEMENT** See *Mentis*.

**MENTCHIKOFF.** See *Menshikoff*.

**MENTOR**, son of Alcimus, the companion of Ulysses, who intrusted to him the care of his domestic affairs, during his absence at the siege of Troy. The education of the young Telemachus to his charge, and when the latter was on a voyage in search of his father, Mentor appeared him under the form of Mentor. (See *Ulysses*, p. 12, &c.), acting the part of a prudent and constant counsellor to the young hero. The character of a sage adviser is more fully developed in the *Maquis de Fénélon*, in which Mentor plays a conspicuous part. Mentor has thence acquired a metaphorical sense of a wise and faithful monitor.

**MENTZ**, or **MAYENCE**, or **MAYN**, in Germany, in Hesse-Darmstadt, formerly an electorate and archbishopric, situated at the conflux of the Rhine and Main, called a *Landgravia*, or *Moguntinacum*; lat. 50° 15' N.; population, 25,251. It is the capital of Germany: towards the river lies a delta, but on the land side the works are extremely complicated. The fortress belongs to the German confederation. The town is built upon a hill of a semicircle, the Rhine forming the base; the interior is by no means handsome. The streets are crooked, narrow, and gloomy, and the houses old fashioned. It contains a cathedral, a school of medicine, a cabinet of coins and medals, a cabinet of natural history, a gallery of paintings and a library of 90,000 volumes. The suburbs are partly in wine, and partly in commerce connected with the navigation of the river. It is famous for the beauty of its view and for its university was founded here by Henry VIII. in 1527, and re-established in 1682, by the Elector Diether, of the house of Hesse.

converted into a lyceum. The honour of the invention of printing was claimed by John Faust (q. v.), a goldsmith of Ments, and by John Guttenberg. (q. v.) The archbishopric of Ments was an extensive electoral principality. The archbishop was also elector, and ranked as the first archbishop in Germany. The archbishopric was suppressed in 1802, and the city of Ments is now only a bishop's see. See *Germany*.

**MENU.** The Hindoo mythology mentions fourteen of these mystical personages, of whom seven have already reigned on the earth. The celebrated code of laws, or the *Manava Dharma Sastra*, which goes under the name of *Menu*, is attributed to the first of the name, or Swayambhaura, the son of Brama. The name is derived from *men*, signifying intelligence (Latin *mens*, mind), and Sir W. Jones suggests that it is connected with *Mene*, the name of the first king of Egypt and *Minos* (q. v.), the Cretan avenger. The code, which has been translated into English by Sir W. Jones (*Works*, vol. iii.), is the basis of the whole civil and religious policy of the Hindoos. Menu appears in it relating the history of the creation of the universe to the *Rishis*, or holy saints; he then commands Brigu to repeat the divine laws of Brahma. These laws relate to the divisions into castes, education, marriage, diet, purification, devotion, private and criminal law, penances and expiations, transmigration, &c. The last Menu, whose reign is not yet over, was Satyavrata, or Vaivaswata, whose history is given as follows, in the Bhagvat:—Brahma, being inclined to slumber, the demon Haya-griva stole the Vedas from his lips. Heri, the preserver of the universe, discovering this deed, assumed the shape of a small fish, and appeared to the holy king Satyavrata, who was so devout that his only sustenance was water. Having grown to an enormous size in a few days, he was recognised by the pious king, to whom he declared that in seven days the earth should be plunged in an ocean of death, and promised to send a large vessel for his deliverance; into which continued the god-fish, thou shalt enter with seven saints and pairs of all brute animals; and thou shalt fasten it with a large sea-serpent to my horn, for I will be near thee. Satyavrata complied with these directions, and the primeval male, speaking aloud to his own divine essence, pronounced by his instruction a sacred *purana*, explaining the principle of the soul, the external being. Heri then slew the demon, and recovered the sacred books, and Satyavrata was appointed the seventh Menu; but the appearance of the horned fish was *Maya* (or deception).

**MENZABANO**; a town of Italy, on the Mincio. On the 28th of December, 1801, a bloody battle was fought here between the French and the Austrians: the French conquered, and made 8000 prisoners.

**MENZALEDH**, or **MENZALA**; a large lake in Egypt, running parallel with the Mediterranean, from which it is divided by a narrow slip of land, sixty miles in length, and from two to twelve in breadth, overflowed and filled by the waters of the Nile. It is as anciently called *Tanis*, from the town of that name. Its waters are soft in the time of inundation, and become brackish as the river retreats within its channel. Numerous boats continually fish on the lake. Length of the lake from north-west to south-east 43,000 fathoms, breadth from 12,000 to 26,000. **MENZEL**, **FREDERIC WILLIAM**; private secretary to the royal cabinet at Dresden, whose treachery hastened the breaking out of the seven years' war. Frederick II., suspecting that negotiations were going on against him between the courts of Petersburg, Vienna and Dresden, directed his minister at the court of Saxony to procure information on the sub-

ject. Chance made the ambassador acquainted with Mensel, whose expensive and dissipated habits had plunged him into embarrassments, to relieve which he had been induced to purloin from the public treasury. The unhappy man hoped to preserve himself by a greater crime, and, in consideration of a large sum of money, delivered to the Prussian ambassador copies of the secret correspondence between Saxony, Russia, and Austria, relating to Prussia. His conscience, indeed, was awakened, but he could not turn back without forfeiting the protection of the ambassador in case of detection. During a journey to Warsaw, in the retinue of the king, traces of his guilt were at length discovered. Mensel himself was surprised by the report of the discovery of his treachery in a social party. He attempted to save himself by flight, but was arrested at Prague, on the demand of the court of Saxony, and imprisoned, first at Brunn, but after the conclusion of the peace of Hubertsburg, in the castle of Konigstein. Here he lived thirty-three years, at first in the strictest custody. During his imprisonment at Brunn, he cherished the hope that Prussia would stipulate for his liberation at the conclusion of peace. Through the favour of king Frederic Augustus I., his condition was somewhat alleviated in the latter part of his life; he received better food, and permission to take the air now and then; he was also relieved of the heavy chains which he had worn many years. He died in May, 1796, at the age of seventy years.

**MENZIKOFF.** See *Menachikoff*.

**MEPHITIC** (from the Latin *mephitis*, an offensive odour) is used to signify those kinds of air which will not support combustion or animal life, or, more generally, offensive exhalations of any sort. Modern chemistry has given particular names to many of these. (See *Carbon*, and *Sulphur*.) There was a Roman goddess called *Mephitis*, who was worshipped as a protectress from such exhalations.

**MEQUINEZ**; a city of Morocco, in Fes, situated in a plain surrounded with fertile valleys and eminences, watered by a number of rivers; 35 miles south-west of Fes, 165 north-east of Morocco; lon. 5° 30' W.; lat. 35° 56' N.; population stated by Jackson at 110,000; by Hassel at only 15,000. It is frequently the residence of the emperor. It is surrounded with walls, and the palace is fortified with bastions. The Jews have a quarter appropriated to themselves, walled in and guarded. The Moors at Mequinez are much more affable than in the southern provinces.

**MERCANTILE SYSTEM**, in political economy, is one that prevails to a greater or less extent in every country of Europe. It was introduced in France by Colbert. As originally understood and acted upon, it embraces some fallacious doctrines, and carries some just ones to excess. The notion, for example, that wealth is derived mostly from foreign commerce, and depends upon an annual importation of specie, called the *balance of trade*, is erroneous. This balance was understood to be the bullion or coin received by a country in exchange for a part of its exports, and the foreign trade was supposed to be advantageous and promotive of the national wealth in proportion as the returns of trade were made in the precious metals, instead of other merchandise, whereas an exchange for iron, tin, leather, or any other useful merchantable commodity, is quite as advantageous, as the importation of specie. It will depend upon the wants of the community whether the importation of one or another article will most promote the national wealth. It would be quite absurd, therefore, to attempt, by legislation, to force trade to yield a balance in specie. As far as this was a direct object of the commercial system, it was accordingly mis-

taken. If a nation needs other things more than specie, such prices will be offered as will induce their importation. But this notion of the importance of the balance of exports and imports is not without its truth in a certain respect. It is undoubtedly an evil for one nation to be constantly indebted to another. It will be found true between individuals, different districts of the same country, and also between different nations, that the indebted party is the one most liable to make sacrifices. If a people or district, or an individual, will keep in advance of their means, and anticipate the income of the coming year, the consequence will be a perpetually straitened and embarrassed state. This was always the case with the British American colonies, and even of the states for many years after the establishment of the American independence. The liberal credits in England enabled them to anticipate their income, and they were, accordingly, always largely indebted to England, and thus constantly straitened and distressed, notwithstanding the country was, during the same time, rapidly growing in population and wealth. It is desirable that the commerce of a country should be so conducted as not to keep the country constantly indebted. If we were, therefore, to consider the balance of trade to be a constant standing balance of debt due to, or from, a country, in this sense it would be a subject of great importance. The consequence of large foreign credits, and of the desire to consume more of foreign products than the people have present produce of their labour sufficient to pay for, is occasionally to drive specie from the country; and the more extensive the credits, the more complete and exhausting will be this drain when it happens. This has been a subject of very frequent experience in the trade between Europe and America. The only way of preventing its recurrence is to produce at home so great a proportion of the commodities wanted for consumption, that the exportable produce will be amply sufficient to pay, in the foreign markets, for the foreign products needed. But whether legislation shall be at all, and if at all, to what extent, directed to the advancement of commerce, or any other branch of industry, so as incidentally and consequentially to affect the kind and amount of exchanges with foreign nations, are much agitated questions. The practice of the whole civilised world is to legislate with a reference to national industry, and such it always has been. The real ground of doubt seems to relate to the proper objects and extent of this legislation.

MERCATOR, GERARD, a mathematician and geographer, born at Rupelmonde (not, as usually stated, at Ruremond), in the Low Countries, in 1512, studied at Louvain, applying himself with such intensity as to forget to take the necessary food and sleep. His progress in the mathematics was very rapid, although without a teacher, and he soon became a lecturer on geography and astronomy, making his instruments with his own hands. Granvella (q. v.), to whom he presented a terrestrial globe, recommended him to Charles V. Mercator entered into the emperor's service, and executed for him a celestial globe of crystal, and a terrestrial globe of wood. In 1559, he retired to Duisburg, and received the title of cosmographer to the duke of Juliers. His last years were devoted to theological studies. He died in 1594. Mercator published a great number of maps and charts, which he engraved and coloured himself. He is known as the inventor of a method of projection called by his name, in which the meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, which has the effect of enlarging the degrees of latitude, as they recede

from the equator. His first maps of the provinces were published in 1569; the principles on which they were explained by Edward Wright, in 1593. His corrections of Errors in Navigation, where the discovery has sometimes been attributed to him. His *Tabula Geographica* (Cologne, 1594) is the last edition of the maps of Ptolemy, and he has many copied by his successors. His Atlas has been republished.

MERCER, HENRY, a brigadier-general in the American revolutionary army, was a native of Scotland. He was liberally educated in medicine, and acted as a surgeon; and was in the memorable battle of Culloden. He escaped from his country, not long after, to France, but removed to Virginia, where he settled and married. He was engaged with Washington in the Indian wars of 1755, &c.; and his children are in possession of a medal which was presented to him by the corporation of the city of Philadelphia, for his good conduct in the expedition against an Indian settlement, conducted by General Armstrong, in September, 1754. In one of his engagements with the Indians, General Mercer was wounded in the right wrist, and being separated from his party, he found that there was danger of his being surrounded by hostile Indians, when he whooped and yell indicated their near approach. Becoming faint from loss of blood, he took refuge in the hollow trunk of a large tree. The Indians came to the spot where he was concealed, and searched themselves about for rest, and then disappointed. He left his hiding-place, and pursued his course through a trackless wild of about one hundred miles, until he reached Fort Cumberland. On the way, he climbed on the body of a rattlesnake, which he cut and killed. When the war broke out between America and the mother country, he immediately joined the American standard, relinquishing a lucrative medical practice. Under Washington, valour and confidence he enjoyed beyond most of his fellow-officers, he soon reached the rank of brigadier-general, and, in that command, distinguished himself, particularly in the battles of Brandywine and Princeton, in the winter of 1776-7. In the attack on Princeton, General Mercer, who commanded the van of the American army, after exerting his usual valour and activity, had his horse killed under him, and, being thus dismounted, he was surrounded by some British soldiers, with whom, when they seized him quarter, he fought desperately, until he was completely overpowered. They clanked him with their bayonets, inflicted several blows on his head with the butt-end of their muskets, and left him to die on the field of battle. He died a few weeks after, from the wounds in his head, in the arms of Major George Lewis, the adjutant of General Washington, whom the British commanded to watch over his expiring friend. The night corpse was removed from Princeton, under a strong escort, to Philadelphia, and exposed a day in a coffee-house, with the design of exciting the sympathy of the people. It was followed to the grave by at least 30,000 of the inhabitants. General Mercer, though a lion in battle, was unassuming, plain, and almost diffident in private life. He was valued and admired, as an accomplished, published, and benevolent gentleman. Some interesting anecdotes are related in the 3d chapter, 1st vol. of General Wilkinson's Memoirs. That writer observes: "General Mercer, we lost, at Princeton, a chief, not only for education, talents, disposition, courage, patriotism, was second to no man but the commander-in-chief, and was qualified to be the highest trusts of the country." General Mercer

was about fifty-six years of age when he thus perished.

MERCIA, the largest kingdom of the Saxon heptarchy, comprehended all the middle counties of England, and, as its frontiers extended to those of the other six kingdoms, as well as to Wales, it derived its name from that circumstance (Anglo-Saxon *Merk*, marches, q. v.). It was reduced by Egbert (q. v.), king of Wessex. See Turner's *Hist. of the Anglo-saxons*.

MERCIER, LOUIS SEBASTIAN, a French writer, remarkable for the eccentricity of his sentiments. He was born at Paris in 1740, and, at the age of twenty, published a volume of heroic epistles, after which he renounced poetry for criticism. In his *Essai sur l'Art dramatique*, he attacked the reputation of Corneille, Racine, and Voltaire, proposing to place their works by his own productions; and, as the comedians paid no attention to his diatribe, he published a virulent manifesto against them. In 1771 appeared, under the title of *L'An 2440*, a clamatory tract, which was suppressed by authority. In 1781 was published, anonymously, the two last volumes of his *Tableau de Paris*; after which he removed to Switzerland, and at Neufchâtel printed more volumes of that work, which was favourably received, both in France and in other countries. Returning home at the beginning of the revolution, he declared himself a friend to liberty, and, in concert with Carra, published *Les Anales Politiques*, and *Chronique du Mois*,—journals which displayed both moderation and spirit. He became a member of the convention, in which he led for the detention, instead of the death of Louis XVI. In 1795, he passed into the council of five hundred, and was subsequently professor of history at central school, and a member of the institute at its nation. Mercier died at Paris in 1814. Among numerous works are *Mon Bonnet de Nuit* (Neufchâtel, 1783, 4 vols., 8vo); *De l'Impossibilité des systèmes de Copernic et de Newton* (1806, 8vo); and *ire contre Racine et Boileau* (1808). See Ersch's *Encyclopædie Littéraire*.

MERCURE DE FRANCE; a journal remarkable for its antiquity. It is a continuation of the *Mercurie* of 1681, and forms 1800 small volumes. The *Mercurie Galant* was established in Paris by J. Donneau Visé, in 1672, and continued until 1716 (formed 571 12mo volumes.) The periodical then took the title of *Mercurie de France*, and appeared, uninterruptedly, from 1717 to 1778, in 603 volumes. Kowacke edited it from 1778 to 1792 (174 volumes 8vo.). It then became a daily, and sometimes a weekly paper. A new series, until 1797, comprises 17 volumes, 8vo. It was continued, though interrupted, to 1803. At a later period, the *Minerve française* appeared, as a continuation. Another radical adopted the title *Mercurie de France*. So a continuance must necessarily give value to contents of a journal, although they may not have been of the most interesting character at the time of their publication. *Mercury* is, in France, as well as in Germany, a very common name for radicals.

MERCURIALE; the first Wednesday after the vacation of the French parliaments. On this day they held a full session, in order to discuss the business in the administration of justice, and particularly in the course of business, and to take measures for correcting them. The first president of the crown-advocate had alternately the duty of reporting to the meeting. From the day of assembly, their speeches were called *mercurials*. The name was also given to a reproof or rebuke, and the members, on this day, received their

reprimands. See *Crown-Advocate*, *Parliaments*, and *France*.

MERCURY (called, by the Greeks, *Hermes*) was the son of Jupiter and Maia, the daughter of Atlas. According to tradition, Arcadia was his birth-place. Four hours after his birth, he left his cradle, and invented the lyre, which he made by killing a tortoise, and stringing the shell with seven strings. He then sang to it the loves of Jupiter and his mother Maia. Having concealed the lyre in his cradle, he began to seek for food; for which purpose, he went, in the evening, to Pieria, and stole fifty oxen of the sacred herd of the gods, which he drove backward and forward to confound their tracks; then, going backward himself, he drove them backward also; and, after having killed two of them near the river Alpheus, roasted them by a fire procured by rubbing two sticks together, and sacrificed a part to the gods. He concealed the remainder in a cavern. He also carefully destroyed all traces of them. The next morning Apollo missed his oxen, and went in search of them; but he could discover no traces of them until an old man of Pylos told him that he had seen a boy driving a herd of oxen in a very strange manner. Apollo now discovered, by his prophetic art, that Mercury was the thief. He hastened to Maia, and accused the infant, who pretended to be asleep, and, not terrified by the threat of the god, that he would hurl him into Tartarus, steadily maintained his innocence. Apollo, not deceived by the crafty child, carried his complaint to the god of gods. Mercury lied even to him. But Jupiter penetrated the artifice of the boy, and perceived him to be the offender; yet he was not angry with him, but, smiling good-naturedly at his cunning, ordered him to show the place where the oxen were concealed. To secure him, Apollo bound his hands; but his chains fell off, and the cattle appeared, bound together by twos. Mercury then began to play upon his newly-invented lyre, at which Apollo was so much enraptured, that he begged the instrument of the inventor, learned of him how to play on it, and gave him a whip to drive the herds, thenceforth belonging to both in common. Apollo was still more astonished when the ingenious god also gave the flute its tones. They then concluded a contract with each other: Mercury promised never to steal Apollo's lyre or bow, and never to approach his dwelling: the latter gave him in return, the golden wand of peace, the *caduceus*. The ancients represent Mercury as the herald and messenger of the gods. He conducts the souls of the departed to the lower world (whence he is called *Psychopompos*), and is therefore the herald of Pluto, and the executor of his commands. His magic wand had the power to close the eyes of mortals, to cause dreams, and wake the slumbering. The qualities requisite for a herald he possessed in the highest perfection, and bestowed them on others—grace, dignity, and insinuating manners. He was also the symbol of prudence, cunning and fraud, and even of perjury. We must remember that rude antiquity did not, as we do, associate any thing dishonourable or base with these ideas. Whoever was distinguished for artifice and deceit, as, for example, Ulysses, was a favourite of Mercury, and enjoyed his assistance. Mercury was also distinguished as the god of theft and robbery, especially when fraud and cunning were employed. The exploits of his childhood have this symbolical signification. Among the actions of his manhood, the following are examples of his cunning: He accompanied Hercules when he carried off Cerberus; delivered Jupiter from the cave into which Typhon had cast him; rescued Mars from the prison in which the Aloides, Otus and Ephialtes had confined him; killed Argus, the keeper of the unhappy

Io; assisted Perseus, when he went to kill Medusa, and lent him the helmet of Pluto, which rendered him invisible, and his winged sandals; to Nephele, the mother of Phryxus and Helle, he gave the ram with the golden fleece, upon which she carried off her children, when they were about to be sacrificed to the gods, at the instigation of their step-mother Ino. In the wars of the giants, he wore the helmet of Pluto, which rendered him invisible, and slew Hippolytus. When Typhon compelled the gods to fly before him, and conceal themselves in Egypt, he metamorphosed himself into an ibis. He is also mentioned by Homer as the patron of eloquence, and still more particularly by Hesiod. Of his inventions Homer makes no mention. Later writers ascribe to him the invention of dice, music, geometry, the interpretation of dreams, measures and weights, the arts of the palestra, letters, &c. He was also regarded as the patron of public treaties, as the guardian of roads, and as the protector of travellers. (See *Hermes*.) Fable relates many of his amours. His children were numerous: among them were Pan and Hermaphroditus. Mercury was worshipped in all the cities of Greece, but Arcadia was the chief place of his worship. His festivals were called *Hermæa*, and were solemnized in various ways. He had several temples in Rome, and his festival took place on the 15th of May (which month received its name from his mother Maia). At this festival, the merchants particularly offered him sacrifices, that he might prosper them in their trade, and render them successful in their enterprises. Art has variously represented Mercury; first, in the rude *Hermes*. (q. v.) In the monuments of the more ancient style, he appears with his beard just beginning to grow; at a later period, the prevailing representations of him were as an adroit herald and athlete, and he acquired the appearance of extreme youth. In this character, also, room was allowed to fancy. He was represented as a boy, in the prime of youth, and also in the full power of early manhood. Among the curled locks of the boy appear two projecting wings. His dress consisted of a short leather tunic. In his left hand he bears a purse, and, holding his right forefinger against his chin, smiles archly at some device in his mind. As a youth, we find him represented in a variety of attitudes, sometimes with the purse in his hand, sometimes with the *caduceus*, and sometimes with his winged cap, standing, sitting, or walking. The artists of later times placed him among the youthful and beardless gods. The most prominent traits of his character are vigour and dexterity. His short hair lies curled over his head and forehead; his ears and mouth are small; his positions, whether standing or sitting, always simple and easy; his head inclined forwards, and his look thoughtful. In his beautiful and vigorous frame, we see the inventor of gymnastics; in his attitude, air, and aspect, we see the prudence, cunning, and good nature of one who can easily gain every body, and accomplish every thing. In the representation of Mercury, the relations of corporeal beauty and mental dexterity are wonderfully preserved. He is either entirely naked, or clad only in the *chlamys*, which is not often put on with any regularity, but is merely thrown over his shoulders or wound round his arms. His head is sometimes bare; sometimes he has a pair of wings fastened on his temples, and sometimes the cap is placed on his head, to which are occasionally added wings (*petasus*). The hat, which particularly denotes a wanderer, has, in works of statuary, a flat top and narrow brim: upon vases, however, his hat is represented with wide, hanging flaps, and a pointed top. If the wings are not attached to a band about his head or hat, they are fastened either to his ankles or the soles of his feet, or to the *caduceus* alone.

Artists made the cock his symbol, on account of a vigilance, or love of fighting (a *coxa* is a *gymnastic*); the tortoise, on account of its immovability; the lyre; the purse, because he was the god of trade; a ram and a goblet, because he was the donor of religious ceremonies and sacrifices; the date of a palm-tree, upon which his station was said to be was the inventor of arithmetic and other arts upon palm-leaves); the *Aegle*, or sock-like shape, on account he was the slayer of Argus, on account (only upon Alexandrine coins), to denote vigilance and vigilance.

MERCURY; a planet. See the article *Pan*.  
MERCURY, or QUICKSILVER, the *hydrargyrum* of the Latins, from *hydr*, water, and *argyrum*, silver, an allusion to its fluidity and silvery appearance. Its name *quicksilver* is derived from the ancient, who regarded this metal as silver in a fluid state, given by some inherent principle, which they hoped either to fix or expel. It was known to the ancients, even to the Greeks and Romans, who employed it as a pain, and in the extraction of the precious metals. It is distinguished from all other metals by its corrosibility, which is such that it does not take its state until cooled to the 30th degree below zero (Fahrenheit), and, of course, is always found in the warm climates of the earth. Its colour is white and silver bluer than that of silver. In the solid state it is imperfectly malleable; specific gravity 13.6. It is volatile, and rises in small portions at the common temperature of the atmosphere. At the temperature of 656°, it boils rapidly, and rises in a fumes. When exposed to such a heat as may cause it to rise quickly in the vaporous form, a portion becomes converted into a red oxide, provided oxygen be present. This was formerly known to be the case of precipitate per se. A greater heat than 656°, however, revives this metallic oxide at the same time that this oxygen is again liberated. Mercury, if pure, is not tarnished in the cold by exposure to air and moisture; but if it contains other metals, the amalgam of those metals oxidizes readily, and collects as a film upon its surface. It is said to be oxidized by long agitation in a bottle half full of air and the oxide so formed was called by *Boyle* *Ethiops per se*; but it is very probable that the oxidation of mercury, observed under these circumstances, was solely owing to the presence of other metals. The oxides of mercury are two: the *protoxide*, which is a black powder resembling a coal, is best prepared by mixing calomel broken in a mortar with pure potassa in excess, so as to effect a decomposition as rapidly as possible. The product is then to be washed with cold water, and to spontaneously in a dark place. It consists of an equivalent, or 200 parts of metal, and one equivalent, or eight parts of oxygen. The *peroxide*, which is commonly known under the name of *red precipitate*, is prepared, as already mentioned, from the metallic agency of heat and air, or by dissolving mercuric nitric acid, and exposing the nitrate so formed to a temperature just sufficient to drive off the whole of the nitric acid. It contains double the quantity of oxygen found in the protoxide. It is said to be poisonous, and carries these qualities into its other combinations; whereas the protoxide is entirely bland, and is the basis of all the useful mercurial medicines. Of the combustibles, mercury combines only with phosphorus and sulphur. The phosphure is formed by heating either of the oxides along with phosphorus in a retort filled with hydrogen gas under water, with frequent agitation, the oxide is reduced, and a phosphuret is the result. It has a black colour, is easily cut with a knife, and in the air, exhales vapours of phosphorus. There are two

sulphurets, the black and the red, or the *proto-sulphuret* and the *dento-sulphuret*. The first is formed by rubbing vigorously in a glass or porcelain mortar three parts of sulphur and one of mercury, or by adding mercury at intervals, and with agitation, to its own weight of melted sulphur. The second, which is commonly called *cinnabar*, or *vermilion*, is formed by subliming the proto-sulphuret. Large quantities of it are manufactured in Holland. The ordinary process consists in grinding together 150 pounds of sulphur and 1080 of quicksilver, and then heating the mixture in a cast-iron pot, two and a half feet in diameter and one foot deep, precautions being taken that the mixture does not take fire. The calcined Ethiops is then ground to powder, and introduced into pots capable of holding twenty-four ounces of water each, to which are attached subliming vessels, or bolt heads of earthenware. The sublimation usually takes thirty-six hours, when the sublimer is taken out of the furnace, cooled, and broken. The acids sustain an important relation to mercury. All of them either dissolve the metal or unite with its oxides. Sulphuric acid exerts little or no action upon it in the cold, but, if heat be applied, it is decomposed, the mercury is oxidized, sulphurous acid is disengaged, and the oxide combines with the remaining acid. This *proto sulphate* of mercury crystallizes in slender prisms, forming a mass, soft, and partly liquid. It is very acrid, deliquescent, and soluble in water. If it is urged with a heat gradually raised until the mass becomes dry, the metal is more highly oxidized, and a portion of the acid is dissipated. On pouring boiling water on this dry mass, it acquires a lively yellow colour, forming an insoluble powder, known by the appellation of *turbith mineral*, or yellow sulphate of mercury. The water, in this process, produces the usual effect which it has when it decomposes metallic salts. Exerting a stronger attraction to the acid than to the metallic oxide, it combines principally with the former, but, from the influence of quantity on chemical affinity, the acid carries with it a portion of the oxide, and conversely, from the operation of the same force, the oxide which is precipitated retains a portion of the acid combined with it. The neutral sulphate is thus resolved into a super-sulphate, which the water dissolves, and a sub-sulphate, which remains undissolved. This sub-sulphate is chiefly used in preparing corrosive sublimate and calomel. Nitric acid acts on mercury with facility, oxidizing it, and combining with the oxide, forming a perfect solution. The product of this action varies considerably, particularly with regard to the state of oxidation, according to the circumstances under which it is exerted. If the acid is diluted with rather more than an equal part of water, and if the action is not accelerated by heat, the proto-oxide only is formed, and the salt is the *proto-nitrate of mercury*. If the acid is less diluted, and if its action on the metal be promoted by heat, the peroxide is produced, and the compound is the *per-nitrate of mercury*. Both these solutions, when concentrated crystallise, a mass being deposited, consisting of a number of slender prisms. Both salts are corrosive, deliquescent, and soluble in water. If the solution of the per-nitrate is poured into water, a partial decomposition happens, similar to that of sulphate of mercury, and a yellow insoluble sub-per-nitrate of mercury is precipitated. Nitrate of mercury is decomposed by the alkalis and earths; and in these compositions are well displayed the differences which arise from different states of oxidation of the metal. By potash, soda, or lime, added to the solution of the proto-nitrate, a precipitate of a grayish colour, with a tinge of yellow, is thrown down: from the solution of the per-nitrate the precipitate is

yellow, more or less bright. These precipitates are sub-nitrates, the oxide, separated by the alkali, retaining a portion of the acid combined with it. The action of ammonia on these solutions is more peculiar. From the solution containing the mercury at a high state of oxidation, it throws down a white precipitate, which is a ternary combination of the oxide, with portions of the acid and alkali. From the solution at which the metal exists at the *minimum* of oxidation, it throws down a precipitate of a dark gray or blue colour. The gray precipitate by ammonia (*oxidum hydrargyri cinereum* of the pharmacopœias) is a preparation much used in medicine. It is a mild mercurial, and is very similar, in its operation on the system, to the mercurial preparations formed by trituration. To obtain it of uniform composition, it is necessary to use every precaution to moderate the action of the nitric acid on the metal, as by free dilution with water, and by avoiding the application of heat. A *fulminating* preparation of mercury is obtained by dissolving 100 grains in one and a half ounce by measure of nitric acid. This solution is poured cold into two ounces by measure of alcohol in a glass vessel, and heat is applied till effervescence is excited, though it ordinarily comes on at common temperatures. A white vapour undulates on the surface, and a powder is gradually precipitated, which is immediately to be collected on a filter, well washed, and cautiously dried. This powder detonates loudly by gentle heat or slight friction. It has been very much used of late as the match powder, or priming, for the percussion caps of the detonating locks of fowling pieces. Two grains and a half of it, mixed with one-sixth of that weight of gunpowder, form the quantity for one percussion cap, according to the researches of Aubert, Pelissier, and Gay-Lussac. In preparing this powder in quantities, the fulminating mercury should be moistened with thirty per cent. of water, then trituated in a mortar, and thereafter mingled with the sixth part of its weight of gunpowder. Matches of this kind resist damp very well, and take fire after several hours' immersion in water. The detonating match, or priming powder, made with chlorate of potash, sulphur, and charcoal, has the inconvenience of rusting and soiling the fowling pieces, and thence causing them to miss fire; whereas, with the above fulminating powder, a hundred shots may be discharged successively. The mercurial percussion caps are sold now in Paris for three francs and a half per thousand. The acetic and most other acids combine with the oxide of mercury, and precipitate it from its solution in the nitric acid. Muriatic acid does not act on mercury. When mercury is heated in chlorine, it burns with a pale red flame, and the substance called *corrosive sublimate* is formed. This *dento-chloride* may also be formed by mixing together equal parts of dry bi-dento-sulphate of mercury and common salt, and subliming. The corrosive sublimate rises, and incrusts the top of the vessel, in the form of a beautiful white semitransparent mass, composed of very small prismatic needles. Its specific gravity is 5.14. Its taste is acrid, styptic-metallic, and eminently disagreeable. It is a deadly poison. Twenty parts of cold water dissolve it, and less than one of boiling water. It is composed of 73.53 mercury and 26.47 chlorine. It may be recognised by the following characters: It volatilizes in white fumes, which seem to tarnish a bright copper-plate, but really communicate a coating of metallic mercury, which appears glossy white on friction. When caustic potash is made to act on it with heat in a glass tube, a red colour appears, which by gentle ignition vanishes, and metallic mercury is then found to line the upper part of the tube in minute globules. Solution of corrosive sublimate

reddens litmus paper, but changes sirup of violets to green. Bicarbonate of potash throws down from it a deep brick-red precipitate, from which metallic mercury may be procured, by heating it in a tube. Lime-water causes a deep yellow precipitate, verging on red. Water of ammonia forms a white precipitate, which becomes yellow on being heated. With sulphureted hydrogen and hydrosulphurets, a black, or blackish-brown precipitate appears. Nitrate of silver throws down the curdy precipitate characteristic of muriatic acid; and the proto-muriate often gives a white precipitate. From six to twelve grains were the mortal doses employed by Orfila, in his experiments on dogs: they died in horrible convulsions, generally in two hours; but when with a larger quantity, the whites of eight eggs were thrown into the stomach, the animals soon recovered after vomiting. The effect of this antidote is to convert the corrosive sublimate into calomel. Sulphureted hydrogen may also be employed along with emetics. The *proto-chloride* of mercury (*mercurius dulcis*, or *calomel*), is usually formed from the deuto-chloride, by triturating four parts of the latter with three of quicksilver till the globules disappear, and subjecting the mixture to a subliming heat. By levigating and edulcorating with warm water the sublimed grayish-white cake, the portion of soluble corrosive sublimate which had escaped decomposition is removed. It may also be made by adding solution of proto-nitrate of mercury to solution of common salt; the proto-chloride, or calomel precipitates. The following is the process used at Apothecaries' Hall, London:—Fifty pounds of mercury are boiled with seventy pounds of sulphuric acid to dryness, in a cast-iron vessel; sixty-two pounds of the dry salt are triturated with forty pounds and a half of mercury until the globules disappear, and thirty-four pounds of common salt are then added. This mixture is submitted to heat in earthen vessels, and from ninety-five to one hundred pounds of calomel are the result. It is washed in large quantities of distilled water, after having been ground to a fine and impalpable powder. When proto-chloride of mercury is very slowly sublimed, four-sided prisms, terminated by prisms, are obtained. It is nearly tasteless and insoluble, and is purgative in doses of five or six grains. Its specific gravity is 7.176. Exposure to air darkens its surface. It is not so volatile as the deuto-chloride. Nitric acid dissolves calomel, converting it into corrosive sublimate. Proto-chloride of mercury is composed of mercury 84.746, and chlorine 15.254. There are two *iodides* of mercury; the one yellow, the other red; both are fusible and volatile. The yellow, or *protiodide*, contains one half less iodine than the deutioidide; the latter, when crystallized, is a bright crimson. They are both decomposed by concentrated sulphuric and nitric acids. The metal is converted into an oxide, and iodine is disengaged. They are likewise decomposed by oxygen, at a red heat.

Mercury, on account of its fluidity, readily combines with most of the metals, to which it communicates more or less of its fusibility. When these metallic mixtures contain a sufficient quantity of mercury to render them soft at a mean temperature, they are called *amalgams*. It very readily combines with gold, silver, lead, tin, bismuth, and zinc; more difficultly with copper, arsenic, and antimony; and scarcely at all with platina or iron. It does not unite with nickel, manganese, or cobalt; and its action on tungsten and molybdena is not known. Looking-glasses are covered on the back-side with an amalgam of tin. (See *Silvering*.) The medicinal uses of mercury have already been alluded to. The amalgamation of the precious metals, water gilding,

the making of vermilion, the adorning of looking-glasses, the construction of barometers and thermometers, are the principal uses to which the metal is applied. Scarcely any substance is so liable to adulteration as mercury, owing to its property of dissolving completely some of the base metals. This union is so strong, that they are to be separated with it in vapour when distilled. It never, however, can generally be detected by its being so liable to its tarnishing, and becoming covered with a red oxide, on long exposure to the air; by its adhering to the surface of glass; and, when shaken in water in a bottle, by the speedy formation of a white powder. Lead and tin are frequent adulterations; the mercury becomes capable of taking up some of these, if zinc or bismuth be previously added, in order to discover lead, the mercury may be agitated with a little water, in order to exclude the rest; then pour off the water, and digest the mercury with a little acetic acid; this will dissolve the rest of lead, which will be indicated by a blackish precipitate, with sulphureted water; or to the same end, add a little sulphate of soda, which will precipitate a sulphate of lead, containing seven or seventy per centum of metal. Bismuth is detected by pouring a nitric solution, prepared without heat, into distilled water; a white precipitate will appear if this metal be present. Tin is manifested in the same manner, by a weak solution of proto-nitrate of mercury, which throws down a purple sediment; and lastly, exposing the metal to heat.

*Ores of Mercury.* The native mercury and its sulphuret are the only two ores explored to the extraction of this metal. The first of these is found in globules, disseminated through different rocks, adhering to the sides of cavities and forming in the form of little drops, and rarely accumulating in masses of considerable dimensions, so as to stand out being dipped up in pails; though it never accumulates in sufficient quantity to form the sole object of extraction. Occasionally it is found amalgamated with other metals, containing one third its weight of the metal in this condition, it is rarely observed crystallized, but in the form of the rhombic dodecahedron. The sulphuret is the common ore, which furnishes more than the mercury of commerce. It occurs, crystallized in rhomboids, and six-sided prisms and tables, some of a cochineal red; lustre adamantine and granular, translucent; streak scarlet-red, shining, harder than gypsum, sectile, and easily frangible. Specific gravity, 6.7 to 8.2. It also occurs massive and compact, and often blended with bituminous matter, which communicates to it a liver-brown or fuscous colour, whence the name of *Argenteo-mercurialis*. The ore is very rich, and affords, by analysis, sulphur or eighty-five per centum of mercury; that which is bituminous gives eighty-one per centum. The muriate of mercury, or *hera quadrifida*, is common and presents itself in such small quantities in the mines, as scarcely to receive the attention of the miner and it is sought after only by the manufacturer. It occurs in incrustation, and rarely crystallized in quadrangular prisms, terminated by pyramids. It is translucent, with a lustre between adamantine and vitreous, and is sectile. It consists of 75 parts of mercury, 16.4 muriatic acid, and 7.4 sulphur. The ores of mercury are more frequent in countries than in primitive rocks, and are found particularly in sandstones, bituminous shales, and argillaceous rocks accompanied by organic remains. In general, mercury is a metal which cannot be used to form a wide distribution, and the mines which furnish it in quantity are few. The principal are those of Almaden, in the Austrian dominions, discovered in 1492, and which chiefly afford a bituminous sulphuret of

metal. These mines have already been explored to a depth not far from 1000 feet. They are capable of furnishing annually 6000 quintals of metal; but the Austrian government, in order to maintain the value of the metal, have limited their produce to 1500 quintals per annum. Their total produce from 1809 to 1813, a period of fifty-six months, was 1,419,425 pounds of mercury; 270,029 pounds of vermilion; 76,225 pounds of lump cinnabar; 6,400 pounds of calomel; 2,867 pounds of red precipitate, and 2,450 pounds of corrosive sublimate. The memorable conflagration of these mines in 1803 was extinguished only by filling their chambers and galleries with water, and the mercury which was sublimed during that catastrophe, occasioned the most dreadful diseases among more than 900 persons. Next to the mines of Idria come those of Almaden, in the province of Manche, in Spain, and which are nearly as rich as those of Idria. Their mean annual product is about 5000 quintals of quicksilver. These celebrated mines, near which are also those of Cuebas and Almadenejos, were known to the Romans, and, it is presumed, are those alluded to by Pliny, under the name of the mines of the territory of Sisapanus. After having been, for a great number of years, leased out to the merchants of Ausbourg, they are now explored on account of the government, and their product is exclusively applied to the amalgamation of gold and silver in the mines of Mexico and South America. The mines of the palatinate, situated upon the left bank of the Rhine, approach next in importance to those of Idria and Almaden. Their annual product is estimated at about half that of the Spanish mines. There exist in Hungary, in Bohemia, and in many other parts of Germany, small exploitations for mercury, of which the total yield is about 400 quintals per annum. The mines of Guanica Velica, in Peru, have afforded an immense supply of quicksilver for the purposes of amalgamation in the new world. Between the years 1570 and 1800, they are said to have furnished 537,000 quintals of this metal; and their actual product is, at present, rated at 1800 quintals. The ores of mercury are found in several places in Mexico, but are nowhere wrought to any extent. In 1590, mercury was sold in Mexico at £40 10s. per cwt.; in 1750, it had diminished to £17 15s.; in 1782, a further reduction had taken place, the price then being £8 17s. 6d. The consumption was estimated in the year 1803 (for Mexico), when the mines were in full work, as being 2,000,000 pounds per annum.

MERCY, FRANÇOIS DE, one of the most distinguished generals in the thirty years' war, was born at Longwy, in Lorraine, and rose in the service of the elector of Bavaria, through the successive ranks. After having defeated general Rantsau at Tuttingen, he was appointed, with the rank of Bavarian lieutenant-general and imperial field-marshal, to the command of the combined forces, and captured Rotweil and Ueberlingen. In the succeeding year (1644), Friburg fell into his hands, and he threw up a fortified camp in its vicinity. The great Conde attacked him in this position, and, after a combat of three days, compelled him to retire. Turenne pursued him, but the retreat was so ably conducted, that the French general was unable to obtain any advantage over him. May 5 (April 25), 1645, he defeated Turenne, at Marienthal (Mergentheim), and fell, August 3, in the battle of Allersheim, near Nordingen. He was buried on the field, and a stone was raised with the inscription *Sta, viator, heroem calcas*. Rousseau, in his *Emile* (liv. iv.), very justly remarks, that the simple name of one of his victories would have been preferable to this pompous sentence, borrowed from antiquity.

MERCY, FLORIMOND CLAUDE DE, a grandson of the preceding, born in Lorraine, 1666, entered the service of the emperor Leopold, 1682, and distinguished himself as a volunteer in the defence of Vienna against the Turks. His gallantry, particularly in the battle of Zenta, 1697 (see *Eugene*), was rewarded with the rank of major. He afterwards served with equal distinction in Italy and on the Rhine. In 1705, he stormed the lines of Pfaffenhofen, and compelled the French to retreat under the cannon of Strasburg. In 1706, he covered Landau by his skilful manœuvres, and supplied it with provisions and troops. In 1707, he defeated general Vivans, at Offenburi; but, in 1709, having penetrated too far into Alsace, was entirely defeated at Rumsheim. In 1716, he commanded against the Turks, as field-marshal, and took part in the victories of Peterwardein and Belgrade. In 1719, he commanded, with equal success, in Sicily, against the Spaniards, and, during the peace, exerted himself in improving the condition of the Bannat. In 1734, he received the command in Italy, and occupied the duchy of Parma; but fell, while leading the attack, in person, on the village of Croisetta. His remains were interred at Reggio.

MERGANSER (*mergus*); a genus of aquatic birds, consisting of five species. These birds are wild and untamable, migrating, according to the season, from cold to temperate climates. They keep in flocks, the adult males usually by themselves, leaving the young with the females. They are extremely voracious, destroying immense numbers of fish. They build among grass, near fresh water: the nest is lined with down, and contains from eight to fourteen eggs. The male keeps near the nest, though the female alone incubates. They swim with the body very deep in the water, the head and neck only appearing; dive by plunging, and remain under water for a long time. They walk badly; fly well, and for a long time. Their flesh is dry, and of a bad flavour.

MERIAN, MATTHEW, senior, born at Basle, in 1593, studied at Zurich, under Dietrich Meyer, and at Oppenheim, under Theodore de Bry, settled at Frankfurt on the Maine, and died in 1651. His principal engravings consist of views of the chief cities of Europe, particularly those of Germany, with descriptions, and are remarkable for the excellence of their perspective. His other works are landscapes, historical scenes, the chase, &c.

His son Matthew, born at Basle, 1621, was a good painter of portraits. He studied at Rome, 1644, travelled in England, the Low Countries, France, &c., and died in 1687.

Maria Sibylla, a daughter of the elder Matthew, was born at Frankfurt, in 1647. She studied under her step-father Morefels, and Mignon, and was distinguished by the taste, skill, and accuracy with which she painted flowers and insects in water colours. Her zeal for this department of painting induced her to make a voyage to Surinam, for the purpose of observing the metamorphosis of the insects of that country; and, after a residence of two years, she returned with a large collection of drawings of insects, plants, and fruits on vellum. Her works are *Erucaeum Ortus*, *Alimentum*, et *Metamorphosis*; History of the Insects of Europe; and *Metamorphosis Insectorum Surinamensium*, with sixty plates. She died at Amsterdam, 1717. One of her daughters published a new edition of the last named work, which her mother was preparing at the time of her death.

MERIDA, or YUCATAN; one of the states of the Mexican confederacy. See *Yucatan*, and *Mexico*.

MERIDIAN, in astronomy (from the Latin *meri-*

*dies*, mid-day), is a great circle of the celestial sphere, passing through the poles of the earth and the zenith and nadir, crossing the equator at right angles, and dividing the sphere into an eastern and western hemisphere. When the sun is on this circle, it is noon or mid-day, to all places situated under that meridian, whence the derivation of the word, as above stated.

*Meridian*, in geography; a corresponding terrestrial circle in the plane of the former, and which, therefore, passes through the poles of the earth. All places situated under the same meridian have their noon or mid-night at the same time; but, under different meridians, it will arrive sooner or later, according as they are situated to the eastward or westward of each other; viz. the sun will be upon that meridian soonest which is most to the eastward, and that at the rate of an hour for every fifteen degrees.

*First Meridian* is that from which all the others are reckoned, which, being totally arbitrary, has been variously chosen by different geographers. Ptolemy makes his first meridian pass through the most western of the Canary islands; others have chosen cape Verd; some the Peak of Teneriffe, others the island of Ferro, &c.; but most nations now consider that the first meridian which passes over their metropolis, or their principal observatory. Thus the British reckon from the meridian of Greenwich; the French from Paris; the Spanish from Madrid; the Americans from Washington, &c.

*Meridian of a Globe* is the brass circle in which it turns, and by which it is supported. *The Brazen Meridian* is divided into 360 equal parts, called *degrees*. In the upper semicircle of the brass meridian these degrees are numbered from 0 to 90, or from the equator towards the poles, and are used for finding the latitudes of places. On the lower semicircle of the brass meridian they are numbered from 0 to 90, from the poles towards the equator, and are used in the elevation of the poles.

*Meridian Line* is a north and south line, the exact determination of which is of the greatest importance in all cases relating to astronomy, geography, dialling, &c., because on this all the other parts have their dependence. The most celebrated meridian line is that on the pavement of the church of St Petronio, in Bologna, which was drawn to the length of 120 feet, by the celebrated Cassini. Without knowing the meridian line of a place, it would be impossible to make a dial, set a clock, or measure degrees on the earth's surface. For the measurement of degrees of the meridian, see the article *Degrees, Measurement of*.

*Meridian Line*, on a dial, is the same as the 12 o'clock hour line.

*Magnetic Meridian*; a great circle passing through the magnetic poles. See *Magnetism*.

*Meridian Altitude*; the altitude of any of the heavenly bodies when they are upon the meridian.

MERINO SHEEP. See *Sheep*.

MERLIN, AMBROSUS, a British writer, who flourished about the latter end of the fifth century. The accounts we have of him are so mixed up with fiction, that to disentangle his real life from the mass would be impossible. He was said to be the son of a demon and a daughter of a king of England who was a nun. His birth-place was Carmarthen, in Caledonia. He was instructed by his father in all branches of science, and received from him the power of working miracles. He was the greatest sage and mathematician of his time, the counsellor and friend of four English kings, Vortigern, Ambrosius, Uther Pendragon, and Arthur. Vortigern, at the advice of his magicians, had resolved to build an impregnable tower, in order to secure himself against the Saxons; but the foundation was scarcely laid,

when the earth opened by night and consumed it up. The magicians informed the king, that to prevent the foundation, he must wed a wife to him of a child born without a father. Afterward, the young Merlin was brought to the king, who Merlin had heard the dictum of the magicians, to disputed with them, and showed them the stone foundation of the tower was a great tale of the lake two great raging dragons, one representing the British, one white, representing the Saxons. The earth was dug open, and so near the dragons found, that they commenced a hot battle; whereupon Merlin began to weep, as he uttered prophecies respecting the future state of his land. The miracles ascribed to him are numerous. He is said to have escaped from the Saxons in a bag of glass. Instead of dying, it was supposed that he fell into a magic sleep, from which, after a long period, he would awake; and to this false superstition in his Faery Queen. In the *Brazen Meridian* in his *Compte de la Vie de Merlin et de ses Faits et de ses Prophecies* (2 vols., folio, on woven velvet date or place). We have also the *Life of Merlin*, surnamed Ambrosius, by T. Heywood, in *Keighton's History of Poetry*, and *Spranger's Faery Queen*, &c.

MERLON, in fortification, is that part of a parapet which is terminated by two embrasures of a battery. Its height and thickness are the same with those of the parapet; but its breadth is generally one foot on the inside, and six on the outside. It serves to cover those on the battery from the enemy; and is better when made of earth, well beat and rammed, than when built with stones, because they fly about and wound those they should defend.

MERMAID (from the Anglo-Saxon *mere*, sea, and *maid*, a fabulous creature, which seamen have described as having the head and body of a woman with the tail of a fish. Mermaids are represented as having long green hair, breasts, and arms, and as sometimes floating on the surface of the ocean. *Salmagundi* gives them a voice:

I heard a mermaid, on a dolphin's back,  
Uttering such dulcet and harmonious breath,  
That the rude sea grew civil at her song;  
Oberon, in *Midsummer Night's Dream*.

This reminds us of the ancient *syrenes*, who were winged and clawed. (See *Syren*.) Women have also been seen, if we may trust the tales. The stories have probably arisen from the appearance of Phœbe, and similar creatures.

MEROE; a city and state of ancient Egypt, in the north-easterly part of Africa, upon a fertile peninsula, surrounded by sandy deserts, and bounded by the Astapus (Bahr el Abiad), the White Nile, properly the Nile, on the west, and the Atbara (now the Tacazzu) on the east, as far as the modern province of Gojam. It now forms the district of Atbar, between 13° and 18° north latitude, with a town of the same name, and lies on the kingdom of Senaar, which constitutes a part of Nubia. The people of the ancient priestly state of Meroe, according to Herodotus, were negroes, and are the same black nation of which we have any account, that made much progress in intellectual cultivation. They had a fixed constitution, a government, law, and religion. The government was in the hands of a caste of priests, which chose a king from that number, who was obliged to live and act according to certain prescribed rules. The priests alone could doom the king to death in the name of the gods, and he must submit. It was customary for the king (ministers) of the king to share the same fate as their master, even death. Ergamenes, king of Meroe, in the third century B. C., during the reign

tolemy II., in Egypt, first made himself independent of this oppressive priesthood by murdering the its in the golden temple. Meroe was the centre of the great caravan trade between Ethiopia, Egypt, Nubia, Northern Africa, and India. Several colonies went from Meroe, and the first civilized state in the East, that of Thebes, which, as a resort for the Romans, always remained intimately connected with Meroe, and was governed by priests, must have originated thence. The priests were of a lighter complexion than the others, and were probably descended from India, from which, generally speaking, Meroe and the Ethiopian coasts must have received their first inhabitants. Ammonium (see *Ammon*, and also) was also a small priestly state, with a king, founded by Egyptians and by Ethiopians from Meroe. Meroe and Axum (in Abyssinia) which appears to have been also a colony from Meroe, remained the centre of the southern commerce till the time of the Romans. The existing monuments of their architecture, and many other vestiges of them, prove an early religious and social cultivation. Frederic Cailliaud of Nantes has given us the latest accounts of these memorials of Indian and Ethiopian antiquity in *Voyage à Méroë, au Fleuve Blanc, &c., en 1822* (Paris, 1824, in 3 parts, with engravings, maps, 2 vols., folio). Cailliaud took advantage of the Nubian campaign of Ismail, the son of the Pasha of Egypt, in 1821, to ascend the Nile farther than his predecessors had done. Gau (q. v.) reached the second cataract; Browne, in 1793, went to Cobbe, in Darfour (lat. 16° N.); Bruce went to Sennaar to the coast of the Red sea, as far as 30°; but Cailliaud penetrated into southern Nubia, following the principal branch of the Nile 2° north, 100 leagues above Sennaar, and 300 leagues farther from the southern boundary of Egypt. Gau, into a new country hitherto unknown to the geographers. He made observations and collections illustrating the physical geography and natural history, besides obtaining materials for an authentic map of the country through which he passed; but he attended particularly to the monuments and ruins of the most ancient architecture. His work, edited by Jomard, therefore forms a sequel to that of Gau, since Cailliaud begins where Gau ended. Cailliaud was well prepared for this second journey, and kept an accurate journal. With his companion Letornec he settled more than fifty points systematically, collected plants, animals, and minerals, and particularly took drawings of the remains of temples, pyramids, colossuses, bass-reliefs, and Egyptian and hieroglyphic inscriptions. He described and sketched about 100 ancient monuments, and directed, on his way to Meroe, nearly eighty pyramids and sepulchres. The most remarkable are the temples of Iaga and Soleb, the ruins of Subah (lat. 15° N.), pyramids at Parkal and Shendy (Chandy), where ancient Meroe was probably situated. Here he found the beetle worshipped by the Egyptians (*rabæus*, or *Atenhus sacer*), a gold beetle, from which it may be concluded that the Egyptians derived their worship from the Ethiopians. The latter still have about their necks the image of the *Scarabæus*. Cailliaud also found in the region of the ancient Meroe the hump-backed ox, and the true ibis, as it is delineated on the Egyptian monuments. Among more recent travellers to Nubia are the Prussian naturalists doctor Ehrenberg and doctor Hemprich, who, in 1823 et seq., under royal patronage, examined the coasts of the Red sea as far as Nubia and Sennaar. Hemprich died at Massuah, the principal port of Abyssinia, June 30, 1825. Ehrenberg returned, in 1827, to Berlin. Edward Rüppel, a native of Frankenstein on the Maine, in 1823, penetrated as far as Dou-

gola, in the upper part of Nubia, and, in 1825, returned to Cairo from an excursion in Nigritia. He then visited the coasts of the Red sea, went thence to Abyssinia, and, in June, 1827, again returned to Cairo. A Russian by the name of Ssenkowsky, who, since 1820, has travelled over some parts of the East and Africa, returned to St Petersburg in 1822, and published his travels in the Russian language, which, among many other things, probably contain good accounts of Nubia.

MEROPE; the daughter of Cypselus, king of Arcadia, and the wife of Cresphontes, king of Messene. She bore him many children, of whom the youngest was Æpytus (according to some, Telephontes). Cresphontes having made many changes in favour of the common people, the nobles conspired, and slew him, with all his children except Æpytus, whom Merope concealed, and afterwards sent to her father, by whom he was secretly educated. Polyphontes, who assumed the government in Messene, caused a search to be made for him everywhere in vain, and offered a reward to whoever should kill him. As soon as the youth was grown up, he went secretly to Messene, with the determination of revenging his father's death. He there demanded of Polyphontes the price which was set upon his own life, pretending that he had killed Æpytus. Merope, expecting a change in the government, had already sent a messenger to bring back her son. The messenger returned with the report that Æpytus had disappeared. She did not therefore doubt that the stranger was actually the murderer of her son, and she determined to kill him while he was asleep. She was on the point of executing her design, when she recognised her son, and concerted measures with him to take vengeance on Polyphontes. She pretended a reconciliation with him, and promised to reciprocate his love. Polyphontes immediately prepared a sacrifice; but, while he was at the altar, Æpytus killed him, and ascended his paternal throne. This story has been dramatised by Voltaire, Maffei, Alfieri, &c.

MEROVINGIANS; the first dynasty of Frankish kings, which ruled in the northern part of Gaul, since called *France*. They derived their name from *Merowig* (*Mervæus*), the grandfather of Hlodowig (Clovis). They ruled from 496 till 752, when they were supplanted by the Karolingians (Carlovingians). Thierry (*Lettres sur l'Histoire de France*) has shown that this revolution was a national change, the second dynasty being eastern Franks (Austrasians), who had become predominant over the Neustrians, or Western Franks, to whom the Merovingians belonged. See *France*.

MERSCH, VAN DER, leader of the Brabant patriots, in 1789, was born at Menin, and entered the French service, in which he acquired the title of the *brave Fleming*. He afterwards served in the Austrian army, in which he rose to the rank of lieutenant-colonel. In the beginning of the opposition to Austria in the Low Countries, the command of a hastily raised body of troops was given to him, with which, though undisciplined and inferior to the enemy, he made a successful attack on the imperial forces at Hoogstraaten, near Antwerp. After some other successful operations, which placed Ghent and Brussels in his hands, the chief command of the Belgian troops was intrusted to him. Party divisions soon, however, found their way into the government, and the enemies of Van der Mersch succeeded, by their intrigues, in removing him from his command, and, although they could prove nothing against him, threw him into prison. He remained in confinement until the Austrians recovered possession of the country, and died at Menin, in 1792, esteemed and regretted.

MERSEBURG; on the Saal, over which is a stone bridge, seat of government of a circle of the same

name, in the Prussian duchy of Saxony, with 8900 inhabitants. It is an old, badly built town. It has a good gymnasium, an obstetrical institute, several religious establishments, and some manufactures. The cathedral has four handsome towers, and an organ of a remarkable size. The bishop Dittmar (died 1018), one of the best historians of the middle ages, lies buried here. Merseburg is celebrated for its beer. Lon. 12° 0' E.; lat. 51° 21' N.

MERU, MOUNT, in the Hindoo cosmology and mythological geography; the sacred mountain, on whose summit resides Siva, situated in the centre of the earth, and sustaining and uniting earth, heaven, and hell. It is surrounded by seven zones, or *dwipas*, and seven seas,—the salt sea, the sea of intoxicating liquor, the sea of sugar, the sea of clarified butter, the sea of curds, the sea of milk, and the fresh water sea. Its four sides of four different colours, are directed to the four cardinal points, and watered by four rivers, issuing from a common source.

MESCHID, or MESGHID, or IMAN ALI, or MESCHED ALI; a town of Arabian Irak, ninety miles south of Bagdad; lon. 43° 34' E.; lat. 32° 5' N.; population, 6000. It is near a large lake, called *Rahemat*, which communicates with the Euphrates by a canal. This town was built on the spot where Ali, the cousin, friend, and one of the successors of Mohammed, was interred. His tomb is annually visited by a great number of Persian pilgrims, who esteem this point of devotion equal to a pilgrimage to Mecca.

MESCHID, or MESCHED; a city of Persia, in Chorasani; lon. 57° E.; lat. 37° 35' N.; population stated at 50,000. Five of its twelve quarters are now in ruins. The city is surrounded by a strong wall, seven miles in circumference, but the houses are meanly built. Velvet, of the finest quality, and fur pelisses, much esteemed, are manufactured here. There is also a manufacture of beautiful pottery. In time of peace, caravans pass continually through this town, from Bukharia, Balk, Candahar, Hindoostan, and all parts of Persia.

MESENTERY (*mesenterium*, from the Greek *mesos*, middle, and *enteron*, intestine); a membrane in the cavity of the abdomen, attached to the lumbar vertebrae, and to which the intestines adhere. Its uses are to sustain the intestines in such a manner that they may possess both mobility and firmness to support and conduct the blood-vessels, lacteals, and nerves, to fix the glands, and give an external coat to the intestines.

MESMER, FREDERIC ANTHONY; a German physician, author of the famous doctrine of animal magnetism, called also *Mesmerism*. He was born at Mersburg, in Suabia, in 1734. He first made himself known in 1766, by the publication of a thesis *De Planetarum Influens*, in which he maintained that the heavenly bodies exercised an influence on the bodies of animals, and especially on the nervous system, by means of a subtile fluid diffused through the universe. But this whimsical association of the Newtonian philosophy with the reveries of astrologers being too abstruse for general reception, he added the notion of curing diseases by magnetism, and went to Vienna to put his ideas in practice. Father Hell had previously performed some pretended cures by the application of magnets, and he considering Mesmer as a rival, charged him with borrowing, or rather stealing, his invention. The new empiric thought it prudent, therefore, to renounce the use of common magnets, and declare that his operations were conducted solely by means of the magnetism peculiar to animal bodies. He had little success at Vienna, and his applications to the academies of sciences at Paris and Berlin, and the

royal society of London, were treated with neglect. After an abortive attempt to cure Miss Parolan, a celebrated blind musician, by the curve of his art, Mesmer quitted Vienna for Paris in 1778. There he for some time in vain endeavored to attract the notice of men of science; but at length succeeded in making a convert of M. Desha, who was long his pupil, became his rival, and when he was represented as an impostor. Mesmer had to ascend to demand from the French government the gift of a castle and estate, as a reward for his pretended discoveries; and this he was actually carried on a negotiation with the government offering him a large pecuniary reward, if he would establish a magnetic clinicum, and select two persons chosen by government, as his preceptors. The latter condition induced him to reject the proposal and he removed, with some credulous patients, to Spa. A subscription was opened, to induce him to return to Paris and reveal the principles of his confessed discovery. He consequently was there gained a number of proselytes, and received 300,000 livres. Government at length appointed a committee of physicians, and members of the academy of sciences, among whom was Franklin, to examine the pretensions of Mesmer; and the result of their inquiries appeared in an admirable manner compiled by M. Bailly, which completely exposed the utility of animal magnetism, and the quackery of the author. He afterwards resided some time in England, under a feigned name, and then retired to Germany, and, in 1799, published a new edition of his doctrine, which attracted no more notice than at his native place, in 1815. He was the author of *Mémoire de F. A. Mesmer sur son Méthode ou son autre*. See *Magnetism*, *Animal*.

MESNE; he who is lord of a manor or his tenants holding of him, yet himself held of a superior lord.

MESNE PROCESS; an intermediate process which issues pending the suit, upon some intermediate matter. Sometimes it is put as a condition to final process, or process of merits, and then it signifies all such processes as intervene between the beginning and end of a suit.

MESOPOTAMIA (Greek, signifying the land between the rivers, called, by the Indians, *Euphrates*, or the island). The Greeks called by so name the extensive region enclosed by the Tigris and Euphrates, and bounded on the north by the Taurus and Masius. The northern part of the country was mountainous, and rich in grain, and pasturage; but the southern part was flat, and unfruitful. The principal cities were Nineveh or Charra, Edessa, Zoba (Nisibis), Asbeck, Vodonie, and Singara. This country has always been inhabited by husbandmen, who lived a settled life, and by shepherds, who wandered from place to place. The Mesopotamians sprung from the Chaldeans, the primitive inhabitants, from the Chaldeans who, in the reign of Nimrod, built the cities of Edessa and Nisibis, and from the descendants of Shem, of the tribe of Thara. The latter first settled the region around Ur Chaldeum, and then extended in and around Haran or Charra; but, in former times, they spread throughout the whole country, even into Chaldaea and Syria, so that the Chaldeans were compelled either to retire before them, or submit to them. It was originally a part of Nimrod's dominion. After an interval of more than 1000 years (B. C. 2000), Kusan Rishathian reigned in Mesopotamia, who extended his dominion over the Lydians. The Israelites, who then possessed Palestine, were compelled to pay him tribute for the space of eight years. In the golden age of the Assyrians

power (790 years B. C.), Mesopotamia was entirely subjected to that empire, and suffered the fate of its subsequent conquerors. Trajan subjected it to the dominion of Rome, A. D. 106, but the Persians did not suffer her to remain long in undisturbed possession of it. When the Arabs, in 651, established a new empire upon the ruins of the kingdom of the Sassanides, Mesopotamia was also obliged to submit to the storm. In the year 1040, it fell into the hands of the Seljooks. From that time it had many rulers, in rapid succession. Genghis Khan made himself master of it in 1218, but, in the year 1360, it fell into the hands of Tur Ali Bey. Forty years afterwards, Mesopotamia was conquered by Tamerlane, and, in 1514, Ismael Sophi incorporated it with the Persian empire. The Persians were, however, in 1554, compelled to cede more than half of it to the Turks; and though they again, in 1613, recovered the lost portion, they were unable to withstand the attacks of Amurath IV., who united this, in 1637, with many other provinces, to his empire. The present extent of this country is computed at about 36,000 square miles, with 800,000 inhabitants. The capital, Diarbekr, situated on the Tigris, with 8,000 inhabitants, a considerable manufacturing and commercial city, is the seat of a sangiac. See S. Buckingham's *Travels in Mesopotamia* [*Aleppo, Diarbekr, Mosul, Bagdad, the Ruins of Babylon*, &c.] London, 1827, quarto.

MESS, in sea language, denotes a particular company of the officers or crew of a ship, who eat, drink, and associate together, whence *messmate*, one of the number thus associated. In military language, *mess* denotes a sort of military ordinary, for the maintenance of which every officer, who takes his meals here, gives a certain proportion of his pay. These associations of officers, in the British armies, exist not merely in time of peace, but even in the field; and foreigners are surprised at the degree to which the national love of comfort prevails, even amid the fatigues of service, leading the officers to carry with them loads of table equipage, thereby adding to the cumbersome baggage of a British army. In all the descriptions of the British military life, the mess is conspicuous; and it may easily be imagined that these social meetings, when the toils of service are suspended, and the pleasures of the table are heightened by music; when the restraints of military etiquette are relaxed, and a soldier-like frankness prevails; when the young express their hopes, and the older relate their experiences,—are among the bright spots of British military life. Several armies, particularly the Prussian, have attempted, in time of peace, to imitate the British mess, but without being able to copy it fully.

MESSA DI VOCE (*Italian*) signifies, in music, a gradual swell and diminishing of the tones. It takes place in notes of long duration, especially upon *trill* mates (q. v.), and in the preparation of a cadence. In the duration of the note, the gradation in the *and*, *crescendo*, *forte* and *decrecendo* must depend. In shorter notes, less gradation takes place. The *nessa di voce* requires the singer to have his breath entirely under his control. If well executed, it has a very fine effect; but it is not to be confounded with the erroneous practice of many singers, to begin every tone *piano*, and gradually to increase in strength; neither ought it to occur too frequently.

MESSALIANS (in the Syriac), or Euchetes (in Greek, that is, *praying people*), also Enthusiasts, and Neumatists (as they called themselves); the members of a heretical sect, which arose in Mesopotamia about the year 360, and was introduced by Adelphius (one of their teachers), in the fourth century, into Syria. The Messalians insisted upon the incessant exercise

of prayer, which they considered as alone sufficient for salvation. They did not labour, but supported themselves by begging, and gave themselves up to fanciful speculation, which explains both their confused notions of Christianity, founded on Oriental mysticism, and resembling Manicheism, and also their expectation of being able by prayer to arrive at such a degree of perfection that in it all sin would be of necessity removed. With this are also connected those ascetic, and, in part, indecent excesses and strange convulsions, of which they were accused, those divine revelations and visions, of which they boasted, and their contempt of the church. Notwithstanding the opposition and denunciations of councils, emperors, and bishops, Messalians of both sexes continued to exist, although not in large numbers, among the Oriental Christians, till the end of the seventh century. The modern Messalians, or Bogomili, who are often improperly confounded with this sect, are more nearly connected with the Paulicians. (q. v.)

MESSALINA, 1, Valeria. This notorious Roman empress, the daughter of Messala Barbatus, and wife to the emperor Claudius, has left behind her the infamy of having surpassed, in licentiousness, the most abandoned women of any age. She had all the males belonging to the household of the emperor for her lovers; officers, soldiers, slaves, players—nothing was too low for her. Not satisfied with her own shame, she even compelled the most noble Roman ladies to commit, in her presence, similar excesses. Whosoever did not comply with her wishes she punished with death. She at length went so far as, during the lifetime of her husband, publicly to marry Caius Silius, a senator. Narcissus, a freedman and favourite of the emperor, formerly a paramour of the empress, discovered to Claudius, who was then absent from Rome, this new act of infamy on the part of Messalina. But Claudius delayed to punish her, and Narcissus, seeing that his own life was at stake, if the empress should succeed in recovering the favour of her weak and infatuated husband, gave orders to his friends to murder her secretly (A. D. 46).—2. Statilia Messalina; the third wife of Nero, on whose death she returned to private life. She then devoted herself to the study of eloquence and the fine arts, and acquired some celebrity.

MESSANA. See *Messina*.

MESSE CONCERTATE (*Italian*); masses in which the recitation is intermixed with choruses.

MESSE DI CAPELLA; an expression applied by the Italians to masses sung by the grand chorus. In these compositions, various fugues, double counterpoints, and other elaborate qualifications, are always required.

MESSENA; a country of ancient Greece, in the southern part of the Peloponnesus. Its capital was Messene (Mavromati), with the mountain fortress Ithome; Mothone (Modon), Korone (Coron) and Pylos (Navarino), with the stronghold Phææ, now Calamata, were its principal ports. On its southern coast lay the Messenian gulf (now the gulf of Coron). A ridge of mount Taygetus separated Messene from Sparta. Messenia is celebrated for the long struggle of its inhabitants with the Lacedæmonians, in defence of their liberty. In the first Messenian war (743—724 B. C.), the Lacedæmonians with the Athenians invaded Messenia, notwithstanding the proposal of the Messenian king to submit their differences to the arbitration of the Areopagus, or the Amphictyonic council. For twenty years, the Messenians defended themselves valiantly, under their king Aristodemus, who, in consequence of an answer of the Delphic oracle, which promised them the victory on condition of the sacrifice of a virgin of the

royal family, offered his own daughter as the victim. Her lover, to save her life, declared her to be pregnant by himself, and Aristodemus, to prove her innocence, stabbed her with his own hand, and caused her to be opened and sacrificed. The Messenians, though for some time successful, were finally obliged to submit by the loss of Ithome. About forty years after, they again rose; and thus commenced the second Messenian war (685 B. C.), which ended in their subjugation. (See *Aristomenes*.) A part of the Messenians are said to have emigrated to Sicily; and there to have founded Messina (see *Messina*), on the site of the ancient Zancle (668 B. C.) After 200 years of servitude, the Helots (q. v.) and Messenians took up arms. This third Messenian war lasted ten years (465—455 B. C.), and resulted in the expulsion of the Messenians from the Peloponnesus. Epaminondas restored them. They rebuilt Messene (369 B. C.), and maintained their independence till the country was conquered by the Romans. The Messenians remained true to their customs, manners, and language, through all changes of fortune. Delavigne has called his elegies *Messenienes*. In modern Greece as organised since the revolution, two of the seven departments of the Morea, in the south-western part of the peninsula, have received the names of *Upper Messenia* and *Lower Messenia*.

MESSENIUS, JOHN, born at Wadstena, in East Gothland, in 1584, was a Swedish historian. He was in the confidence of the great Gustavus Adolphus, and became professor of law and politics at Upsal. His fame exposed him to envy, and his enemies accused him, in 1615, of corresponding secretly with the German emperor Sigismund, on which he was sentenced to imprisonment for life. He died in confinement, in 1637. Of his writings, the principal is *Joan. Messenii Scandia* (not Scandia) *illustrata, seu Chronologia de Rebus Scandiae, hoc est Sueciae, Daniae, Norvegiae, &c.* (Stockholm, 1710, 14 vols., folio). His son Arnold was executed in 1651, on account of a libel against the queen and the senate. This libel was written by John, son of Arnold, who was then but seventeen years old. The father, however, had been accessory to it. John shared his fate.

MESSIAH; a Hebrew word, signifying the anointed; in the Greek translation *χριστος*, whence *Christ*. In the Old Testament, the word is applied to the whole Jewish people, to the priests, to the kings ("the Lord's anointed"—in the original, "Messiah"), and even to Gentile kings. In the books of the prophets, however, it began to be applied, by way of eminence, to the Saviour and Redeemer of the Jewish nation, and, in this sense, is used in the New Testament, with the extension of its meaning so as to signify the Saviour of all men. The Jews deny that the Messiah is yet come, and still expect the restoration of their state and nation from his arrival. See *Jews*, and *Jesus*.

MESSIER, CHARLES, an astronomer, born at Radonviller, in Lorraine, in 1739, went to Paris at the age of twenty, and was employed by the astronomer Delille, in copying and drawing maps. Delille, who was struck with his zeal in the study of astronomy, obtained a situation for him, and, in 1758, the observation of the comet, which then occupied the attention of astronomers, was intrusted to him. He was one of the first to discover the comet whose return Halley had predicted in 1759; and he carefully observed the newly discovered planet Uranus. A telescope, a quadrant, and a pendulum, were his only instruments. His sight was remarkably keen, and enabled him to discover objects of search before other observers. The revolution deprived him of his former appointments, but he continued his observations

through the reign of terror, and was afterwards appointed a member of the institute, of the board of longitude, and of the legion of honour. He died in 1817, at the age of eighty-six. His *cometes* are contained in the *Mémoires de l'académie*, and in the *Connaissance des Temps*.

MESSINA (anciently *Messana*), a city on the eastern coast of Sicily, lying on the neck which the *Pharos of Messina*, with a wide and commodious harbour; lat. 38° 11' N.; lon. 15° 34' E. *Palazzo* of an archbishop. The streets are broad, well out, and paved with lava, cut into black and white square. Since the earthquake of 1783, the town have been rebuilt, of fewer stories. The population is 55,000; thirty convents and about sixty schools, four seminaries of education, several hospitals for the poor, hospitals, and *monti di pietà*, a seminary, a royal and an episcopal palace, are among the public buildings. It has an extensive transit trade between Italy and the Levant, and exports silk, wax, fruits, wool, &c. The cathedral is dedicated to the virgin, who is the patroness of the city, under the title of *Madonna della Lettera*, and contains a letter in the hand-writing of the virgin to the Madonna, a lock of her hair, an arm of St. Paul, and the skull of Mary Magdalen! The city was ravaged by a plague in 1743, and almost entirely destroyed by an earthquake in 1783. See *Sicily*.

MESTIZOS, or METIS (Spanish, *mestizo*), countries where Spanish Europeans have united and intermingled with the natives, the descendants are called *Mestizos*. In Mexico the European Spaniards were called *Chapetones*, or *Gachupenes*. The pure descendants of Europeans are called *criollos* (q. v.); in similar countries. The *Mestizo* is denoted as having a transparent skin, a thin hard nose, hands and feet, and a certain obscurity of the eyes. If a Metis marry with a white, the fruit of the union differs but slightly from a European.

MESTO (*Italian*); a term signification of *distraction* and melancholy style of performance.

MESTRE DE CAMP; formerly the title of the commanding officer of a regiment of cavalry in the French service. He was distinguished by the appellation on account of there being a colonel-general in the cavalry. The chief of a regiment of *chasseurs* was also formerly so called.

MESUE; a name given to the author of some ancient Arabic works on medicine, which were translated into Latin. They are founded on the principles of Galen, and enjoyed great authority for a time, in the middle ages, and were commented upon down to the sixteenth century. There is much uncertainty respecting the name itself, and the life of the author. It seems necessary to suppose the existence of two physicians of this name, an Arabian who was body physician to the famous caliph Harun al Rashid (q. v.), and to several other caliphs, and died at Bagdad about A. D. 851. Harun al Rashid, and his successor, Almansur, employed him to translate several works from the Greek. The younger Mesue was born in the eleventh century. He is said to have been a Christian, and a pupil of Avicenna. His works on medicine, translated into Latin, were common text books in the medical schools of the middle ages, and were commented upon as late as the seventh century.

MESURADO, CARL. See *Liberia*.

META; a Greek preposition (*meta*) of a great variety of meanings. It is used in numerous compound words, which have been adapted to English, and, in this case, generally means *with*, *over*, *after*.

METAL; the most numerous class of unpounded chemical bodies, distinguished by the

lowing general characters: 1. They possess a peculiar lustre, which continues in the streak and in their smallest fragments. 2. They are fusible by heat, and in fusion retain their lustre and opacity. 3. They are all (except selenium) good conductors both of electricity and caloric. 4. Many of them may be extended under the hammer, and are called *malleable*; or under the rolling press, and are called *laminable*; or drawn into wire, and are called *ductile*. 5. When their saline combinations are electrized, the metals separate at the negative pole. 6. When exposed to the action of oxygen, chlorine, or iodine, at an elevated temperature, they generally take fire, and combining with one or other of these three elementary dissolvents, in definite proportions, are converted into earthy, or saline-looking bodies, devoid of metallic lustre and ductility, called *oxides*, *chlorides*, or *iodides*. 7. They are capable of combining in their melted state with each other, in almost every proportion, constituting alloys. 8. Most of them combine, in definite proportions, with sulphur and phosphorus, forming bodies frequently of a semi-metallic lustre; and others unite with hydrogen, carbon and boron, giving rise to peculiar gaseous or solid compounds. Their names are as follows: 1. platinum, 2. gold, 3. silver, 4. palladium, 5. mercury, 6. copper, 7. iron, 8. tin, 9. lead, 10. nickel, 11. cadmium, 12. zinc, 13. bismuth, 14. antimony, 15. manganese, 16. cobalt, 17. tellurium, 18. arsenic, 19. chromium, 20. molybdenum, 21. tungsten, 22. columbium, 23.elenium, 24. osmium, 25. rhodium, 26. iridium, 27. rranium, 28. titanium, 29. cerium, 30. potassium, 31. sodium, 32. lithium, 33. calcium, 34. barium, 35. trontium, 36. magnesium, 37. yttrium, 38. glucinum, 39. aluminum, 40. strontium, 41. silicium, 42. thonium.\* The first twelve are malleable, and so are he 30th, 31st, and 32d, in their congealed state. The first 16 yield oxides, which are neutral salifiable bases. The metals 17, 18, 19, 20, 21, 22, and 23 are acidifiable by combination with oxygen. Of the oxides of the rest, up to the 30th, little is known. The remaining metals form, with oxygen, the alkaline and earthy bases.

**METALLIQUES**; a kind of Austrian stocks, so called because the interest is paid in the precious metals, and not, like the interest of other stocks, in paper money. The name was afterwards used also in other countries, for instance, in Russia, for stocks of a similar kind.

**METALLOID**, in chemistry; a name given at first to the metals which have been obtained from the fixed alkalies and some of the earths. These bodies, having been found to be completely metallic, are now classed with the other metals, and no distinction is necessary.

**METALLURGY, METALLURGIC CHEMISTRY**, is that part of chemistry which teaches the combinations and analyses of metals. It has been much cultivated of late.

**METAMORPHOSIS** (from the Greek *μετα*, over, and *μορφη*, the form); a change of the form, used also for an entire change of the subject. The active imagination of nations in an early stage of history, indulges itself in representing metamorphoses of men, beasts, plants, stones, &c., and these productions of youthful imagination enter into their religion, philosophy, poetry (generally at first identical). Surrounded by the constant metamorphoses of nature, and seeking, as man always does, to connect effects and causes, yet unable, from his limited knowledge, to satisfy his desires, he is led to ascribe many changes, which riper ages find to be the con-

sequences of eternal laws, to sudden metamorphoses. To these he resorts to explain the mysteries of his present condition (which perplex the mind of man in the infancy of society as well as in advanced cultivation), and, by a series of metamorphoses, accounts for the undefinable connexion between man, nature and providence. To all this we must add the great interest which attends the story of metamorphoses. Even in this reflecting age, in which cool understanding seems to have acquired the ascendancy, who can read, without interest, the tales of strange transformations contained in the Arabian Nights—those wild productions of a creative imagination? Of the metamorphoses of the Greek mythology, while some startle the sober taste of our age, others belong to the sweetest productions of poetry. The popular belief in metamorphoses has by no means subsided entirely in all Christian countries. In natural history, the word *metamorphosis* is used sometimes for any change in the organization of matter, as, for instance, the transformation of food or rain into animal or vegetable organic substances, but more particularly for those sudden changes in the form of things, which are obvious and interesting even to ordinary observation, as the change of the pupa into a butterfly.

**METAPHOR** (Greek, *μεταφορα*, from *μετα*, a preposition often signifying in compound words, over, and *φορεω*, I carry); a figure of rhetoric, by which a word is transferred from the subject to which it properly belongs, and applied to another which has some similitude to its proper subject, with a view to give impressiveness to the latter. The metaphor may be merely in an epithet or an auxiliary term, as "winged haste," the "spring of life," &c., or in the main subject of a sentence, as when a hero is called a *lion*, a minister a *pillar of the state*, &c. In respect to the points of comparison, the metaphor may either put something animate or intellectual for something inanimate and material; for instance, "the wrath of the sea," "the bountiful earth," to represent nature as if endowed with will; or, *vice versa*, may substitute the physical for the spiritual, as, "the stars of his merits will shine from the night of the grave." As the impressions which we receive through the senses are the liveliest, the designation of things spiritual by images taken from the material world may often produce a striking effect. Thirdly, a metaphor may consist in the transfer of a term from one thing to another, falling under the same great division of material or spiritual, but substituting the more familiar for the less, as when we speak of the "silver moon." Brevity and power are the characteristic excellencies of the metaphor; novelty shows the original wit. Unexpected contrast may produce an effect sublime and ridiculous in the highest degree. Jean Paul, in his *Vorschule der Aesthetik* says, "The metaphor is the proof of the unity of both worlds (spiritual and physical.) The metaphors of all nations are similar, and none calls error light, or truth darkness." Liveliness of conception, comprehensiveness of view, and activity of imagination, are necessary to produce good metaphors, which often produce great effects, sometimes to the prejudice of sober reasoning. He who wishes to study metaphors must read the Old Testament and Shakspeare. A slight consideration will show us how constantly we speak in metaphors, and that we convey most abstract ideas by metaphors of the second kind; thus, He is *cold* towards me, He is *large minded*, &c. It is maintained by many, that all language began by the designation of objects and actions affecting the senses, and that when the mind began to abstract, man was obliged to use his stock of words for abstract ideas, so that all words, if we had the means to trace them, would be found to refer originally to

\* To this list we must now add vanadium, a new metal lately discovered by Sestrom, director of the iron mines of Falun, Scandinavia.

things material, which, it cannot be denied, is often the case. In the speculative sciences, morals, metaphysics, politics, &c., metaphors, instead of being confined to the rank of illustrations, have often been treated as if they had an independent meaning, and have been made the foundation of reasonings. No philosophy deserves this reproach more severely than the most recent philosophy of Germany, which often takes ingenious metaphors as explanations of truth.

**METAPHYSICS.** What am I? What is all that surrounds me? What is mind, soul, existence, perception, feeling, thought? What is evil? What is time, space, cause, effect? What is truth? What is necessity? What is freedom? Can we know any thing with certainty? Questions of this character are continually suggesting themselves to the mind of man. It is one of his distinguishing characteristics to look for causes, and to establish relations among the numberless phenomena around him, and within him; to separate the generic from the special, and to reduce the whole system of things to harmonious order. His acquisitions and advancement are all owing to this disposition, ineradicably planted in his soul by his Creator. The rudest speculations of uncivilized man, and the profoundest systems of philosophy, are alike proofs that this desire cannot be extinguished, this anxious feeling cannot be lulled into apathy. All investigations relating to these great questions belong to what has been called, though arbitrarily, *metaphysics*. Such speculations it is neither possible nor desirable to check, though they may result in but distant approximations to truth. Revealed religion does not attempt to repress them, and even if the end of the whole should be that the search was vain, this itself would be a fact of the highest interest. A man who condemns metaphysics must think his own nature unworthy of examination. Metaphysical inquiries, indeed, have often been disfigured with overstrained subtilty and revolting sophistry, and too often arbitrary analogies, bold comparisons, and unmeaning mysticism have claimed and received homage as having unlocked the long hidden truth; but the same has taken place in regard to religion and politics, and all the great subjects which strongly stir the soul of man. In an historical point of view, all these aberrations, and even absurdities, mournful as they may be, are interesting. Among the writings of Aristotle, on natural subjects, are some which treat particularly of the original causes of all existence. When the various treatises of that philosopher were first arranged by his commentators, the latter received a place after the others, and, not having a special title, were designated in the older manuscripts as *in prima via physica*, that is, *after the treatises on nature*; and of this the schoolmen formed the barbarous word *metaphysica*; and as the subjects which Aristotle treats in these chapters are purely speculative, metaphysics was considered the science of general speculation, and of things placed beyond the reach of the senses. This science was not new; its elements were spread through all philosophical systems; and that which bears the name of Aristotle, being but a collection of considerations on the principles of things, on general terms, axioms, causes, the properties of existence, substance, matter, motion, space, time, God, the immaterial and eternal intelligences who preside over the movement of the heavenly spheres, forms but part of it; for *metaphysics* comprehends every thing which can occupy the human mind. God, nature, the soul, and all the conceptions which result from the rational exercise of our faculties. Few philosophers have embraced the whole of the vast domain of metaphysics; generally they have attached themselves to one of its parts, and have treated it accord-

ing to their different genius. Some have submitted themselves to the promptings of a busy and creative imagination; others have devoted themselves to a cool analysis; some have employed themselves in speculation, others in observation; and a superior observation, some have combined themselves to facts perceptible by the senses; and some to phenomena within us, moral and intellectual. It does not mean that any class has exhausted and exclusively in either of these ways, but each to take a favourite path, to which the others were attracted. Thus the Oriental philosophy observes ideas more freely, analyses not at all, and imagines causes. It creates and sets in action suppositions, but suggests mysterious causes and arbitrary analogies and peoples space with spirits standing between us and men. The dogma of the two principles and a system of emanations, form the basis of the Oriental philosophy. Traces of these notions may appear in the metaphysics of Pythagoras and Plato. Aristotle, in the treatises above mentioned, gives what other philosophers have not assigned subjects lying beyond the reach of our senses, as often only hints at what is to be sought, rather declaring that it is found. The great system which Aristotle enjoyed in the middle ages, and a little actual knowledge respecting the laws of existence, induced his pretended followers to turn to his philosophical fragments what they thought a connected and well founded system, which served as a canon for the philosophy of the time. Even the most commentators of Aristotle directed their labours to this point; but metaphysics, as an independent science, was developed by the substance of the middle ages (Thomas Aquinas, Duns Scotus, William Occam, and others), and was cultivated to what this word can be given to their use of *metaphysics* (science) so much the more as all other sciences have been forgotten. Not until the seventeenth century was the metaphysics of the scholastics corrected by the introduction of a critical spirit of investigation. Lord Bacon, More, Hobbes, appeared in England; Th. Campanella, in Italy; Descartes, in France, as adversaries of the Aristotelian metaphysics. More details and a continuation of the historical sketch will be found in the *History of Philosophy, Intellectual*, as well as some account of the most important systems of metaphysics. It has become customary to designate the theoretical principles of any branch of knowledge as the metaphysics of a science. The French, in particular, have considered metaphysics in this light, and have lost the habit of despising abstract speculation, though a different spirit seems to have arisen among the latest philosophical writers.

**METAPONTUS**; a son of Sisyphus, who was Theban. See Thebes.

**METASTASIO**, PIETRO ANTONIO DOMENICO BUONAVENTURA; born at Ancona, 1734. His name was Trapassi, and his father was a country soldier. His poetical talents were early awakened, particularly by the reading of Tasso, and while a child, were displayed in making rhymes, and improvisations: the latter, however, he was obliged to renounce, on account of his excessive nervous excitement. The celebrated Cavalletti, who accidentally became acquainted with him, took him under his protection, called him, (by a corruption of his name into Greek) *Metastasio*, paid gratification to his education, and, on his death, in 1782, left him his whole estate. The young poet, being placed in an easy condition, devoted himself to his favourite study, and, under the guidance of the celebrated singer Maria Remondini (afterwards the Garelli), created the modern Italian opera. He is

already produced an opera, *Il Giustino*, in his fourteenth year. In 1724, he began his career as a dramatic poet, with the *Didone abbandonata*, which was brought out at Naples with Sarti's music, and in which he is thought to have depicted his own connexion with Romanina. His success was such that Charles VI. invited him to Vienna in 1729, and appointed him poet laureate (*poeta cesareo*) with a pension of 4000 guilders. Thenceforward no gala took place at court which was not graced by his verses. Ferdinand VI. of Spain, who was delighted with his operas, in which Farinelli (q. v.) performed, sent the poet a flattering token of approbation. Metastasio constantly declined all the distinctions which Charles VI. and Maria Theresa were desirous to confer on him, and died in 1782. Pius VI., who was then at Vienna, visited him in person, and sent him his apostolical benediction in *articulo mortis*. The most important of Metastasio's works are his operas and musical cantatas, which have appeared in numerous editions. A ninth edition of his *Opere drammatiche* was published in Venice in 1748; a better edition is that of Turin (1757, 14 vols.). His complete works, published in Venice (1781, 16 vols.) contain his life. His *Opere postume* appeared at Vienna (1795, 3 vols.). Metastasio's purity, clearness, elegance, and grace of style, the harmony, sweetness, ease, and expressive rhythm of his *arie*, *anonets*, and songs, have rendered him a classic among the Italians. No poet, perhaps, has ever possessed in a higher degree the power of embracing the most essential circumstances of a poetical situation in a narrow compass. The songs, with which his personages retire, are almost always the most concise and natural expression of the state of the feelings. His representations of the passions are, however, general; his pathos equally destitute of individual character, and of general contemplation. He is throughout musical, and never picturesque. His melodies are light and pleasing, but are frequently repeated with little variation: when one has read several of his pieces, he is acquainted with all. The gallantry of his heroes and the fondness of his heroines are, perhaps, less to be blamed than the choice of subjects whose serious character makes rising out of place. His tragic attempts failed. His astonishing success through all Europe, and particularly at courts, was owing partly to his being at only in office, but in manner, a court poet. brilliant and superficial, arraying prosaic thoughts in a poetical style, always preserving a courtly elegance, with a constant observance of the conventional proprieties of high life, he could not fail to please in the courtly world. Few of his operas have maintained a place on the stage, on account of the change in the musical taste.

**METASTASIS**, in medicine; the transfer of a disease from one part of the body to another, or such a alteration as is succeeded by a solution.

**METAURUS**; a town with a small river of the same name in the country of the Bruttii. The river Metaurus falls into the Adriatic.

**METELIN**. See *Lesbos*.

**METELLA**; the wife of Sylla.

**METELLI**; the surname of the family of the Metellii, at Rome, the most known of whom were a general, who defeated the Achæans, took Thebes, and invaded Macedonia, &c.; *Q. Cecilius*, who rendered himself illustrious by his successes against Mithridates, the Numidian king, from which he was surnamed *Numidicus*. He took, in this expedition, for his lieutenant, and son had cause to repent of the confidence he had placed in him. Marius raised himself to power by effacing the character of his benefactor, and Metel-

lus was recalled to Rome, and accused of extortion and ill-management. Marius was appointed his successor to finish the Numidian war, and Metellus was acquitted of the crimes laid to his charge before the tribunal of the Roman knights, who observed that the probity of his whole life, and the greatness of his exploits, were stronger proofs of his innocence than the most powerful arguments.—Another, who saved from the flames the Palladium, when Vesta's temple was on fire. He was then high priest. He lost his sight and one of his arms in doing it, and the senate, to reward his zeal and piety, permitted him always to be drawn to the senate-house in a chariot, an honour which no one had ever before enjoyed. He also gained a great victory over the Carthaginians, &c.—*Q. Cecilius*, a general who conquered Crete and Macedonia, and was surnamed *Macedonicus*.

**METEMPSYCHOSIS** (Greek, from *μετα*, beyond, or, in, and *ψυχή*, I animate); transmigration; the passage of the soul from one body to another.—*Metempsychosis* (from *μετα*, beyond, and *συνεμψύχω*, I embody) has a similar meaning. Generally the doctrine of transmigration of souls implies some change in the soul itself for better or worse, for purification or punishment. See *Transmigration of Souls*.

**METEMPTOSIS**, (from *μετα*, after, and *εμπτω*, I fall); a term in chronology expressing the solar equation necessary to prevent the new moon from happening a day too late.—*Proemplotis* signifies the lunar equation necessary to prevent the new moon from happening too soon.

**METEOR**. (Greek, *μετεωρα*, in the air.) The term *meteors* is often applied to all the phenomena which take place in the atmosphere, but is sometimes restricted to the appearance of luminous bodies flying or floating in the atmosphere, or in a more elevated region, including those brilliant globes or masses of matter which are occasionally seen moving rapidly through our atmosphere, and which throw off with loud explosions fragments that reach the earth, and are called *falling stones*; also those fireballs which are usually denominated *falling stars*, supposed to be owing to gelatinous matter, inflated by phosphureted hydrogen gas (see *Falling Stars*); also the lights which appear over moist grounds and burial grounds, called *ignes fatui*, which are ascribed to the same cause. Falling stars appear under a variety of circumstances, but particularly in autumn and spring, when the sky is clear. Their size and brilliancy are variable. They always move with great celerity. They are higher than the region of the clouds, because they are never seen in a cloudy sky. Electricity, spontaneous combustion of matter in the atmosphere, or the incandescence of little globes of a nature similar to that of the bolides, are the agents to which philosophers in general, though without sufficient reasons, attribute the origin of these meteors, with the true nature of which we shall not become acquainted without more numerous and exact observations. Meteors, in the most general sense of the word, may be reduced to four classes—*igneous* or *fiery* meteors, including, besides those above mentioned, lightning, St Elmo's fire; *luminous* meteors, as the rainbow, haloes, aurora borealis, zodiacal light, parhelia, or mock-suns, paraselenes, or mock-moons; *aqueous* meteors,—dew, hoar frost, mist, clouds, rain, snow, hail, &c.; and *aerial* meteors, as winds, water-spouts. It will be seen that these phenomena are of very different natures, and owing to different causes. The only connexion between them is that of a common medium, and we therefore refer to the separate articles for information concerning them; also to *Electricity*. See also the articles *Meteoric Stones*, and *Meteorology*.

**METEORIC IRON.** See *Iron, Native*, and *Meteoritic Stones*.

**METEORIC STONES, or AEROLITES,** are solid, semi-metallic substances, which fall from the atmosphere. The descent of such bodies had been long reported; but the fact was not considered authentic till within a few years. The larger stones have been seen as luminous bodies moving with great velocity, descending in oblique directions, and frequently with a loud, hissing noise, resembling that of a mortar shell when projected from a piece of ordnance; they are sometimes surrounded with a flame, tapering off to a narrow stream at the hinder part, are heard to explode, and seen to fly in pieces. Of course, these appearances have been observed only in the night; when the stones have fallen in the daytime, the meteor has not been observed, but the report and the shower of stones only have been noticed. The same meteoric mass has often been seen over a great extent of country; in some instances, a hundred miles in breadth, and five hundred in length, which implies that they must have had a great elevation. Indeed, from various calculations, it appears, that during the time in which they are visible, their perpendicular altitude is generally from twenty to a hundred miles; and their diameter has, in some instances, been estimated to be at least half a mile. Their velocity is astonishing. Though rarely visible for more than a minute, yet they are seen to traverse many degrees in the heavens. Their rate of motion cannot, according to calculation, be generally less than 300 miles in a minute. From the dimensions of these moving bodies, which certainly have not been overrated, since they have been known to illuminate, at once, a region of one or two hundred miles in extent, we are warranted in the conclusion that the stones which come to us from them, form but a very small portion of their bulk, while the main body holds on its way through the regions of the heavens. The velocity with which the pieces strike the earth is very great, frequently penetrating to a considerable depth, and when taken up, they have been found, in some cases, still hot, and bearing evident marks of recent fusion. Such falls have happened in cloudy as well as in clear weather, which leads to the belief that they are wholly unconnected with the state of the atmosphere. The most remarkable circumstance respecting them is, that they invariably resemble each other in certain easily cognizable characters, both as respects their external properties and chemical composition, so as to render it possible for a mineralogist or a chemist to recognize them with certainty, though he should have no information of their origin or fall. Those specimens in which earthy matter preponderates, resemble pretty closely certain varieties of the trachytic rocks, or ancient lavas, but they invariably contain disseminated through their substance, an alloy of iron and nickel, which has as yet never been discovered among the productions of our earth. The earthy minerals of which they are composed, are felspar, olivine and augite—the former greatly preponderating; and of metallic substances, besides the native iron, magnetic iron pyrites is a frequent ingredient. The alloy of iron and nickel often contains chrome, manganese and cobalt in minute proportions. This alloy varies in the proportion which it bears to the earthy matters, in stones which have fallen at different times: sometimes it is scarcely to be detected without the aid of the microscope; at other times it forms more than one half the bulk of the stone, and immense masses are found consisting entirely of native iron:—such masses are called *meteoric iron*, while the expression *meteoric stones* is applied more strictly to those in which the earthy minerals prepon-

derate. These last are invariably round, or a little outside, with a thin, black crust, and have a general a spherical figure, in which we often observe indentations, similar to those which are caused by a mass that has been impressed with a finger. These constant characters, as respects their external chemical and mechanical composition, strongly point to a common origin, and have given rise to a variety of hypotheses to account for their phenomena. We can only hint at these hypotheses. Some attribute them to terrestrial, and others to lunar volcanoes. They are again being supposed to be concretions formed in the regions of our atmosphere; while others have imagined them as small planets revolving about the earth, which, coming in contact with our atmosphere, take fire from the resistance and friction which they meet with in passing through it. We also repeat our first supposition, viz., that these stones proceed from terrestrial volcanoes, it will be sufficient to state that no remarkable eruption has been known to have happened at or near the time of their fall, and that such bodies have been found at the distance of several thousand miles from any known volcano. And the immense force that would be necessary to project bodies of such enormous dimensions at these rates are known to possess, far exceeds any force that can conceive of, not to notice the want of connection between meteoric stones and ordinary volcanic eruptions. As to the theory that they proceed from volcanoes in the moon, it has a greater appearance of probability. The same force that would project a body from the moon to the earth, would not, if it were exerted at the earth's surface, send the body to the distance of ten miles, as compared with the superior gravity of our planet and the density of the atmosphere. It is computed that a body projected from a favourable spot on the moon's surface, say the centre of her disk opposite to earth, would acquire a velocity about four times that commonly given to a cannon ball, or 8220 feet per second, and would carry it beyond the centre of attraction, and would enter into the sphere of the earth's attraction, where it must necessarily either fall to the surface, or circulate about us as a satellite. A body projected from the moon to the earth, would take 27½ hours in its passage; which is not so long but that it may retain its heat, particularly as it is devoid of atmosphere in passing through a vacuum, or very rare medium, it would be possible for the body to escape, not to say that it might acquire a fresh accumulation of heat, by passing through the denser part of our atmosphere. Besides, eruptions resemble those of our volcanoes, have been frequently observed in the moon; and her atmosphere is extremely rare, presenting but little resistance to projected bodies. This theory might perhaps be troublesome if we had to account for these showers of stones which come to our earth's surface; but there, it has been shown, is a very trifling part of the main masses from which they descend, and which are believed to be in some instances more than a mile in circumference. And since it is conceived that we experience a fall of these stones every few months in some part of the world, it is obvious that at that rate the mass of the moon must soon be shot away. We have this all. Among a number of bodies, therefore, that descend from the moon, it is not probable, that 10,000 would have precisely that direction and rate of motion which would be requisite to cause them to pass through our atmosphere, without falling to the

\* Since the discovery of Sir H. Davy, that the carbonaceous tallic oxide, it has been suggested that the mass of these may originally exist in the meteor in the form of charcoal, and that when the body arrives within our atmosphere, a red and violent combustion is produced by the strong affinity of the metals to oxygen.

ground. With regard to the theory of these bodies being concretions formed in the air, there is one principal objection, viz., that the velocity with which they strike the earth, estimated by the depth to which they have been known to penetrate, is so great as to indicate their having fallen from heights far exceeding the limits of the terrestrial atmosphere. The remaining theory especially that modification of it which conceives these meteoric masses to be terrestrial comets, appears encumbered with fewer difficulties than either of the others. The solar comets, it is well known, revolve round the sun in very eccentric orbits. In one part of their revolution, they sometimes come so near as almost to strike his body. They then move off, far beyond the orbits of all the planets; and in some instances are gone hundreds of years, before they return. The earth, it is imagined, in like manner, is furnished with its system of comets, whose size and periods of revolution are proportioned to the comparative smallness of the primary body about which they revolve, and which, like the solar comets, fly off in very elliptical orbits; and during the greatest part of their circuit are too far distant to be visible. In their approach to the earth, they all within our atmosphere; by friction of the air they are heated, and highly electrified, and the electricity is discharged with a very violent report, accompanied with the detachment of a portion of the mass, which descends in fragments to the earth. This hypothesis certainly accounts, in a very happy manner, for most of the phenomena attending the fall of bolides. The velocity of the meteor corresponds with the motion of a terrestrial comet, passing through the atmosphere in an elliptical orbit. A body moving near the earth with a velocity less than three hundred miles in a minute, must fall to its surface by the power of gravitation. If it move in a direction parallel to the horizon, more than four hundred and thirty miles in a minute, it will fly off in the curve of a hyperbola; and will never return, unless disturbed in its motion by some other body besides the earth. Within these two limits of three hundred miles on the one hand, and of four hundred and thirty on the other (some allowance being made for the resistance of the air and the motion of the earth), the body will revolve in an ellipsis, returning in regular periods. Now, the velocity of the meteors, which have been observed, has generally been estimated rather more than three hundred miles in a minute. In some instances it is perhaps too great to suffer the body ever to return; but in most cases, it is calculated to be such as would be necessary in describing the lower part of an elliptical orbit.—Various lists of the periods, places, and appearances of these showers of stones have been given from time to time in the scientific journals. One of the latest and most complete is that published in the first volume of the *Edinburgh Phil. Journ.*, compiled partly from a printed list by Chladni, and partly from a manuscript one of Mr Allan, read some years ago at the Royal society of Edinburgh.

METEOROLOGY (from *μετεωρος*, raised in the air, and *λογος*, discourse); the science which treats of the phenomena which occur in the atmosphere, of their causes and effects. Men, in all conditions of society, are led by motives of necessity or comfort to study the indications of the weather in the different appearances of the skies. The mariner, the shepherd, the husbandman, the hunter, have the strongest motives to examine closely every varying appearance which may precede more important changes. The result of these observations forms a body of maxims, in which facts are often stated correctly, but mixed with erroneous deductions and superstitious notions, such as the credulity of ignorant people

always renders them ready to adopt. Hence the disposition to refer the ordinary changes of the weather to the influence of the moon, and even the stars, and to look for signs of approaching convulsions, even in the moral world, in horrid comets and strange meteors. The progress of science, which tends to separate the casual precursors from the real causes of phenomena, refutes these false reasonings, dissipates the empty terrors to which they give rise, and aims, by more patient, long continued, and wide extended observations, to deduce the general rules by which the phenomena of the atmosphere appear to be regulated. Meteorology borrows from chemistry her analysis to determine the composition of the air itself, and of the substances which it contains, and by which it is acted upon; the manner in which the different processes of evaporation, freezing, thawing, &c., go on, and how they affect the state of the atmosphere; the action of these invisible agents, light, heat, electricity, &c., and their tremendous effects. From physics meteorology takes the mechanical action of these and similar powers and substances, the weight and velocity of the air, the laws of the reflection, refraction, and motion of light, &c. By these aids this science explains the formation, fall, or deposition of hail, snow, rain, dew, and frost, (see these articles, and those on *Clouds*, *Evaporation*, *Freezing*, and *Caloric*); the action of thunder and lightning (see *Electricity*); the prevalence and properties of certain winds (q. v.); the effect of the position of a country and the nature of its surface on its climate and productions (see *Climate*, *Temperature*, and *Mountains*); the nature and causes of meteors (see *Meteors*, and *Meteoric Stones*), &c. To prepare the way for these and similar inquiries, it is necessary previously to determine the extent and constitution of the medium in which the phenomena take place (see *Air*, and *Atmosphere*), and to indicate with precision, and observe with minuteness and accuracy, its precise condition at the time of their occurrence, by philosophical instruments. Some of these have long been known, but others are either of recent origin, or have received a more delicate construction from recent observers. The ordinary observations are generally confined to the weight and temperature of the air (see *Barometer*, and *Thermometer*); but other data are important, and have of late years received more attention than formerly. The dryness or humidity of the atmosphere (see *Hygrometer*); its brightness, or degree of illumination (see *Photometer*); the tint or shade of the cerulean hue of the sky (determined by the cyanometer, invented by Saussure); the variable disposition to chill the surface of the earth by impressions of cold transmitted from the higher regions (determined by the *æthrioscope*),—are all to be taken into consideration. The daily evaporation from the ground is to be measured by the anemometer; the quantity of rain which falls is to be registered by the ombrometer, or rain-gauge (q. v.); the amount of dew deposited should be observed (see *Drosometer*), and the direction, force and velocity of the wind indicated by the anemometer and anemoscope. (See Saussure's *Essais sur l'Hygrométrie*; De Luc's *Idées sur la Météorologie*; Cotte's *Traité de Météorologie*; Lampadius's *Grundriss der Atmosphärologie*; article *Meteorology* in the *Encyclopædia Metropolitana* (1830, second division); Daniell's *Meteorological Essays and Observations*).

The value of a meteorological register depends on the accuracy with which it is kept. The observations should be made in a place rather elevated, and exposed freely on all sides to the aspect of the sky, and should be repeated either at equal intervals during the day and night, or, at least, at those hours which represent most nearly the mean state

of the atmosphere. The position and exposure of the place should also be made known. These requisites are seldom attained, and very few registers of the weather are entitled to much confidence. Accurate observations, made in all parts of the world, and in a regular and scientific manner, are yet necessary for the systematic classification of all meteorological phenomena into a complete science.

**METHOD**; a convenient arrangement of things, proceedings, or ideas; in logic and rhetoric, the art or rule of disposing ideas in such a manner that they may be easily comprehended, either in order to discover the truth, or to demonstrate it to others. Method is essential to science, and gives to our knowledge its scientific character. Scientific authors make use of different methods, according to the object which they have in view. The apparently strictest is the mathematical, which is capable of giving the greatest possible clearness to its theorems by a series of explanations and deductions; but it ought to be observed that this method is only adapted to a science which has to do with numbers and magnitudes, and has had unfortunate consequences when nothing was considered true but what could be mathematically proved, and when the mathematical method was applied to intellectual philosophy. Methods have made epochs in philosophy, proceeding from the spirit of the systems to which they were applied. Thus there are the *sceptic* method (see *Scepticism*), the *critical* method (see *Kant*), and the *dogmatic* method, which, in philosophy, is the method that starts from acknowledged general principles,—all of which are limited and partial. The truly philosophical method is determined by the nature of the science. As to the way of proceeding, the method may be analytical (i. e. it starts from particular cases, and seeks from them to deduce general causes) or synthetic (i. e. it infers the consequences from the causes); but it must always proceed from elementary principles admitted by all, with logical strictness, in order to remain scientific. The popular method starts from the well known and the individual, and is generally analytical. Orators, both lay and clerical, and teachers of youth, make use of this less scientific method. As to external form, the teacher may speak uninterruptedly (this is adapted for adults and academical lectures), or proceed by way of interrogation. In those branches the elements of which lie in the operations of human reason, as in morals, mathematics, and religion, the catechetical method will be found best, because it addresses the reason or heart of the pupil directly, and by questions calls into action the powers of his understanding. The catechetical method deserves the name of Socratic only when the teacher limits himself to directing, by his questions, the course of the pupil's thoughts, but allows the conclusions to be formed by the operation of the scholar's own mind. Every art and science requires its own method of teaching, which, indeed, should be accommodated to the individual characters of the teacher and pupil. In order to teach the first elements to many pupils, Lancaster's method will be always found useful. (See *Mutual Instruction*.) Pestalozzi strives, in his method, whatever the branch of instruction may be, always to keep in view the elevation of the whole being, the strengthening of all the powers, and, as far as possible, to make the pupil's own powers co-operate in the work of instruction. (See *Pestalozzi*.) A mistaken benevolence has at times undertaken to make all study amusing, and to beguile the pupil into knowledge without the necessity of laborious exertion on his part. Such a method, however, tends to prevent the development of the facul-

ties, and to unfit the mind to cope with difficulties. Private instruction requires different methods from public instruction; in fact, circumstances will constantly vary the methods of a skilled teacher.

**METHODISTS**; those defenders of the Papal church who, in the seventeenth century, strove to bring to a close the controversy with the Protestants, by new methods of reasoning. A serious religious sect which arose in the bosom of the English church in the early part of the eighteenth century. Some young men at Oxford united themselves together, in 1729, for the purpose of strengthening each other's pious resolutions, and observing to religious services with strictness. They went particularly at a more rigid compliance with the precept of the New Testament than was usual at the time, and devoted themselves to works of love, and to instructing poor children, visiting the prisons, &c. Their more worldly fellow-students, among whose names indicative of their peculiarities, stand the *Methodists*, on account of their methodical observance of the rules of religion and the regularity of their lives. This name was adopted by themselves and has since been continued to their followers by the members of this small society. The principal was John Wesley (q. v.), the founder, his brother Charles and George Whitefield (q. v.), who joined in 1735. In 1735, Wesley went out to Georgia, to engage in the conversion of the heathens. There he remained two years, and, becoming separated from some of the Moravian Brothers, was much offended with their severe simplicity and pious doctrine (See *United Brethren*.) He then visited America after his return to England, and determined to set up his own society somewhat after the manner of Whitefield's preaching had already proved to be a people for this undertaking. Wesley founded a small society in London, which held its meetings in a private house, without any disputation at the time, to secede from the church. But the clergy of the establishment having refused their pulpits to the Methodist preachers who endeavoured to get on their hearers to their society, and the numbers of auditors being too great to be accommodated in a church, they began to preach in the open air, and to organise a separate church on the primitive apostolical model. The peculiar character of the Methodist preaching, which was distinguished from the philosophical indifference of that of the established clergy by its vehemence, religious enthusiasm, and popular style, and which dwelt more on the fall and depravity of man, on the atonement, on the resurrection, and the merits of a crucified Saviour, on repentance and regeneration, with all the eloquence which a sincere zeal could inspire, had a great effect in increasing the numbers of the society. Whitefield, the boldest and most zealous apostle of Methodism, in eloquence, courage, and fire the Paul of his sect, often collected hearers to the number of 12,000 in the fields, churches, and even at fairs, and, by the clamours of the multitude and the terrors of his denunciations, produced such an effect upon his audience, that many of them were thrown into convulsions, and, amidst cries of groans of anguish, were turned to flesh and blood at the spot. These sudden conversions were considered the outpourings of grace, and came to be regarded by the Methodists as desirable results of their preaching. They soon, however, gave up the practice of field-preaching, and built houses of worship (chapels), partly to protect themselves from exposure to the weather, and partly to avoid the outrages which they experienced from the rabble. Although they suffered much from the violence of the populace, as the government made no opposition, they succeeded to the regular establishment of their churches.

stitution, which was modelled on the plan of the Moravian Brothers, but divided into two distinct parties, the Wesleys, or Arminians, and the Whitefieldians, or Calvinists. Their liturgy was that of the established church, with some alterations. It appears, from the Sunday service of the Methodists of 1826, that the offices for the ordination of priests and deacons, and for the consecration of bishops, are altered into forms for the ordination of deacons, elders, and superintendents; the thirty-nine articles are, by omissions, reduced to twenty-five; the Nicene and Athanasian creeds are rejected, the apostles' creed only being retained; and the apocryphal books of the Old Testament are rejected. In 1797, the *New Connexion*, as it is called, arose out of a separation from the Wesleyan establishment, on grounds of church discipline and government, and not of doctrine. Alexander Kilham was their head and founder. The steps by which the Wesleyan Methodists became a distinct religious body might have been anticipated. The societies collected in London and other places were divided into little companies of from ten to twenty persons, called *classes*, and even in charge to a *leader*. The leader presided in the weekly meeting of his class for spiritual conversation and prayer, and received their contributions. General meetings of the society were called *body bands*; and, as the persons who were employed to preach to them soon became regular preachers, the country was divided into *circuits*, consisting of the societies of a certain district. These circuits were under two or more preachers, one of whom was at the head of the circuit, with the name of *superintendent*. The conference consists of a certain number of the preachers, who meet annually to discuss the affairs of the connexion. The distinctive character of Methodism is to be sought for, not so much in its doctrines as in the application of them, which it endeavoured to make the purpose of producing strong excitement; and those whom it has awakened to a sense of their sins, subjects to a course of discipline intended to unite them closely with the connexion. The fruits of Whitfield's preaching were, perhaps, not less than those of Wesley's, his followers being about as numerous in England as those of the great patriarch of Methodism. The rise of Methodism, though it cannot be denied to have been attended with some regularities and extravagances, was a revival of religion in England. Since the reformation there had been no such efforts made in the cause of religion; preaching so awakening, so little sectarian; no preachers with more zeal, singleness of purpose, and power of exhortation. It awoke the slumbering church from its lukewarmness, and dissenters to more bold and united efforts of Christian zeal. It addressed the ignorant, the poor, the hardened, in such a manner as to interest their feelings and command their attention. It has done, and is doing, much to instruct as well as to excite them. It made its way at first through persecution and outrage, and, after spreading over the native country, it has established missions in the most distant parts of the old and new world, among the slaves of the West Indies and the savages of the South Sea. See Southey's *Life of Moore*; *Life of Wesley*; *Crowther's Portraiture of Methodism*; *Gillie's Life of Whitfield*; the works of Wesley and Whitfield.

At an early period of the history of the connexion, the attention of Mr Wesley was directed to the British colonies of North America. In the Southern and Middle States, where sufficient provision had not been made to supply the spiritual wants of an increasing population, Methodism was particularly calculated to be eminently useful. It was introduced into those parts by preachers ordained by Wesley, and has

spread extensively. Some difference in discipline and government was introduced into the American connexion, among which that of the Episcopal government was the principal. The first Methodist society was established at New York, in 1766, by preachers from Ireland, and after the revolution, the first bishop was consecrated. There are, however, some modifications in the church discipline of the Methodists in different parts of the Union.

METIS (Greek, *μῆτις*, wisdom); the mother of Minerva, daughter of Oceanus and Tethys, the wisest of gods and men. (See *Jupiter* and *Minerva*.) Ritter thinks that the name of the Palus Mœotis is derived from her, and places her sanctuary at the mouth of the Borysthenes, where she was worshipped as the great mother.

METO or METON, was a celebrated mathematician of Athens, who flourished 432 years B. C. In the first year of the eighty-seventh Olympiad, he observed the solstice at Athens, and published his cycle of nineteen years, by which he endeavoured to adjust the course of the sun and moon, and to make the lunar and solar years begin at the same point of time. This is called the *golden number*, from its great use in the calendar. Meton was living about 412 B. C., for, when the Athenian fleet was sent to Sicily, he escaped a share in that disastrous expedition by counterfeiting insanity.

METONYMY; a figure in rhetoric, by which the name of an idea or thing is substituted for that of another, to which it has a certain relation. Such relations are *substance and quality, cause and effect, precedence and subsequence*, &c.; thus if we say, the tears of "joy," instead of the "joyous person," or respect for "gray hair," instead of "old age," or "olive-branch" for "peace," "stage" for the whole establishment connected with theatrical performances, &c. It is one of the most common figures in rhetoric.

METOPE (*μῆτα*, between, and *ὀπή*, a hole), in architecture; the interval or square space between the triglyphs, in the Doric frieze. The ancients were in the habit of ornamenting these parts of their buildings with carved works, or with paintings representing the heads of oxen, vessels, and other articles used in heathen sacrifices. The difficulty of disposing the triglyphs and metopes in symmetrical proportion may have been the cause of their omission in the Ionic and Corinthian orders.

METOPOSCOPY (from the Greek *μῆτα*, the forehead, and *σκοπία*, I observe); the pretended art of divining from the wrinkles of the forehead. The Romans, believing in every kind of divination, practised this, but not so much as the people of the middle ages. It seems singular that metoposcopy never was so much in vogue as chiromancy (q. v.), though there might be some possibility of divining, in part, the character of a man from his forehead and its wrinkles, while the lines in the hand have no connexion with it.

METRE; the French unit of measure. See *France*, division *Decimal System*.

METRE, in versification. See *Prosody* and *Rhythm*.

METROPOLITAN is the Greek name of an archbishop. The chief place of a province is called, in Greek, *metropolis*, and, as the bishops of the chief places, or capitals, were distinguished by superior rank (see *Bishop*), they also received a distinguished title. The metropolitan is above the bishop, but below the patriarch. The title of patriarch, however, is in use only in the Eastern churches. *Metropolitan church* is the archiepiscopal church.

METZ (anciently *Divodurum*; later, *Mediomatrici*, and *Mettæ*); a strongly fortified city, in the western

part of France, on the Moselle, thirty leagues north-west from Strasburg, sixty-one north-east from Paris; population, 45,276; lat. 49° 7' N.; lon. 6° 11' E. It is the seat of military, religious, and civil authorities, and contains numerous literary, scientific, and charitable institutions. It is a military place of the first class, highly important both for offensive and defensive measures. Its fortifications are very extensive, and constructed on the modern system, under the direction of Vauban and Belle-Isle. Besides manufactures of cotton, woollen, silk, &c., it has numerous and extensive public works in the war department. It is a very old place, founded at an early period by the Gauls, and adorned by the Romans with fine monuments. It was a free city of the German empire, from the eleventh century, but was occupied by the French troops, in 1552, and confirmed to France in 1648. About a league from the city, are the ruins of a Roman aqueduct, called, by the people, the *devil's bridge*. In 1822, some remains of antiquity were discovered in the ancient citadel, which have been described by Devilly (Metz, 1823.)

METZU, GABRIEL, a painter, born at Leyden, in 1615, lived in Amsterdam, where he died in 1658. His models were Douw, Terburg, and Mieris. His style, however, was nobler. He painted subjects from common life,—fruit-women, chemists in the laboratory, physicians attending the sick, &c. His manner is free and pleasing, and his imitation of nature true. His colouring was admirable. A lady tuning her lute, and another washing her hands in a silver basin held by her woman, are among his best pieces. His works are scarce, as he spent much time on them, and highly valued.

MEUDON; a village and castle, two leagues from Versailles, and the same distance from Paris. The old castle, built in the fifteenth century, and which, in the seventeenth, belonged to Louvois, was demolished in 1804. The *château*, built by Louis XIV., is situated on a rising ground, and commands a view of Paris, the Seine, and the environs. There is a fine terrace in front, and a small park planted by Lenoux. Napoleon improved the works, and assigned it as the residence of his son, while at the breast. During the expedition to Russia, the empress resided there.

MEULEN, ANTONY FRANCIS VAN DER, a battle painter, born at Brussels, 1634, was a pupil of Peter Snayers. Some of his compositions, having been carried to France, attracted the notice of Lebrun, and Colbert invited the young artist to Paris, with a pension of 2000 livres, and a residence at the Gobelins manufactory. His talents as a battle painter recommended him to Louis XIV., who always took him on his expeditions, and often pointed out the subjects which he desired him to represent. The painter had thus an opportunity of perfecting himself in his department of the art, and is considered, on account of his truth of expression, one of the best battle painters. He was also distinguished in the representation of scenes from common life, and in landscape painting. Among his most celebrated works, are the entrance of Louis XIV. into a conquered city; the entrance of the same prince into Arras; the siege of Maestricht; a horseman with a glass in his hand speaking to a young girl, who is tuning her guitar, &c. He also executed many excellent views of the royal *châteaux* in France. The expression of his horses is particularly admired, and Lebrun intrusted to him the execution of the horses in his paintings of the battles of Alexander. Van der Meulen died in 1690. The most celebrated engravers of his time executed a series of 152 engravings from his works, among which those of his pupil Baudouin, which now form the sixteenth, seventeenth,

and eighteenth volumes of the great collection called *Cabinet du Roi*, are distinguished.

MEUNG, or MEUN, JOHN DE, a French poet, surnamed, from his lameness, *Copain*, was born at Meung sur Loire, about 1250. He was so talented and, by his poetical talents and other endowments, himself a favourite at the court of Philip le Bel. He was satirically inclined, and exercised his wit upon the ladies of the court, who were so cruel against him, that a party of them secured him, and caused to give him a severe flogging; but he was not in his assistance, and he escaped contempt in being the most unchaste to give the first blow. He died about 1322, directing, by his will, that he should be buried in the church of the Dominicans at Paris, leaving to that order a heavy chest, not to be opened until after the funeral. The friars, expecting a treasure, opened the chest, but found only some old man, scrawled with sums and figures. In revenge, he disinterred the body; but the paragonage of Paris obliged them to bury it again with great honour. His principal work was his continuation of the *Roman de la Rose*, begun by William de Lorris, which comprises more than three parts of the whole. It is so poetical as the other, but has more extent and knowledge of the world. He was also the author of a translation of Boethius's *de Consolatione*, the work of Abelard; a work on the Resurrection of the dead; and a satirical piece, styled the *Century of John de Meung*, prefixed to Langlet du Fresnoy's edition of the *Roman de la Rose*, &c.

MEURSIUS, JOHN, a Dutch critic, born at Losdun, near the Hague. At sixteen, he was a student in the university of Leyden. He published his first work, an edition of Lycophron's *Cassandra*. He was afterwards selected by the celebrated Barneveldt, as travelling tutor to his sons, whom he accompanied over great part of the continent. On his return to Holland, after a ten years' absence (1627), he was elected professor of history and of Greek at Leiden, with the title of historiographer to the state. The fall of Barneveldt (q. v.) obliged him to resign his situation; and, accepting an invitation of the court of Denmark, he proceeded to Copenhagen. Here he soon became established at the university, erected for the education of the young nobles of Sora, in a similar post to that which he had occupied in Holland. His works are a *History of Athens*; the *Athenian Archons*; (On the people of Athens); On the Festivals of the Greeks; On the Dates of the Ancients; new editions of several classical works; History of Denmark, &c. The only complete edition of his works is that of Florence, in twelve volumes, 1743. Meursius died in 1659, leaving a son who died at an early age, in 1653 the author of several valuable antiquarian treatises.

MEURTRE; a department in the north of France (See *Lorraine*, and *Department*). The chief town is Nancy.

MEUSE, in Dutch, *Mosa*, (Mous) a navigable river, which rises in the department of (See *Marne*) (Champagne), in France, passes through the provinces of Namur, Liege, and Luxembourg, separates those of Guelderland and Holland from South Brabant, and divides, at Gorcum, into two branches, the northern and southern, which empty into the North sea by several mouths. It passes by Namur, Liege, Maestricht, Ruremonde, Venloo, Gorcum, Boedrecht, and Rotterdam, in the Low Countries.

MEUSE, a department in the north of France with 366,339 inhabitants; chief place, Bar-le-Duc. See *Lorraine*, and *Department*.

MEUSEL, JOHN GEORGE, was born in 1712 at Eyrichshof, in Franconia, and in 1764, removed to the university of Gottingen; in 1768, that of Halle.

where he lectured until he was appointed, in 1769, professor of history in the university of Erfurt. From 1780, he lived in Erlangen, where he died Sept. 19, 1820, having continued active, in lecturing and publishing, almost to his death. He wrote statistical and historical works, and compiled several collections relating to the history of literature, literary men, and the arts. His *Gelehrtes Deutschland* (5th ed., Lemgo, 1796, et seq.—the 21st vol. was edited by Ersch (q. v.), Lemgo, 1827); his Lexicon of all the German Authors who died from 1750 to 1800 (Leipsic, 1802, et seq.); his new edition and *Supplementum* of Struvius's *Bibliotheca Historica*, 21 vols., not finished, are proofs of his accuracy and industry. In the department of the fine arts, he prepared several valuable works. In the department of statistics, he wrote *Anleitung zur Kenntniss der Europäischen Staatenhistorie* (5th ed., Leipsic, 1816); *Literatur der Statistik* (Leipsic, 1806—7, 2 vols.); and *Lehrbuch der Statistik* (3d ed., Leipsic, 1805). He was as happy as an historian, being oppressed by the immense mass of his materials.

MEXICAL, or MESCAL; a spirituous drink, extracted from the aloe (*Maguey, Agave Mexicana*), which is consumed in large quantities by the Mexicans. It is also called *aguardiente de Maguey*. See *Pulque*.

MEXICO. The republic of the United States of Mexico (*Estados Unidos Mexicanos*), which comprises the former viceroyalty of New Spain, is bounded E. by the gulf of Mexico and Louisiana, W. by the Pacific ocean, N. by the United States of North America, and S. by Guatemala. It lies between 87° and 124° E. lon. and 15° and 42° N. lat., extending over 27 degrees of latitude, or 1876 miles from north to south. Its greatest breadth is in lat. 30°, according to Humboldt, 364 leagues (25 to a degree). Our acquaintance with a great portion of the country is very imperfect, and, even in those parts which have been most attentively examined, few of the positions are accurately determined. Almost the whole of the immense region lying north of 28°, comprising 14 degrees of latitude, is uninhabited by whites, and has never been explored. Humboldt calculates the superficial area at 118,478 square leagues of 25 to a degree; but this estimate does not include the space between the northern extremity of New Mexico and Sonora, and the boundary line of the United States. About one third of this territory lies within the torrid zone, but the peculiar geological structure of the republic exerts the most striking influence upon the climate. The Cordillera of Mexico separates into two branches, which, diverging to the north-east and north-west, form, as it were, the declivities of an elevated platform, or table-land, which, in the more central parts, is raised to an elevation of 7000 feet above the level of the sea, and extends to the north as far as the limits of the torrid zone. This remarkable elevation modifies the effect of the geographical position of the country in such a manner that, while the towns on the central plateau enjoy a mild temperature, those on the eastern and western coasts are exposed to a torrid sun, and the intervening space is filled with almost every modification of heat. In ascending from the low country, the climates succeed each other in layers, and in two days the whole scale of vegetation is presented to view. Again above this table-land rise ridges, or single prominences, in which the same appearances are exhibited. Durango is situated 6848 feet above the level of the sea; Zacatecas, 8169; Catorce, 9254; to the south, Jalapa, 4335; Perote, 7724; La Puebla, 7200; Cuernavaca, 5428; to the west, Valladolid, 6434; Guanaxuato, 6825; Queretaro, 6362; in the centre Mexico is situated

in a large valley, or basin, 7000 feet above the sea. Some of the *haciendas*, or residences, are about 10,000 feet high, and, in some instances, carriage roads pass over still more elevated positions. The principal summits are, Popocatepetl, 17,884 feet; Orizava, 17,373; Cerra de la Leona, near Catorce, 10,645; and Istaccihuatl, 15,704. There are five volcanoes in activity, all near the nineteenth parallel of latitude—Orizava, Popocatepetl, Tustla, Colima, and Jorullo; earthquakes are frequent, but not destructive. The inhabitants designate these successive climates by appropriate names: the low, hot country is called *tierra caliente*; the higher regions, *tierra fria* (cold country); and the intermediate regions, *tierra templada* (temperate country). Our division of the year into four periods, is there unknown, the only distinction being into the rainy season (*estacion de las aguas*), which commences about the end of May, and lasts four months, and the dry season (*el estio*), which comprises the rest of the year. Mexico suffers for want of water. The rivers are few and insignificant, if we except the Colorado, the del Norte, and the Grande. The lakes, which abound, appear to diminish gradually; the principal are, Chapala, Zumpango, S. Christoval, Tezcuco, &c., in the valley of Mexico; Cayman and Parras, in the Bolson de Mapimi; and the Timpanogos, further north. Among the various productions are maize and other corn, the banana, manioc, tropical fruits, cotton, coffee, sugar, tobacco, indigo, vanilla, cochineal, &c. Maize is produced in almost every part of the country, and in great abundance; its flour forms the chief food of the bulk of the inhabitants. Wheat succeeds very well on the table-land, but in the *tierra caliente*, the ear will not form, and the difficulty of communication between the coast and upper country is such, that the former may be supplied at a cheaper rate from the United States of North America. Sugar is raised in great quantities; enough is raised on the plateau, for the supply of its inhabitants, and the producers on the coast depend upon a foreign market; but, since 1822, the amount produced has much diminished. Coffee has been more recently introduced; the use of it has not been general in the interior till within a few years; extensive plantations were laid out in 1818 and 1819, near Cordova and Orizava, to which constant additions have been since made. Cotton was found among the indigenous productions of Mexico, and was generally used by the inhabitants. Up to the close of the last century, the annual amount of the cotton manufactures was estimated at 5,000,000 dollars. They have, however, gradually disappeared, but the raw material may be an important article of export, if properly attended to. The domestic animals are the same as in other parts of North America. The wool of the Mexican sheep is of an inferior quality. It has recently been discovered that the silk worm is indigenous in some parts of the country, and the silk produced is of an excellent quality, similar to that of the *bombyx mori* of China. The cultivation of the mulberry, and the breeding of silk worms, were introduced by Cortez, but were afterwards prohibited by the mother country. The total agricultural produce of Mexico was estimated, by Humboldt, at 29,000,000 dollars. The amount of the mineral productions has been differently estimated. Mr Ward calculates the total annual produce, from 1796 till 1810, at about 24,000,000 dollars, of which 22,000,000 were exported. The registered coinage, in that period, was 342,114,285 dollars. In a second period of fifteen years (1811 to 1825 inclusive), the total amount of coinage was only 153,276,972 dollars, the capital invested in mining having been much dimin-

ished by the emigration of capitalists during the revolution. The whole amount of circulating medium, in 1810, is estimated by Mr Ward to have been about 72,000,000 dollars, and the average annual exports, since 1810, at 13,587,052. Mexico will not probably, at least during the present century, become a manufacturing country, her mineral and agricultural wealth being sufficient to obtain for her all the necessary articles from other countries. Neither will she be a great maritime power. The Mexican ports on the Atlantic side are most of them insecure, and many of them are mere roadsteads. On the western coast there is, however, a series of magnificent ports, from Acapulco to Guaymas, many of which have never yet been entered. The commercial intercourse, on the western side, is much less important than that of the eastern coast, most of the countries with which it can be maintained on the Pacific (Columbia, Peru, Chile, China, and Calcutta), producing nearly the same agricultural articles. Hides, tallow, and wheat are, however, exported in considerable quantities. The returns are so imperfect, and the state of the country has been so fluctuating, that it is not easy to determine any thing with regard to the amount of the exports and imports, for any recent period.

The Spanish colony of Mexico was, for a long time, divided as follows: 1. the kingdom of Mexico; 2. the kingdom of New Galicia; 3. the new kingdom of Leon; 4. the colony of New Santander; 5. the province of Texas; 6. the province of Cohahuila; 7. province of New Biscay; 8. province of Sonora; 9. province of New Mexico; 10. province of Old and New California. In 1776, a new division was established, into, 1. the viceroyalty of New Spain, consisting of the intendancies of Mexico, Puebla, Veracruz, Oaxaca, Merida or Yucatan, Valladolid, Guadalajara, Zacatecas, Guanajuato, S. Luis-Potosi, and the two provinces of Old California and New California; 2. the internal provinces depending on the viceroyalty (*Provincias internas del Vireynato*), comprising the province of the new kingdom of Leon, and the province of New Santander, and, 3. the internal provinces dependent on the governor of Chihuahua (*Provincias internas de la comandancia general*) consisting of the intendancies of New Biscay, or Durango, and Sonora, and the provinces of Cohahuila, Texas, and New Mexico. This republic is now divided into nineteen states and five territories. The states are, Yucatan, or Merida, Tabasco, Las Chiapas, Oaxaca, Veracruz, Tamaulipas (New Santander), San Luis-Potosi, New Leon, Cohahuila and Texas, La Puebla, Mexico, Valladolid (Mechoacan), Guadalajara (Xalisco), Sonora and Cinaloa, Queretaro, Guanajuato, Zacatecas, Durango, Chihuahua. Old and New California, Colima, Tlascala and New Mexico are territories, their population not being sufficient to enable them to return members to the congress. The first census, which was taken in 1793, gave a population of 4,483,529. As the natives suspected the object to be taxation, this number was probably below the truth. Humboldt thinks that it exceeded 5,000,000, and estimated the number, in 1803, at 6,500,000, which agreed very well with the results of the census of 1806. Ward estimates it at about 8,000,000, in 1827. Previous to the expulsion of the Spaniards, in 1829, the population was composed of Europeans (Chapetones or Gachupines); Creoles, or native whites of pure European descent; Indians, or the indigenous races; Mestizoes, or a mixed breed of whites and Indians; Mulattoes, or descendants of whites and negroes; Zambos, or Chinos (Chinese), descendants of Negroes and Indians; and African Negroes. The descendants of Mulattoes and whites were called *quarte*

roons; and those of a quarter-Indian and a white, *quinteroons*. These distinctions were imposed by the colonial policy of Spain, for the purpose of keeping up a rivalry of castes; and the king had the privilege of conferring the honours of citizenship upon an individual of any colour, by a decree of the monarch, *que se tenga por blanco* (that he should be held as a white). The revolution, which divided the population into Europeans and Americans, has endeavored to efface these prejudices. The principal part of the white population is the table land, north of the centre of which the Indians are likewise absent. The northern frontier is inhabited chiefly by Indians, while the coasts are principally occupied by the *Tejotes* and *Zambos*. The Indians form about one-fifth of the whole population, and are divided into a great number of tribes, whose manners, language, degree of civilization, &c., are widely different. Their costumes, of course, vary with the various tribes; in the annexed cuts, the first a Mexican priest, the others a male and female native, may be given as specimens of ordinary dress.

No less than twenty languages, entirely distinct from each other, are found among them, and of some of them grammars and dictionaries have been compiled. The Catholic religion is the religious state. No other is tolerated. The old ecclesiastical divisions are retained, forming one archbishopric (that of Mexico), and nine bishoprics, comprising 1073 parishes. The clergy is composed of about 8000 individuals, including 4000 monks and nuns, in 206 convents. The clergy are not well educated, and the great mass of the Mexican population is ill

te of deplorable ignorance. The policy of the other country was calculated to keep down all that nation of the inhabitants who now form the population of the republic. All civil, military, and ecclesiastical dignities were in the hands of Europeans, and any attempt towards instructing even the higher classes was discountenanced. The natural sciences were taught, and have been cultivated with some success. The moral state of the country is also far from being favourable. An attempt was made, at a time, to establish a navy, and, in January, 1827, consisted of one ship of the line, two frigates, five vettes and brigs, and a few smaller vessels; but this force has not been kept up. The army, in 1827, consisted of 58,955 men, of whom 32,161 were actually under arms. The confusion which prevailed for some time in the country, renders impossible to give much statistical information of recent date. The revenue, under the old government, was 20,000,000 dollars; during the revolution, it became exceedingly embarrassed, and did not exceed 4,000,000 or 5,000,000 dollars. In 1825, it was 10,500,000 dollars, and the expenditure was only 18,000,000. Several loans were made in 1823, and succeeding years, but at an enormous rate of interest.

Under the government of Spain, Mexico was one of the four great viceroyalties of Spanish America. The viceroy was endowed with all the prerogatives of the king. The only checks upon him were the *audencia*, or investigation into his conduct on his return home, and the *audencia*, composed of Europeans, and of which he was himself president. The *recopilacion de las leyes de las Indias* was a name given to the heterogeneous mass of decrees by which the colonies were governed. Special *fueros*, or privileges, were conferred on different professional and corporate bodies, which rendered the confusion complete. All the higher offices, in church and state, were Europeans. A system of dilapidation, beginning with the chiefs, extended through all the offices of government, and a monstrous corruption perverted the whole administration. The colony was not allowed to manufacture any article which could be supplied by the mother country, and the whole trade was confined to a single port in Spain, and all foreigners were rigidly excluded. Books were prohibited, schools discouraged or suppressed, and every measure taken to prevent information from being spread among the inhabitants. The present form of government is that of a federal republic (*república representativa popular federal*), each member of which manages its own internal concerns. The legislative power is vested in a congress, divided into two chambers, the house of representatives (*cámara de diputados*), and a senate (*senado*). The former is composed of members elected for two years, one from each of the states, one member for every 100,000 inhabitants. The senate is composed of two senators for each state, elected by the state legislatures, the one first named for four years, and the other for two years. The congress is a high court of impeachment, and its powers are to maintain the union, regulate commerce, promote information, open roads and canals, lay taxes and imposts, declare war, approve treaties, &c. The supreme executive power is vested in a president, chosen by the legislatures of the states for four years. He has powers very similar to those of the president of the United States. The council of government (*consejo de gobierno*) exists only during the intervals of the sessions of congress, and is composed of one senator from each state, with the vice-president of the republic at the head. Its duties are to watch over the observance of the federative act and the federal laws, to

advise the president to call out the militia, to approve the nomination of officers, &c. For the despatch of business, the government is divided into departments, with secretaries at their head. The judicial power is lodged in a supreme tribunal of justice, and in inferior courts, as determined by congress. The supreme court takes cognizance of all matters between different states, or individuals of different states, admiralty cases, treason, construction of the constitution, &c. It may itself be called to account, by a tribunal constituted for the purpose by the chamber of deputies. The states are organized in a similar manner, with much the same powers and rights as those of the North American Union.—See *Acta Constitutiva* (Jan. 31, 1824), y *Constitución Federal de los Estados Unidos Mexicanos* (Mexico, 1828). This constitution was sanctioned Oct. 4, 1824. For information on subjects connected with Mexico, see Bullock's *Six Months' Residence, &c.*, in 1823; Hall's *Journal on the Coasts of Chile, Peru and Mexico*, in 1820—22; Lyon's *Journal of a Residence in Mexico*; Beaufoy's *Sketches*; Poinsett's *Notes*; the works of Robison, Brackenridge, and Hardy; Ward's *Mexico* (2d ed., London, 1829); Humboldt's *Essai Politique sur le Royaume de la Nouvelle Espagne*; 2d ed., 1828.

*History.* Numerous remains of antiquity which have been discovered in different parts of the country testify to the state of civilization at which the natives had arrived previous to the arrival of the Spaniards. In 1519, Cortes discovered the country, and having landed on the western coast, founded the city of Veracruz, and penetrated into the country of Anahuac, occupied by the Aztecs. Montezuma then reigned over the country. The capital Tenochtitlan, bore the title of *Mexico*, which signifies the residence of the god of war, and which was finally extended to the whole region. (See *Mexico, Antiquities of*.) After the death of Montezuma, the capital was taken by the Spaniards (1521), and the whole country fell into their hands. Cortes called it *New Spain*, and was created captain-general, but, in 1535, was displaced by a viceroy. We have already given some account of the colonial policy of Spain, and the condition of the colony under the Spanish dominion. Such was the condition of the country for three centuries (see Robertson's *History of America*; Clavigero's *Historia Antica del Mexico*, translated into English; Solis's *Historia de la Conquista de Mexico*; new edition, with notes, Madrid, 1825), when the events of 1808 in the Spanish peninsula led to a change in the state of affairs. The Mexicans were, in general, loyally disposed to their sovereign, but the assumption of authority by a new body, the cortes, and their unwise and inconsistent proceedings tended to alienate their feelings of attachment. Don Jose Iturrigaray, the viceroy, in order to conciliate the Americans, proposed to constitute a junta, formed of representatives from each province, and composed equally of natives and Europeans, which should organize a provisional government. The latter, however, fearful of losing some of their former superiority, arrested the viceroy, and sent him out of the country. The new viceroy, Venegas, displayed an offensive partiality for the Spaniards, and exasperated the Creoles by the severity of his measures. An extensive conspiracy was organized, and the insurrection broke out in September, 1810. A priest, Hidalgo, a man of strong mind and great firmness, put himself at the head of the insurgents; but, after some fighting, and the commission of great atrocities on both sides, Hidalgo was captured and put to death in 1811. Morelos, a priest in the southern part of the country, who had been named captain-general of the southwest by Hidalgo, had meanwhile raised a considera-

ble force, and, meeting with a series of successes, he advanced (in January, 1812) to within a short distance of the capital. In this expedition, Victoria first distinguished himself. Morelos was obliged to retire, but captured Oaxaca and Acapulco. A national congress was assembled at Chilpancingo, September, 1813, which declared Mexico independent. The forces of the insurgents were afterwards almost annihilated by Iturbide, and Morelos was himself shot in 1815. Victoria retired to the mountains, where he remained concealed eighteen months. Guerrero alone maintained a small force in the south. In 1817, general Mina landed with a small body of foreigners, and gained some temporary success; but he was made prisoner in July of that year, and shot. Thus in 1819 all the insurgent chiefs had been pardoned or executed, except Guerrero. In 1820, the cortes having ordered the sale of the church property, Apodaca, the viceroy, refused to acknowledge the cortes; he employed Iturbide to reduce Guerrero, but that general joined the insurgent chief, proposed the plan of Iguala, and proclaimed the independence of his country, February 24, 1821. At this time, the constitutional viceroy, O'Donoghue, arrived in the country, and concluded with Iturbide the peace of Cordova, by which it was stipulated that the Spanish army should evacuate Mexico. The viceroy and Iturbide were associated in the government, and the army was called the *army of the three guarantees*, the objects to be maintained being the independence of Mexico as a separate monarchy under a Bourbon prince, the maintenance of the Catholic religion, and the union of all classes. A congress was assembled February 24, 1822, to settle the principles of the constitution. But the cortes having declared the past proceedings null, Iturbide caused himself to be proclaimed emperor May 18, 1822, under the title of *Augustin the First*. A powerful party opposed the new state of things. After a bloody struggle, the emperor offered to abdicate in March, 1823, and was allowed to depart for Europe. A new form of government, on federal republican principles, was now established. Iturbide returned to the country in 1824, but was immediately arrested and shot. On the banishment of the emperor, a *poder ejecutivo*, or executive, was formed, consisting of Vitoria, Bravo, and Negrete, and, in 1824, the constitution was adopted and proclaimed. Vitoria was chosen president and Bravo vice-president of the new republic. The first constitutional congress convened January 1, 1825, and held an extraordinary session in August of the same year. In December (20th), the castle of Ulloa was surrendered by the Spaniards, and the whole Mexican soil was now delivered from European hands. The prospect of tranquillity which was held out by the complete liberation of the country and organisation of the government was soon interrupted by the violence of parties. The animosity of the Escoceses and Yorkinos resulted in acts of outrage and bloodshed, and the land has been distracted with civil war. The Escoceses (Scotch) was a masonic society of Scottish origin, composed of large proprietors and persons of distinction, who were mostly men of moderate principles, but decidedly favourable to the cause of independence. Many of them had, at one time, been in favour of a Spanish prince as constitutional king of Mexico, and they were therefore often styled *Borbonistas* by their adversaries. The Yorkinos constituted a masonic society, which derived its origin from a masonic lodge in New York, through the agency of Mr Poinsett, American minister at Mexico. These two political parties (for such they had become) were arrayed against each other on occasion of the choice of the second president in 1828, and also differed as to the policy

to be pursued in the treatment of the Spanish who resided in the country. The Yorkinos being in favour of their entire expulsion from the country. The result of the election, after an intense contest, was the triumph of the Escoceses party, who elected general Pedraza, was chosen, by a majority of two votes, over general Guerrero, the latter candidate. General Santana, at the head of a new army, declared that this vote was not an expression of the will of the majority, and proclaimed himself president. This movement was unavailing, as another was soon organised, and an army commanded the expulsion of the Spaniards. After fighting, the government was obliged to quit general Pedraza, to avoid bloodshed, and to allow friends to submit, and expressed his intention to leave the country. Guerrero was afterwards inaugurated president in April, 1829, and he passed ordering all Spanish residents to quit the country. In the summer of 1829, an expedition fitted out in the Havana, under the command of general Barradas, to undertake the conquest of the Mexican republic. A force of 8000 men was sent at Tampico July 27, but on the 10th of August surrendered to general Santana. But the danger of a foreign invasion were no sooner past than dissensions were again renewed. Guerrero had been invested with dictatorial powers as the enemy of the invaders, was unwilling to resign them, and this was made a pretext for the opposition of Bustamante. Bustamante, the vice-president, put himself at the head of a body of troops in January 1829, and issued a proclamation denouncing abuses of the executive. He immediately moved upon the capital, and was joined by the army of Guerrero, finding himself deserted, abandoned presidency, and Bustamante was elected as his successor. In the latter part of 1829 disturbances commenced, and a civil war was Guerrero, who was made prisoner in February, was condemned to death for having overthrown the established government, and that, after a period, Bustamante remained at the head of government, as vice-president. Besides the previously referred to, the reader may consult Carlos Maria Bestamante's *Compendio Historico de la Republica Mexicana*, extracted from the *Antiquities*. Our knowledge of the early history of the country since called Mexico, is derived in part from the Mexican pictures, many of which were destroyed by the Spaniards. There are also chronological histories, and copies of some of which were made by native Mexicans at the time of the destruction of the originals. The greatest of these was a celebrated table in the possession of Benigno Gongora, professor of mathematics in the university of Mexico, in 1698. The original is a copy of undoubted authenticity extracted by Humboldt has given an account. It begins with the deluge of Coxcoc, or, according to the cosmogony, the fourth destruction of the Coxcoc, with his wife, was saved from death their descendants received the gift of four fifteen families arrived in Mexico. According to a Mexican author, who wrote some years after the first age, *Thamand*, a giant, lasted 5206 years; the second, *Thamand*, or age of fire, 4804; the third, *Thamand*, or age of winds, 4010; the fourth, or age of the present, described in the above-mentioned painting, 5000 years. The Toltecs migrated from a country of Mexico, in A. D. 544, and in 1001, their monarchy was destroyed. The Aztecs arrived from Aztlan in 1178, and, in 1325, founded the

lan, or the city of Mexico. Clavigero enumerates the collections of paintings which have been preserved; they were executed on skins, cotton cloth, and the leaves of the maguey or agave. At the time of the arrival of the Spaniards, the Aztecs had attained such a degree of civilization that the right of private property was understood, cities built, professions and distinctions of rank existed, the arts were cultivated with considerable success, &c. among the most remarkable monuments of architecture are the *teocallis*, or pyramids. The pyramid of Cholula comprises a square, of 1773 feet, and is 177 feet high. It is formed of unburned bricks and clay, and is attributed to the Toltecs, who preceded the Aztecs in the country. The object is unknown. About two miles from Puebla are a number of pyramids, described by Humboldt. The first, the house of the sun, has a base of 682 feet in length, and is 10 feet high. The second, or house of the moon, is 10 feet high. They are both truncated, as is that of Cholula, and are also of Toltec origin. A group of little pyramids surrounds them, which are supposed to have been tombs. In the wall of the cathedral at Mexico is fixed a circular stone, covered with hieroglyphical figures, by which the Aztecs designated the months. Near it is a second stone, on which human sacrifices were performed. In the Dominican convent is a large idol, representing a serpent devouring a human victim. Mr Bullock obtained leave to examine another, which was concealed under the gallery of the university; it represented a goddess of war, and was six feet nine inches high, and nine feet nine inches broad, and was composed of a deformed human figure, a tiger, and a rattlesnake. For information on the subject of this idol, the reader may consult the works of Robertson, Clavigero, Humboldt, &c., mentioned in the article *Mexico*; also Ranking's *Conquest of Peru* and *Mexico* by the Mongols (London, 1827), and *Antiquities of Mexico* (7 vols., folio, London, 1830), containing facsimiles of the Mexican paintings in the royal libraries of Paris, Dresden, Berlin, the imperial library of Vienna, the Vatican, the Bodleian library, Oxford, &c., with indited Mexican stories.

*Mexico*, or *Mejico*, one of the states of the Mexican confederacy, with a population of about 1,000,000 inhabitants, is divided into eight districts; between 19° 30' and 20° N. lat., and 102° 50' and 107° 20' W. lon. It lies principally on the central plateau; its western coasts on the Pacific are low. It is bounded north by Queretaro, east by Puebla, south and south-west by the Pacific, and west by Valladolid.

Its capital is Tezcuco, Mexico, the chief city, having been declared a federal city. The magnificent port of Acapulco lies on its western coast. A great number of valuable mines lie within its territories, and its rich soil yields a valuable agricultural produce. The legislative assembly is composed of fifteen deputies; and the districts are placed each under a prefect, whose duty it is to establish village schools, form a census, &c. Its constitution was adopted in 1827. The former intendancy of Mexico comprised the states of Mexico and Queretaro.

*Mexico, New*; a territory of the Mexican confederacy, lying north of the state of Chihuahua, between 36° and 38° N. lat., 107° 50' and 111° 50' E. lon. It is traversed by the Rio del Norte, which flows into the gulf of Mexico. The population is not more than 100,000, of whom about half are Indians; capital, Santa Fe.

*Mexico*, formerly *Tenochtitlan*, capital of the Mexican confederacy, see of an archbishop, lies 7400 feet above the level of the sea; lat. 19° 25' 45" N.; lon. 98° 45' 30" W. The streets are broad, airy, and run

at right angles; the houses spacious, but low, rarely exceeding one story, with flat roofs; it is the most magnificent city of America, and among the capitals of Europe, there are few that can support a comparison with it. It is situated at about an equal distance from Veracruz and Acapulco, in an extensive valley, surrounded with lofty mountains, and containing several lakes, among which are Tezcuco and Xochimilco. It is on the site of the ancient city of Tenochtitlan, but the waters of lake Tezcuco, on which it borders, have so far subsided that the islands on which the old city was built are now confounded with the main land. The three causeys which connected them still remain, and four have since been built, which are well paved, and bordered with trees, forming avenues to the city. Humboldt estimated the population, in 1803, at 137,000; Poinsett, in 1822, at between 150 and 160,000, and later estimates have stated it at 168,000. The principal public buildings are the cathedral, about 500 feet in length, the palace of government, the college of mines, a noble building, but now somewhat dilapidated; the mint, with a front of 360 feet by 250 feet in depth, the Franciscan and Dominican convents, &c. There are, besides, forty-eight convents, hospitals, churches, theatres, &c. The public walks are the Alameda, and the Pasco. The rides to the Chapultepec, or summer palace of the viceroy Galves, beautifully situated on an eminence, near which is an aqueduct of 900 arches, and to Tacubaya, a village about four miles from the capital, which contains the country residence of the archbishop, are very pleasant. The canal of Chalco, which extends from the lake of that name to the capital, is covered, morning and evening, with canoes of the peasants, conveying fruits, flowers, and vegetables, to market; near it are the remains of the Chinampas, or floating gardens, which are surrounded with a broad ditch, and are now, if they were not always, firmly fixed. The inhabitants display a good deal of splendour in their dress and equipages, but many of the wealthiest have been obliged to leave the country by the wars of the revolution. The Iazaroni population, which, in 1824, amounted to 20,000 individuals, called by the Mexicans *leperos*, is described by Ward as presenting a most disgusting appearance of filth and rags. Measures have since been taken by the government to reform them, by compelling them to labour. Mexico enjoys a mild climate, and a pure and healthy atmosphere: it is subject to inundations from the lakes, and numerous works, such as canals, dikes, &c., have been erected as a protection against such a calamity. Tenochtitlan was founded by the Aztecs, in 1325, and was a rich, flourishing, populous, and active city, the seat of government and of religion, at the time of its discovery by the Spaniards. It was taken by Cortes, in 1521, after a siege of seventy-five days, and a most dreadful slaughter of the inhabitants. The besiegers razed the buildings as they advanced, in order to approach the principal quarter with safety. The ancient city was thus entirely destroyed, and the present city arose on its ruins.

*Mexico, Gulf of*; a large bay or gulf of the Atlantic, extending north and south, from the coast of Florida to the coast of Tabasco and Yucatan, about 600 miles, and from the island of Cuba westward to the coast of Mexico, about 700 miles. Cuba divides it into two straits, one to the south, between cape Antonio and cape Catoche, forty-five leagues wide, through which it communicates with the Caribbean sea, and another to the north, forty leagues in width, called the *gulf or strait of Florida*. It receives the waters of the del Norte, Sabine, and Mississippi. The Mexican ports on this gulf are mere roadsteads. The principal are Tampico, and Veracruz. Havana and

Pensacola are magnificent harbours. The principal current in the gulf is the Gulf stream, which takes its name from that circumstance; it is produced by the equatorial current from east to west, enters the gulf between the capes Antonio and Catorce, winds round its shores, and flows out by the channel of Florida, where Humboldt found its velocity to be five feet a second, against a strong north wind. See *Current*.

MEYER, JONAS DANIEL, born at Arnheim, in Guelderland, 1780, studied at Amsterdam and Leyden. He was at first an advocate in Amsterdam, in 1811 et seq., occupied several important judicial offices, and, in 1817, retired to private life. Doctor Meyer is a distinguished writer on law, politics, and legislation. His *Espit, Origine et Progrès des Institutions judiciaires*, &c. (Hague, 1819—23, six vols.) is a valuable work. He has recently published a work *On Codification*, particularly in England.

MEZZO; an Italian adjective, which means *half*, and is often used in musical language, as *mezzo forte*, *mezzo piano*, *mezzo voce*, which imply nearly the same thing, viz., a middle degree of piano or soft—*Mezzo soprano*; a pitch of voice between the soprano or treble and counter-tenor.

MEZZOTINTO. See *Engraving*.

MI; one of the six monosyllables adapted by Guido to his hexachords, and which was applied to the third and seventh notes of the natural diatonic scale.

MIAMI OF THE LAKES. See *Maumee*.

MIAMI; a river of Ohio, which rises in Hardin county, and runs south-westerly into the Ohio river at the south-west corner of the state. Its length is about 100 miles. Its navigation is not easy, but it affords numerous sites for mills and manufactories.

MIAMI, LITTLE; a river which rises in Madison county, Ohio, and runs in a south-westerly direction about 100 miles, and falls into the Ohio river seven miles above Cincinnati. It is one of the best mill-streams in this state, but affords little navigation.

MIASMA (from the Greek *μῆμα*, any thing polluting); a term used in the doctrine of contagious and epidemic diseases, with different meanings. Some authors use it precisely like *contagion*; with others it signifies the contagious matter of chronic diseases; with others, that contagious matter which collects in the atmosphere—flying contagion. Some understand by *miasma*, the vehicle of contagion; for instance, the pus of small-pox, which contains the proper contagious matter. *Miasma* also signifies certain matter, in the atmosphere, owing its origin to putrefied animal or vegetable bodies, or to the exhalation of animal bodies, and producing specific diseases. It would be well to contradistinguish *miasma* from *contagion*, and designate by the former term all the poisonous matter of diseases, which is not generated in living animal bodies, but has, in some other way, entered the atmospheric air. One of the most powerful correctors of miasmatic effluvia is chloride of lime, which is getting much into use among navigators and other persons exposed to such effluvia.

MICAH, the sixth of the minor prophets, was a Morasthite, of the tribe of Judah. He prophesied in the reigns of Jotham, Ahas, and Hezekiah, from 749 to 679 B. C. Nothing is known of his life or death. His prophecy is directed against Samaria and Jerusalem, whose sufferings, he declares, shall be greater than those of Babylon and the other gentile cities. The village of the Saviour's birth is designated by him (v. 2)—“But thou, Bethlehem Ephratah, little among the thousands of Judah, out of thee shall come forth a ruler in Israel, whose generation is of old, from everlasting.” His style is pure and correct, his

images bold, his denunciations not of empty bitterness.

MICHAEL (Hebrew, *for who is equal to God*) spoken of in Daniel (x. 13 and xi. 12), as one of the “chief princes,” and the “great prince of Jude” (ver. 9), he is called the “angel who is disputed with the devil about the body of Man” in the Revelation (xii. 7), it is said “then we saw heaven: Michael and his angels fought against the dragon.” From this expression, it has been stated that he was the chief of the celestial hosts, as it is in this character that the Catholic church ascribes to him religious honours. Milton (vi.) calls him “celestial armies prince,” and “prince of angels” attributes to him the command of the host of heaven in the war with Satan.

MICHAEL, St (S. Michael), the subject of the Azores, was discovered in 1444, and taken possession of by Cabral, in the name of Portugal, as it was power it now belongs; lat. 37° 50' N.; in 39° W.; twenty-five leagues S. E. from Terceira. The interior is mountainous, some of the peaks rising to a height of more than 7000 feet, and some of volcanic origin. Earthquakes are frequent, the soil is in many places composed of volcanic products. In the valleys it is fertile, and produces potatoes, oranges, grapes, peaches, and pears. The coasts abound with fish, and there are many warm springs in the interior. The climate is mild and agreeable. The commerce is considerable, especially with Britain, Portugal, and the United States. The population is about 80,000; capital, Ponta da Gada. (See *Azores, and Portugal*. See also *Wester's Description of St Michael*, 1861.) In 1831, the troops of donna Maria took possession of St Michael.

MICHAELIS, JOHN DAVID; professor of German, a celebrated theologian and Orientalist, born Halle, Feb. 27, 1717, where his father, Olaus Benedict, was a distinguished professor of the same branches. John David received his first education from his father, and afterwards studied at the university of Halle. After taking his degree, he went on a journey to England and Holland, where he had connections with several learned universities at London and Oxford, and in Leyden. After he returned to his native country, he prosecuted his studies with arduousness, and, in consequence of the death of Jakob Ludwig, was intrusted with the preparation of a catalogue raisonné of the Halle university library. Through the influence of the baron von Münchow Michaelis, in 1745, was made professor of philosophy at Gottingen, where in 1751, he was appointed, by Haller, to draw up the constitution of the new society of sciences, of which he was secretary-director, until some differences with one of his colleagues induced him to resign his post and leave society. From 1753 to 1770, he was one of the editors of the Gottingen Literary Notices, and from 1771 to 1783, was librarian to the university. After the death of Gesner (1761), he undertook the duties of the philological seminary, from which as an eminent philologists have proceeded. During the troubles of the seven years' war, Michaelis was employed in making preparations for an expedition into Arabia, which was afterwards not taken by Niebuhr, and which constituted an important explanation to obscure passages of scripture. He died in 1791. His labours in this criticism and history are of great value. His principal works are *Mosaisches Recht* (6 vols., second edition 5 vols., 1776—80, translated into English, under the title of *Commentaries on the Laws of Moses*, 1803), and *Reductions to the Study of the Old and New Testament* (the latter has been translated by Morrell). See

*um Geogr. Hebræorum*; Translations of the Old and New Testaments, with grammatical and lexicographical productions. Heyne and Eichhorn have enriched tributes to his memory, and he himself left an autobiography.

MICHAUX, ANDRÉ, a celebrated traveller and botanist, born at Sartory, near Versailles, in 1746, is early led by the example of his father and his own inclinations to devote himself to agricultural pursuits, but at the same time did not neglect to cultivate the sciences and polite literature. The loss of his wife, soon after an early marriage, interrupted his prospects of domestic happiness, and carried him to Paris, where he became acquainted with Lemonnier, and acquired a taste for botany. He attended the lectures of Jussieu, and, in 1780, visited Auvergne, the Pyrenees and Spain, in company with Delamarck and Thouin, on a botanical excursion. In 1782, Lemonnier obtained for him permission to accompany Rousseau, who was appointed Persian consul, to Persia, and after spending two years in those parts, Michaux returned with a fine collection of plants and seeds. In 1785, he was sent to America for the purpose of sending out trees and shrubs for the establishment at Rambouillet, landed at New York, visited New Jersey, Pennsylvania, and Maryland. In 1787, he formed a new establishment at Charleston for the procuring and preserving plants, visited Georgia, Florida, the Bahamas, &c. In 1792, he examined the more northern parts of the continent, to the vicinity of Hudson's bay. The two gardens which he had established at New York and Charleston were now in a flourishing condition, and he done much towards advancing arboriculture in the United States. Soon after his return to Philadelphia, Michaux was sent to Louisiana by the French government on a public mission, and in July, 1803, crossed the Alleghenies, and descended the Ohio. The project in relation to which he had been then having been abandoned, he returned, in December, to Philadelphia, by the way of Virginia. The next year, he again crossed the mountains, and examined the western parts of the United States. The difficulties which he had to encounter in these expeditions may be easily imagined. In 1796, he returned to Europe, was shipwrecked on the coast of Ireland, but saved the greater part of his valuable collection, and, on his arrival in Paris, found that out of 30,000 stocks which he had sent out to Rambouillet, only a very small number had escaped the ravages of the revolution. Michaux was unable to claim the arrears of his salary for seven years, or employment from the government, and occupied himself in preparing materials for his works on North America. In 1800, however, he was attached to the expedition of Baudin to New Holland; but, on visiting Teneriffe and the Isle of France, he left the party, and went to Madagascar, where he soon died of a fever (November, 1802). His works *Histoire des Chênes de l'Amérique Septentrionale*, Paris, 1801, folio, with thirty-six plates, representing thirty species and sixteen varieties; and *Flora californiana* (2 vols., 8vo, 1803, with fifty-two plates, comprising 1700 plants, and about forty new genera).

MICHAUX, FRANÇOIS ANDRÉ, son of the preceding, is the author of the *North American Sylva* (5 vols., 8vo, Philadelphia, 1817, 150 coloured engravings); and of *Travels in Ohio, Kentucky, and Tennessee* (London, 1805.)

MICHEL ANGELO, or MICHELANGELO. See *Michelangelo*.

MICHIGAN; a territory of the United States of America. This territory may be viewed in two aspects—one, as presented by its political limits,

established by the acts of congress of January, 1805, and April, 1818; the other as exhibited by the natural boundaries by which it will probably be defined when it enters the confederacy; and known by the appropriate and more usual designation of *Michigan Proper*. The whole extent of country called *Michigan*, lies between 41° 38' 58" and 48° 37' N. lat., and 82° 15', and nearly 95° W. lon. from Greenwich. That portion lying W. of 87° 10' lon., comprises the extensive district attached to Michigan, and contemplated to be set off and organised as a new territory. This latter region, bordering east on lake Michigan, north on lake Superior (nearly half of which it embraces), and the chain of small lakes connecting that Mediterranean with the heads of the Mississippi, and west and north-west on the Upper Mississippi, has been little explored. Judging from known portions of it, however, it must gradually assume, as its resources are developed by the progress of improvement, great interest and importance. The country included between the Fox and Wisconsin rivers, and the western shore of lake Michigan, bears a highly inviting character. The soil is a rich, black alluvial, irrigated by innumerable veins of water. The face of the country is unbroken by hills of any magnitude. From its northern extremity south to the Milwaukee and the heads of Rock river, it is covered with a dense forest, opening, as traced farther down to the southern bend of lake Michigan, into fertile and extensive prairies. It is not marked by that sterility which usually distinguishes mineral regions. Explorers have noticed, as a feature of geological interest, the entire absence of pebbles upon the surface of these prairies, and to a depth of two or three feet. The succeeding stratum is of clay. More than 36,000,000 pounds of lead were yielded, by the mining district, from the autumn of 1824 to that of 1829. The southern shore of lake Superior affords strong indication of copper. By the treaty of Prairie du Chien, 1829, the United States purchased of the Winnebagoes, Chippewas, Ottawas, and Potawatamies, a tract of about 6,000,000 acres of land, of which 2,300,000 are supposed to be within the limits of the contemplated territory. About 132,000 in the vicinity of Green bay have also been ceded. The former cession comprehends nearly all the mining district of the Upper Mississippi. It is occupied principally by the Winnebago, Chippewa, and Sioux tribes of Indians. The white population, confined chiefly to Green bay and the mining district, is estimated at 6000. Military posts are established at Green bay, Prairie du Chien, fort Snelling, on the St. Peters, and Fort Winnebago, at the portage of the Fox and Wisconsin rivers. Settlements are formed, more or less extensive, at Green bay; Pembina, on Red river of lake Winnepeg; Prairie du Chien, on the Mississippi, and the lead mine, bounding on the Mississippi and Wisconsin.

*Michigan Proper* lies between 41° 38' 58" and 46° 50' N. lat., and 82° 15' and 87° 10' W. lon., and is bounded N. by lake Superior, E. by St. Mary's river, lake Huron, St. Clair river, lake St. Clair, Detroit river, and lake Erie; S. by Ohio and Indiana; and W. by a line dividing lake Michigan N. and S. to Big Beaver island; and thence running due N., to the national boundary in lake Superior. These limits comprehend about 60,500 square miles, of which a third, perhaps, is covered with water. They comprise two peninsulas:—the larger, being the peninsula of Michigan, bounded E. by lakes Erie, St. Clair, and Huron, and W. by lake Michigan, containing about 36,000 square miles; the smaller bounded S. by the straits of Mackinac, E. by the river St. Mary, N. by lake Superior; containing about 2000 square miles. The former is about 280

miles long, N. and S., and from 180 to 200 broad. E. and W. From the base of the peninsula, as far N. as Grand and Saginaw rivers, the country has been ceded by the Indians. The jurisdiction of Michigan extends over all the territory of the United States E. of the Mississippi and N. of Illinois. As generally indicating its geological and mineralogical character, we may remark, that the rock is covered with a bed of alluvial earth, from 30 to 150 feet deep. The rocks belong to the secondary class. The strata, in the southern part of the territory, are supposed to dip S. E. at an angle of about  $4^{\circ}$  with the horizon. Ferriferous sand rock, saliferous rock, and mill-stone grit, are found alternating on the surface, at various points in the middle and western parts of the peninsula. Salt springs occur on the branches of many of the interior rivers. Bog iron ore, lead ore, gypsum and bituminous coal are found, though in considerable quantities. Peat is abundant in many parts of the territory. The face of the country is generally level or gently undulating. A strip of table land, stretching N. and S., and assuming, as it is traced N., the character of a ridge, divides the waters emptying eastward into lakes Erie, St Clair, and Huron, from those passing westward into lake Michigan. Its elevation is estimated to be 300 feet above the level of the lakes. South of a line drawn due W. from the southern extremity of lake Huron, the country consists of open land, known by the name of *Oak plains*. The soil is a loam, with varying proportions of clay. It becomes fertile by cultivation, and is good farm land. In the country bordering on the Kalamazoo and St Joseph rivers, prairies of a black, rich, alluvial soil and unusual productiveness, frequently occur. The northern part of the peninsula is in the occupation of Indians, and has been little explored, except along the borders. The land is in many places more elevated than that farther south, and is covered with the trees usually found in those latitudes. The Indians raise corn in abundance. The peninsula between the straits of Mackinac and lake Superior, as far as is known, resembles, in its soil, forests, form and climate, the northern part of the peninsula of Michigan. In the southern part of the territory, the climate is temperate; in the northern, cold. Snow falls at Detroit from six to eighteen inches deep, and remains two or three weeks. The transition from the cold of spring to the heat of summer is rapid; from summer to winter, gradual and prolonged. As general characteristics, the spring is wet and backward; summer, dry; autumn, mild; winter, cold and dry. The average temperature is, in the spring,  $50^{\circ}$  of Fahrenheit; summer,  $80^{\circ}$ ; winter,  $20^{\circ}$ ; autumn,  $60^{\circ}$  to  $65^{\circ}$ . The rivers, with the exception of St Mary's, St Clair, and Detroit, which form connecting links in the great chain of lakes, are small. They rise near the dividing ridge, and run, with a rapid current, E. or W. Their numerous branches furnish abundance of mill-seats in all parts of the country. From the greater proximity of the ridge to the eastern border of the peninsula, the streams running E. are of course shorter than those which take a contrary direction. They are also, in general, smaller, and navigable to less extent. Thunder bay river, emptying into Thunder bay, and Cheboygan river, into the straits of Mackinac, are the only considerable streams N. of Saginaw bay.

The animal and vegetable productions are such as are usually found in the same latitudes. Game, fish, and aquatic birds, are in great abundance and variety. The civil divisions of the territory are those of counties and townships. The legislative power is vested in a governor and council; the latter elected biennially, and restricted to annual sessions of sixty

days each; the executive, in a governor elected for terms of three years; the judicial system, a supreme court, consisting of three judges, who one of them are four years; circuit courts, held by two judges; and subordinate jurisdictions, county courts, magistrates, &c. Detroit is the seat of government. It is situated on the right bank of the river, eight miles from lake Erie, and seven from lake St Clair. It contains about 3000 inhabitants. With every facility for becoming a place of important transaction, Detroit has hitherto depended on the pecuniary support afforded by the fur trade for the maintenance of public moneys, while a military post, as a liberal appropriations by government to its objects. The impulse and effect produced by the settlement and cultivation of the surrounding country was wanting. This, though recent a Michigan commenced, and is rapidly increasing. A new and increasing tide of immigration has set in. The use of prosperity once is secured, their results will surely be shown there, as they have usually been shown elsewhere. The population of Michigan exceeds 40,000. Regular settlements were first made in the beginning of the last century. The government, under the dominion of the French, was uniting the civil and military authority in the person of a "commandant." Lands were held of the king, and undergrants, temporary or permanent, were made by his governor-general, to which lands was usually incident. The rules regulating the right of property, particularly in regard to the marriage relation, succession, and divorce, were those of French customary law, called *coutume de Paris*, as far as applicable to the circumstances of the case. These were abrogated, as to further acquire the territory, in 1810. In 1763, the French possessions in Canada were ceded to England, by the treaty of Paris, 1763, the country was ceded to the United States. From this period to the present, the government ceased to exercise a criminal control over it. In 1796, under Jay's treaty of 1794, the cession of these upper points was decreed to the American government. The North-western territory was ceded by Virginia, New York, Maryland, and Connecticut to the United States, and a congress passed an ordinance for its government, amended in 1789, to adapt it to the new government of the United States, which had taken effect in interim. A delegate to congress is elected from whom may debate, but not vote. The qualifications necessary to suffrage are—to be a free white male; age; citizenship; a year's residence in the territory; payment of a county or territorial tax. By the articles of compact, slavery is prohibited. The number of Indians within the peninsula is estimated at 9000; within the territory of Michigan at 60,000. Those in the peninsula are Chippewas, Potawatamies and Ottawas, and are kindred tribes. The Potawatamies live on reservations of land in the territory. The Ottawas and Chippewas of Thunder bay, Saginaw, and river on St Clair, live on reservations north and west of a line drawn from the base of Grand to the source of Thunder bay river. They are hunters and trappers. The Ottawas are the most agricultural in their habits, and a few of the tribe have a flourishing settlement at L'Anse-au-Loup on the western coast of lake Huron. The tribes on St Clair river and lake, rivers Detroit, River St. Ignace, and Plattsburgh bay, at the mouth of the river are settled by French inhabitants. They are a lack of land on the borders of these rivers, 20 miles broad. They are civil, honest, industrious and industrious, with little education, and even deficient in enterprise.

MICHIGAN, LAKE; one of the five great lakes

the northern part of the United States, and wholly within the territory of these states. It has the Michigan Territory on the east, Indiana on the south, and is connected on the north-east with lake Huron, by the strait of Mackinac. Its length is nearly three hundred miles, its breadth about sixty miles, and its average depth about 900 feet. The distance from the southern extremity to the Mississippi is 161 miles. Lon.  $84^{\circ} 40'$  to  $87^{\circ} 8' W.$ ; lat.  $41^{\circ} 15'$  to  $45^{\circ} 35' N.$  It contains, according to Hutchins, 10,868,000 acres. The waters are clear and wholesome, and contain many kinds of fish. In the north-west part there are two large bays, Noquet's and Green.

MICHILIMACKINAC, or MACKINAC; a post-town and military post in Michigan. It is situated upon an island in the strait connecting lake Huron and lake Michigan; the best authorities now give to the town and island the name *Mackinac*, and to the county of which the town is the capital, and the strait in which it is situated, that of *Mackinac*. The common pronunciation is *Mack-i-naw*, and the name is not unfrequently written in this manner. The island is about nine miles in circuit. The population of the county, in 1830, was 877. It is much resorted to by fur traders, and during the summer is visited by thousands of Indians, on their way to Drummond's island. On a cliff above the town is the fort. Lon.  $84^{\circ} 40' W.$ ; lat.  $45^{\circ} 54' N.$

MICHILIMACKINAC, STRAITS OF; a channel connecting lake Michigan with lake Huron, forty miles long from east to west, and four miles wide in the narrowest part.

MICKLE, WILLIAM JULIUS, an English poet, the son of a Presbyterian clergyman, was born in Dumfriesshire, Scotland, in 1734, and received his education at Edinburgh. At first he engaged in business as a brewer, but not succeeding, he devoted himself to literature, and removing to London, was noticed by Lord Lyttleton. In 1765, he was employed as corrector of the press in the Clarendon printing-office at Oxford, where he published a poem entitled the *Comubine*, in imitation of Spenser, republished with the title of *Sir Martyn*. He afterwards edited Pearch's *Collection of Poems*, 4 vols. supplementary to that of Dodsley. In 1775, appeared his principal production, a translation of the *Lusiad* of Camoens. Preixed to the poem is a historical and critical Introduction, including a life of Camoens; and the work itself is executed in a manner highly creditable to the talents of the translator. In 1778, Mr Mickle accompanied commodore Johnson as his secretary on a mission to Lisbon; and died in 1788. His poetical works were published collectively, in 3 vols. 8vo, 1807, with a biographical memoir.

MICROMETER; an instrument fitted to telescopes in the focus of the object-glass, for measuring small angles or distances, as the apparent diameters of the planets, &c. Various forms have been given to this instrument by different authors, and various claims have been urged for the honour of the invention. It seems, however, to belong to Gascoigne, an Englishman, though it is doubtful whether Huygens did not also invent the one which he used, without any knowledge of that of the former. Under all the forms of this instrument, the principle of operation is the same, which is, that it moves a fine wire parallel to itself, in the plane of the picture of an object, formed in the focus of the telescope; and with such accuracy as to measure with the greatest precision the perpendicular distance from a fixed wire in the same plane, by which means the apparent diameters of the planets, and other small angles, are exactly determined. This may be illustrated as follows:—Let a planet be viewed through a telescope, and when the parallel wires are opened to such a distance

as to appear to touch exactly the two opposite extremities of the disc of the planet, it is obvious that the perpendicular distance between the wires is then equal to the diameter of the object in the focus of the object-glass.

MICROSCOPE. The history of the microscope is veiled in considerable obscurity, and among the moderns the discovery of this instrument has been claimed by several individuals. The ancients appear to have been acquainted with it in one of its forms; for Seneca says, "Letters, though minute and obscure, appear larger and clearer through a glass bubble filled with water." In the middle ages this knowledge was lost. The invention of the modern instrument is attributed by the celebrated Dutch mathematician Huygens, to a countryman of his, named Drebell, who constructed them about 1621, or thirty-one years after the invention of the telescope. Borelli attributes it to Jansen, the reputed contriver of the telescope; Viviani to Galileo. The first microscope, consisting of two double convex lenses, seems to have been made by F. Fontana, a Neapolitan, who dates his invention from 1618. The numerous forms of microscopes may be included under the heads of single, compound refracting and compound reflecting microscopes. The theory of the *single microscope* may be thus explained. We all know that at a small distance we see more distinctly than at a large. If we look at two men, one 200 feet distant, the other 100 feet, the former will appear only half the height of the latter, or the angle which the latter subtends to the eye of the observer will be twice that subtended by the former. Hence we must conclude, that the nearer we can bring an object to the eye, the larger it will appear. Now if to render the parts of a minute object distinguishable, we bring it very near the eye (suppose within one or two inches), it will become very indistinct and confused, in consequence of the great divergence of the rays of light from the object, and the power of the crystalline lens of the eye not being sufficient to collect the rays whereby an image of the object may be formed on the retina at the proper distance on the back of the eye. Now if we employ a single microscope, which consists of a convex lens usually made of glass (though any other transparent substance would have the same power in a greater or less degree), and mounted in a brass setting, and place it between the object and the eye, the former being in the focus of the glass, the diverging rays from the object will be refracted and rendered parallel by the lens, and thus we shall obtain a distinct and near view of the object. The increase of apparent magnitude obtained by the employment of lenses, is proportioned to the difference of the distance of an object from the lens and the distance when seen without its assistance. This latter distance (the distance of distinct vision of minute objects with the naked eye) varies in different persons, and at different periods of life. Some measure therefore must be assumed as a standard, before we can express the amplifying power of a lens so as mutually to have the same idea of the magnitude of an object. Some authors adopt ten inches as the standard of the focus of the eye, under ordinary circumstances, and its decimal character makes it a convenient multiplier or divisor. With this decimal standard we can determine the magnifying power of lenses of any focal length, or formed of any substance (media). Thus if we have a lens which requires for distinct vision the object to be one inch from its centre (in a double convex), we must divide the standard ten by one which will give ten as the magnifying power. If the lens require the object to be 1-25th of an inch distant, its magnifying power will be 250. We have called the magnifying power in the first instance ten, because the length of

the object is increased ten times; but as its breadth is also increased ten times, the real magnifying power of the lens is ten times ten, or a hundred. The common form of the magnifiers employed for microscopes is double-convex, and they should be made as thin as possible; for the wandering and spreading out of the rays proceeding from an object when refracted by the lens with spherical surfaces, whereby an indistinctness is produced in its image, will be decreased, as the square of the thickness of the lens employed, and the loss of light in passing through the lens is less in proportion as it is thin.—Within a few years diamonds have been formed into lenses in consequence of their high refractive power, whereby we can obtain lenses of any degree of magnifying power with comparatively shallow curves, and as the dispersion of colour in this substance is as low as in water, the lens is nearly achromatic. Next to the diamond the sapphire possesses all the powers requisite for the formation of perfect magnifiers, and presents less difficulty in their construction; hence the expense of employing it is considerably less.

M. M. Trecoart and Oberhausen lately presented to the Academy of Sciences at Paris, microscopic lenses formed of diamond, sapphire, and ruby, all ground to the same curvature. The diamond lens magnifies 210 times, and with a compound eyeglass, the power is extended to 245; the power of the sapphire, with the same eye-piece, is 255; and that of the ruby 235. The grinding and polishing of these lenses is very laborious. The polishing of the diamond occupied twenty-four hours, the wheel making not less than 200 revolutions per second.

A *compound refracting microscope* is an instrument consisting of two or more convex lenses, by one of which an enlarged image of the object is formed, and then by means of the other employed as an eyeglass, a magnified representation of the enlarged image is obtained. The distance at which the two lenses of a compound microscope are placed from each other must always exceed the sum of their focal lengths, in order that the image may be formed by the object-glass in the interior focus of the eyeglass. Compound microscopes have been constructed of almost all possible dimensions, from a few inches in length to that of twenty feet; but from experience it appears that whenever their magnitude is augmented beyond a certain point, the effect is diminished, though we suppose the amplifying power of both microscopes the same.

The *solar microscope* consists of a common microscope connected with a reflector and condenser, the former being used to throw the sun's light on the latter, by which it is condensed to illuminate the object placed in its focus. This object is also in the focus of the microscopic lens on the other side of it, which transmits a magnified image of it to a wall or screen (sometimes a combination of two magnifying lenses is used). The magnifying power will be greater in proportion as the focal distance of the object-glass, compared with the distance of the wall or screen from the object-glass is less. The principle of the *lucernal microscope* is the same, except that a lamp is used instead of the sun to illuminate the object; this lamp is enclosed in a lantern, to screen the light from the observers.

**MICROCOSM** (from *μικρος*, little, and *κοσμος*, the universe); the name given to man in the times when astrology flourished, as it was supposed that his organisation accurately corresponded to the organisation of the universe, called in this case *macrocosmos* (from *μακρος*, meaning great, and *κοσμος*, the universe). The different parts and limbs of man were made to correspond to the different parts of the universe; and engravings are found in works of

that time, in which man stands in the centre of the universe, surrounded by lines indicating the various connexions of the heavenly bodies with his limbs. This idea owes its origin partly to the supposition which early ages attributed to the position of man in the universe. The earth is at first supposed conceived of as the centre of the universe; the heavens are a mere dome over the earth, to grow up to; and man, the present lord of the earth, is considered actually the lord of all the domain. The relations between him and the vast cosmic phenomena are then imagined. But the progress of science makes man modest. It shows him to be belongs only to one period of a small part. *Microcosm* is still used in a figurative sense for an

**MICROSCOPICAL ANIMALS, or ANIMALCULES.** See *Animalcula*.

**MIDAS**, the son of Gordius and Cybele, was a ancient king of Phrygia, of whom many tales are related. His story has the anatomy of a fable. While he was yet in the cradle, the sun put on his mouth, and the soothsayers prophesied that he would acquire great riches. When he was big, as Bacchus was travelling through Phrygia, he came in his way, and strayed to the court of the king. He hospitably entertained him, and conducted him to Bacchus, who permitted Midas to choose whatever recompense he pleased. Midas requested as every thing he touched might become gold, and so god granted his wish. But when even his food was transformed into gold at his touch, he begged Bacchus to take back the fatal privilege. The god commanded him to go up the river Pactolus and dip his head in the sources of the stream, and the words to bathe in it. The property of transforming every thing into gold was then transferred to the waters of the Pactolus. Pan and Apollo against Midas and Timolus their umpires in a music contest. Midas gave to the syrinx of Pan the preference over the lyre of Apollo, and was punished by the latter with a pair of ass's ears. Hence the phrase *ears of Midas*, often bestowed upon quarant critics. Midas now exerted himself to cover this ornament of his head by his royal cap, but he was obliged to uncover his head under the hand of his hair-dresser; and, although the king often secrecy upon the severest penalty, yet the overweighed upon the barber so heavily that, to lighten his mind, he dug a hole in the ground, and crept in it, "king Midas has ass's ears," and then covered up the hole. Soon after words spring up on this spot, which, when moved by the wind, murmured the words of the barber. Thus the curse was divalged.

**MIDDLE AGES**; that period in the history of Europe, which begins with the final destruction of the Roman empire, and, by some historians, is considered to end with the reformation; by others, with the discovery of America; by others, with the conquest of Constantinople; and again, by some, with the invention of the art of printing; all of which may be right, according to the special purpose of the historian. In general, it may be said, the middle ages embrace that period of history in which the feudal system was established and developed, from the most prominent events which mark its rise to its overthrow, though its consequences and influence are still very observable in the states of Europe (See *Feudal System*, and *Chivalry*). The first centuries of the middle ages are often treated as a *barbarie*—a name which they certainly deserve. It is, however, the destruction of the Roman empire by the irruption of barbarous tribes, a state calamitous, and the beneficial consequences of which it overlooked. True it is, that many of the ages

tions, which had cost mankind ages of toil and labour, were lost in the general wreck, and only regained by the efforts of many successive generations; the flowers of civilization were trampled under foot by barbarous warriors; the civil development of society suffered a most severe shock; those nations to which Roman civilization had extended previous to the great invasion of the Teutonic tribes, were thrown back, in a great measure, to their primeval barbarism,\* and the unruly passion for individual independence in the northern tribes, greatly retarded the development of public and private law, and, in some countries, has entirely prevented a regular civil constitution. Though we admit all this, we ask whether those who deplore the irruption of the barbarians, are well aware of the enormous degree to which Roman civilization had degenerated? While, however, the injury which the world suffered from the destruction of Roman civilization has been often over-rated, there is, on the other hand, a class of persons who laud the condition of Europe during the rudeness of the feudal ages, in a spirit of romantic exaggeration, much like that of certain philosophers, who have treated the savage state as that best fitted to nourish and preserve virtue, the one showing guarantee of history, the other of man. Any one may speculate as he pleases on such subjects, but such speculations are foreign to the spirit of history, whose proper office is to state facts, and show the influence of past ages on the succeeding. The feudal system filled Europe with powerful barons, possessing large landed estates, and commanding the services of numerous armed adherents, and with inferior lords, protected by the former. They were all possessors of land, with arms perpetually in their hands, too proud to follow any laws except those of honour, which they had themselves created, and despising all men of peaceful occupations as ignoble, treated to obey and to serve. If, therefore, the classes not belonging to the military caste wished to preserve their independence, they could succeed only by union, which would afford them the means of mutual protection, and enable them to exercise their various callings unmolested, and thereby acquire wealth in money and goods, which would serve as a counterpoise to the landed possessions of the feudal aristocracy.

This necessity gave rise to cities. Small cultivators, at first under the protection and superintendence of the counts, bishops, and abbots, to whom they subsequently became so formidable, arose, and attained (particularly in the eleventh century) through their own industry and skill, to a state of prosperity, which enabled them to purchase their freedom, and soon to obtain it by force. They did not remain stationary; but small states began to grow into great ones; and the most of them became so old as to acknowledge no superior except the highest authority of the country to which they belonged. Strong, high walls, impenetrable by the rude military art of the time, secured, in conjunction with the valour of the citizens, the freedom of the cities, and protected them from the tyrants of the land; well-ordered civil institutions preserved peace and prosperity within, and were secured by the wealth acquired by trade and manufacturing industry. Many of the nobility themselves, attracted by the good order and prosperity of the cities, established themselves there, and were ambitious of obtaining the offices of government in these commonwealths.

In fact, they soon usurped the exclusive possession of them, in many of the cities. The looser the social organization in any state, and the more intolerable the pride of the nobility, the greater became the prosperity and power of the cities, which grew, at length, so great that, in Germany and Italy, these republics were formidable even to the emperor. In Arragon, the third estate was fully developed as early as the twelfth century. In England the cities, in conjunction with the barons, obtained the *Magna Charta*, in 1215, and, in France, they increased, in consequence, from the circumstance that Louis the Fat and his successors, particularly Philip the Fair, 200 years after him, found it their best policy to protect them against the nobility, and thereby increase their own means of resisting that order. But the cities of these countries never attained the importance of those of Germany and Italy. What single cities could not accomplish, was effected by the union of several; as the league of the Lombard cities in Italy; the Hanseatic, Rhenish, and Suabian leagues in Germany (see *Italy*, and *Hanseatic League*), appeared, at the same time, as great and formidable powers. Under the protection of such associations, and sheltered by the walls of the cities, all arts and trades, and every kind of civilization, made rapid progress. Many of the important inventions, which we now prize so highly, originated among the citizens of these small free states, or were suggested by their active commercial and manufacturing spirit.

With constitutions similar to those of antiquity, the same spirit appeared to be awakened; all the virtues and vices of Athens, Sparta, and Rome, are found in the free states of Italy, where even the climate resembled that of the republics which had perished 1500 years before. There was the same love of country, strict morals, and valour, the same (but more violent) party contests, the same changes of administration and ambitious intrigues, the same (though differently directed) love of arts and knowledge. But the communities were not exempt from the influence of the domineering spirit of the times, which they opposed. The overwhelming power of individuals, so dangerous to all free states, became, through this spirit, doubly formidable, and compelled the oppressed portion of the citizens, in the same distress which had given rise to their parent city, to have recourse to the same means of relief. They bound themselves together for the protection of their rights. Such associations, usually formed among people of the same trade, and having for their object, next to security from external enemies, the maintenance of internal order in these stormy times, were called *corporations*, or *guilds*, and were under the direction of a master. The strictest regulations appeared necessary for the attainment of this object. No one, without serving an apprenticeship of years, and advancing through certain degrees, could become a member. At a later period, admission into the corporation was purchased by individuals who did not follow the business of the members, but wished to share in the advantages of the associations. For in the fourteenth century, the corporations became so powerful as to obtain almost exclusive possession of the government of the cities, which until this period, the nobility had mostly retained in their own hands. The corporations now taught them that, as they contributed not to the prosperity of the city by their industry, it did not become them to govern it. The nobility, so far as they continued in the city after this removal from power, preserved themselves in close connexion, and those who resided in the country formed confederacies against the power of the cities. Associations which, to the best men, appeared the only means of security from the disorders of

\* These nations, in point of civil institutions, had undoubtedly advanced much beyond the German tribes, whom the histories of Arminius (which preserved them independent of Rome) had, at the same time, prevented from receiving the benefits of the Roman law and social organization.

the time, became so universal, that, almost everywhere, persons of the same trade or profession were closely united, and had certain laws and regulations among themselves. Knowledge itself, in the universities, was obliged to do homage to this spirit, and the liberal arts themselves, in the latter part of the middle ages, were fettered by the restraints of corporations (see *Master-singers*), so that knowledge as well as arts was prevented from attaining that perfection which the secure life of the city seemed to promise them; for nothing more impeded their progress than that pedantry, those prescriptive and compulsory rules, that idolatrous veneration for old institutions, which are inseparable from such associations.

So also the most remarkable institution of that time, its characteristic production—chivalry—exhibited all the peculiarities of the corporations. War was the profession of the nobles. No one of their order, who was not a knight, could bear a lance or command cavalry; and the services of years, as an attendant or squire, were necessary to entitle even one of the highest order to be dubbed a knight. But squire, knight, and baron were all inspired with the same spirit of honour, pride, love, and devotion. The religious zeal of the middle ages produced actions almost inconceivable to the cooler spirit of our time. We see hundreds of youths and maidens, in the flower of their age, shutting themselves up in gloomy walls, or retiring to wild deserts, and spending their lives in prayer and penance; we yearly see thousands barefoot and fasting, travelling many hundred miles, over sea and land, to pray at the grave of their Master; we see hundreds of thousands thronging thither, from age to age, with the cross and sword, at the risk of life, to deliver the Holy Land from the pollution of infidels.

This enthusiastic spirit was peculiarly suitable to soften the ferocity of the age; but ambitious men artfully turned it to their own selfish purposes. Intolerance, the destruction of the Jews and heretics, the luxurious splendour of the papal court, and the all-embracing system of the hierarchy, were the unhappy fruits of this mistaken spirit. In opposition to the secular power, resting on the feudal system, and supported only by armies of vassals, the pope formed, from the archbishops, bishops and priests, still more from the generals of religious orders, provincials, abbots and monks, an immense army, invincible through its power over the conscience, and through the spiritual weapons which belonged to it and to its head. From the general belief in his possession of the power to make happy and unhappy in both worlds, to bind and loose for eternity, the pope ruled, with absolute sway, the minds of Christians. All the kings of the West acknowledged him as the living vicegerent of Christ. Many were vassals to him; many tributary; almost all obedient and subject to him, or, in a short time, victims of a vain resistance. At the time in which little idea was entertained of restraining princes by constitutional laws, and when the spirit of the times allowed them to dare whatever they could do, it was an inestimable advantage that the pope aided the people for centuries in opposition to their usurpations; but the luxury, cruelty, ambition, and hostility to the diffusion of knowledge, which pervaded the clergy, from the pope down to the lowest mendicant friar, has left a deep stain upon these times. In vain did men like Arnold of Brescia and the Waldenses, Wickliffe, Huss, and their followers, endeavour to overthrow the hierarchy by reminding the people of the simplicity and purity of the primitive church. They found their contemporaries accustomed to the supremacy of the church, not yet ripe for freedom of mind, and inattentive to their reasonances; and

their noble endeavours, in a great measure, failed. The hierarchy was able to erect new barriers against new enemies; mendicant orders and the inquisition were instituted to prevent the dangerous spirit of the thirteenth century from entering the kingdom of darkness; excommunications and smothered heresies Christendom in terror; till at length, when the spirit of the times, the diffusion of a freer spirit of investigation, the establishment of a more rational order of monarchies, and the cooling of religious enthusiasm, announced that the middle ages were drawing to a close, Luther proclaimed that Europe would no longer be held in leading-strings.

The ages of which we have been speaking, a life of battles and adventures, of pride and duty, of devotion and love, must have borne poetic fruit. The knights were particularly disposed to poetry, by lives spent between battle and love, pomp and religious exercises. Hence we see poetry first appearing among the knights in the thirteenth century. In southern France, where chivalry was first established, we see the first sparks of modern poetry. The Provençal Troubadours, who were pally sung at the court of Berenguer of Toulouse, are the founders of it. Soon after them, the French Trouvères (*ministres*) and the German Minnesingers sang in their mother tongue; the Italians, first from mistrust of their vulgar tongue, in the Provençal; and the English, from the same cause, in the French language. But the minstrels were less among the latter also, a national poetry; and the Italians, at a later period, after the poets had brought the Tuscan dialect into honour, aimed at the improvement of it, a high poetic form. In fact, the Catalonian poetry was the same as the Provençal, but the Castilian and Portuguese borrowed much from the Arabians. With lyric poetry the epic was also developed in great beauty and power. In epic, its indefinite longing for something more elevated, than the realities of earth, creates a romantic. See *Romantic*.

The romantic epics of the middle ages are confined to three cycles of stories. Italy, more a stranger to these, but her great Dante was won by them all, and stood high above them, though in tone of love and devotion which predominates in a poem sprung from the character of the time. The first of these cycles of stories is the truly German *Nibelungen*, and the stories of *Siegfried*, *Attila*, *Dieterich of Berne*, *Ortuit*, *Hugendinck*, and *Etzel*, and other heroes of the time of the germination of the nations, which belong to a cycle. To these stories stand the equality and tales of the British king Arthur, his Round Table, and the *Quest*, which, in accordance with old British or Celtic tales, were sung in France, and afterwards by German minstrels, and to which *Titurel*, *Parsifal*, *Parzival*, *Lohengrin*, *Gawan*, *Durand*, and *Baruch*, the *Enchanter Merlin*, and others belong. To the two was added a third, originally French, cycle of stories, of *Charlemagne* and his *Peers*, of whom the *Enchanter Malegys*, and the *Four Sons of Aymon*. The romance of *Amadis de Gaul* belongs peculiarly to the Spanish, and to neither of these or collections. See *Chivalry*.

Besides these subjects, the poetic appetite of the middle ages seized upon the historic events of ancient and modern times, particularly the deeds of Alexander the Great, and the crusades, fabricating upon true history, and even upon the subjects of the epics of Homer and Virgil, for new poems. But whether from political causes, or, as we believe, from the downfall of chivalry, and from an increasing spirit of reflection, the last centuries of the middle

ages were highly unfavourable to poetry. The voice of the minstrel was almost entirely silent in Germany, France, and Spain, even in the fourteenth century; but Italy had now its Petrarch and Boccaccio, and England its Chaucer. In the thirteenth century, there was not a story in the cycles above-mentioned, which was not eagerly sung by many poets; and more than 1400 love songs, by 136 poets of this century, are contained in the Manesse collection alone (see *Manesse*); but hardly a single poet appeared among the knights, after the fourteenth century.

The epic poems of former times gave place to prose romances, in which their stories were diluted, and the lyric poetry, in France and Germany, fell into the rude hands of the Master-singers (q. v.), who, by a studied observance of rules, preserved its formal existence. So did it continue till the fifteenth century, which, attentive only to the great events that were in preparation, and the struggles which preceded them, and actuated by the spirit of reflection from which they proceeded, was far removed from that free flow of feeling which had given birth to the poetry of the past time. It was not till the end of the middle ages, when the early spirit of poetry lived only in remembrance, that Ariosto took the stories of Charlemagne's peers from the nursery, and gave them new dignity. Spain and England received a new national poetry from Cervantes and Shakspeare. But how great is the difference between these creative geniuses, complete masters of their subjects, who poured forth their whole souls in their poetry, so that we know not which most to admire, the feeling which inspires, the fancy which adorns, or the understanding which regulates them, and whose humorous (often ironically) tone proclaims them the offspring of modern times, and those simple poets of the middle ages, who took the world as it was, and were rather the organs of the spirit of poetry in the people than independent poets!

Among the arts of the middle ages, architecture was distinguished by its peculiar character. In the noblest buildings of antiquity, the form of the first rude dwelling-houses is not to be mistaken; they appear only as the ornamented forms of abodes which necessity created, and can only be called fine buildings; but the Gothic architecture of the middle age was founded on a deep and great conception. This conception, which appears in the union of the grandeur of great masses with the most finished delicacy of parts, was the representation of the world. The other arts, which, in the fourteenth and fifteenth centuries, came from Greece into the Western world, attained their greatest splendour, in the middle ages, upon the Lower Rhine and in Italy. See *German Painting*, and *Italian Art*.

The weak side of the middle ages is the scientific. The youthful spirit of the time, bent upon action, could not devote itself to a sedentary life and continued study. The efforts of Charlemagne, to encourage science and instruct the people, hardly produced any effect beyond his life; for they were not in the spirit of the time. Several centuries after him, the German tribes considered no knowledge of use, but that of managing the lance and the steed. The barbarism was so great, that most of the laity, even the most distinguished, could scarcely read or write. He who was instructed in these, was considered a distinguished scholar, and he who obtained more knowledge, particularly in mathematics or natural science, exposed himself to the danger of being burned as a sorcerer. But the monks, by their retired situation, and the leisure which they enjoyed, as well as by the necessity of some knowledge of the Latin language, which the Roman Catholic ritual required, were driven to a more literary employment, to which they

were educated in the schools of the cathedrals and convents. But their literary labours were confined to the copying of the old writers, particularly the fathers of the church, and to accounts of the occurrences of the times in meagre chronicles. Nevertheless we are indebted to them. Through their activity the valuable remains of ancient times, materials and incitements to new improvements, have been, in a great measure, preserved to us; and from their annals we gather our only knowledge of the events and manners of that time. Moreover, the Latin literature, which was common to all the people of the West, not merely in the affairs of the church, but in science and public transactions, produced a certain agreement in their general character, which contributed much to promote intercourse and improvement.

The East has no middle age, like that of Europe; yet the introduction of Mohammedanism and the Arabic literature, make epochs there. But as the spirit of man is hostile to a partial development, in the eleventh century the need of thinking was again felt in Europe; the taste for knowledge awoke, here and there, partly by means of the monasteries, but afterwards through the arts and industry which prevailed in the cities; study was encouraged by Henry II. of England, the Hohenstaufen, St Louis, the Alphonso, and other intellectual princes. From these times (the periods of Lanfranc, Abelard, John of Salisbury, and others), the middle ages produced distinguished individuals, whom the coldness of their contemporaries in the cause of science only urged to a more ardent pursuit of it. Meantime the necessity was felt of defending the doctrines of the church against unbelief and heresy. This led to the sharpening of the intellect by dialectics; hence the church dogmatics, or theology, was formed, from which philosophy at length proceeded. As, in scholastic theology, the dogmas of the church were early received as authority; so, in the domain of laws, the Roman code soon obtained a complete ascendancy; and the juriconsults of that time were never weary in studying it, learning it by heart, and explaining it by glossaries and illustrations. The students of philosophy pursued the same course with the subtle Aristotle, for whom the middle ages, although acquainted with him only through Arabic translations, or *refracmentos*, had an unbounded respect. Unfortunately, however, for the progress of philosophy, these commentaries, glosses and abridgments, occasioned the neglect of the original. When the union of scholars, in particular places, gave birth to universities, these received the stamp of the time, both in the corporate character which was given them, and the absorbing interest which was taken in the study of dialectics. Only jurisprudence, theology, and what was called *philosophy* (which was, in fact, the art of disputing with subtilty upon every subject), were taught; and these sciences, especially since the middle of the twelfth century, had degenerated into a mere tinkling of scholastic sophistry. Medicine, as regards any useful purpose, was taught, at this time, only by some Arabs, and students of Salerno who had been instructed by them; in other respects, it was a slave of astrology, and an object of speculation to ignorant impostors, principally of the Jewish nation. Philology flourished in the time of Lanfranc and Abelard, but was again forgotten in the eleventh and twelfth centuries. Notwithstanding the unprofitable character of what was taught at this time, teachers stood in high esteem, and the highest academic rank was considered equal to knighthood. The universities, on their side, showed themselves worthy such honour by their independence of pope and prince. With all its worthlessness, the disputatious spirit of the time had

this good effect, that truths were advanced and maintained in the universities, which were alarming to the vigilant hierarchy; and Luther's theses, in Wittenberg, contributed in no small degree to bring on the reformation, and thereby to the shedding of new light upon science. Yet the reformation did not (as many are inclined to believe) give the first signal for higher intellectual endeavours and freedom of thought; it was rather produced by this striving and this freedom, which had originated some centuries before, with the flight of the Greek scholars from Constantinople, and the invention of the art of printing, had been encouraged by the lovers of science among the princes of Italy, and had shone forth, even in Germany, in the brotherhood of Deventer, in Wessel, Erasmus, Celsus, Reuchlin, and others. But with the appearance of these men, with the rise of the sun of the new day, the romantic twilight of the middle ages faded away.

We shall now give briefly the chief epochs of the history of the middle ages, leaving more copious details to the articles on particular countries and men. The formation of separate Germanic states succeeded the general irruption of the barbarians, and was followed, after some hundred years, by the universal monarchy of Charlemagne. This had only a short continuance; but it left the idea of the unity of the whole of Christendom under a spiritual head, and under the temporal protection of the newly-revived Roman empire—an idea which had a powerful influence during the whole of the middle ages. New modifications of the European states after the fall of the Carolingians: the devastations of new tribes of barbarians; of the Saracens in the south, of the Normans in the north and west, and the Hungarians in the east, all of whom, at length, became subject to the Germanic power. Colonies of the Normans in France, Italy, and England. From these romantic adventurers especially proceeded the spirit of chivalry which made its way through all Europe. Christianity gained a footing among the Slavonian tribes. Struggles between the spiritual and secular power convulsed Christendom. The idea of their unity, as well as of knighthood, is ennobled in the crusades, whose success these discords frustrated. Origin of the cities and of the third estate. Commerce with the East, by means of Italy and the Hanse towns. Corruption of the clergy, at two epochs, after Charlemagne and after Gregory VII. Mendicant orders, and the inquisition. Decline of the imperial dignity in Germany and Italy. Desolation of these countries by private warfare. Other kingdoms are now enabled to obtain more solidity. The flourishing of new arts and knowledge. Universities. The popes humbled by their dependence upon France and the great schism. Councils at Constance and Basle. Subjection of the Greek empire; hence the formidableness of the Turkish power to the west of Europe; and hence, also, the diffusion of learning by the fugitive scholars of Constantinople. Printing. The discovery of the New World, and of a way by sea to the East Indies. Reformation. See Hallam's *View of the State of Europe during the Middle Ages* (3d edit., London, 1822); Berrington's *Literary History of the Middle Ages*, etc. (London, 1814); Sismondi's *Hist. des Républiques Italiennes* (3d edit., Paris, 1825); Ruh's *Handbuch der Geschichte des Mittelalters* (Berlin, 1818); Rehm's *Handbuch der Geschichte des Mittelalters* (Marb., 1821 seq., 2 vols.).

MIDDLEBURG; capital of the province of Zealand, kingdom of Holland, situated in the centre of the island of Walcheren; lon. 3° 37' E.; lat. 51° 30' N.; population, 13,200. The town-house was formerly a rich and celebrated abbey, founded in the

year 1256. It has six Calvinist churches and an atheneum or academy, which also carry the same course of instruction as an university. The foundations of Middleburg were formerly very strong, but are not now kept in repair. It grows in a circular mound of earth, divided into lanes and surrounded by a broad and deep ditch to the *landes*.

MIDDLETON, CONYERS, a learned lawyer, divine and polemical writer, was born at *St. Paul*, 1683, and was the son of an Episcopalian clergyman. He became a student, and afterwards a member of Trinity college, Cambridge, in which college he attracted some notice by his quarrel with the celebrated doctor Bentley (q. v.). He was called to the bar in 1724, he visited Italy, and on his return, published a tract, designed to show that the medical profession was held in little esteem by the ancient Romans; and, in 1729, appeared in Latin from Rome, on the conformity between pagan and christianism. Not long after, he obtained the wardian professorship of mineralogy, which he held till 1734, when he was chosen librarian to the university. In 1735, he published a Dissertation concerning the Origin of Printing in England, his greatest literary undertaking was the *History of the Life of M. T. Cicero* (2 vols., 8vo, 1741), in which he displays an intimate acquaintance with the subject, accompanied with a degree of elegance in style and language which entitle him to rank with the principal modern historians of England. In 1743, he published the *Epistles of M. T. Cicero to Brutus*, and of Brutus to Cicero, with the Latin Text and English Notes, a prefatory Dissertation, &c. In 1747, doctor Middleton published his *Inquiry into the Miraculous Powers which are supposed to have subsisted in the Christian Church from the earliest Ages through several successive centuries*. This treatise brought on the author a reputation of infidelity, and occasioned a warm controversy, which was continued after his death, &c. His miscellaneous works have been published in 3 vols., 4to, and 5 vols., 8vo.

MIDDLESEX; the smallest county (except Kent) in England, yet the most important, as containing within its limits the metropolis of the British empire, is bounded on the north by Hertfordshire, on the south by the river Thames, which separates it from the county of Surrey; on the west by Berkshire, from which it is separated by the river Colne; and on the east by Essex, from which it is divided by the river Lea. Its length from east to south-west, is about twenty-three miles; in breadth it does not exceed fifteen. The soil is supposed to be derived from the Middle Saxon people inhabiting it lying between the east and south Saxons. The prevailing soil of Middlesex is loam and clay; much of the city and vicinity of London has been dug up for building. A great portion of the country is used as gardens, nurseries, and pasture-grounds; and the hay-making, the Middlesex farmers are said to be superior to any in the island. Middlesex contains 197 parishes, two cities (London and Westminster) and six market towns. It returns eight members to parliament; namely, two for the county, four for the city of London, and two for Westminster. Population, in 1801, 818,129; in 1831, 1,338,348.

MIDIANITES; an Arabian tribe mentioned in the Old Testament, as the descendants of Midian, of Abraham by Keturah (Gen. xxv. 2), and descended as engaged at an early period in a commerce with Egypt. They dwelt in the land of Madian (Petra), to the south-east of Canaan. One per-

of them inhabited the country to the west of mount Sinai; another portion dwelt on the east of the Dead Sea. The Arabian women having entered the Jewish camp and seduced the Israelites, Moses was enraged by the Lord to send 12,000 men into their country, and cut off all the inhabitants, except the virgins. This order was executed, and the victory brought off a rich booty of 32,000 virgins, 675,000 oxen, 72,000 asses, and 61,000 mules.

MIDWIFERY is the art of aiding and facilitating childbirth, and of providing for the preservation of the health and life of the mother during and after her delivery. It is founded on physiological and pathological sciences. Midwifery, in some form, has been employed from the most ancient times, even among the rudest nations, although it was at first very defective, and consisted, probably, only in the most obvious and indispensable manual applications and aids. Even in the most cultivated nations of antiquity, this art was in a low state. The Israelites had their midwives. The first accounts of scientific male midwifery are to be found among the Greeks of the age of Hippocrates (who died 357 B. C.). From the writings of that period, we learn that the obstetrical art had then reached a higher degree of cultivation among the Greeks than in most parts of Europe during the last century. Notwithstanding, there was much that was wrong and injudicious in their system, and only a small part of the proper means of assistance was made use of. They often contented themselves with invoking Ilithyia, the goddess of childbirth. Among the Romans, midwifery was confined to a few simple aids, and sacrificing to Juno Lucina, and other deities who presided over childbirth. It was not till a later period, that the Roman women mutually employed midwives; but, in difficult cases, physicians were called in. These were either Greeks living in Rome, under the dominion of the Roman emperors, or they drew their knowledge chiefly from Greek authors. To this epoch belong particularly Soranus (100 A. D.) and Muscilion, who composed the first manual of midwifery which has come down to us. In the middle ages the science was very much neglected; it was confined to the cutting of the fetus from the body of the mother, in case of her death before delivery. In consequence of the injudicious interference of the popes, who conferred the professorships in the newly established schools on the monks, and gave them the privilege of practising physic, while they strictly prohibited the practice of surgery and anatomy, both to the physicians and lay (1515), the obstetric art became more confined to internal and superstitious applications, and, indeed, generally sank into the hands of women, monks, peasants, and other ignorant persons. When they had exhausted their medical skill, the saints were invoked, images and relics were hung upon the woman in labour, &c. The art continued in this state till the sixteenth century. At this time, the improvements in printing and engraving gradually introduced better era, since the surviving works of the Greeks, Romans and Arabians were multiplied, the intellectual intercourse among men became more general, the spirit of inquiry was awakened, and found a new field. At this period, the business of midwifery was so exclusively in the hands of women, that it was disgraceful for a man to engage in it. Such an undertaking was considered as an abominable attempt on the virtue and honour of the female sex, and he who ventured upon it, as a magician. In Amsterdam, in 1521, one Veites was condemned for an offence to the flames. Several books, however, were published for the better instruction of midwives in their profession. The first was by Eucharius Rossius, at Worms, called the *Rose-Garden for Midwives*

and *Pregnant Women* (1515). The science of anatomy, which was now more freely studied and patronised, also contributed much to the improvement of midwifery, in which Vesalius, in Padua (1543), particularly distinguished himself. The physicians and surgeons turned their attention only to the theoretical part of the science, but the latter gradually proceeded to the practice of it, by performing the Cæsarean operation on women who had died in childbirth (which was now not only permitted, but commanded by law), and gradually undertaking other operations on women pregnant and in labour. Francis Rousset, a surgeon in Paris, published a treatise, in 1581, in which he brought several proofs of the possibility of safely performing the Cæsarean operation on the living mother, and it was he who first gave this operation its present name. After the publication of this treatise, the operation was frequently performed on the living subject, both in and out of France, and sometimes even when it was not unavoidably necessary. Pineau, a surgeon in Paris, first suggested, in 1580, the section of the pubes, by the observations which he communicated on the separation which takes place between the bones of the pelvis, for the purpose of facilitating birth, when made difficult by the extreme narrowness of the pelvis. In Germany, midwifery long remained in an imperfect state: the midwives were generally ignorant, and men were seldom employed; while, in France and Italy, it was already a common thing to call in the aid of physicians and surgeons. A surgeon of Paris, Clement, distinguished in the practice of midwifery, who had attended La Valiere, the mistress of Louis XIV., in her delivery, first received the name of *accoucheur* as a title of honour. The surgeons were so well pleased with the name, that they gradually adopted it as a general appellation. Henry of Deventer, a surgeon of Holland, was the first who, in 1701, endeavoured to establish midwifery on scientific principles. In France, where the art had risen to higher perfection than in other countries, a school for midwives was established in the *Hôtel Dieu*, in 1745. The history of the origin and invention of the forceps, that highly useful instrument in midwifery, is involved in some obscurity. Between 1600 and 1670, Chamberlen, a London surgeon, professed to have invented an instrument with which he was able to terminate the most difficult labours without injuring either the mother or child; but he kept this discovery to himself, and, in 1688, went to Amsterdam, where he sold it to certain practitioners, who turned it to their profit. It was thus kept secret among certain persons for a long time. At last, Palfyn, a famous anatomist and surgeon of Ghent, in Flanders, got some knowledge of the instrument, and caused one to be made, 1723. Some species of forceps appear to have been known even in the time of Hippocrates; but the merit of Chamberlen's invention consisted in making the blades separable, and capable of being locked together after having been introduced into the vagina, and placed one on each side of the head of the child. It was afterwards very much improved, especially by Levret, in Paris, 1747, Plevier, in Amsterdam, 1750, and Smellie, in London, 1752. The art of midwifery was also perfected by the writings and instructions of these men. Germany, too, produced several men of eminence in this department of the medical art, who were not only famous for their operative skill, but contributed much to the advancement of midwifery by their observations, and to the diffusion of correct principles on the subject by their lectures and writings. The establishment of several schools of midwifery also facilitated the study of the art, and brought it to the degree of perfection which it now boasts. Those physicians of recent date, who

have contributed most to this art in Germany, are the two Starks in Jena, Osiander, in Göttingen, Siebold in Würzburg, Wigand, Nagele, Boer, Jorg, &c. The course now adopted seems to be the true one, viz. by the cultivation of all the branches of knowledge connected with this department, to determine the cases in which art may and ought to be passive, and leave the work to nature, and those in which nature is insufficient to accomplish the delivery alone, or at least without injury to the mother or child.

**MIERIS, FRANCIS**, a very celebrated painter of the Dutch school, was the son of a jeweller at Leyden, where he was born in 1635. He was the pupil of Vliet, Gerard Douw, and Van den Tempel, and he is generally considered as the principal scholar of the second. His works consist of portraits, and scenes in common life. He possessed the delicate finish of Gerard Douw, with more taste in his designs; his colouring, too, is more clear, and his touch more spirited. He usually worked for a ducat an hour; but, through his intemperance, he always remained in poverty. One of his finest productions was the picture of a young lady fainting, a physician attempting to recover her, and an old woman standing by; and for this 3000 florins were vainly offered by the grand duke of Tuscany. An engraving from this painting will be found in the "Republic of Letters," a literary miscellany, published at Glasgow, in 1832. Mieris died at Leyden, in 1681.—He had two sons, —*John*, the elder, who gave great promise of excellence, but died in 1690, at Rome: the younger *William Mieris*, was the pupil of his father, and adopted his style, in which he showed great talent. He died in 1741.—His son, *Francis Mieris*, the younger, was also a painter, but was not very successful. He published several works relating to the history of the Low Countries, and the lives of their sovereigns.

**MIGNARD, PIERRE**; a French painter, born at Troyes, in 1610. His father discovering early indications of his talent for painting, placed him, when eleven years old, at Bourges, in the school of Jean Boucher; and the young artist next studied the works of Primaticcio, Rosso, and Nicolo dell' Abbate, in Fontainebleau. He afterwards became a pupil of the celebrated Vouet, and, in 1636, went to Rome, where he formed himself by the study of the masterpieces of Raphael and Titian. His historical paintings and portraits, among which were those of Urban VIII. and Alexander VII., soon gained him reputation; and he also painted a great number of portraits in Venice. In 1658, Colbert engaged him to return to France in the service of Louis XIV., and Mignard was placed at the head of the academy of St Luke, and, after the death of Lebrun, with whom he was constantly at war, became chief painter to his majesty. At this time, he executed one of the greatest fresco paintings which France possesses—the dome of the Val-de-Grace. It represents the region of the blessed: in the centre of a great number of saints, martyrs, prophets, &c., is queen Anne (of Austria) presenting to God the model of the new church. He also adorned the palace of St Cloud with numerous mythological paintings, executed several works at Versailles, and painted portraits, &c. Besides the posts already mentioned, the direction of the royal collections of art, of the academy of painting, and of the Gobelins manufactory, was conferred on him. He continued actively engaged in his art until his death, in 1695. In respect to invention and composition, Mignard is not entitled to rank among profound and original geniuses; yet the grace and loveliness which characterise his works, particularly his *Madonnas*, the brilliancy and harmony of his col-

ouring, and the ease of his pen, are his defects. His talent for imitation of other masters was remarkable; he discovered in that style, among them, his rival Lebrun, in a picture in the manner of Guido.

**MIGRATION OF ANIMALS**. The migration of animals, that is, the travelling of any number of the same species toward a certain point of destination, or in a certain direction, is one of the most remarkable phenomena in nature. Some migrations takes place with quadrupeds, but not with insects. As to the first, it does not move to it of them migrate periodically and regularly. Some species of fish and birds, for which I cannot see any reason, may be found in the almost unintercepted way which air and water permit, without the least impediments to change of place. In quadrupeds are suddenly seized by the migration. The *lemmings* rat, which is found in the northern parts of Europe, migrates in winter, when a severe winter is approaching, in great numbers, and always in a straight line, up rivers or lakes. Some other quadrupeds occasionally move in large numbers, and to considerable distances; but these expeditions are in place at regular periods, and seem to be accidental causes. The *buffaloes* proper to the western wilds of North America, and wild horses sometimes take long journeys in bodies. Some fishes, also, remove to warmer waters during winter; thus the salmon rivers and shores, on the approach of winter, the warmer waters of the deep sea. The same. The cod-fish move in great numbers about the month of May, from the northern coast toward Newfoundland. The shoals of herring periodically traverse the ocean, are numerous. The same is the case with the mackerel, sardine, anchovy, &c. That insects migrate is a fact, for instance, locusts, bees, &c., and even a surprising obstinacy, in a given direction. To some, however, with whose migrations are seasonal and which appear to migrate most regularly, some species of birds. The facts which are relative to this point are very curious, and form a vast field of interesting observation. They regularly return, after a certain absence, to the same country, but to the same spot where they built their nests before, or where they were born. Many storks, which become half tame, and have been marked, and found to return upon their old nests, built on a wheel, which is one of that country, particularly in the south, for that purpose, on the corner of the roof of houses. The same is related of swallows, and birds of passage. Other birds do not migrate to any particular country, but travel, according to circumstances, from one to another. Among these some which remain in the country of their birth, as long as is necessary to breed and rear young; others are absent but for a very short time. The *lark* remains but three months in the regions of Europe, whilst the *lark* is absent for a very short time.

Mr. Becham, a German, has collected many interesting facts respecting the birds of passage. Generally speaking, they are determined to go to where they build their nests, by the assistance which they find, as, for instance, the beak, goldfinch, pidgeon, crane, lark, &c. Some species of herons, woodcock, geese, &c., the fruit of the pine tree being scarce in the north of Europe, whilst it was very abundant in the south. Large numbers of the *crane*, which lives upon this food, were found in the south.

be drought, in 1819, made the meadows around Lunenburg, in Saxony, very dry, and no landrails (in several frequent flocks) were seen during that season; they had fled to the valley of the Rhine, where the drought had been less. The cold in the winter, also, has much influence on the migration of birds. The winter of 1821—1822 was very mild in Middle Europe, whilst in the north, it was unusually cold, in consequence of which many birds were seen in Germany which hardly ever quit the northern regions. Some birds of Bohemia went to Switzerland, and some birds arrived in France which never had been seen there before. The contrary took place during the following winter, when the mercury stood, in Germany, much lower than in Sweden. Hunters, and other people living much in the open air, know that certain birds do not migrate, except on the approach of a severe winter. How are these birds led to migrate in such seasons? The general and easy answer is, *Instinct*. But what is *instinct*? Certainly we must mean, by this term, a constant direct interposition of Providence, which drives the birds away from a severe winter is coming on. *Instinct*, whatever it may be, must be guided by general laws.

In what way, however, the birds are led to guard against the severity of the approaching season, whether by a peculiar sensibility to the causes from which its severity will proceed, or in other ways, we know not. In the article *Instinct*, it has been maintained, that much of the conduct of animals necessarily implies reflection. The vicissitudes of the atmosphere, on the arrival of the migrating time, are also a great influence upon them. Most birds reform their migration during the night; some cease, however, by day. Others stop not either day or night. To the class which fly by day belong the birds of prey which obtain their food by day; the crow, pie, titmouse, wren, woodpecker, chaffinch, goldfinch, lark, swallow, and some others. Some which travel by night are the owl, blackbird, &c., and a great number of aquatic birds. Those which stop not, day or night, are the heron, wagtail, shore-hammer, plover, stork, crane, wild goose, &c. It is very remarkable, that individuals of some species which travel day and night, and which, some cannot, are prevented from migrating, remain, throughout all the time of the migration of their species, idle, and only occupy themselves with taking food. These birds like particularly to travel in bright moonlight. Many birds obtain their food on the wing, the swallows, traversing the sea, catch insects, and song birds catch fish, whilst they continue their journey. If the titmouse, wren, woodpecker, and a great number of birds, on the branches of trees, they resume their flight, after having fed. Those which habitually alight on spots where they find subsistence in abundance, never remain longer than a few days in succession, if nothing opposes the continuance of their flight. It is a curious fact, that, at some times, many birds utter cries such as they are never heard to make at any other time. Unless urged by fog to keep near the ground, birds generally fly very high during their migration.

Of all migrating birds the cranes are, perhaps, the most remarkable. They seem to be most conversant with foresight. They call each other by certain notes, several days before they depart, assemble, and take a great number, as if consulting; after which they arrange themselves in two lines, forming an angle, at the vertex of which is the leader, who appears to exercise authority and give orders, for instance, to form a circle in a tempest, or to be watchful if eagles, hawks, &c.; he also gives the sign to descend and to feed. If he is tired, he places himself at the end of the line, and the bird next behind him takes

his place. They utter, during the night, more piercing cries than during the day, and it seems as if orders and answers were given. Wild geese and ducks travel in a similar way.

To enable birds to fly with ease, and to continue long on the wing, they must fly against the wind, in which respect flying is directly opposite to sailing. Sportsmen are acquainted with this fact. If the wind is unfavourable for a time, the migration is retarded, yet never entirely given up, only the birds arrive much later, fatigued by their efforts. It is astonishing how tender birds, as the linnet, for instance, set out from the extremity of Norway, and brave a long journey even over the ocean. The quails, who are heavy in their flight, wait on the shores of the Mediterranean, often a long time, for a favourable wind, of which they immediately avail themselves, halting on all the islands. If the wind suddenly changes, many are drowned in the sea. Certain birds, as the moor-hen, rail, &c., being unable to fly for any considerable distance, travel partly on foot. Some, as the great auk, or penguin, diver, and guillemot even migrate by water. Ornithologists have observed that, on the old continent, birds migrate in autumn to the south-west, and in spring toward the north-east; yet the courses of rivers and chains of mountains exercise considerable influence on the direction of their flight. On the new continent, the points of direction are not the same. Captain Parry has satisfied himself that the birds of Greenland go to the south-east. It is remarkable, also, that the young of certain species do not make the same journey as the old birds; they go more to the south, so that it is very common to find, in the south of Europe, only the young birds of a certain species, whilst the older ones remain more to the north. In other species the females go farther south. It was formerly believed that the birds of the tropical regions never migrate, and that they never pass the line; but Humboldt has shown that this is not the case. He observed, moreover, that the migration there took place with the periodical rise of rivers.

MILAN, DUCY or; or THE MILANESE; formerly a duchy in the north of Italy; one of the finest and most fruitful countries in Europe; bounded on the west by Piedmont and Montferrat, south by the Genoese territory, east by the territories of Parma, Mantua, and Venice, and north by Switzerland. Its extent was 3820 square miles; principal productions corn, rice, wine, fruits, and silk. The first duke of Milan was Gian Galeazzo Visconti, who was named to that dignity by the emperor Wenceslaus, in 1395. The duchy was composed of a number of the most flourishing cities of Lombardy, in which the Visconti acquired the sovereignty, partly by means of arms, and partly through the favour of the citizens and the emperor. The male line of the Visconti became extinct in 1447, and, although the rightful claim then fell to France, Francesco Sforza, the husband of a natural daughter of the last duke, obtained possession of Milan for himself and his family, and they held it until the end of the fifteenth century. Louis XII. and his successor, Francis I., then attempting to enforce their claims, the duchy was alternately in the hands of the French and the Sforzas. Francis I., by the peace of Madrid (1526), was obliged to give up all his Italian possessions; and, the male line of the Sforzas having become extinct in 1535, Charles V. granted the duchy to his son, Philip II. of Spain; and it continued to be an appendage to the Spanish crown till the war of the Spanish succession, in 1706, when it came into the possession of Austria. By the peace of Vienna (1735) and the convention of Worms (1745), portions of it were ceded to the king of Sardinia. In 1796, the French occupied the country.

and by the peace of Campo-Formio, 1797, it was annexed to the Cisalpine republic. Although the Austrians and Russians annihilated this republic in 1799, yet Bonaparte again became master of Italy by the battle of Marengo, changed the name into the Italian republic (1801), and into that of kingdom of Italy (1805), of which the duchy of Milan constituted an important part until the events of 1814. Austria then united Milan and Mantua with the Lombardo-Venetian kingdom, the western part of which, the government of Milan, contains 2,194,000 inhabitants, and 8437 square miles. Sardinia also recovered its former portion of the Milanese territory. (3095 square miles), by the treaty of Paris, in 1814. See *Austria, Italy, Lombardy, and Sardinia*.

**MILAN** (*Milano*, in German *Mailand*, anciently *Mediolanum*); capital of the Lombardo-Venetian kingdom, situated in a fertile and pleasant plain, on the left bank of the Olona, 140 leagues from Vienna, 110 from Rome, 160 from Paris; lat.  $45^{\circ} 28' N.$ ; lon.  $9^{\circ} 11' E.$ ; population, 129,000. It is one of the richest, most splendid and populous cities in Italy; and, in spite of time and wars, has preserved a great part of its magnificence. Of the antiquities the only remains are the ruins of the *Thermae*, which are usually called the *colonne di S. Lorenzo*. Milan is rich in architectural monuments of modern times, among which the celebrated cathedral is the most remarkable: the foundation was laid in 1386, and, after St Peter's, it is the largest church in Italy. It is built entirely of white marble, and its interior and exterior produce an indescribable effect. The oldest architects, who worked upon it, adopted the latter Gothic style; but in the middle of the sixteenth century, Pellegrino Tibaldi erected the front in a more ancient style, and thus destroyed the unity of the whole. Napoleon almost completed it at an immense expense. The emperor Francis appropriated 12,000 *lire* monthly to finish it. While the exterior dazzles and astonishes the beholder by the pure brilliancy of the marble, the Gothic ornaments and the statues (of which there are 4000), he is not less strongly affected by the interior, which rests upon fifty-two marble columns. It is, described by Franchetti in *Descrizione storica del Duomo di Milano*, with engravings. Rupp and Bramati also published a description in 1823, under the title *Descrizione storico-critica del Duomo di Milano*. One of the oldest churches in Milan, that of St Ambrose, into which you descend by several steps, is remarkable for a number of antiquities, but is dark, and without beauty. Of the numerous other churches, many are splendid. The former Dominican convent, *Madonna delle Grazie*, contains, in its refectory, the celebrated fresco of Leonardo da Vinci, the Last Supper, now much injured, but yet beautiful. The former Jesuits' college of Brera, a magnificent building, remarkable also for its observatory, still contains several establishments for the arts and sciences; among them a picture gallery and a library. The former is particularly rich in works of the masters of the Lombard and Bolognese schools; the latter is valuable. The Ambrosian library, founded by the cardinal Borromeo, who was bishop of Milan in 1595, and died in 1631) contains, besides the books, a treasure of valuable manuscripts (among them, those of Leonardo da Vinci), paintings, sketches (Raphael's cartoons of the school of Athens), antiques and casts in plaster. The abbe Angelo Mai, who was appointed librarian in 1819, has made some important discoveries among these manuscripts. (See *Library*.) The military geographical institute of Milan, founded in 1801, has published an atlas of the Adriatic sea and other charts. Among the charitable institutions, the great hospital is the most remarkable, on account of its architecture, magnitude,

and the care paid to the patients. The *Carretto*, a large quadrangular building, is during the prevalence of the pest, a very different destination. The theatre *area* of Milan, one of the largest in Italy, and, since its renovation, it was built by Piermarini, in 1778, as a reward to all others in its accommodation. The *area* is built on a hill, and here exhibited as a stage of triumph and magnificence in its architecture. There are the theatres *Re, Canonica, area*. Milan contains a great number of palaces in the handsome buildings, but the *area* is a great broad or straight. The *area* is the *area* with which the public gardens form a beautiful promenade, is particularly fine. The *area* is a much frequented as the *area*, in which is a considerable world of pleasures and, in the evening, principally in rich equipages, every evening. The principal articles of commerce are wool, silk, and cheese. The number of manufactures is enormous. The arts and sciences are held in high esteem in the Milanese school of engineering is distinguished. The environs of the city are fertile, and are connected with the Ticino and the Adige, as the Alps of Switzerland are visible.

**MILESIAN TALES**. See *Novels*.

**MILDEW**. See *Fungus*.

**MILE**. See *Measures*.

**MILETUS**; a city of Asia Minor or the West of the Ionian Athens, (see *Asia*), and, near a *Thales* Smyrna, the most celebrated and important commercial city of Ionia. It early acquired wealth and founded a great number of colonies and colonies long and expensive wars with the Persians. After the conquest of Lydia by Cyrus, Miletus, the rest of Ionia, was also reduced under his dominion. The city was treated with severity, and continued to enjoy its former prosperity, after often shaken by internal dissensions, and in war, when it was raised to the ground. The inhabitants rebuilt the town, but never recovered its ancient importance. Miletus was the place of Thales, of Anaximander, Epicharmus, and celebrated Asclepias. The Miletian schools of teachers were famous in ancient times.

**MILFORD HAVEN**: a deep inlet of the sea, Wales, county of Pembroke. Several ships have been proposed, at different times, for permanent accommodations. These plans have given rise to the new town of Milford, or

*Milford Haven*; a town which was built in 1790, on the northern shore, six miles west of the county of Pembroke, and has risen with great rapidity. Houses are built with confidence, and each vessel. It has a church with a lofty tower, a commodious plain but commodious building, and a dock which forms a principal feature in the plan. A number of packets have been formed here, under various regulations, for conveying the mail and passengers to Waterford in Ireland. An establishment is also formed for the southern whale-fishery. It is also an extensive establishment of commerce.

**MILITARY ART**. See *Arms, Military, and War*.

**MILITARY FEVER**; a name given to every description, when accompanied by a number of military vessels, so called from resembling a seed.

**MILITARY COLONIES OF RUSSIA**. See *Colonies*.

**MILITARY DISTRICT, or MILITARY TIER** (in German, *Militärgrenz*): a district of the Austrian monarchy, containing 15,239 square miles, with 1,040,878 inhabitants; which consists of the along the Hungarian and Transylvanian borders.

as they border on the Turkish territory. It has a military constitution, and the inhabitants are soldiers or peasants at the same time. They have received hereditary use of the land, for which they are obliged to render certain services to the government, amongst which the military service is the most important. They form thus an uninterrupted cordon against the Turks, and the Austrian government has an army always ready without great expense. The soldiers usually in service belonging to this district amount, were, to 45,000 men. In 1815, they amounted to 110,000 men. These frontier soldiers protect their country against the Turks and the plague, without pay.

When they are marched against enemies in a great quarter, they have the common pay of other levies. In the thirty years' war, in the Austrian war of succession, and in the seven years' war, their services were important; and still more so in the repeated contests between Austria and Turkey. At the beginning of the French revolutionary war, not more than 100,000 of them appeared in the field. They have shown themselves unflinchingly faithful to their monarch. Their military officers exercise also civil and judicial authority. The highest office is that of the *general command*, under whom stand the *commandants* of the regiments. The whole country is divided into five generalships (*generalates*), which, in 1815 contained three fortresses, eleven cities (or, as they are called, *military communities*, which have their own magistrates), twenty-four market-towns, staff quarters, and 1995 villages. In the generalship of Carlsbach and Warasdin, the most important places are Karlovo, Zengh and Bellowar; in the generalship of Banat, Petrinia, and Kostainic; in the Slavonic generalship, or that of Peterwardein, Land and New Gradisca, Peterwardein, Carlowitz, and Sabin, to which also belong the Tschakists; in the Hungarian Banat generalship, Pancsova, Weiskirchen, and Karansebeo. In the Transylvanian generalship there are no places particularly worthy of notice. Next to agriculture and the raising of cattle, the cultivation of wine and garden fruits is carried on extensively. Flax, hemp, tobacco, and many other important plants are cultivated. The country is rich in valuable minerals. Mining, particularly in the present Banat and the Transylvanian frontiers, is in a flourishing condition even in the time of the mines; but these mines are, at present, little worked. Manufactures are in a low condition. The mechanics, as well as the merchants, live chiefly in *communities*, so called. The inhabitants belong principally to four races. The most numerous are the Slavonians; after these, the Walachians; then the Hungarians and Sackler; after these, the Germans. The majority belong to the Greek church; the Roman Catholics, however, are almost equally numerous. There are also Greek Catholics, Calvinists, Lutherans, and Unitarians. In the time of the Romans, this country belonged partly to Illyria and Pannonia Savia, partly to the kingdom of Dacia, and shared the changes of those countries. Sigismund of Hungary laid the foundation of the military power when he founded the *captaincy* of Zengh, in the middle of the sixteenth century, the frontier was to have been already divided into two chief tracts. The Croatian frontier was the first; the others were established much later, when, by the peace of Carlowitz, Austria received from Turkey several provinces entirely unpeopled. In no part of the empire does the population increase so rapidly; yet the frontier has to furnish many troops in all the wars of Austria, and many young people, unable to obtain land for the support of a family, emigrate to other parts of the monarchy. The Transylvanian frontier was established the latest. See *Statistics*

*der Militärgrenze des österreich. Kaiserthums*, by Hietzinger, Vienna, 1822.

MILITARY GEOGRAPHY. See *Military Sciences*, and *Geography*.

MILITARY ORDERS. See *Orders*.

MILITARY ROADS are, 1. such roads as are destined chiefly to facilitate the movements of military bodies; for instance, some of the superb roads which Napoleon constructed in Italy, to effect an easy military connexion with France; 2. roads on which, according to treaty, foreign troops may march to a certain place of destination, in traversing the states of a friendly power.

MILITARY SCHOOLS and ACADEMIES; schools in which soldiers receive instruction, or in which youths are educated for the army. Among the former are the *soldier schools*, in which, as in the case in many armies, particularly in the Prussian, the private soldiers learn reading, writing, and arithmetic; they are also, in the last named country at least, often instructed in singing, so that it is common, in the Prussian army, for a battalion to have its choir, which sings during divine service, and on other occasions. Instruction has become so general in the Prussian army, by means of regimental and battalion schools, that during the last years of peace, the army was considered an institution for the instruction of the whole country, as every Prussian is obliged to serve for a short time in the standing army. In some armies *conversations* have been introduced, in which the officers hold discourse with the sergeants and privates, on subjects connected with the service. When the officers in the armies of the European continent were taken from the nobility only, academies were established by government to educate young noblemen. They were called in Germany *Ritterakademien*, and sometimes were of a high character. These establishments must be distinguished from the *cadet houses*, so called, where, generally speaking, the children of officers only are educated for the army. In many countries, noblemen only are admitted into these also. In several French cities, companies of *cadets* existed when Louis XV., in 1751, first established an *école royale militaire* for 500 young noblemen, from eight to eleven years old. The principal features of its organization have been retained in most similar institutions.—See *Recueil d'Édits, Déclarations, Règlements et Ordonnances du Roi, concernant l'Hôtel de l'École roy. militaire* (Paris, 1762). The (so called) *Ritterakademien* originated later. Frederic the Great established the *École militaire* at Berlin, for the further accomplishment of young officers. Even before the seven years' war, every French city in which a regiment of artillery was garrisoned, had its artillery school. Saxony followed in 1766, Austria and Prussia later. At present, the two last have excellent artillery schools, as well as others in the department of engineering. Since 1815, the standard of scientific education of officers has been much raised in several armies; in none, however, so high as in the Prussian, in which no person can be promoted without a severe examination. Besides the regimental schools in this army, mentioned above, every division has its school, to which young sergeants, &c., are admitted (if they appear, on examination, to possess the necessary elementary knowledge), in order to prepare themselves for examination for a lieutenancy. Mathematics, history, geography, statistics, the applied mathematics, modern languages, particularly French, and the military sciences (q. v.), are here the chief subjects of study. The artillery corps and engineer corps have their separate schools for young officers, to prepare themselves for examination for the rank of captain. The captain must continue his studies by himself, to stand an examination

for the rank of major. Of the troops of the line, every regiment is allowed to send a few of its young officers, who must have shown great diligence, talent, and considerable acquirements, to the general military school in Berlin—an institution of a very high character. Here the highest branches of mathematics, geology, and mineralogy, chemistry and natural philosophy, history, politics, the military sciences, languages, &c., are taught in a course which occupies three years. The officers also attend such lectures in the university as they choose. It is evident how much such establishments must raise the standard of learning in the whole army, and, indeed, the corps of officers contains some of the most accomplished men in Prussia. In France, the former cadet houses have been called, since the revolution, *military schools*.

MILITARY SCIENCES have, by some of the latest writers been divided into the following heads:

1. *Tactics*, i. e., the science of the drilling of an army, as well as of disposing and directing it in battle, requiring, of course, an acquaintance with the different kinds of arms. The artilleryist devotes himself particularly to the ordnance, and the various branches of science requisite for its proper management. The lower, or elementary tactics, treats of the drilling and formation of soldiers, and accustoming them to the movements of small and large divisions, and varies in character with the different regulations of different armies. Tactics proper treats of the mode of disposing troops in the actual combat, and of the peculiar use of each species of force, cavalry, infantry, both heavy and light, and artillery. With them is nearly connected the choice of camps, or encampment (q. v.), though, since the introduction of the system of requisition, this branch of military science has gone almost entirely out of use. The knowledge of the employment of pontoons seems also to fall within this department.

2. *Strategy*, the science of forming the plans of operation, and of directing armies accordingly. It has been but lately treated as an independent branch, since von Bulow wrote on the subject. Many military writers will not as yet admit such a division; but little doubt can exist that it will be universally adopted. See, among other works, *Principles of Strategy, elucidated by the Description of the Campaign of 1796, in Germany*, by the archduke Charles.

3. The branch which treats of the just understanding and proper use of the surface of the earth for military purposes. The tactics of our time can overcome a number of obstacles, arising from the character of the ground, which were formerly considered insurmountable; still, however, this department of military science, embracing, as it does, a knowledge of the usual character of the ground under given circumstances, the course of rivers, of mountains, valleys, geological formations, &c., remains indispensable for a useful officer. To this branch belongs, or, at least, with it is intimately connected, reconnoitring, surveying, drawing of topographical maps, &c.

4. *Military Architecture, or Fortification*, which teaches how to fortify any given point by artificial means, so that a few persons may be able to defend themselves against the attacks of many. It embraces the construction of proper fortresses (*fortification permanente or royale*), the attack and defence of fortified places, and the knowledge of field fortification (*fortification passagère*), which treats of the construction, attack and defence of redoubts in the field, raised for transitory purposes, and not so solid as in standing fortifications.

5. *Military History and Biography*, which em-

braces a knowledge of all important wars, and also of the various organizations of armies, the principles upon which war has been carried on, the different arms used, and the consequences attending their use, &c.; also the lives of the greatest commanders and the resources which they found in situations when many leaders would have despaired. The history of military literature, to a certain extent, is not peculiar to a young officer, that he may be directed to the best works of the different nations. Of the military sciences, the most important is mathematics, which is indispensable for a scientific soldier. Meteorology, embracing a knowledge of winds, rivers, valleys, &c., the law of nations, modern anatomy, and gymnastics. The branches of study not enumerated are more or less essential to the well-trained soldier; but they cannot make a general, or more than the study of the thorough man can be a Mozart, or the knowledge of perspective a Rembrandt, or a Raphael. Although a waste of a useless waste of time to act about proving a scientific study is essential to a commander, yet the greatest general must find the most important resources in his own genius; and this must be unfailing promptness. An artist, if unskilled, may renew his efforts; but in war, the fate of a battle may depend upon an instant decision, and a hour is ruin.

MILITIA (from the Latin *milites*); is the name adaptation of the word, a body of armed citizens regularly trained, though not in constant service in times of peace, and thereby contradicting what is meant by *armies*. It includes all classes of the citizen, with certain exceptions, who are drilled at particular periods in peace, and liable, according to their laws, to march, in cases of emergency, against an enemy, in some countries, however, not beyond the frontiers. The regular organization of the militia distinguishes it from the *levée en masse*. In the militia exists in different countries under different names; thus, in France, the *nationale garde* or *garde nationale* are elsewhere called *militia*, *see Guards*. In some countries, they are denominated *sergeants*; in Austria and Prussia, *Landwehr* (defence of the country), while the *levée en masse* is called, in these two countries, *Landsturm*.

In the articles *Army*, and *Army*, Standing, &c. a brief sketch of the different organizations of arms from the feudal militia to the standing armies of the last century, and from them again to the citizen soldiers of later times. The reader will also find the titles of several works which afford more information on this subject. In the article *Feudal System*, the origin of the armies in the middle ages was briefly touched on. When the feudal system had rendered almost every nobleman on the European continent an independent monarch in his own castle, the difficulty of assembling a large number of men even for a good purpose, was immense. In the time where a more republican spirit prevailed, the citizens were obliged, at least, to take part in the defence of their city, a duty which they were seldom called upon to perform. The introduction of standing armies, chiefly in consequence of the endeavour of monarchs to render their government more and more independent upon the militia, caused the citizens to take less and less share in military service, and, in many cases, excluded them from it entirely; yet, while, in some countries, the services of the citizen soldiers were becoming every day of less importance, so that *bourgeois-militia* became a term of contempt in many places, governments began to foster the national militia.

The Swedish army was, at an early period, a

of general militia. The army consisted of twenty-one regiments, of which each owner of landed property was bound to maintain one man. They assembled every year for three weeks, and, during this time as well as in war, received full pay (as is now the case in Prussia). The Danish army was formed on a somewhat similar plan, about a third of each regiment consisting of enlisted foreigners, while two thirds were Danish subjects, who, like those in Sweden, were supported by the owners of landed property, but, in return, were obliged to assist the latter in the cultivation of their estates. In Germany, similar plans were adopted. The privates and non-commissioned officers of the militia followed their agricultural or mechanical pursuits, and were generally under the command of officers out of active service. They were only obliged to serve within the country. Frederick the Great used them to garrison the fortresses: the same was the case with the Austrian militia during the war of succession. The bad organization and unmilitary spirit of these troops rendered them the butt of the troops of the line. In some cases, it was even considered allowable, by the laws of war, not to give them any quarter, when they were employed out of the limits of their country, and were taken prisoners. They became extinct almost everywhere on the European continent.

Similar, but better organized, was the English militia. The origin of this national force is generally traced back to Alfred. The feudal military tenures succeeded, and although the personal service which his system required degenerated by degrees into pecuniary commutations, or aids, the defence of the kingdom was provided for by laws requiring the general arming of the citizens. Under Edward III., it was provided that no man should be compelled to go out of the kingdom at any rate, nor out of his hire, but in cases of urgent necessity, nor should provide soldiers, unless by consent of parliament. The first find lord-lieutenants of counties, whose duty was to keep the counties in military order, mentioned as known officers in the fifth year of Philip and Mary. When Charles I. had, during his northern expeditions, issued commissions of lieutenancy, and exerted certain military powers, which, having been long exercised, were thought, by one party, to belong to the crown, it became a question, in the long parliament, how far the power over the militia should inherently reside in the king, which, after long agitation, ended by the two houses denying the crown this prerogative, and taking into their own hands the entire power of the militia. After the restoration, when the military tenures were abolished, the sole right of the crown to govern and command the militia was recognised. The most characteristic features of the English and Scottish militia at present are, that a number of persons in each county is drawn by lot, for five years (liable to be prolonged by the circumstance of the militia being called out and embodied), and officered by the lord-lieutenants and other principal land-owners, under a commission from the crown. They are not compellable to leave their county, unless in case of invasion or actual rebellion within the realm, nor, in any case, to march out of the kingdom. When drawn out, they are subject to military law. In all cases of actual invasion, or imminent danger thereof, and in all cases of rebellion or insurrection, the king may embody the militia, and direct them to be led into any part of the kingdom, having communicated the occasion to parliament, if sitting, or, if not sitting, having declared it in council, and notified it by proclamation. In Tyrol, a general arming against the French was effected in 1799. When, in 1808, the archduke Charles was placed at the head of military affairs, a

general *Landwehr* was organized throughout the Austrian provinces. In 1809, these troops fought well, and amounted, at that time, to 300,000 men; after 1811, only to 71,500; but, after 1813, the *Landwehr* was again placed on its old footing, and, quite lately, parts of it have been called out to increase the army, which stands ready to overrun Italy. In Hungary, the common law obliges every nobleman to serve himself and to bring his vassals into the field, if called upon. This *levée* is called an "insurrection of the nobility." In 1809, this insurrection consisted of 17,000 horse, and 21,000 foot. In 1807, a general militia was organized in Russia, which, in 1812, was of considerable service against the French.

Prussia has carried the *Landwehr* to greater perfection than any other country: in that country, the militia forms the main body of the army. In 1813, every male person under forty-eight years was obliged to serve against the French in the militia. The national militia, at that time, included both infantry and cavalry. The lower commissioned officers were elected by the militia-men, and the higher by the estates of each circle. When Napoleon returned from Elba, Prussia had 150,000 infantry and 20,000 cavalry of the militia under arms. After the peace of 1815, the *Landwehr* was established on its present footing. Every Prussian, with the single exception of mediatised princes, is obliged to serve for three years in the standing army, between his seventeenth and twenty-third year. Part of this time, however, he is generally on furlough. If a person equips himself and undergoes an examination, by which he proves that he has received a certain education, he has to serve one year only in the standing army. After this time, every Prussian belongs, until his thirtieth year, to the first class of the *Landwehr*, attends frequent drills on Sunday afternoons, and has to serve for three weeks every year, when the *Landwehr* is called together for great manoeuvres. Every man is in the *Landwehr* what he was in the standing army—foot-soldier, horseman, or artilleryman. Government hires horses for the time of manoeuvring, and, as they are well fed and ridden by experienced men, the owners generally like to let out their horses for the occasion. Every Prussian, from his thirtieth year until his fortieth, belongs to the second class of militia. This is not called together in time of peace, and, in war, only in time of the greatest emergency, and then only for local or provincial service. Thus Prussia is enabled to assemble a very large army in proportion to its population, whether to the injury of the nation is a question not to be discussed here.

In regard to the militia of the United States of America, it is provided, by act of congress of 1792, that all able-bodied, white male citizens, between the ages of eighteen and forty-five, with certain exceptions (officers of government, members of congress, mariners in service, &c. &c.) shall be enrolled in the militia. The persons so enrolled are to provide themselves with the common arms of infantry, and with ball cartridges, &c., at their own expense. These are arranged into brigades, regiments, companies, &c., as the legislatures of the several states may direct. Each battalion is to have at least one company of grenadiers, light-infantry or riflemen, and each division at least one company of artillery and one troop of horse. Proper ordnance and field artillery is to be provided by the government of the United States. The cavalry and artillery troops are to consist of volunteers from the militia at large, not exceeding one company to each regiment, and are to equip themselves, with the exception of the ordnance above mentioned. Whenever the United States shall be invaded, or in immi-

ment danger of invasion from any foreign nation or Indian tribe, the president is authorised to call forth such number of the militia of the state or states most convenient to the scene of action as he may judge necessary. In case of any insurrection in any state against the state government, he may, on application from the legislature of such state (or from the executive, when the legislature cannot be convened) call forth such number of the militia of any other state or states as may be applied for, or as he may judge necessary to suppress the insurrection. So, whenever the laws of the United States are opposed in any state by combinations too powerful to be suppressed by the ordinary course of judicial proceedings, or by the powers vested in the marshals, the president may call forth the militia of such state, or any other state, to suppress them, and may continue the militia in service for thirty days after the commencement of the next session of congress. During the last war with Great Britain, it was provided, by an act which expired with the war, that, when the militia were in pay of the United States, and acting in conjunction with the regular troops of the United States, they were to be governed by the rules and articles of war in like manner with the regular forces, and subject to be tried by courts martial, these courts martial, however, to be composed of militia officers. It was also provided that the militia, when called into the service of the United States, might, if the president of the United States was of opinion that the public interest required it, be compelled to serve for a term not exceeding six months in any year. The sum of 200,000 dollars is appropriated annually for the purpose of providing arms and equipments for the whole body of the militia of the United States, which are divided among the states and territories respectively, in proportion to the number of effective militia in each. In all the states, the governor is the commander-in-chief of the militia, with more or fewer restrictions. In Massachusetts, he has power to exercise, assemble, and govern them, and to employ them to resist invasion or detriment to the commonwealth, but cannot march them out of the limits of the state without their free consent, or the consent of the general court, except that he may transport them by land or water out of the state, for the defence of any part of the state to which access cannot otherwise conveniently be had. By the constitutions of many of the states, especially those which are of recent origin, the governor is not commander-in-chief of the militia, when they are in the actual service of the United States. This is to prevent collision between the general government and that of the separate states, such as took place between the government of Massachusetts and that of the United States, during the last war with Great Britain. Such a provision exists in the constitutions of Connecticut, Pennsylvania, Delaware, South Carolina, Kentucky, Tennessee, Ohio, Indiana, Mississippi, Illinois, Alabama, Missouri, Maine. In some of the states, the governor is not to command personally, except when so advised by the legislature. This is the case in Vermont, Maryland, Kentucky, Indiana, Louisiana. In North Carolina, the governor cannot embody the militia of his own authority for the public safety, except in the recess of the general assembly. In some of the states, the organization of the militia is not provided for by the constitution, but left to be settled by the legislature: this is the case in Pennsylvania, Louisiana, Mississippi, Illinois, Alabama. In most of the states, however, particular provision is made for the election or appointment of officers of different degrees. In Massachusetts, the captains and subalterns are elected by the written votes of

their companies, the field officers of regiments by the written votes of the captains and subalterns of their respective regiments, the brigadiers by the first officers of their respective brigades. The general commissions these officers. The major-generals are appointed by the senate and house of representatives, each having a negative on the other, and are commissioned by the governor. If the electors of brigades, field-officers, and captains fail to elect the persons with the advice of the council, this returns to New Hampshire, the general and field-officers of the militia are nominated by the governor and council. The captains and subalterns are nominated by the field-officers, and, if approved by the general, are appointed by him. The commanding officers of regiments appoint their adjutants and quarter-masters, the brigadiers their brigade-majors, the major-generals their aids, the captains and subalterns the non-commissioned officers. In Vermont, the militia companies elect their captains and other officers, and the captains and subalterns nominate and recommend the field-officers, who appoint their adjutants. The superior officers are appointed by the general and council. The provisions of the New York constitution are much the same as those of Massachusetts. In New Jersey, the captains and inferior officers are chosen by the companies, but field and general officers by the council and assembly. In Maryland, the officers of the militia are appointed by the general. In North Carolina, the senate and house of commons appoint the generals and field-officers of the militia. In Georgia, the general officers of the militia are to be elected by the general assembly, as commissioned by the governor. The other officers are elected as the legislature may direct. In Kentucky, the commanding officers of the respective regiments appoint their regimental and brigade-major-generals their brigade-majors, major-generals their aids, and captains the non-commissioned officers of companies. A majority of the field-officers and captains in each regiment nominate the commissioned officers in each company, who are commissioned by the governor. In Tennessee, field-officers, captains, subalterns, and non-commissioned officers, are chosen by the citizens subject to military duty in the division of these officers, brigadier-generals by the battalions of their respective brigades, major-generals by a field-officers of their respective divisions. The governor appoints the adjutant-general, the major-generals appoint their aids, the brigadier-generals the brigade-majors, and the commanding officers of regiments their adjutants and quarter-masters. In Ohio, captains and subalterns are elected by the companies, majors by the captains and subalterns, the battalion, colonels by the majors, captains and subalterns of the regiment, brigadier-generals by a commissioned officers of their respective regiments, major-generals and quarter-master-generals are appointed by the joint ballot of both houses of the legislature. The governor appoints the adjutant-general; the major-generals appoint their aids, and other division officers, the brigadiers their major-commanders of regiments their adjutants, quarter-masters, and other regimental staff-officers, and captains and subalterns the non-commissioned officers and musicians. In Indiana, the elections are not as in Tennessee, except that brigadiers are chosen by all the commissioned officers of their respective brigades, and major-generals by the commissioned officers of their respective divisions. In Missouri, the constitution provides that field-officers and major-officers shall be elected by the persons subject to military duty within their respective commands, brigadier-generals by the field-officers of their respective brigades, and major-generals by the brigade

and field-officers of their respective divisions, until otherwise directed by law. General and field-officers appoint their staff-officers. The governor appoints an adjutant-general, and all other militia officers whose appointments are not otherwise provided for. In Maine, the system is much as in the last mentioned state, except that the major-generals are elected by the senate and house of representatives. The constitutions of some of the states exempt from militia duty, with more or less qualification, persons conscientiously scrupulous about bearing arms. This is the case with those of Maine, New Hampshire, New York, Pennsylvania, Tennessee, Indiana, Missouri, Illinois, Alabama. See *Army*, and *Army, Standing*.

**MILK**; a secretion peculiar to the females of the class *mammalia*, or those animals which feed their young from their teats, and which takes place, in some of them, only during and after the time of gestation. It differs as procured from different animals, but its general properties are the same in all. When this fluid is allowed to stand for some time, it undergoes spontaneous changes, and is resolved into its component parts: a thick yellowish substance collects on the surface, which is called *cream*, and the milk beneath becomes thinner than before, and is of a pale bluish colour. When cream is kept for some days without being disturbed, it gradually becomes thicker, till at last it acquires the consistence of cheese; and hence one method of making cream-cheese, merely by putting cream into a linen bag, and leaving it there till it becomes solid. When cream is shaken, it is resolved into its component parts. The process by which this is accomplished is called *churning*, by which two substances are obtained, *butter* and *butter-milk*. In the making of butter, cream is allowed to stand for some time, during which an acid is generated. It is then put into a churn and shaken, by which the butter is gradually separated. What is left (the butter-milk) has a sour taste, but by no means so much so as that of the cream before the churning. Butter is sometimes also made from cream which has not become sour, but the process is much more tedious, the acid formed in the other case favouring its separation. Butter is merely an animal oil, solid at a natural heat, but held in solution in milk, by some of the other substances. As thus procured, it is not pure, but may in a great measure be freed from its impurities, by washing it with cold water; and though apt to become rancid, yet, when mixed with salt, may be kept any length of time. Milk from which butter has been taken, undergoes spontaneous changes. It becomes much sourer, and congeals into a mass of the consistence of jelly. When heated, the fermentation of this coagulum is hastened, and by the addition of certain substances, it very soon takes place; thus acids and spirit of wine curdle it, which is owing to the albumen it contains being acted on by them, in the same way as blood or white of eggs. By far the most powerful coagulator, however, is the substance called *rennet*, which is the decoction of the stomach of animals, as a calf. When the milk is previously heated, and rennet added, it is almost instantly coagulated. If after this it is cut, a thin fluid flows from it, and if it be put into a bag and squeezed, the whole of this is forced out, and a whitish, tough matter is left; the former is *whey*, the latter *curd*. On this depends the process of making cheese, which varies in richness, according to the mode followed in preparing it. When milk is heated gradually, and merely to the temperature at which it curdles, and if the curd be freed gently from the whey, it retains almost the whole of the cream, which adds to its richness and flavour. But when it is curdled quickly, and the whey is speedily removed by cutting the curd,

a great deal, or nearly the whole of the cream is carried off, and the cheese is poor, and has not the rich flavour of that made in the other way. In making cheese, having obtained the curd, and freed it from its whey, the remaining part of the process is merely to subject it to pressure, by which the whole of the whey is forced out, the colour being communicated by the addition of colouring matter: that generally used is annotta, which is mixed with the milk. Whey has a pleasant taste, and contains a considerable quantity of a sweetish substance, called *sugar of milk*; hence it is frequently used as drink, and from its nutritious quality, it is administered to delicate people; hence the use of asses' milk, which contains a large quantity of it. It is from its containing this saccharine matter, that it is sometimes, as in some of the northern counties of Scotland, made to undergo fermentation, by which a very weak spirituous fluid is obtained. By evaporation it affords a minute quantity of saline matter and a considerable portion of sugar of milk. When whey or milk is exposed to a temperature between 60° and 80° it undergoes a spontaneous change, attended by the production of an acid, which was originally examined by Scheele, and has been termed *lactic acid*.

**MILKY WAY**. See *Galaxy*.

**MILL**; originally, a machine, adapted to divide, crush, or pulverize any substance; but more extensively applied, in modern times, to almost all machinery consisting of wheel work, whether intended to change the form, or merely the position of the substance operated upon. The term as thus used is very indefinite, both in regard to the moving power and the application of the power or the process. Mills therefore take different names, from the process, as stamping-mills, saw-mills, fulling-mills, grinding-mills, &c.; from the moving power, as wind-mills, water-mills, hand-mills, steam-mills, &c.; or from the material operated upon, as cotton-mills, flour-mills, sugar-mills, oil-mills, &c. This great variety in the nature and uses of mills renders it impossible to give descriptions of them under one head. The general principles of the machinery and the moving powers will be found described under the heads *Mechanics*, *Hydrodynamics*, *Machinery*, *Pneumatics*, *Steam*, *Wheels*, &c., and their particular applications to different materials will be treated of under the appropriate heads. One of the earliest and most universal applications of machinery of this kind is to the comminution of grain. Among the rudest nations we find this done by pounding it between two stones; but with the first advances of art, a simple hand-mill is constructed, composed of an immovable nether-stone (Gr. *μωλη*) and an upper-stone (*μωλος* or *ωμος*), put in motion by the hand. These machines were used by the Hebrews and Greeks, and commonly moved by slaves or criminals. Asses were afterwards employed. According to the Greek mythology Pilumnus, Myles, or Mylantes, invented the mill. Water-mills (*molæ aquariæ*) seem to have been used by the Romans. Wind-mills were invented in the time of Augustus. Among the moderns the common mill for grinding grain is constructed with two circular stones placed horizontally. Buhr-stone is the best material of which mill-stones are made, but sienite and granite are frequently used. The lower stone is fixed, while the upper one revolves with considerable velocity, and is supported by an axis passing through the lower stone, the distance between the two being capable of adjustment according to the fineness which it is intended to produce in the meal or flour. When the diameter is five feet, the stone may make about ninety revolutions in a minute without the flour becoming too much heated. The corn or grain is shaken out of a hopper by means of projections from the revol-

ing axis, which give to its lower part, or feeder, a vibrating motion. The lower stone is slightly convex, and the upper one somewhat more concave, so that the corn, which enters at the middle of the stone, passes outward for a short distance before it begins to be ground. After being reduced to powder, it is discharged at the circumference, its escape being favoured by the centrifugal force, and by the convexity of the lower stone. The surface of the stones is cut into grooves, in order to make them act more readily and effectually on the corn; and these grooves are cut obliquely, that they may assist the escape of the meal by throwing it outward. The operation of *bolting*, by which the flour is separated from the bran, or coarser particles, is performed by a cylindrical sieve placed in an inclined position and turned by machinery. The fineness of flour is said to be greatest when the bran has not been too much subdivided, so that it may be more readily separated by bolting. This takes place when the grinding has been performed more by the action of the particles upon each other, than by the grit of the stone. For this sort of grinding, the buhrstone is peculiarly suited. The patent improvements of Evans consist of a series of machines calculated to save hand-labour, by performing every movement of the grain and meal from one part of the mill to another, or from one machine to another, by the force of the water.

MILLAR, JOHN, professor of law in the university of Glasgow, was born in the parish of Shotts, Lanarkshire, 1736, and after being educated for the bar, was called to the vacant chair of civil law in Glasgow college, in 1761. This situation he filled with great success for forty years; and under him, many who have since distinguished themselves in public life—lord Brougham, lord Jeffrey, lord Commissioner Adams, the earl of Lauderdale, and others—received their first lessons in political science. He died in 1801. The interest which his lectures on jurisprudence excited, particularly those which referred to the government of nations, induced him, in 1771, to publish a short treatise on the subject, which was favourably received. This led him, some years afterwards, to the composition of a more elaborate work, which appeared in 1787, under the title of "Historical View of the English Government, from the settlement of the Saxons in Britain to the accession of the House of Stuart." This history he intended to bring down to his own time, but he only completed it to the Revolution, and a new and posthumous edition in 1803, four vols. 8vo, comprised that period. A fourth edition, with a memoir of his life by his nephew, Mr John Craig, was published in 1808. The work is written with great force and distinctness, and is highly esteemed, as one of the few standard English works which we have on political science.

MILLENNIUM (*a thousand years*); generally taken for the thousand years in which some Christian sects expected, and some still expect, the Messiah to found a kingdom on earth, full of splendour and happiness. This opinion originated from the expectations of the Jews, in regard to a Messiah. Excited and nourished by their prophets, endeared to them by their sufferings, during and after the Babylonish captivity, and by the national pride, which their misery served to increase, those expectations took a more and more decidedly sensual turn in the time of Jesus, particularly under the oppression of the Roman government. (See *Messiah*.) Jesus declared himself to be the expected Messiah, announcing his new religion as the fulfilment of the promises given by the prophets of the Old Testament. Notwithstanding his express declaration, that it was not his intention to establish a worldly kingdom, but a spiritual kingdom of truth and virtue, and notwithstanding the

doctrine of his apostles, that a *kingdom* *happens* could only be expected in a better world, the new Christians could not refrain from expressing the glorious return of Jesus, as described by its apostles, on earth, and from interpreting the sayings of Jesus, which seem to favour such a hope according to their wishes, bent on worldly happiness. These expectations, entertained by the converts from Judaism to Christianity, were blended with the hope of a golden age, which had been substituted in its converts from paganism, who still cherished the ideas of heathen mythology. Besides, it was natural, in the situation of the first Christians, growing out of the oppression of their heathen masters, should contribute to increase their desire for a new state of things. *Chiliasm*, or the expectation of the *thousand millennium*, became, therefore, a universal belief among the Christians of the first centuries, and was strengthened by the prophecies contained in the Revelation (chap. xx. xxi.) of the signs which are to precede and indicate the happy times of the millennium. This belief was clothed in still more *new* colours by the descriptions of such a state in some pseudo-prophetical writings, forged towards the end of the first, and the beginning of the second century under the names of personages of the Old Testament and apostles (as the Testament of the twelve Patriarchs, the 4th book of Ezra, the Revelation of Peter &c.), and in the Sibylline books of the Christians the Epistle of Barnabas, the Pastor of the Psalm-Hermas, and in the Talmud. How eagerly and descriptions were received, is shown by the unanimity with which the doctrine of the millennium was adopted and promulgated by the Christian teachers of the first centuries. Not only the *heavenly* *canon*, thus, who had imbibed this doctrine from Jesus, but also orthodox teachers, as Papias of Smyrna, Irenæus, Justin the Martyr, &c., delighted in the dreams of the glory and happiness of the millennium. Before it began, human misery, according to the opinion, was to rise to the highest degree, and the overthrow of the Roman empire would follow, and from its ruins would proceed a new state of things, in which the faithful who had risen from the dead, and those still living, would enjoy ineffable happiness. At that blissful period, every ear would produce 10,000 grains, and every grain ten pounds of wheat flour, every vine would yield millions of millions of measures of wine, the innocence of paradise would be united to every intellectual and sensual pleasure, to victory of the faithful over the unbelievers to complete, and the blessed reside in the heavenly Jerusalem, which would descend from heaven to extraordinary splendour and grandeur, to receive them in a magnificent habitation. The Millenniumists found their belief on the Mosaic history of the world. Considering this history as a prototype of the last of the world, and concluding from Psalm xc. that 6000 years make with God one day, they believed in the 6 days of creation, 6000 years of terrestrial labours and sufferings, and in the seventh, the day of rest, a period of 1000 years, in which the reign of Christ should be established.—The Gnostics, despite matter, were adversaries to the doctrine of the millennium, and the more seriously it was debated by the Montanists (for instance, Tertullian, the one suspicious did it gradually become to the orthodox also. The philosophic school at Alexandria, particularly Origen, opposed it in the third century, by arguments, which were soon adopted by all the fathers. Lactantius was the last distinguished teacher of the primitive church who adhered to the idea of a millennium. When Christianity became the predominant religion of the Roman empire, the doctrine lost its interest for the multitude; the new

liberty, and security, which the millennium was expected to bring, being now actually enjoyed by the Christians. The belief of the resurrection of the body, however, which could not be dispensed with in the pleasures which the Millenarians promised themselves, passed from them into the dogmas of the church, though the fathers of a later period supported it on different grounds from the Millenarians. Jerome and Augustine zealously opposed the gross ideas of the few enthusiasts, who, in the fifth century, were still expecting this period. Since that time, the church has rejected the dogma of the millennium, together with other Jewish notions. The expectation of the last day in A. D. 1000, gave it some weight for a short time only, and similar hopes excited by the crusades were soon disappointed by the event. At the time of the reformation, the doctrine of a millennium was in some degree revived, by its application to the overthrow of the papal dominion. But it was only some sects of fanatics, such as the Anabaptists, and some mystical enthusiasts, in whom the seventeenth century was rich, that adhered to these notions. During the religious and civil wars in France and Britain, the persecuted sought consolation in the dreams of a millennial kingdom: the raptures of the Mystics and Quietists among the Catholics led to a similar result, and the most learned and zealous friends of Chiliasm rose among the Lutherans during and after the thirty years' war. The disciples of Weigel and the adherents to the religious principles of Petersen, went the farthest; yet even many moderate and sober theologians, misled by idle speculations on the prophetic books of the Bible, particularly on the book of Revelation, which, up to the middle of the eighteenth century, formed a favourite occupation among a certain class of divines, indulged themselves in the ideas of a millennium. As the philosophical vindication of this doctrine, which was attempted in England by Thomas Burnet and Whiston, could not satisfy the orthodox Christians on account of the scepticism of its authors, several apocalypics, among whom Bengel (q. v.) formed a separate school, exhausted their efforts in endeavouring to calculate, at least, the time in which the kingdom of Christ should commence. Bengel is of opinion, that this period will begin in the year 1836, and last 2000 years. While his disciples were flattering themselves with very sensual descriptions of the kingdom of Christ, Lavater and Jung Stilling, who possessed more imagination, but even less coolness and learning, indulged similar visions and predictions, with which they entertained their adherents up to the nineteenth century. Of all the vagaries of disordered fancy, the doctrine of a millennium is one of the most useless, and, at the same time, one of the most dangerous. Aversion to all that exists, hatred of contemporaries, indolence and spiritual arrogance—these are its fruits; and the exercises of penitence, which it leads, are nothing but the effects of terror, and without moral worth. Quite lately a sect of this name can be given to the Mormons, who have sprung up in the United States, believing, as far as they are informed, in the near approach of the millennium, whose enjoyments are to be of a sensual and worldly character.

MILLER, EDWARD, M.D., an eminent physician and professor at New York, was born at Dover, in the state of Delaware, May 9, 1760. In 1778, he undertook the study of medicine. He began practice in Delaware, but made himself advantageously known under other states, by a disquisition on the Origin of the Yellow Fever, one of the earliest and ablest publications in support of the doctrine of domestic origin. In 1796, doctor Miller removed to the city of New York. Within a few weeks after, he formed, in con-

cert with doctor S. Mitchell and doctor E. H. Smith, the plan of a periodical work, to be devoted to medicine. The first number was issued in 1797, under the title of the *Medical Repository*. No work of a similar kind had appeared in America. It excited medical inquiries, and recorded their results. It occasioned the establishment of similar journals in other parts of the United States. Doctor Miller lived to see its fifteenth volume brought nearly to a close. In 1803, he was appointed resident physician for the city of New York. He witnessed, as such, several pestilential seasons. The fruits of his observation and reflection he embodied in a Report on the Rise, Progress, and Termination of the Yellow Fever, to which a high degree of merit is ascribed. In 1807, he was elected professor of the practice of physic in the university of New York. In 1809, he became clinical lecturer in the New York hospital. Notwithstanding the laborious duties of those offices, and the calls of an extensive practice, he kept up an active correspondence with many distinguished physicians and men of letters in the principal parts of Europe and America. Professional honours were conferred upon him from all quarters. He died of typhus fever, March 17, 1812, in the fifty-second year of his age. His printed works have been collected and published in one large volume.

MILLER, JOHN. See *Millar*.

MILLER, JOSEPH, a witty actor, whose name has become proverbial in the English language, was born in 1684, it is supposed in London, and was a favourite low comedian about the time that Congreve's comedies were fashionable, to the success of which, it is said, his humour much contributed. In these he performed Sir Joseph Wittol, in the *Old Bachelor*, and Ben, in *Love for Love*. Another of his favourite characters was Teague, in the *Committee*. He died in 1738. The jests which have immortalized his name, were collected by John Mottley, author of the life of Peter the Great, and other works. Joe Miller's Jest had run through eleven editions in 1751. A copy of the original edition was lately valued at ten guineas, in the catalogue of an eminent bookseller.

MILLET is a coarse, strong grass (*holcus sorgum*), bearing heads of a fine round seed, a little larger than mustard seed. The plant, although coarse, makes good food for horses and cattle, and the seed is equally good for them; it is excellent for fattening poultry, and is sometimes made into bread. It is also used for making puddings, for which purpose it is by some preferred to rice.

MILLIARD (*French*); one thousand millions.

MILLIN, AUBIN LOUIS; professor of antiquities at Paris, member of the academy of inscriptions and of the legion of honour, and, after the death of Barthélemy, *conservateur* of the imperial (royal) cabinet of medals and antiquities. Millin was born in Paris, in 1759, and at first devoted himself to the study of natural history, but afterwards to that of philology, and finally to archæology. In his earlier writings he appeared as a partisan of republican principles; among these are his *Almanac Republicain*, and other works, which he did not include in the later catalogues of his publications. In the reign of Napoleon, he made two antiquarian excursions in France and Italy, where he discovered several remains which had been overlooked by the Italians. He was one of the most learned archæologists that France has produced. He edited the *Magazin Encyclopédique* nearly twenty years. Among his principal works are his *Dictionnaire des Beaux Arts*; *Monumens Antiques inédits*; *Galerie Mythologique*; *Peinture des Vases Antiques*; *Voyage dans les Départemens du Midi de la France*; *Histoire Métallique de la Revolu-*

*tion Française; Histoire Méthodique de l'Empereur Napoléon.* His lectures, which were fashionably attended, contributed, with his works, to diffuse a taste for the study of antiquities in France. His services as a *conservateur* of the cabinet of antiques, of which he made a systematic arrangement, also deserve to be remembered. He died in 1818.

MILLOT, CLAUDE FRANÇOIS XAVIER; a learned and ingenious French author, born in 1726, at Besançon. He was educated at the Jesuits' college, and became a member of that fraternity, but quitted it, and settled at Parma, where the patronage of the duke de Nivernois obtained him the historical professorship. This situation he filled with much ability and reputation for some years, when the prince of Condé offering to his acceptance the appointment of tutor to the young duke d'Enghien, he returned to Paris. His works, some of which are much esteemed for the spirit and elegance of their style, consist of a History of the Troubadours (in 3 vols.); Memoirs, Political and Military, for the History of the Reigns of Louis XIV. and Louis XV. (6 vols.); Elements of Universal History (9 vols.); Elements of the History of England (3 vols.); Elements of the History of France (3 vols. 12mo), besides some academical papers, and a few translations from the Latin. His death took place in the French capital, in 1785.

MILLS, CHARLES, an historian, born at Greenwich, in 1788, was articled to an attorney in London. Ill health and the attractions of literature prevented him from engaging in practice, and, in 1817, he published a History of Mohammedanism, which met with a favourable reception. He afterwards produced the History of the Crusades (1819); Travels of Theodore Ducas, at the Revival of Letters and Arts in Italy (1821), and the History of Chivalry (1825). He died October 9, 1826.

MILNER, JOHN, a celebrated Catholic divine and writer on theology and ecclesiastical antiquities, was born in London, in 1752, and finished his studies at Douay. In 1777, he was ordained a priest, and, in 1779, appointed pastor to the Catholic chapel at Winchester. Doctor Milner's study of ancient ecclesiastical architecture procured for him admission into the royal society of antiquaries in 1790. He contributed many valuable communications to the *Archæologia*, and published a Dissertation on the modern Style of altering Cathedrals, as exemplified in the Cathedral of Salisbury (1798). The same year, he published his History, Civil and Ecclesiastical, and Survey of the Antiquities of Winchester (2 vols. 4to), and subsequently a Treatise on the Ecclesiastical Architecture of England during the Middle Ages (8vo). Some observations in the history of Winchester gave offence to doctor Sturges, a prebendary of the cathedral, who animadverted on them in a tract entitled Reflections on Popery. Doctor Milner replied to this attack in his Letters to a Prebendary, which display great learning, ability, and acuteness. In 1801, he published his Case of Conscience solved, or the Catholic Claims proved to be compatible with the Coronation Oath. On the death of bishop Stapleton, doctor Milner was appointed to succeed him as vicar apostolic in the midland district, with the title of *bishop of Castabala*. He for some time refused that dignity, but at length he was prevailed on to accept it, and was consecrated in 1803. In 1807 and 1808, he visited Ireland, that he might be enabled, from personal observation and intercourse, to form an opinion concerning the charges brought against the Roman Catholics of that country. As the result of his researches, he published his interesting Inquiry into certain vulgar Opinions concerning the Catholic Inhabitants and the Antiquities of Ireland. At this period, he was appointed agent in England to the

Irish Catholic hierarchy. His estimate for the interests of religion in both countries would be to take a journey to Rome in 1814, and to remain there about twelve months. In 1804, he published a treatise entitled the End of Religious Controversy, containing a defence of those articles of the catholic faith usually regarded as objections to Unitarians. This was succeeded by his *Manifesto to the End of Religious Controversy* against the Ensign of the Bishop of St David's and the reverend Henry Grier; and a Parting Word to the Roman Catholics with a Brief Notice of Doctor Samuel Parr's humorous Letter to Doctor Milner. His death took place in 1826.

MILO; an island in the Greek Archipelago to ancient Melos. See *Melos*.

MILO, a native of Crotona, in Italy, was one of Pythagoras, and one of the most famous Grecian athletes. He bore off the prize at nine of the Olympic games. Of his prodigious strength many instances are cited. When the temple of Pythagoras was teaching his pupils was on the point of falling, Milo seized the main pillar, and saved the destruction of the edifice until all present had escaped. He once carried a bull to the market on his shoulders, and killed it with a blow of his hand. His strength, however, was the cause of his death. Seeing in a forest a strong trunk of a tree, which he had been vainly attempting to split with wedges, he determined to pull it asunder: but his strength was insufficient. The wedges which had but just cut open had dropped out, and he remained with his hands fastened in the fissure. No one coming to his assistance, he was devoured by wild beasts. According to the tradition of the Pythagoreans, he was pursued to his home in Crotona by Cylon, slain and burned.

MILORADOWITCH, MICHAEL ANTONOVICH, count of, a distinguished Russian officer, was born in 1770; served in 1787 against the Turks, a year against the Poles; rose rapidly; commanded a corps the vanguard of Suvoroff's army in Italy, a division in 1805, as lieutenant-general at the battle of Austerlitz. In 1808, he fought valiantly against the Turks, and, in 1812, organized the *corps de reserve*, and led it to the main army into the battle of Mojsiak. He was of great service in this whole campaign against the French, and in the succeeding war in 1813. He contributed essentially to the victory of the allies at Cambray, commanding under the grand prince Constantine a *corps de reserve*, consisting of Prussian grenadiers and cuirassiers, and the Russian and Prussian guards. In the battle of Leipzig, he was again active, and marched with the armistice into France. After peace, he was appointed military commissioner at St Petersburg. In the intervention of the troops in 1825, at the accession of the emperor Nicholas, he was killed by a pistol-shot. As an active commander of vanguards he had few equals.

MILTIADES; an Athenian general, who lived about B. C. 500. He had already successfully established an Athenian colony in the Chersonesus, and subjected several islands in the Ægean to the dominion of his country, when Darius at the head of a formidable army, undertook the subjugation of Greece. Miltiades, Aristides and Themistocles animated the Athenians, disabused by the superior numbers of the enemy, of resistance. Each of the ten tribes placed 1000 men under the direction of a leader. This little army advanced to the pass of Marathon (B. C. 490), where 10000 Persian men, by their allies the Plataeans, joined them. Miltiades was in favour of an attack; Aristides and some of the other generals supported him, others, on the

contrary, wished to wait for the auxiliaries from Lacedæmon. The general-in-chief (polemarch), Callimachus, however, concurred with the proposal of Miltiades, and the attack was determined upon. The chief command, which belonged to all the generals alternately, was unanimously conferred on Miltiades, who nevertheless made no use of it, but waited for the day which regularly called him to the head of the army. He then drew up his troops at the foot of a mountain in a wooded plain, to impede the action of the enemy's cavalry. The Platæans occupied the left wing; Callimachus commanded the right, and Aristides and Themistocles the centre of the army. Miltiades himself was in every part where his presence was necessary. The Greeks began the attack at full speed; the Persians defended themselves with coolness, but with obstinacy, until, after a contest of several hours, both their wings gave way. In the centre, Datis, the Persian general, with his best troops, pressed Aristides and Themistocles hard; but being attacked in the rear by the Greeks, he was compelled to forego his advantages. The rout was now general. Those who escaped the sword were obliged to flee to the waves; of these many fell into the hands of the Greeks. The Persians lost 400 men, the Athenians 192. Miltiades was himself wounded. Glorious as this victory was, it would have been fatal to Athens, had it not been for the activity of Miltiades. Datis determined to fall upon Athens in his retreat, and his fleet had already passed Cape Sunium, when Miltiades, receiving information of it, immediately put his troops in motion, and arrived under the walls of the city in time to compel the enemy to return to the coast of Asia. Miltiades was then highly honoured, but was soon both envied and persecuted. His enemies represented that he might easily be tempted to possess himself of absolute power. An unsuccessful enterprise, of which he was the projector, facilitated their success. He had desired that a fleet of seventy ships should be placed at his disposal, and promised, by means of it, to put the Athenians in possession of great wealth and advantages. His design was probably to plunder some of the Persian cities on the coasts, and to punish those islands of the Ægean sea which had taken part with the Persians; but he failed in his attack on Paros, and was compelled to refund the expenses of the expedition, and died of his wounds in prison.

MILTON, JOHN, the most eminent of English poets, was descended from an ancient family, formerly proprietors of Milton, near Thame, in Oxfordshire. His grandfather who was under-ranger of a forest of Shotover, being a zealous Roman Catholic, disinherited his son, the father of Milton, for coming a Protestant, on which account he was obliged to quit his studies at Oxford, and settle in London as a scrivener. This gentleman, who was a good classical scholar, and remarkable for his skill in music, had two sons and a daughter: John, the eldest, Christopher, who became a judge in the court of common pleas, and Anne, who married Edward Phillips, secondary at the crown office. John Milton was born at his father's house in Bread-street, December 9, 1608. He received his early education in a learned minister of the name of Young, and was afterwards placed at St Paul's school, whence he was removed in his seventeenth year to Christ's college, Cambridge, where he graduated M.A. and distinguished himself by the purity and elegance of his Latin versification. The original purpose of Milton was to enter the church; but his dislike to subscription and to oaths, which, in his opinion, required an accommodation of conscience, prevented the fulfilment of this intention. On leaving college, therefore, he repaired to his father's

house, who, having retired from business, had taken a residence at Horton, in Buckinghamshire. Here he passed five years in a study of the best Greek and Roman authors, and in the composition of some of his finest miscellaneous poems, including his *Allegro* and *Penseroso*, *Comus* and *Lycidas*. That his learning and talents had by this time attracted considerable attention, is proved by the production of *Comus*, at the solicitation of the Bridgewater family, which was performed at Ludlow castle, in 1634, by some of its youthful members; as also by his *Arcades*, part of an entertainment, performed before the countess-dowager of Derby, in the same manner, at Harefield. In 1638, having obtained his father's consent to travel, he visited Paris, where he was introduced to Grotius, and thence proceeded successively to Florence, Rome, and Naples, in which latter capital he was kindly entertained by Manso, marquis of Villa, the patron of Tasso. His general reception in Italy was also highly complimentary, although he would not disguise his religious opinions. After remaining abroad for fifteen months, he returned to England, giving up his intention of visiting Sicily and Greece, in consequence of accounts of the state of affairs in his own country. "I esteemed it dishonourable," he writes, "for me to be lingering abroad, even for the improvement of my mind, while my fellow-citizens were contending for their liberty at home." He settled in the metropolis, and undertook the education of his two nephews, the sons of his sister, Mrs Phillips. Other parents being also induced by his high character to apply to him, he engaged a house and garden in Aldersgate-street, and opened an academy for education. However engrossed by tuition, he soon found time to mingle in the controversial struggles of the day, and published four treatises relative to church government, which produced him antagonists in bishop Hall, and archbishop Usher. A fifth production followed, entitled *Reasons of Church Government urged against Prelacy*, in which he promises to undertake something, but yet he knew not what, which "might be of use and honour to his country;" a calm anticipation of great performance, which he amply redeemed by his *Paradise Lost*. About this time, his father, who was disturbed in his residence by the king's troops, came to reside with his son John, who, in 1643, united himself in marriage with Mary, daughter of Richard Powel, Esq., a magistrate in Oxfordshire. In more than one respect, this was an unsuitable connexion; for the father of the lady being a zealous royalist, who practised the jovial hospitality of the country gentlemen of that party, the residence of her husband so disgusted the bride, that in less than a month, under the pretence of a visit, she left him, and remained for the rest of the summer with her parents. His letters and messages for her to return home being treated with neglect, Milton at length became incensed, and regarding her conduct as a desertion of the marriage contract, he sought to punish it by repudiation. To this matrimonial disagreement it is to be attributed his treatises, the *Doctrine and Discipline of Divorce*; and the *Judgment of Martin Bucer concerning Divorce*; and *Tetrachordon*, or *Exposition upon the four chief Places in Scripture which treat of Marriage*. The Presbyterian assembly of divines, then sitting at Westminster, alarmed at this reasoning, had the author called up before the house of lords, which, however, instituted no process. Convinced by his own arguments, Milton began to pay attention to a young lady—a step which alarmed the parents of his wife, who, having become obnoxious to the ruling powers, had need of the good offices of their son-in-law with his party. Thus disposed, they surprised him into an interview with Mrs Milton, whom, on

her expression of penitence, he not only received again with affection, but also took her parents and brothers, in the most generous manner, into his own house. He continued to employ his pen on public topics, and, in 1644, published his celebrated Tractate on Education. The Presbyterians, then in power, having continued the subsisting restraints upon the press, he also printed, in the same year, his Areopagitica, a Speech for the Liberty of Unlicensed Printing,—a spirited and energetic defence of a free press. In 1645, he published his juvenile poems, in Latin and English, including, for the first time, the *Allegro* and *Penseroso*. Milton's notion of the origin and end of government carried him to a full approbation of the trial and execution of Charles I., which he sought to justify in a tract, entitled the *Tenure of Kings and Magistrates*. Even in the title-page he asserts the right to put "a tyrant or wicked king" to death on due conviction, "by any who possess the power," should the ordinary magistrates have no means to do so. He further employed his pen in the same cause by the composition of a History of England, of which, however, he had only completed six books, when he was interrupted, by being nominated Latin secretary to the new council of state. He had scarcely accepted the appointment, when he was requested to answer the famous book, attributed to Charles I., entitled *Icon Basilike*. This task he accomplished in a work, which he called *Iconoclastes*, or the Image-breaker, which is considered by many writers as one of the ablest of his political tracts. His celebrated controversy with Salmasius soon after followed, which originated in the latter's defence of Charles I., and of monarchs, under the title of *Defensio Regis*, written at the instigation of the exiled Charles II. Milton entitles his reply, *Defensio pro Populo Anglicano*. It was published in 1651, and though tainted with party virulence and the discreditable personal acrimony which distinguished the controversies of the times, exhibits a strain of fervid eloquence, which completely overwhelmed the great but inadequate powers of his opponent. He acquired by this production a high reputation both at home and abroad, and was visited on the occasion by all the foreign ambassadors then in London; he also received from the government a present of £1000. He, however, bought this triumph dear, as an affection of the eyes, previously produced by intense study, terminated, as his physicians predicted, by an irremediable *gutta serena*, owing to his exertions on this occasion. It is unnecessary to observe how nobly and feelingly he has alluded to his blindness in more than one passage of his exalted poetry. His loss of sight did not, however, impede his facility of composition, and in 1652 he wrote a second Defence of the People of England, against an attack by Du Moulin, under the name of More, similar to that of Salmasius. In 1652, Milton lost his wife, who had born him three daughters, and soon after married another, who died in childbed the same year. To divert his grief for this loss, he resumed his History of England, and also made some progress in a Latin dictionary, and still composed much of the Latin correspondence of his office. On the death of Cromwell, he employed his pen with great alacrity to check the increasing feeling in favour of the restoration. On the restoration, Milton took refuge for some time in the house of a friend. His Defences of the People and Iconoclastes were called in, and ordered to be burned; but the author was reported to have absconded; and in the act of indemnity which followed, his name formed no exception. He appears, however, to have been some time in the custody of the serjeant-at-arms, but was at length discharged, as it is said, owing to the friendly interposition of

Sir William Davenant, who had received similar kind offices from Milton, when engaged by his adherence to the royal cause. In several circumstances, and under the disadvantages of poverty, he now removed to a private residence, and to a house in the city, and, his ordinary morning hours, was led, in his fifty-fourth year, to the loss of a third wife, Elizabeth Minshull. He now resumed the poetical studies which he had for some time laid aside, and, left in response to invitations upon the lofty ideas that filled his mind, produced his immortal *Paradise Lost*, which was finished in 1667, and first printed in 1667, in a small duodecimo. The success which he obtained for it was five pounds, with a contingency of fifteen dependent upon the sale of no more impressions, the copyright, however, remaining his own. *Paradise Lost* long struggled with its taste and political prejudices, before it took a secure place among the few productions of the human mind which continually rise in estimation, and are not limited by time or place. In 1672 appeared the *Paradise Regained*, which he is said to have preferred to its predecessor. With *Paradise Regained* appeared the tragedy of *Samson Agonistes*, composed upon the ancient model, and abounding in most descriptive beauties, but exhibiting little poetic dramatic talent, either in the development of plot or delineation of character, and never intended for the stage. In 1672, he composed a species of hymn, after the manner of Ramus; and the following year again entered the field of polemics, with a *Treatise of True Religion, Heresy, Schism, Transubstantiation, the best Means of Preventing the Growth of Popery*. A publication of his familiar epistles, in Latin, and of some academical exercises, occupied the last year of his life, which repeated fits of the gout were now rapidly bringing to a close. He died tranquilly under an exhaustion of the vital powers on November, 1674, when he had nearly completed his sixtieth year. His remains, with a numerous and splendid attendance, were interred in the church of Cripplegate, where the elder Samuel Vassall has erected a monument to his memory. Dr. Thomas, bishop of Rochester, as dean of Westminster, desired him a monument in the abbey, where, however, in 1737, one was erected to his memory by another Benson.

Milton was distinguished in his youth for person and beauty; his habits of life were those of a scholar and philosopher, being strictly sober and temperate. His chief relaxations consisted of music and conversation. His temper was serene and cheerful, and although warm and acrimonious in controversy, he appears to have indulged no private animosities, and to have been civil and urbane in the ordinary intercourse of society. Of the sublimity of his genius and the depth and variety of the learning of Milton there can be no difference of opinion, and it is superfluous to the first, his own countrymen, at least, scarcely admit that he has ever been equaled. Had he never even written *Paradise Lost*, his *Allegro*, *Penseroso*, and *Comus*, must have stamped him a poet in the most elevated sense of the word. In his prose writings his spirit and vigor are striking, and his style, although sometimes harsh and uncouth, is pregnant with energy and imagination. Moving in the ranks of party himself, no man has been more rancorously attacked than Milton, by political animosity; but after all its deductions it has been able to make, as a nation's genius he will ever rank among the chief glories of the English nation.

The best editions of the poetical works of Milton are those of Newton, Hawkes, and Todd in 1796, 8vo, with his life in one volume. His prose works

have been published by Symmonds, with an account of his life (7 vols., 8vo.) Thomas Warton published an edition of the minor poems, with a valuable commentary. In 1825, an unpublished work on the Christian Doctrine was discovered among some state papers, and published in the original Latin, and in an English translation, by Mr Sumner, a royal chaplain. This publication led to a new discussion, not only of the theological tenets, but of the general merits of Milton, in the periodical works of the time. The most celebrated treatises thus produced were the one in the Edinburgh Review by Mr Macaulay, and the one in the Christian Examiner (Boston, America) by the Rev. Dr Channing.

**MIMES** (μῦθος, imitation). The Greeks gave this name to short plays, or theatrical exhibitions, the object of which was to represent some action of a simple nature. They consisted merely of detached scenes, generally of a comic character, and often of a dialogue composed extemporaneously; they were commonly exhibited at feasts, but appear to have also been occasionally represented on the stage. The mimes of Sophron of Syracuse were a kind of comic delineations of real life in rhythmical Doric prose, which Theocritus imitated in his Idyls. Among the Romans, the mimes were, at first, irregular comedies, calculated to amuse the people by their broad humour; they afterwards assumed a more artificial form. The actors who performed them were also called *mimes*, and differed from the *pantomimes* (q. v.), who represented every thing by action. Decimus Laberius (50 B. C.) and Publius Syrus, his contemporary, were the principal mimographers, or authors of mimes. See Ziegler, *De Mimis Romanorum*, Gottingen, 1789.

**MIMIC**. See *Pantomime*.

**MIMNERMUS**; the name of an ancient Greek poet and musician, known, according to Athenæus, as the inventor of the pentameter measure in versification. Strabo assigns Colophon as the city of his birth, which took place about six centuries before the commencement of the Christian era. Horace speaks in the highest terms of his love elegies, which he prefers to the writings of Callimachus, while Propertius places him before Homer in the expression of the softer passions. Both he and his mistress, Nanno, are said to have been musicians by profession, and to have been celebrated for their performance on the flute, especially, according to Plutarch, in a particular air, called *Kradias*, used at the Athenian sacrifices. A few fragments only of his lyric poems have come down to posterity, as preserved by Stobæus; they are, however, of a character which leads us to suppose that the high reputation he enjoyed was not unmerited. Nothing is known of the time or manner of his death. See Schonemann's *De Vita et Carm. Mimnermi*, Gottingen, 1824.

**MIMOSA**. See *Sensitive Plant*.

**MINA** (μῆνα), among the Greeks; a weight of a hundred drachmæ; also a piece of money valued at a hundred drachmæ; sixty of them were equivalent to a talent.

**MINARET**; a round tower, generally surrounded with balconies, and erected near the mosques in Mohammedan countries, from which the *muezzin* summons the people to prayer, and announces the hours, bells, as is well known, not being in use among the Mohammedans. (See *Mosque*.)

**MINAS GERAES**; a province of the central part of Brazil, so called from the richness and variety of its mines. It is between 14° and 23° south latitude and 45° 20' and 52° 30' west longitude, to the south of the provinces of Pernambuco and Bahia. It is in general mountainous, with an agreeable and healthy

climate, and a fertile soil, yielding a great variety of fruits, aromatic plants, &c. Its mineral productions are gold, iron, lead, quicksilver, arsenic, bismuth, antimony, diamonds, and other precious stones, salt, sulphur, &c. It contains a population of 514,500 inhabitants, of whom 131,000 are whites, 150,000 free mulattoes, 51,544 free blacks, and 182,000 slaves. Chief town, Villa-Rica.

**MINCIO** (Mincius); a considerable river of Italy, which flows from lake Garda, and, after forming the lake and marshes that surround Mantua, falls into the Po eight miles below the city. Its banks are remarkably fertile, and are celebrated by Virgil, who was a native of this country, for the beauty of their scenery.

**MINDANAO**, or **MAGINDANAO**; one of the Philippine islands, and next to Luzon in point of size, of a triangular form, about 300 miles long, and 105 broad, with many deep bays; discovered by the Spaniards who accompanied Magellan, in 1521. It lies south-east of Manila, at the distance of 600 miles. All the country, except upon the sea-coast, is mountainous, yet it abounds in rice, and produces very nourishing roots. There are infinite numbers of the palm-trees, called *sago*. (q. v.) This island likewise produces all sorts of fruits that are to be found in other islands of this archipelago, but the cinnamon-tree is peculiar to Mindanao, and grows on the mountains without cultivation. In the sea between this island and that of Xolo, very large pearls are taken. Lon. 122° to 126° 27' E.; lat. 5° 40' to 9° 55' N. The population is about 1,000,000.—*Mindanao*, the principal town and the residence of the sultan, is on the Pelangy, about six miles from its mouth; lon. 124° 40' E.; lat. 7° 9' N. The town properly called Mindanao contains only about twenty houses, but Selangan, opposite to it, makes with it but one town. See *Philippines*.

**MINDEN**; a town of Prussia, in the province of Westphalia, government of Minden, on the left bank of the Weser; lat. 52° 17' N.; lon. 8° 53' E.; population, 8960. It is one of the oldest towns in Germany, and was formerly the see of a bishopric, secularized in 1648. Its fortifications have been repaired since 1814; the stone bridge over the Weser is 600 feet long by twenty-four wide. It lies partly on a plain and partly on a mountainous ridge, in which is a singular opening, called *Porta Westphalica*, through which the Weser flows. Minden was twice captured by the French in the seven years' war (1757 and 1759), and a third time in 1814. The government of Minden formed a part of the kingdom of Westphalia in 1807, and, in 1810, of the French department of the Upper Ems. In 1814, it was restored to Prussia.

**MINDORO**. See *Philippines*.

**MINE**, in military language; a subterranean passage dug under the wall or rampart of a fortification, or under any building or other object, for the purpose of blowing it up by gunpowder. The gunpowder is in a box, and the place where the powder is lodged is called the *chamber* (in French, *fourneau*). The passage leading to the powder is termed the *gallery*; the line drawn from the centre of the chamber perpendicularly to the nearest surface of the ground is called the *line of least resistance*. It has been found, by experience, that the figure produced by the explosion is a paraboloid, and that the centre of the powder, or charge, occupies the *focus*. The pit, or hole made by springing the mine, is called the *excavation*. The fire is communicated to the mines by a pipe, or hose, made of coarse cloth, whose diameter is about an inch and a half, called a *saucisson* (for the filling of which near half a pound of powder is allowed to every foot), extending from the chamber to the entrance of the gallery, to the end of which is fixed a match, that

the miner who sets fire to it may have time to retire before it reaches the chamber. The saucisson is laid in a small trough, called an *auger*, to prevent it from contracting any dampness. This is made of boards. The mines of a fortress are called *countermines*, the gallery of which runs under the covered way along the outer margin of the fosse. From this, ramifications, called *rameras*, extend under the glacis, from which again little passages are made on both sides, to afford means for listening and finding out the enemy's subterraneous movements. If the powder is lodged so deep under the ground that its explosion is not perceptible on the surface, it yet shakes the ground all round, and destroys the hostile mines in the neighbourhood. This is the *globe de compression*, invented by Belidor. The mining-war has many peculiarities. The miners are often armed with short weapons, as pistols and cutlasses, in order to defend themselves if they meet a hostile mine. The mines are often so long that it is necessary to convey fresh air by artificial means to the most advanced workmen, and those who faint are passed back from one to the other; the same is done with the dead, if a combat ensues below. Frequently, also, balls, made of all kinds of substances which produce an offensive smoke, are lighted, in order to stop the enemy, provided the mine permits the party who leave the ball an easy retreat. Sometimes mines are dug in the field, with a view of blowing up such of the enemy as can be allured to the spot. In such case, a small body of men must sometimes be placed there, in order to induce the enemy to attack them; these are sacrificed with the enemy.

**MINE:** an excavation for obtaining minerals from the bowels of the earth. The minerals are found in veins, strata, lumps, and contain gold, silver, platina, quicksilver, lead, iron, copper, tin, zinc, calamine, bismuth, cobalt, arsenic, manganese, antimony, molybdena, and other metallic substances; also sulphur, brown-coal, pit-coal, bitumen, alum, and all combinations of sulphuric acid with metallic bases. The mines are generally denominated from the substances obtained from them; for instance, gold, silver, iron, lead, coal, alum, salt-mines, &c. We must distinguish, I. the mines in primitive mountains; II. those in fests mountains; III. those in alluvions.

I. Of the first sort the most important are the following:—

1. The mines in the Cordilleras, in Spanish America. There are few regions so remarkable for their richness in minerals as this chain of mountains. The most important mines are the silver mines; yet there are also several gold, quicksilver, copper, and lead mines. In Chile, especially in the province of Coquimbo, are several silver and some important copper mines. The richness of the silver mines of Potosi (Buenos Ayres) may be judged of from the fact that over 1300 millions of dollars have been coined there since the year 1545; but the ores are now poor. Copper, lead, and tin are also found in Buenos Ayres, the latter, however, in beds of sand or clay, from which it is obtained by washing. On the opposite side of the chain, in a low plain, are the silver mines of Guantajaya, famous for the large lumps of solid silver, which they formerly furnished, and of which one weighed eight hundred pounds. In Peru, there are forty districts particularly famous for their gold and silver mines. Gold is found especially in the provinces of Guailas and Patas, and silver in the districts of Guantajaya, Pasco, and Chota. The mines of Pasco, which twenty-five years ago produced more than two millions of dollars yearly, had been, like most of those of South America, very negligently managed, till, in 1816, miners from Cornwall began to work them by means of steam-engines. The mines of the province

of Chota now furnish about 42,000 pounds of silver every year. The quicksilver mine of Camavelica, in Peru, is the only one of the kind in the new world. In the province of Guantajaya, salt mines also are found. North of the range of Chota, the Cordilleras are not so rich a zone. In New Grenada there are several silver mines. Aroa, in Caraccas, a copper mine exists, which yields 1400—1600 cwt. of metal yearly, and a ton of rock-salt and pit-coal are found. Although Peru contains various metals, very little except iron has been obtained from that country. Almost all the mines are situated in the Cordilleras, and consist of 3000 pits, which comprise 4—5000 hands, or men, and may be divided into eight large districts, beginning from the south:—a. the district of Uman, on the southern boundary of Mexico, which, besides the silver mines, contains the only gold mine of the state; b. the district of Tanco, fifty to seventy miles south-west from the city of Mexico; c. the district of Biscania, about fifty miles north-east from the capital, contains the mines of Pacheco, Rami de Mar, Moran, all very rich; d. the district of Tanco contains, besides many silver mines, beds of antimony and arsenic; e. the district of Guanajuato contains the richest mines of Mexico, and among others those of Guanajuato, Catolica, Zacatecas, and Sombereite. This district produces half of all the silver of Mexico. In the neighbourhood of the district copper mines are also worked, yielding about 4000 cwt. There are also mines of tin and quicksilver. f. The district of New Galicia, where the mines of Bolanos are. g. The district of Durango and Sonora. h. The district of Chihuahua. Among the mines contained in these districts, there are several others in Mexico. The working of all the mines of Spanish America has been very imperfectly carried on until the present times. Some years ago even joint-stock companies were established in England and on the Rhine, for the purpose of conducting them better. Many of the companies suffered, however. The produce of silver in Spanish America at the beginning of the present century, according to A. von Humboldt, was 3,259,153 marcs, about 1,250,000 lbs. troy, of the nominal value of about £1,500,000 dollars. Of this sum, Mexico yielded 2,200,000 marcs; Peru, 573,958 marcs; Buenos Ayres, 400,000 marcs, and Chile 25,957 marcs. Gold is principally obtained in America by washing. The principal gold-washings are on the western side of the Cordilleras; in New Grenada, from the province of the bacca to the isthmus of Panama; in Chile, on the shores of the gulf of California; or on the eastern side in the upper valleys of the Amazon. The washings of New Grenada also furnish platinum.

2. The mines of Hungary, including those of Transylvania, and of the Banat of Temeswar, compose four great districts:—a. the north-western, which includes the mines of Schannau, Komorn, Konigsberg, Neusohl, Schornstein, Bethove, Bannau, &c., which chiefly furnish gold, silver, copper, &c. &c.; b. the north-eastern, containing the mines of Nagybanja, Kapnick, Felsobanja, Winkler, Soposbanja and Olapos, which all yield gold, besides the mines of Marmaroeh, which furnish great quantities of iron; c. the eastern district, in which the mines of Nagyag, Korosbanja, Varsanau, Boitau, Cwaratesch, Fatabay, Almas, Fertau, Beschum, and Stonichia deserve notice, which all furnish gold and copper; d. the south-eastern district, or the mines of the Banat of Temeswar, yields silver and copper in Osvenna, Munkacs, Szekes and Dognaczka, while in Dombau and Ruckersberg, iron, quicksilver, and cobalt are obtained.

1. Hungary contains also mines of pit-coal and rock-salt, the latter especially on the banks of the Danube, the Marmarosch and the Nera. The whole produce of Hungary amounts to 5200 marcs (3250 lbs. troy) of gold, 85,000 marcs (53,125 lbs. troy) of silver, 36,000—40,000 cwt. of copper, 6—8000 cwt. of lead, and about 60,000 cwt. of iron.

3. The mines of the Altai mountains (q. v.) are very important; they constitute the districts of Kolyan, Zmeof, Tcherepanofsky, Smenofsky, Nikolaisky, Philipofsky, &c., with a yearly produce of upwards of 3000 marcs (1875 lbs. troy) of gold, (in later times more), 60,000 marcs (37,500 lbs. troy) of silver, and a considerable quantity of copper, iron, and lead.

4. The mines of the Ural (q. v.) are dispersed, at different distances, around Ekaterinburg; those of Ourinsky produce about 20,000, and those of Gounechefskey 40,000 cwt. of copper yearly. The iron, which is obtained in the regions of Balgodat and Ceskanar, amounts to more than 1,000,000 cwt. yearly. Near Beresov, 500 marcs (312 lbs. troy) of gold were formerly produced; but the quantity is now far more considerable.

5. The mines of the Vosges and the Schwarzwald (Black-forest). In the former, nothing but iron is found; in the latter, silver, at Badenweiler, Hochberg and Wolfach, amounting to 1800 marcs (1125 lbs. troy); at the first of these places, moreover, 800 cwt. of lead are obtained yearly, and at Wittichen, cobalt; besides iron in different places.

6. The mines of the Harz: a. the silver, lead, and copper mines, &c., of the Upper Harz, in the environs of the mining towns of Clausthal, Zellerfeld, Lautenthal, Wildemann, Grund and Andreasberg; b. gold, silver, and copper mines, near Goslar; c. copper mines in the neighbourhood of Lautenberg; d. iron mines at Lautenberg, Walkenried, Elbingeroda and Blankenburg; e. silver, lead, and iron mines, in the vicinity of Magdesprung: annual produce, about 10 marcs (6½ lbs., troy) of gold, 30,000 marcs (18,750 lbs. troy) of silver, 2000 cwt. of copper, 50,000 cwt. of lead, 30,000 cwt. of litharge, 200,000 cwt. of iron.

7. Mines in the eastern part of Germany: a. in the Saxon Erzgebirge, at the towns of Freiberg, Marienberg, Annaberg, Ehrenfriedersdorf, Johanngeorgenstadt, Schneeberg, annual yielding of 52,000 marcs (32,500 lbs. troy) of silver; at Altenberg, Geyer, Ehrenfriedersdorf, Zinnwald, annually 3—4000 cwt. of tin; at Schneeberg, annually 8000 cwt. of cobalt, 600 cwt. of copper, 80,000 of iron; b. in Bohemia: silver, at Joachimsthal, Mies, Prábram, &c., 13,800 marcs (8625 lbs. troy); tin, at Schakenwald, &c., 2000 cwt.; cobalt, 4000 cwt.; lead, 1800 cwt.; iron, 190,000 cwt.; c. in the Fichtelgebirge, principally iron, annually about 50,000 cwt.; d. in Moravia, at Iglau, &c., 4—5000 marcs (2500—3125 lbs. troy) of silver; e. in the Riesengebirge, at Jauer, Kupferberg, Reichenstein, 330 cwt. of copper, 560 cwt. of smalt; 1900 cwt. of arsenic, 1200 cwt. of sulphur, 20,000 cwt. of vitriol.

8. Mines in the middle and north-western parts of France. Those at Villefort, in the department of the Lot, yield 2000 cwt. of lead, and 1600 marcs (1000 lbs. troy) of silver; at Poullaouen and Huelgoat, in Bretagne, 10,000 cwt. of lead, 2000 marcs (1250 lbs. troy) of silver.

9. Mines of Great Britain: iron, in Wales, 50,000 tons; Shropshire and Staffordshire, 180,000 tons; Yorkshire and Derbyshire, 50,000 tons; Scotland, 20,000 tons; total, 400,000 tons; copper, 10—11,000 tons; lead in Northumberland, 12,000 tons; North Wales and Shropshire, 8000; Yorkshire, 4500 tons; Derbyshire, 4000 tons; Scotland, Devon, Cornwall, South Wales, 3000 tons; total,

31,500 tons: tin, in Cornwall and Devon, 2800—5000 tons.

10. Mines of Scandinavia: Norway produces 1600 marcs (1000 lbs. troy) of silver; at Kongsberg, in 1768, 40,000 marcs (25,000 lbs. troy), 7200 cwt. of copper, 140,000 cwt. of iron, 4000 cwt. of smalt, 10,000 cwt. of alum; Sweden, 2—3000 marcs (1250—1875 lbs. troy) of silver, 18—20,000 cwt. of copper, 1,500,000 cwt. of iron.

11. Mines of the Pyrenees: these are insignificant, and iron only need be mentioned.

12. Mines of the Alps: they are not, by any means, proportioned to the immense masses of those mountains; the silver mines of Allemont, in Dauphine, annually produce 2000 marcs (1250 lbs. troy); the iron mines of Allevard, in the department of the Isère, the lead and silver mines of Pesey, in Savoy, formerly produced 4000 cwt. of lead, and 2500 marcs (1562 lbs. troy) of silver annually; the iron mines of Cognin and Traverselle, in Piedmont, annually yield upwards of 200,000 cwt. of iron; the copper mines at Falkenstein and Schwatz, in the Tyrol, formerly were of importance; the gold mines, at Gastein and Muerwinkel, in Saltsburg, annually yield 118 marcs (74 lbs. troy) of gold; the iron mines in Saltsburg and the Tyrol, annually produce 60—70,000 cwt.; the iron mines, in Stiria, 450,000 cwt.; those in Carinthia, 260,000 cwt.; and those in Carniola, 100,000 cwt.; the copper mines at Schlading in Stiria, at Kirschdorf in Carinthia, at Agordo in the territory of Venice, and at Zamabor in Croatia, furnish copper containing silver; the zinc mines at Raibell in Carinthia, annually produce 3400 cwt.; the lead mines at Villach and Bleiberg, &c., about 50,000 cwt.; the quicksilver mines at Idria, about 1500 cwt.; the rock-salt mines at Hallein, Berchtesgaden, Aussee, Ischel, Hallstadt, &c., upwards of 3,000,000 cwt. of salt.

13. Mines of the countries bordering on the Rhine, and of the Ardennes: copper is obtained from the mines of Rheinbreitenbach and Dillenburg, about 1200 cwt. yearly; lead and silver, from the mines of Holsapfel, Pfingstweise, Læwenburg, Augstbach, Ehrenthal; of the former, 12,000 cwt.; of the latter, 3500 marcs (2187 lbs. troy); iron of an excellent quality, and in great quantity, is procured in the Stahlberg, in the environs of the town of Siegen, on the banks of the Lahn and Sayn, at Hohenkirchen in Hesse, on the Hunsdruck, in the Eifel, in the territories of Luxembourg, &c.; calamine, in the vicinity of Limburg, in the Netherlands, 14—15,000 cwt. yearly; in the neighbourhood of Aix-la-Chapelle, 30—40,000 cwt.; in the county of Mark, 2600 cwt.; lead, at Vedrin, not far from Namur, 4000 cwt., together with 700 marcs (437 lbs. troy) of silver.

14. Mines of various countries: the environs of Nertschinskoi in Siberia, are very rich in useful minerals, and yield 30—35,000 marcs (18,750—21,750 lbs. troy) of silver. The mineral wealth of Spain and Portugal is now almost exhausted; the quicksilver mines of Almaden formerly furnished 20,000 cwt.; the lead mines only are still productive, yielding annually more than 90,000 cwt. There are copper mines in Japan, China, Persia, Arabia, in Tartary, in the islands of the Indian Sea, in Barbary, Morocco, Abyssinia, &c.; tin is produced in China, Pegu, the peninsula Malacca, Sumatra, Banca, &c., in the latter country alone, 70,000 cwt.: zinc is said to be abundant in India; quicksilver, in China and Japan; Brasil furnishes 28,000 marcs (17,500 lbs. troy) of gold yearly, which is more than is obtained from any other country; Africa at least 7000 marcs (4375 lbs. troy), and Southern Asia at least 2000 marcs (1250 lbs. troy) yearly. The island of Elba contains a great deal of iron.

11. The mines in Flots mountains are highly important, above all, the coal mines—the principal wealth of Britain—this country alone furnishing 400,000,000 cwt.; France 20,000,000; the Netherlands and the countries along the Rhine, 62,000,000; Silesia, 6,000,000; Saxony, 1,200,000; Austria, 680,000; Bavaria, 320,000; Hanover, with the rest of Germany, 6,000,000. The greater part of the iron that is procured in Britain, is from the coal-mountains. The same is the case in other countries, for instance in Silesia. The lead mines in the vicinity of Aix-la-Chapelle, which annually furnish 14—16,000 cwt. of lead, and upwards of 20,000 cwt. of lead ore, called *alquifou*, used for glazing earthen ware, are in Flots mountains; also the copper mines in the territory of Mansfeld, at Frankenberg, Bieber and Riegelsdorf in Hesse, the former yielding 10,000 cwt. of copper and 8000 marcs (5000 lbs. troy) of silver; the important iron mines on the Stahlberg, in the Hessian seignory of Schmalkalden; the lead mines at Tarnowitz, in Upper Silesia, annually yielding 5300 cwt. of lead and 1500 marcs (937 lbs. troy) of silver; the calamine and zinc mines in Upper Silesia and Poland, which annually afford 80,000 cwt. of calamine and 25,000 cwt. of zinc; the zinc mines of Britain and other countries already mentioned; the rock-salt mines in the southern part of Germany, in Cheshire, at Vic in France, at Wieliczka and Bochnia, the latter affording almost 2,000,000 cwt.

111. Of no less importance is the mineral wealth of the alluvial regions. Platina, the greater part of gold, a considerable quantity of tin and iron, also diamonds and most of the other precious stones, are concealed in sand, clay, &c., and obtained by washing. (q. v.)

*Mining.* The science of mining includes the scientific knowledge requisite for opening and working mines, as well as for preparing ores for use. It requires a knowledge of mineralogy and geology (q. v.), and of the different processes requisite in mine working, for searching after useful minerals, bringing them to the surface, mechanically and chemically separating them, and removing all difficulties that occur in the course of the work, the sinking of shafts, propping up the superincumbent earth, so as to give security to the miners, &c. This security is obtained partly by the form of the pits, by propping with stones, by suffering pillars of stone to remain standing, by supports of timber or masonry. Mining also includes the building of machinery, the preparation of the ore for smelting, or the mechanical separation of the useless minerals from the useful, as well as of the different kinds of the latter from each other. The preparation of the ore consists, in the first place, in breaking asunder the larger pieces, and then purifying them, by means of water, from the earth which adheres to them; in the separation of the coarser substances from the finer, by means of a sieve, that moves up and down in water; in the breaking of the ore in stamping-mills, which consist either of hammers or iron cylinders, driven up and down, and in the separation of the finely interspersed metal from the stone or earth, with which it is surrounded, by washing the broken ore in troughs or on inclined tables crossed by a current of water; the heavier ore remains, while the lighter earthy and stony substances are carried away by the water. Mining also includes the final purification of the ore, by means of acids, by amalgamation, by fusion, &c.

*Mining Academies.* In Germany, where the science of mining had its origin, academies exist, in which young men are instructed in the science of mining, and educated as superintendents of mines, founderies, or salt-works. These institutions have

been imitated in other countries. Such academies exist at Freiberg in Saxony, at Schönnau in Hungary, at Petersburg, at Paris, at Lyons, &c.

**MINERAL CAUTCHOUC.** See *Caoutchouc*.

**MINERALOGY, or THE NATURAL HISTORY OF THE MINERAL KINGDOM** considered as a pure science, is of very great use. The observations made at first related only to the usefulness of minerals to the purposes of man; as it was not before the lapse of many ages became to be investigated on account of the great variety and the beautiful arrangements of which they are susceptible. The *opere et monitione* of Aristotle evince no valuable observation as to part of that philosopher concerning minerals, as are chiefly mentioned by him because he knew the former to be derived from the earth, and the latter from water. The allusion to mineral substances found in the writings of Theophrastus, Dioscorides, and Galen, are of more use to an antiquarian and philologist than to the mineralogian. No attempt to classify these bodies was made previous to the introduction of science in Europe by the Arabians; and to Avicenna being the merit of the first arrangement. He divided minerals into stones, metals, sulphureous, and salts—a division which was generally adopted by the chemists of those times, though opposed by naturalists, who confined their investigations to characters derived from the external forms of minerals and their supposed medicinal virtues, but were out deriving from them any just ground of classification. According to one or the other of two vicious methods was the science of minerals treated, down to the sixteenth century to consider either implicitly adopting the ideas of the alchemists, or announcing themselves as little better than empirical collectors of curiosities.

Agricola (who was born in 1490, and died in 1555) directed his views to the mining then in vogue, though he inclined more strongly to the side of the scholastics than to that of the chemists. All *minera* (*corpora subterranea*) are divided by him into *simplicia* or such as consist of homogeneous parts, as compounds, or such as are formed of homogeneous parts, taken in a mineralogical acceptance of the terms. The minerals belonging to the latter of these divisions are found in four different forms: 1. *terra*; 2. *succus concretus*; 3. *lapis*; 4. *metallum*. *Terra* he defines as *corpus humidum et pingue rubrum, cum ferridis asperum humum*, as *quo cum fuerit madefactum, fit lutum*. Thus earth he divides partly according to some external characters, partly after their localities, as *crassa* when the names are derived from the countries or places in which they are found:—*Succus concretus* of *terre fossile siccatum et subdurem, quod aqua calida non molliatur, sed liquecit, aut, si molliatur, pinguitudine differt a terra, vel autem ut visciat*. The fossils of this class Agricola divides into *macra* and *pinguis*. The former consists of a partly mixed with earth (*aut autem, partim metallum*) (*chrysocolle, errugine, ferrugine, natronum*, &c.) mixed both with earth and metal (*stannum, stibium, alumen, &c.*); to the latter he adds sulphur, bitumen, sandarach, and asphodelum. The stones are the third class of Agricola's *minera*. *Lapis est corpus fossile aridum et durum, quod aqua longinquo tempore non molliatur, quod calore redigit in pulverem; vel non molliatur, sed non ignis liquecit calore*. The stones are subdivided into *lapis, gemma, marmor, et crustum*. His definition of metals, being his fourth class, is *corpus naturale vel liquidum vel durum quidem, et quod liquecit calore*. He enumerates two metals in

ast class of Agricola's system comprehends mixed and compound fossils:—1. Mixtures of stones and uices (*succi*); 2. of earth and metal; 3. of stone and metal; 4. of juice, stone, and metal. To the second and third divisions he refers the various ores. A translation of Agricola's system into German was published, with considerable additions, by Lehmann, at Freyberg, in 1809.

Most of the writers on mineralogy who succeeded Agricola until the middle of the following century adopted his system, occasionally making some trifling alterations, in conformity to the slow progress of chemistry. Becher (whose *Physica Subterranea* was published in 1667) made the first important innovation upon the classification of Agricola. He considered water and earth as the remote, and vitreous, inflammable and mineral earths (*sal, sulphur, mercurius*), as the proximate constituent parts of all minerals, which he accordingly arranged under three classes; the first comprehending those stones in which the vitreous earth constitutes the principal ingredient; the second and third class containing the substances in which the two remaining earths predominate. Bromelius, who published a book entitled *Catalogus Rerum Curiosarum* (Gothenburg, 1698), referred sulphur and the bituminous substances to the same class, which he called *sulphurea* and *pinguia*. Magnus von Bromel, a Swede, who was the pupil of Boerhaave, published a system of mineralogy—*Inledning til Kunskap om Mineralier*, &c. (Stockholm, 1730), in which he not only availed himself of all the improvements made by his predecessors, but also proposed a new chemical division of stony substances into such as are refractory (*apyri*), or calcinable, or vitrescible in the fire, to which were added the figured stones (*figurati*).

After Von Bromel, the great Swedish reformer in natural history appeared, whose admirable views respecting the philosophy of the natural sciences have contributed more to the perfection of our science than the labours of all who preceded him; and yet Linnæus appears to have possessed but very little knowledge of minerals, but the complete success with which he applied the method of natural history to the vegetable kingdom rendered it easy for subsequent naturalists to apply his principles to the mineral kingdom. Linnæus, too, has the merit of calling the attention of naturalists to the important characters derived from the diversity of crystallization. Mineralogy, however, remained, from the time of Linnæus to that of Werner, almost exclusively in the hands of chemists, who appear to have regarded the science in no other light than as an appendage of chemistry, and who, while they degraded all regard to the natural properties of minerals, believed that chemical knowledge was alone capable of affording the basis of the classification, nomenclature and diagnosis of the mineral kingdom. To this class of the cultivators of mineralogy belonged Henkel, Pott, Wallerius, and Cronstedt.

In 1774, Werner published his work *On the external Properties of Minerals* (*Von den äussern Kennzeichen de Fossilien*)—a work of great merit and value at that juncture, as it served to call the attention of naturalists to the only correct method of arriving at a knowledge of this department of nature. The external characters of minerals had before been almost wholly neglected; in this work they were described with uncommon minuteness, though they were employed by him in his system without a just regard to their relative importance. The greatest defect, however, in the views of Werner arose from his reluctance to ascertain the properties of minerals through the aid of instruments. He scarcely availed himself of any other means than such as were derived

directly through the eye, the hand, and the tongue. Hence those characters, depending upon the value of angles and different degrees of hardness and specific gravity, and which are now acknowledged to be of the highest value in mineralogy, were turned to comparatively little account. For a knowledge of Werner's system of mineralogy, we are indebted to his translation of Cronsted's mineralogy (to which he subjoined notes), to his catalogue of the mineral collection of M. Pabst von Ohain, and to several memoirs in the *Bergmannische Journal*. In addition to these sources, several expositions of his system have been made by his pupils, the best of which is that published by professor Jameson.

The fundamental principle laid down by Werner in the classification of minerals, is their *natural affinity*, which he allows to be founded on the chemical nature of their component parts. These he distinguishes into essential and accidental component parts, of the former of which only does he take notice in his arrangement. The essential component parts are subdivided into predominant and characteristic ones, and generally the characteristic happen to be, at the same time, the predominant constituents. His classes are four, which are founded on what he calls the *fundamental constituent parts*, viz., the earthy, saline, inflammable and metallic, each class being named after that fundamental constituent part which predominates in and characterizes it. Thus he derives his classes of earths, salts, inflammables, and metals. These classes are subdivided into genera, which are founded upon the variety in the component parts of the minerals comprehended in each class, there being as many genera as there are predominating, or, at least, characteristic constituent parts discovered in their mixture. But neither Werner nor his pupils have been very strict in adhering to this rule for the formation of the genera, these, as well as the species, having more frequently been established by them upon the natural instead of the chemical properties.

Werner's system was essentially deficient in respect to unity, in consequence of the regard which he allowed to the chemical relations of minerals, and, like those which preceded his time, it was rather a mixture of chemistry and mineralogy than the representation of a pure science,—an objection which applies with scarcely undiminished force to the next great system, which was presented to the mineralogical world by Haüy at the commencement of the present century. Mineralogy, however, is under immense obligations to the abbe Haüy for his researches respecting the geometrical character of minerals. His labours, connected with crystallography, gave an entirely new aspect to the science, and communicated to its results a degree of that precision and certainty which belong to geometry. Still his want of knowledge of the principles of natural history prevented him from remedying the faults of his predecessors. His system, like that of Werner, is founded upon two sciences, and consequently wants the order, the connexion and consistency of parts which belong to the idea of a science. He defines a species in mineralogy to be "an assemblage of bodies, the integrant molecules of which are similar to each other, and have the same composition." The following outline of Haüy's system is taken from his *Traité de Minéralogie* (Paris 1822):—*Class I.* Free acids. *Class II.* Metallic substances, but destitute of a metallic appearance. This class contains eight genera, viz., lime, barytes, strontites, magnesia, alumine, potash, soda, and ammonia; and to it is subjoined an appendix, consisting of one order characterized by the presence of silice in all its compounds, and which embraces a larger number of species than the whole class to which it is appended. *Class III.* True

metallic substances. This class contains eighteen genera, characterized by the different metals. *Class IV.* Unmetallic, combustible substances.

In proceeding to notice the labours of professor Mohs, we come to an era in the history of mineralogical science. This eminent philosopher, no less distinguished as a cultivator of the mathematics than of mineralogy, published at Dresden, in 1822, his *Grundriss der Mineralogie*, a work replete with new and philosophical views of our science. His first object is to fix the exact limits of mineralogy, and to exclude from it a variety of foreign matter belonging to other sciences, which had before rendered it a heterogeneous mass of information, incapable of derivation from constant principles by any regular process of reasoning. He then proceeds to develop the science under the following heads:—1. terminology; 2. theory of the system; 3. nomenclature; 4. characteristic; 5. physiography. Under the first of these he explains those properties of minerals which manifest no change, either in the properties themselves, or in the substances which possess them during their observation or examination, and which properties alone form the object of consideration in mineralogy, viewed as a pure science. They had before been treated of under the denomination of external or physical characters, though, from the stress which had been laid upon chemical characters, the greater part of them had been but very imperfectly determined; and this part of the subject is called *terminology*, because, besides the general investigation of those properties, it embraces also the explanations of the expressions which, for the sake of precision, are used in a determinate and peculiar sense. Decomposed and imperfectly formed minerals, or those which are destitute of several of the properties peculiar to these bodies, are not regarded as suitable objects for the consideration of the science; in which respect they are treated like mutilated, defective, or monstrous plants or animals in botany and zoology. And in order to study the productions of the mineral kingdom in their purest state, Mohs takes notice of those properties which belong to minerals occurring in single individuals, separately from those which belong to several individuals of the same quality, formed in a common space, one being the support of, or at least contiguous to, the other,—of the former of which only does he make use in the determination of the species, while he pays no attention to the properties of minerals composed of individuals belonging to different species (mixed minerals), these last falling within the province of geology. This is a distinction of the highest importance and utility, in rendering all the departments of mineralogy mutually consistent, though one which had been almost wholly disregarded by all his predecessors. According to this system, the individual of the mineral kingdom, or the simple mineral, is the sole object of mineralogy, and the natural properties of the simple mineral are the only ones to which, in this science, we ought to direct our attention. It will be obvious, therefore, that all information thus derived must be of one kind, and consequently its aggregate conformable to the logical idea of a science. Mohs has particularly distinguished himself in treating of that part of terminology which relates to the regular forms of minerals. The fundamental forms, from which he derives all the occurring forms among minerals, are but four in number, viz., the scalene four-sided pyramid, the isosceles four-sided pyramid, the rhombohedron, and the hexahedron; and the geometrical constructions by which he illustrates the simple forms capable of appearing in the individuals of one and the same species, or which may produce combinations with one another, entitle him to the first

rank as a crystallographer. The natural laws or properties of compound minerals are treated of in the most precise manner, the previous neglect of which had involved the science in numerous important errors. But one of the greatest improvements under this head was the establishment of a natural scale for the degrees of hardness. This was effected by choosing a certain number of simple minerals, of which every preceding one is scratched by the which follows it, while the former does not scratch the latter; and the degrees of hardness are expressed by means of numbers prefixed to the names of the individuals of the scale. Thus

1	expresses the hardness of talc.	
2	gypsum.	
3	calcium carbonate sp.	
4	fluor spar.	
5	quartz.	
6	feldspar.	
7	quartz.	
8	topaz.	
9	corundum.	
10	diamond.	

The second general head under which mining is developed, according to Mohs, is the *theory of the system*, which contains the reasoning or philosophical part of the science. It determines the idea of the species; fixes the principle of classification, as upon the idea of the species it founds, according to this principle, the ideas of the genus, the order, and the class; and lastly, by applying all these ideas to nature, the outline of the system thus constructed is furnished with its contents, in conformity to our knowledge of the productions of nature, as obtained from immediate inspection. The idea of the genus is here, for the first time, scientifically defined and is founded upon all the series of natural groups without the introduction of any considerations foreign to natural history, which had proved the cause of the contamination that the science had before suffered from heterogeneous principles. The principle of classification consists in the resemblance of natural properties, since in every science the classification must rest upon such relations as are signs of the science. On the different degrees of resemblance are founded the higher ideas of the theory of the system. An assemblage of species connected by the highest degree of natural-historical resemblance is termed a *genus*; an assemblage of similar genera is termed an *order*; of similar orders a *class*; and the collection of these ideas conformably to the degree of their generality, and applied to the productions of the mineral kingdom, constitutes the *mineral system*. The mineral system is therefore the systematic exhibition of the natural resemblance as observed in the mineral kingdom, or of the connection established by nature among its products by means of the resemblance. For this reason it is called the *natural system*, because, in fact, it expresses nature in a very remarkable relation.

The third idea of the science, as developed by Mohs, is its nomenclature, which relates to the connexion of its unities with certain words, through which the ideas and representations may be expressed as to be conveniently applied in writing and speaking. Nothing is better calculated to furnish us with an idea of the situation in which mining lay before been placed, than the consideration of its former nomenclature, and of the method employed in giving new names. Those were regarded as the best which had no signification, as is obvious from the frequency with which designations were adapted from colours, persons, localities, and other accident circumstances; and, as respects those names which referred to the connexion of the different minerals in regard to their resemblance, these were still more objectionable, since the connexion expressed by the

was either entirely incorrect, or without reference to the system in which the names were applied. The nomenclature therefore required to be wholly remodelled, none deserving of the name having been existed,—the reason of which appears to have been that mineralogy had not before been treated as a science, but as an aggregate of various kinds of information, a sort of mixture which would admit every kind of knowledge to be introduced, and in which nothing could be placed wrong, because in such a disposition there could be no order. The order is the highest idea expressed in the nomenclature of Mohs, and in the selection of the names of the orders he has invented but two which are entirely new, having employed as many designations from ancient mineralogy as would answer the purpose. The names receive their signification in agreement with the ideas of the orders; thus *pyrites* embraces the minerals hitherto called by that name. A mineral which may with propriety bear the name of a *metal* must really be a metal, or it must present the properties peculiar to metals. *Mica* signifies a mineral which may be cleaved with facility into thin, shining laminae; the order *mica* therefore contains only such species as present cleavage in a high degree of perfection. The name of the genus is a compound name, formed by connecting another word with the name of the order. Thus we have *lead glance*, *augite spar*, *iron pyrites*. The generic name also refers to the properties of the genus, and expresses, as much as possible, some striking feature of its resemblance with other bodies. Such is the name *garnet-blende*. The genus designated by this name belongs to the order *blende*; the individuals which it contains very often look like garnet. The denomination of the species is produced by the nearer restriction of the generic name by an adjective. The adjective with which the species is designated within its genus is taken from its natural properties, and in general refers to one of those properties of the species which is most useful in distinguishing it from other species of the same genus; hence the systems of crystallization and the relation of the cleavage are the most frequently employed,—examples of which are hexahedral, prismatic, rhombohedral, iron pyrites; rhombohedral, octahedral, dodecahedral, prismatic, iron ore, &c.

The great advantage of the systematic nomenclature is, that the names produce an image of the objects to which they refer, which the trivial nomenclature can never do; for example, if we hear the name *peritomous titanium ore*, and have only an idea of the order ore, this at once will produce a general image of the species, which will be still more restricted if we have some idea of the genus titanium ore; but on the other hand, if we hear the name *rutile*, and do not know the species itself to which it belongs, we never can imagine anything like a representation of the object, though, for the rest, our knowledge of mineralogy may be very extensive. The terminology, the theory of the system, and the nomenclature, form the constituents of theoretical mineralogy. Practice, or the application of it to nature, requires the characteristic, the object of which is, to furnish us with the peculiar terms or marks, by which we are able to distinguish objects from each other, so far as they are comprehended in the ideas established by the theory of the system. In order to find the name of a mineral when its properties are ascertained, we make use of the characteristic, which consists of an assemblage of general ideas, corresponding to the system, and expressed by single distinctive marks. With these ideas are connected the names and denominations as far as the nomenclature extends and requires, not above the order, nor below the species; and they are by degrees transferred to the individual,

in proportion as it enters within the compass of those general ideas. The characteristic is only useful when we have the mineral in our hands, and is not to be studied to obtain a knowledge of the contents of the mineral kingdom, since the characters of its classes, orders, genera, and species, consisting of single marks or properties, are not calculated to produce representations or images of the objects to which they refer. *Physiography*, the last head of scientific mineralogy, consists of the assemblage of the general descriptions, and is intended to produce a distinct image of minerals. We cannot, by its assistance, find the place of a given mineral in the system, or, in other words, recognise it; for it is independent of that connexion, among minerals, upon which the system is founded. Mohs was the first writer who drew the line between the determinative and the descriptive parts of mineralogy—a distinction which is of the utmost consequence to the perfection of the science.

The foregoing heads or departments of mineralogy are all equally important and indispensable for conferring upon the science the character of a whole, though, in the application of the science, the parts are used separately, and, in a measure, independently of each other, according to the object in view. Those who wish to determine an individual occurring in nature, will find the characteristic the most important department, for neither of the others can be of the least use to them; while those who intend to arrive at a general conception of the species from knowing its name, or one of the individuals belonging to it, will find their views forwarded only by the physiography; for neither the characteristic nor any other department of mineralogy, contains any information answering the purpose in view. Mineralogy, thus developed, fulfills perfectly the demands which natural history makes of its several departments. But it enables us to answer no question which lies beyond the limits of natural history. Nobody will ever be able to infer from the mere natural-historical consideration of a mineral, any thing with regard to its chemical, geological, or economical properties. The natural history system has its provinces exactly determined, within which it serves every purpose, but admits of no application without; and these commendable properties are conferred upon mineralogy, as the natural history of the mineral kingdom, solely by making it correspond to the philosophical idea of a science. It contains merely natural-historical information; i. e. such as proceeds from a comparison of natural-historical properties, and all the rest is foreign to it. The development of the whole, in its single departments, is in itself systematical; and what it contains of real systems, the systems of crystallization, and the mineral system itself, really deserve that name; because they are the result of the application of one single idea to the whole compass of a certain kind of information. The science itself forms a whole, being intimately connected in all its departments, and strictly separated from all other sciences, which is a necessary consequence of a systematic mode of treatment. The method employed is so simple, that, on that very account, it is immutable; nor can there be any doubt that other methods, compounded of different principles, from the want of consistency prevailing in their different departments, will finally also be reduced to this method. We conclude our abstract of the system of Mohs, by presenting the reader with a list of the genera, as represented in the translation of the *Grundriss der Mineralogie*, by Haidinger (Edin., 1825).

## CLASS I.

ORDER I.—*Gas*.

Genera. 1. Hydrogen. 2. Atmospheric air.

ORDER 2.—*Water.*

*Genus.* Atmospheric water.

ORDER 3.—*Acid.*

*Genera.* 1. Carbonic acid. 2. Muratic acid. 3. Sulphuric acid. 4. Boracic acid. 5. Arsenic acid.

ORDER 4.—*Salt.*

*Genera.* 1. Natron salt. 2. Glauber salt. 3. Nitre salt. 4. Rock salt. 5. Ammoniac salt. 6. Vitriol salt. 7. Epsom salt. 8. Alum salt. 9. Borax salt. 10. Brythine salt.

## CLASS II.

ORDER 1.—*Haloide.*

*Genera.* 1. Gypsum haloide. 2. Cryone haloide. 3. Alum haloide. 4. Fluor haloide. 5. Calc haloide.

ORDER 2.—*Baryte.*

*Genera.* 1. Parachrose baryte. 2. Zinc baryte. 3. Scheelium baryte. 4. Hal baryte. 5. Lead baryte.

ORDER 3.—*Kerate.*

*Genus.* 1. Pearl kerate.

ORDER 4.—*Malachite.*

*Genera.* 1. Staphyline malachite. 2. Lirocone malachite. 3. Olive malachite. 4. Azure malachite. 5. Emerald malachite. 6. Habroneme malachite.

ORDER 5.—*Mica.*

*Genera.* 1. Euchlore mica. 2. Cobalt mica. 3. Iron mica. 4. Graphite mica. 5. Talc mica. 6. Pearl mica.

ORDER 6.—*Spar.*

*Genera.* 1. Schiller spar. 2. Diathene spar. 3. Triphane spar. 4. Dystome spar. 5. Kouphone spar. 6. Petaline spar. 7. Feld spar. 8. Augite spar. 9. Azure spar.

ORDER 7.—*Gem.*

*Genera.* 1. Andaluite. 2. Corundum. 3. Diamond. 4. Topaz. 5. Emerald. 6. Quartz. 7. Aximite. 8. Chrysolite. 9. Boracite. 10. Tourmaline. 11. Garnet. 12. Zircon. 13. Gadolinite.

ORDER 8.—*Ore.*

*Genera.* 1. Titanium ore. 2. Zinc ore. 3. Copper ore. 4. Tin ore. 5. Scheellum ore. 6. Tantalum ore. 7. Uranium ore. 8. Cerium ore. 9. Chrome ore. 10. Iron ore. 11. Manganese ore.

ORDER 9.—*Metal.*

*Genera.* 1. Arsenic. 2. Tellurium. 3. Antimony. 4. Bismuth. 5. Mercury. 6. Silver. 7. Gold. 8. Platina. 9. Iron. 10. Copper.

ORDER 10.—*Pyrites.*

*Genera.* 1. Nickel pyrites. 2. Arsenic pyrites. 3. Cobalt pyrites. 4. Iron pyrites. 5. Copper pyrites.

ORDER 11.—*Glance.*

*Genera.* 1. Copper glance. 2. Silver glance. 3. Lead glance. 4. Tellurium glance. 5. Molybdenum glance. 6. Bismuth glance. 7. Antimony glance. 8. Melane glance.

ORDER 12.—*Blende.*

*Genera.* 1. Glance blende. 2. Garnet blende. 3. Purple blende. 4. Ruby blende.

ORDER 13.—*Sulphur.*

*Genus.* 1. Sulphur.

## CLASS III.

ORDER 1.—*Resin.*

*Genus.* 1. Melichrone resin.

ORDER 2.—*Coal.*

*Genus.* 1.—Mineral coal.

Among the works on mineralogy, the following are worthy of notice: *Traité de Mineralogie, par A. Brongniart* (Paris, 1807); a Familiar Introduction to the Study of Crystallography, by Henry James Brooke (London, 1823); an Elementary Introduction to the Knowledge of Mineralogy, &c., by William Phillips (London, 1823); *Handbuch der Mineralogie, von C. A. S. Hoffman* (Freiberg, 1811, and continued by A. Breithaupt); Mohs' System of Mineralogy, translated by William Haidinger (Edinburgh, 1825); *Traité de Crystallographie, par M. l'Abbé Haüy* (Paris, 1822); *Traité de Minéralogie, par M. l'Abbé Haüy* (Paris, 1822); *Handbuch der Oryktognosie, von Karl Cäsar von Leonhard* (Heidelberg, 1826); Brewster's Treatise on Mineralogy (Edinburgh, 1827); *Die Mineralogie der A. Hartmann* (Ilmenau, 1829). The only considerable work upon the science

which has as yet appeared in the United States of America, is that of professor Clemens, and which was founded, for the most part, on the system of Brongniart and Haüy.

**MINERAL WATERS** are those waters which contain such a proportion of foreign matter as to render them unfit for common use, and give them a sensible flavour and a specific action upon human economy. They are very various, both in their composition and temperature, and, of course, in their effect upon the system; they are generally, however, so far impregnated with acid or saline bodies as to derive from them their peculiarities, and are commonly divided into four classes: acidulous or carbonated, saline, chalybeate or ferruginous, and sulphureous. In regard to temperature, they are divided into warm, or thermal, and cold. The instances which have been found in mineral waters extremely numerous, but those which most frequently occur are oxygen, nitrogen, carbon and sulphur in different combinations; lime, iron, magnesia, &c. Mineral waters are also divided into artificial and natural, the former being produced in the laboratory of the chemists, and sometimes merely imitating the natural waters by a combination of the same ingredients, and sometimes composed of different ingredients, or of the same in different proportion; in such a manner as to form compounds not known to exist in nature. The saline springs consist, in general, of salts of soda and lime, or of sulphate of lime, with carbonic acid and oxide of iron. The principal are those of Pyrmont, Sedon, Epsom, &c. The ferruginous waters have a decided styptic taste, and are turned black by an infusion of galls. They are sometimes in the state of an oxide, and even by carbonic acid; sometimes exist as a sulphate, and sometimes both as a sulphate and carbonate. The waters of Vichy, Spa, Forges, Passy, Oulston, Tunbridge, Bedford, Pittsburgh, Yafayette, Ohio, Virginia, Pennsylvania, &c., are very fine. The acidulous waters are characterized by their taste, and by the disengagement of gas as they contain five or six times their volume of carbonic acid gas; the salts which they contain are sulphate and carbonates of lime and magnesia, carbonate of sulphate of iron, &c.; the waters of Bath, Buxton, Bristol, Vichy, Selts, New Lebanon, &c., are sulphureous. The sulphureous waters are easily recognized by their disagreeable smell, their property of tarnishing silver and copper, &c.; the springs of St. Atoga and Ballston, Harrogate, Malin, Aix-la-Chapelle, Aix, and numerous others, are of this class.

**MINERVA** (called by the Greeks *Αθήνα*, *Athena*); one of the principal deities of the heathen Olympus, whose origin many mythologists derive from Egypt. According to the fable, Jupiter having obtained the sovereignty of the skies by his victory over the Titans, chose Metis, daughter of Ocean for his wife. An oracle of Gæa and Cronos had, however, predicted that Metis would bear him a daughter, and then a son, who should depose him of the sovereignty. To avoid this, Jupiter endeavored by wiles and flattery, to get possession of her person and then swallowed her with her yet unborn offspring. When the period of her delivery arrived, he experienced a sharp pain in his head, and, being caused Vulcan to split open his skull, was assisted at the sight of a virgin in complete armor, who danced about with a warlike constitution, brandishing her spear, and clashing her arms, as if on the point of attacking an enemy. In her character of a wise and prudent warrior, she was consulted with by the fierce, furious, and blood-thirsty Mars, &c. In the wars of the giants, she was the most

adus. In the wars of mortals, she aids and instructs her heroes. She conducted Hercules to Olym- instructed Bellerophon (see *Hippodamia*) how to Pegasus, and conquer the Chimæra, accom- Perseus on his expedition against the Gorgons, red immortality on Tydeus, honoured Achilles, spanied Ulysses, protected his wife, and guided n Telemachus under the figure of Mentor. She ivoured the inventors of warlike instruments, the Argo, and taught Epeus to construct the n horse, by means of which Troy was captured. likewise represented as the patroness of the f peace; and, as a virgin, is distinguished for kill in all the employments, in which, in the : age, the daughters of kings occupied them- . The loom, the spindle, the embroidering : are her attributes; and, as the wives of the : prepared the garments of their households, so ade the dresses of the goddesses; hence her t *Ergane*. Skilful artists were, therefore, her protection, though she would not tolerate rks of pride. (See *Arachne*.) All the peaceful hich display an active and inventive spirit, a patron in her. The sculptor, the architect ie painter, as well as the philosopher, the and the poet, considered her their tutelary

As bodily health is necessary to the success- rion of the inventive powers of the mind, she represented among the healing gods, and in aracter is called *Pæonia*. In all these repre- ons she is the symbol of the thinking faculty, dness of wisdom, science, and art; the latter, er, only, in so far as invention and thought are considered. Athens, the city of the arts and s, was her favourite residence. She is also the inventress of the flute; but having seen, utain, how much the playing upon that instru- rtoried her face, she threw it into the water, allections on the person who should take it arysas suffered the effects of this malediction. ing love, she consecrated herself to perpetual y; and the unhappy wretch, who directed to- er a glance of desire, suffered the severest as for his rashness. Tiresias, who surprised he bath, was struck blind.

arts have imbodied this conception of pure in the images of the goddess. A manly gra- d an air of reflection, is united with female in her features. As a warrior, she is repre- completely armed, her head covered with a lmet, from which streams a crest of horse- er hand bearing her lance, and her body with the armour of her father. As the god- peaceful arts, she appears in the dress of a matron. To her attributes belong, also, the he Gorgon's head, the round Argive buckler, owl, as the symbol of vigilance (on coins, k). As the preserver of health, she is resented as feeding a dragon, and the olive- is a symbol of the peaceful commerce, which ered prosperous through her favour. An n tradition relates that Neptune and Minerva once contended which should give the name city; the gods, to decide the dispute, declared should be called from the one who should pro- most useful gift for the human race. Nep- erefore, struck the ground with his trident, war-horse sprang forth; Minerva threw her nd from the spot where it fell sprouted forth eful olive-tree. Her present was determined be most salutary, and the city received her

All Attica, but particularly Athens, was o her, and she had numerous temples there. rthenon.) Her most brilliant festival at was the Panathenæa. Another festival was

the solemn washing of her statues at Athens, and more particularly at Argos, which was done yearly in running water, by the hands of virgins. The Romans worshipped her at first only as the goddess of war (Bellona); but she afterwards became one of the guardian gods of Rome. The principal temple in the capitol was dedicated to her, in common with Jupi- ter and Juno, and a yearly festival was observed in hon- our of her, which continued five days (*Quinquatria*.)

MINGOTTI, CATHARINE; an eminent singer, born at Naples in 1728, of German parents. After the death of her father, who was in the Austrian military service, Catharine entered an Ursuline convent. The music made such an impression upon her, that she implored the abbess, with tears, to allow her to receive musical instruction, that she might be able to accompany the choir: her request was granted. At the age of fourteen she returned to her mother, and some years after married Mingotti, a Venetian, who had the direction of the opera at Dresden. On her first appearance in Dresden, she attracted general admiration, and Porpora (q. v.), who was then in the king's employ, procured her an engagement at the theatre. Her reputation soon extended through Eu- rope, and she was engaged to sing at the grand opera in Naples, where she was received with undivided applause. On her return to Dresden, in 1748, Hassa was at the head of the chapel, and endeavoured to place difficulties in her way, which she escaped with such success as to silence her enemies, and even Faustina. In 1751, she went to Spain, under the di- rection of Farinelli, visited Paris and London in 1754, and afterwards the different cities of Italy, but always considered Dresden as her home during the life of Augustus. After his death, she resided at Munich. She died in 1807. Mingotti spoke German, French, and Italian, with elegance, Spanish and English with ease, and understood Latin. Her style of singing was grand and dramatic, and such as discovered her to be a perfect mistress of her art. She was a judicious actress, her intelligence extending to the poetry, de- corations, and every part of the drama.

MINGRELIA; an Asiatic province of Russia, bounded north by the Caucasus, which separates it from Circassia, west by the Black sea, south by Guria, and east by Imeretia. It is in general moun- tainous, with a fertile soil, producing excellent fruits. Wine, honey, silk, and women are the chief articles of commerce. The population is composed of about 14,000 families—Georgians, Armenians, Tartars, and Jews. The Greek church is the predominant reli- gion. The inhabitants are divided into three distinct castes, the Dchinandi, or that of princes, the Ssk- kour, or nobles, and the Moniali, or commons: the last are the cultivators of the soil. Mingrelia is governed by a prince, called the *Dadian*, who, in 1803, declared himself the vassal of Russia. In 1813, Persia renounced all claims of sovereignty over it, in favour of Russia.

MINHO, or, in Spanish, *Mino* (*Minius*), a river of Spain and Portugal, which rises near Mondonedo, among the mountains in the north of Galicia, crosses that province nearly from north to south, till it arrives at the frontiers of Portugal, where it takes a western direction, and forms the boundary between the two kingdoms. It flows into the Atlantic at Guardia. It is only navigable to a small distance for boats, on ac- count of the sand-banks. It gives its name to the northernmost province of Portugal, called also *Entre Douro e Minho*, remarkable for its fertility and delightful climate, of which Braga is the capital, and Oporto the principal port. See *Portugal*.

MINIATURE PAINTING; that branch of paint- ing, in water colours, in which the colours are put on by the mere point of the brush. It differs from other

kinds of painting in being much finer, and therefore must be looked at near, so that it is used to represent subjects on a small scale, commonly on vellum or ivory. Hence the name *miniature painting*, for the smallest kind. The ground of the vellum or ivory is used for the highest lights, and some artists use no white colouring matter at all, supplying its place entirely by this ground. The best colours are those which have the least body, as carmine, ultramarine, lac, &c., which are dissolved in water, and then separated and dried. Miniature painting requires much time on account of the paints of which it consists, which must be delicately put on, so near each other that they appear as one continued colour. As early as the ninth and tenth centuries, miniature pictures are found as ornaments of manuscripts in Italy, France and Germany.—See Rive's *Essai sur l'Art de vérifier l'Age des Miniatures peintes dans les Manuscrits* (Paris, 1782). In general this kind of painting was an occupation of the monks; and as the art was called *illuminare*, so the artists received the names *illuminatores*, or *miniatores*, because they used for the ornaments of the manuscripts the red colour, *minium*, more than any other; hence the name *miniature painting*. This species of painting flourished particularly in the fourteenth century, under Charles V. in France, and reached still greater perfection under Charles VIII. and Louis XII., but sank after the invention of printing, and of paper, and the rise of the art of engraving. In modern times, it has been employed chiefly for portrait painting. Among the distinguished miniature painters deceased are Mengs, Chodowiecki, Finger, Westermann, Nixon, and Shelly.

**MINIM**; a character or note, equal in duration to the sixteenth part of a large, one eighth of a long, one fourth of a breve, and one half of a semibreve.

**MINIM FRIARS** (from *minimi*, Latin, *least*); brethren of St Francisus a Paula (whence they are called also *Paulini*, or *Paulani*), an order instituted in the middle of the fifteenth century, who have established convents in most European countries since 1493. They owe their reputation of particular sanctity to their rigorous fasting, as they are not allowed to take any thing but bread, fruits, and water. Their dress is black, and, like that of the Franciscans, provided with a scourge. Their life is dedicated entirely to solitary devotion. They belong to the mendicant orders, and possessed, in the eighteenth century, 450 convents in thirty provinces. In 1815, Ferdinand IV. of Naples restored to them their original convent. (See *Francis of Paula*.) In the Neapolitan territory, they are called *Paolotti*.

**MINION** (from the French *mignon*, adjective and substantive); a favourite, on whom benefits are undeservedly lavished.

In typography, *minion* signifies a certain kind of type. "Why," says Johnson, in his *Typographia* or the Printer's Instructor, "this letter was denominated *minion*, we have not yet been informed; probably it was held in great estimation on its first introduction, and consequently received the title *minion* [darling]." In size, it is between nonpareil and brevier; as, for instance, a b c.

**MINISTER**; properly a chief servant; in political language, one to whom a sovereign intrusts the direction of affairs of state. In modern governments, the heads of the several departments or branches of government are ministers of the chief magistrate. It is also used for the representative of a sovereign at a foreign court. (See *Ministers, Foreign*.) In Britain, the words *ministry* and *ministers* are used as collective names for the heads of departments, but the individual members are not so designated. In the United States of America, the

heads of the departments are called *secretaries*, are not termed *ministers*. In most large ones we find a *minister for foreign affairs* (whereas are included in those of the secretary of state in United States), a *minister of the interior* (a high secretary for the home department; in the United States there is no such department, and the chief of state has charge of the affairs which would be such minister). The *minister of the treasury* (management of all domestic affairs, such as &c., levying taxes (in many cases; is that a thing which does not belong to the other departments; and it may easily be imagined how important this department varies, as the government is more or less absolute, and depend exercise a more or less minute control over the subjects. In Prussia, where the government is in all the concerns of life, the *minister of the interior* is a most important person. On the eastern Europe, where the judiciary is considered a part of the executive administration, there is a *minister of justice*, whose office is incompatible with the independence of the judiciary and with the idea of the administration of justice common in Britain and the United States (though in the latter country the highest judge, the *lord high chancellor* is a member of the ministry). There is a *minister of finance* (in Britain, the *chancellor of the exchequer*; in the United States, the *secretary of the treasury*). In some states there is a *minister of finance*, a *minister of the navy*. There is also a *minister or secretary of war* in maritime states, a *minister or secretary of the navy*, and sometimes a *minister for the colonies*. There is often a separate *minister of education*. In Britain, the president of the board of trade is *minister of the police* (first established in the treasury in France). In many countries as the idea of a well regulated government is unhappily confounded with a concentration of powers in a few individuals, there is an *ecclesiastical public worship*, who has the direction of ecclesiastical affairs. This department, though it exists in Catholic countries, as in France, yet in some the greatest development in Protestant countries, in which the monarchs have declared themselves heads of the church, and the officers of state are considered, to a certain degree, members of the government. We often find a *minister of religion*, generally the same with the *minister of ecclesiastical affairs*. A *minister of the household* directs the private affairs of the monarch. The name of the ministers in most countries correspond, yet their power is very different in a monarchy (q. v.), where it extends in many directions through the whole organization of society in a country like Britain, where the concerns of particular corporations are independent of the minister. In the former class of governments, a minister is a sort of viceroy in his department. One of these ministers is, in many countries, *minister, or premier*, who, in combination with the chief, is considered as the chief person in the administration. Sometimes he has no particular department. In France, he is called *minister president*. In Britain, the *prime-minister* is the one who receives the king's order to form a ministry, therefore to appoint more of his own strength. He is generally the first lord of the treasury, in some countries, there is, also, a *president of the ministry*. In the United States of America, there is no such post as that of *premier*, but the thing is done in the name of the *president*, in many points, corresponds to the *premier* of a constitutional monarchy. The British king's

ministers vary somewhat: under lord Melbourne, they are the following: 1. First lord of the treasury; 2. lord high chancellor; 3. chancellor of the exchequer; 4. secretary of state for foreign affairs; 5. secretary of state for the colonial department; 6. secretary of state for the home department; 7. president of the council; 8. lord privy seal; 9. first lord of the admiralty; 10. president of the board of control; 11. paymaster of the forces; 12. secretary of war; 13. chancellor of the duchy of Lancaster. The French ministry consists of, 1. the minister of the interior; 2. minister of finance; 3. keeper of the seals and minister of justice; 4. minister of public instruction and ecclesiastical affairs; 5. minister of commerce and public works; 6. minister of marine and colonies; 7. minister of war; 8. minister of foreign affairs. The American cabinet consists of the secretaries of state (foreign and home affairs), of the treasury, of war, and of the navy. There is also an attorney-general, and sometimes also the postmaster-general, are members of the cabinet. The chief justice of the supreme court of the United States is never a member of the cabinet. He is only a judicial officer, and not removable, except by impeachment. The lord high chancellor is the chief judge in Britain who belongs to the ministry. In France and Britain, the members are appointed solely by the king; in the United States, the concurrence of the senate is necessary for the appointment of the secretaries, and all other officers nominated by the president. No case, however, has yet existed in which the senate has refused to concur in the appointment of the secretaries, because it has been thought unfair to deny the president the choice of his own cabinet, as all the responsibility rests upon him. The modern idea of constitutional monarchy, in which two most heterogeneous principles, the inviolability of the law, and that of the monarch, who thus stands above the law, were reconciled, produced a skilful contrivance—the responsibility of ministers—in order to leave the inviolability of the monarch unimpaired, and yet to place a check upon the arbitrary use of his power. Europe owes this development of constitutional law, most of the improvements in her political institutions, to England. One or more ministers in France and Britain (and many other countries) countersign the royal orders, and by thus doing become responsible for the contents. This responsibility is always a delicate thing, because it is impossible to define with exactness what constitutes unconstitutionality and a violation of the public interest; so hard as it may appear in the abstract, the question must be left to the houses of legislature to decide, in case of an impeachment of the ministers. In general, however, there is little danger of the ministers being impeached, except for very flagrant violations of law, or in times of very violent party spirit. Impeachment also forms a ground of impeachment. In the United States of America, no such responsibility rests upon the secretaries, nor is their countersign requisite, for the simple reason that the president himself is answerable for every thing which he does, and may be impeached. (See *Impeachment*.) Though in a constitutional monarchy the full right to appoint and discharge his ministers according to his pleasure, he is, nevertheless, obliged to appoint such as will satisfy public opinion, or the legislature will grant supplies, and, in fact, will not co-operate with the administration. This denial to grant supplies, which is the great support of the people against government, was called, some time ago, in France, an outrageous interference with the king's prerogatives. In Britain, the command of a majority in the houses has become indispensable for the

ministers, so that the loss of a bill brought in by them is regularly followed by the resignation of the premier. This applies, however, only to what are denominated cabinet questions, in respect to which it is considered necessary that the ministry should be united. Where a difference of opinion is openly professed by the ministers themselves, the question is not a cabinet question, and the failure of a bill proposed by a minister respecting it is not considered fatal to the administration. Thus the Catholic emancipation was for a long time not a cabinet question; and when Canning lost his bill, in 1827, he, nevertheless, did not give in his resignation. The situation of the constitutional monarch in France and Britain, and many other reasons in the organisation of the governments of those countries render it necessary for the ministers to be present at the parliamentary debates, and to support their measures: in fact, one member of the cabinet, the lord high chancellor, is, *ex officio*, president of the house of lords. In Britain, those of the ministry who are peers sit in the house of lords; the others sit in the house of commons, in virtue of being elected members; but it is considered indispensable that they should be there. They could not be admitted into the house except as members. The prime-minister, if a peer, sits in the house of lords: Pitt and Canning, who were commoners, sat in the commons. In France, the ministers are also generally members of one or the other house, but they need not be members, because the constitution gives them the right of being heard in either house, by virtue of their office. The ministers have their bench in France. In the United States of America, no secretary can sit in either house, as the constitution prohibits any officer of government from being chosen a representative or senator. In Russia, the cabinet is different from the ministry. The former has the management of the emperor's private affairs and of foreign politics, and its members are called *cabinet* ministers; the members of the ministry, so called, are termed *state* ministers. Some governments have also *conference* ministers, who have no real departments. The love of titles has produced a great mixture of these designations in different countries. In France, it was formerly customary to appoint an ex-minister minister of state, with a pension. Those who were ministers of state before the revolution of 1830, have remained so; but the ex-ministers, since 1830, have returned to their private stations. In Britain, the privy council is to be distinguished from the ministry. The former contains a very large number of members.

**MINISTERS, FOREIGN.** In the article *Diplomacy*, some account has been given of the history of embassies; it remains here to speak of the different classes of foreign ministers as they now exist. Every person sent from one sovereign government to another, and accredited to the latter, in order to transact public business, of a transient or permanent character, in the name of his government, with that to which he is sent, is a foreign minister. Sometimes such ministers are sent merely to be present at the coronation of a foreign prince; sometimes to settle disputed points; at other times to reside permanently with the foreign government. Generally, they are divided into three classes. Those of the first class, called *ambassadors*, are not merely the agents of their government, but represent their sovereign personally, and receive honours and enjoy privileges accordingly. The English, French, Spanish, Russian, Austrian governments send ambassadors to each other; the Prussian government does not send ministers of this rank. The second class are those called by the joint title of *envoys extraordinary and ministers plenipotentiary*; they

represent their government. The third class consists of the ministers resident (*ministres résidents*, *ministres chargés d'affaires*), to whom less honour is generally paid. They, however, like the former, are styled by courtesy *excellency*. Of still lower rank are the *chargés d'affaires*. According to the regulations adopted by the congress of Vienna, the number of classes has been reduced, so that there are at present only ambassadors, envoys extraordinary, and ministers plenipotentiary, and *chargés d'affaires*. Persons who are sent merely to conduct the private affairs of their monarch or his subjects in a foreign place are called *agents*, or *résidents*; and where they are occupied chiefly with subjects of a commercial character, they are called *consuls*. (q. v.) They are not considered diplomatic persons, and do not enjoy privileges accordingly. The *legati latere* (q. v.) enjoy the privileges and honours of ambassadors. Ambassadors and even ministers plenipotentiary have young gentlemen with them, called *attachés*, who have no particular charge, but merely this title to connect them with the legation, and to give them thus admission into the highest society. Sometimes they are sons of noble families, who are preparing themselves for diplomatic offices, but think it beneath their dignity to accept an appointment as secretary of legation. The suite of ambassadors always includes more individuals than the business of the embassy requires, a certain degree of pomp being considered necessary. An ambassador has generally three, always two secretaries of legation; other ministers often but one. A foreign minister receives letters of credence from his court, which, after having delivered an attested copy of it to the secretary of state, he gives himself to the monarch, or head of the government, if he is an ambassador, in a public audience, if not, in a private audience. After the reception of the credentials, the minister is said to be acknowledged. In some countries, he puts the arms of his nation or sovereign on his mansion. After his credentials have been received, he makes formal visits to the other ambassadors, to be recognised by them as such. From the moment that a minister enters the territory of the sovereign to whom he is sent, his person is held sacred and inviolable, and he acquires important privileges. To these belongs, first of all, his freedom from territorial restrictions; that is, he is not regarded as an inhabitant of the country, but his person, suite, house, equipage, &c., are considered as never having left the country to which he belongs, and as being without the jurisdiction of that in which he actually resides. From this follows the freedom of foreign ministers from the civil and criminal law; and the same applies to their suite; and all property belonging to him as minister is free from all taxes, &c. No common police-officer, tax-gatherer, or other public servant, can enter his hotel, and make inquisition, as in the house of a private citizen. But whether his hotel shall be a place of refuge for transgressors, and whether the delivery of them may be refused to the state-officers, are questions equally doubtful and important. The privilege formerly appertaining to ambassadors, by means of which, upon hanging up the arms of their sovereign, they could exempt from the laws of the land the whole quarter of the town or city in which their hotel happened to stand, is abolished as an abuse. The freedom from taxes of all property belonging to the embassy has been subjected to many restrictions, in consequence of the occurrence of abuses of this privilege. Foreign ministers are not free from bridge and turnpike tolls, or letter-postage. One of their especial privileges is that of worshipping according to the forms of their own religion in countries where their religion is not tol-

erated. In transacting business, they must have immediate intercourse with the sovereign himself, and then address him in a private audience, or by the delivery of memoranda; it is uncommonly their intercourse is through a minister for foreign affairs. This state of things continues till the termination of the embassy, which occurs in different ways, either by the expiration of the credentials, by a recall, by a compulsory departure, or by the demand of a minister. A recall occurs when the object of the embassy is obtained or defeated; sometimes it takes place in consequence of a misunderstanding, sometimes from private reasons. A minister voluntarily leaves a court, without being asked when he thinks he suffers personal injury, according to the laws of nations. There are cases, however, in which a minister is compelled to leave a court when it is termed a *removal*. In general, a minister is considered as ended from the moment a minister shows his letters of recall, or his passports for his journey home. When thus furnished him, he must leave the court; if a person remains inviolable even in case of war, he is allowed to retire unmolested. The Pope alone claims to be exempted from this restriction, since it imprisons in the Seven Years' War ministers of states with which any misunderstanding happens to occur. At the peace with Russia, however, in 1813, it engaged never to exercise the power for the future upon Russian ambassadors. The inviolability of person is enjoyed in the other European states, although only in times of peace; couriers and expresses, as also by post, without any public character as envoys, are accredited by their governments with the transmission of matters of importance, and requiring secrecy and trust, but these are not allowed to assume the character of a minister, and, in their relations to other courts, are regarded as private persons merely. As regulations have naturally been introduced among European powers since the establishment of a permanent residence of foreign ministers in the peace of Westphalia. Republics do not send ambassadors, in the European sense of the word; Venice, indeed, formerly sent ambassadors. The United States send only ministers plenipotentiary and *chargés d'affaires*, although the constitution uses the term *ambassador*. Prussia alone sends principal European powers, neither sends minister plenipotentiary nor ambassadors. A history of European diplomacy since the peace of Westphalia, would be a very important work, in regard to politics, system, and the progress of civilization, and a valuable treatise. Flassan has made some excellent contributions towards it. A useful work, and one which gives instruction and examples in regard to the relations and objects of embassies, is the *Art diplomatique, ou Précis des Droits et des Fonctions des Agens diplomatiques, suivis d'un Recueil des d'Offices, pour servir de Guide aux Personnes destinées à la Carrière politique*, by (J. Martens (Leipsic, 1822). The law of European embassies has been particularly treated of by von Moschamm (Landshut, 1816).

MINK (*mustela*). The European mink (*M. erminea*) inhabits the northern parts of Europe, and on the banks of streams, feeding on frogs, &c. &c. It is of a brownish-red colour. It has a very musky smell, and its fur is very fine. The one known in America under the name of *ermine* is similar to the European quadruped of the same name, but they have been generally confounded with each other. The common name of both species is derived from the Swedish *mustela*. The American mink

he *M. vison* of naturalists, and is generally to be found on the banks of streams, especially near farmhouses and mills. It swims and dives well, and can remain under water for a considerable time. It preys upon small fish, muscles, &c., but also commits depredations on the poultry yard, and will devour rats, mice, &c. The mink, when irritated, exhales a very fetid smell, almost equal to that of the skunk. It is easily tamed, and is capable of strong attachment, but, like the cat kind, is readily offended, and will bite on a sudden provocation. The fur is of little value.

**MINNESINGERS.** The ancient German word *minne* was used originally to denote love and friendship, even divine love. At a later period the German poets of the middle ages expressed by it particularly a pure, faithful, and generally happy love between the two sexes. Walther von der Vogelweide distinguishes the high from the low *minne* (a distinction similar to that of the ancients), and defines the former to be the happiness of two hearts which give and receive equal bliss. Love, the vital element of chivalry, was with the German poets something purer, more ideal, more deep, than with the French. The name *minnesingers* is given to the lyric German poets of the middle ages in general, on account of love being the chief subject of their poems. They are also called *Suabian poets*, because the Suabian dialect prevails in their poems. At the beginning of the twelfth century, when the art of poetry came from the south of France to Germany, it found a welcome reception at the court of the Hohenstaufen (q. v.), the Suabian emperors of Germany. The minnesingers were knights, or at least men of noble descent, who lived and sang at the courts of princes who loved and protected the arts, such as the emperor Frederic II., the duke Leopold IV. of Austria, king Wenceslaus of Bohemia, duke Henry of Breslau, and others. After the fashion of the Provencal Troubadours, the minnesingers engaged in poetical contests for the gratification of princes and ladies of the court. Some among them were poor, and earned their living by reciting their songs from court to court; but most of them sang merely for pleasure when their swords were unemployed. Not a few princes took part in these songs. This poetry was essentially chivalric, and breathes the romantic spirit of that extraordinary age. Glowing devotion to the virgin Mary and the catholic religion; ideal love for a chosen lady; the charms of spring, always so intimately connected with romantic and lyric poetry;—these formed the constant subjects of the verse. Every poet sung his compositions and accompanied them himself. The most extensive collection of these smaller poems which we possess, and which contains from 1400 to 500 pieces by 140 poets, was collected by the burgomaster of Zurich, Rüdiger von Manesse, in the beginning of the fourteenth century; at the close, therefore, of the flourishing period of this species of poetry. (See *Manesse*.) L. Tieck has published 20 poems, modernized from that great collection, under the title of *Minnelieder aus dem Schwäbischen Mittelalter* (Berlin, 1803). There is a new critical edition by Von der Hagen. The earliest of the minnesingers now known is Henry of Veldeck, who flourished about 1180. Most of the distinguished ones lived towards the end of the twelfth and at the beginning of the thirteenth centuries. Towards the end of the thirteenth century, after the close of which they gradually became silent, lived Conrad of Würzburg and John Hadlaub. (For the epic poetry of Germany in the same age, see *Nibelungen, Heldenbuch, and German Poetry*.) The knights sank once more back to almost total barbarism, and poetry fled into the cities,

where it was cultivated by mechanics in a mechanical way. See *Masteringers*, also *Chivalry*, and *Minstrels*.

**MINNOW**; the name applied to several species of small fresh-water fish, and even to the young of larger kinds. The minnow of England, is a small *Cyprinus*. Taking these fish is one of the favourite amusements of children. This first essay in angling is generally performed with a bended pin, baited with a small earth-worm. The word *minnow* is derived from the French *menu*, small.

**MINOR**; the Latin for *less*, used in contradistinction to *major*, as *Asia Minor*, *minor excommunication*, *minor offences*.

**MINOR**, in logic. See *Syllogism*.

**MINORATE**; the contrary of *majorate*, i. e. the privilege of the youngest son to inherit the real estate of the father, with the obligation, however, to pay a certain sum to his brothers and sisters. This is actually the custom in some places of Germany.

**MINORCA**; an island in the Mediterranean, belonging to Spain, one of those anciently called *Baleares* (q. v.), about thirty miles in length, and about ten in breadth; 30 E. N. E. Majorca. (q. v.) The surface is uneven, the soil not generally fertile, the water scarce and hard, the air moist. Some wine is exported, but the quantity of grain is not sufficient for the inhabitants. The island owes its political importance to the valuable harbour of Port Mahon. (q. v.) One of the most profitable commodities of the country is salt. Population, 44,167; square miles, 240; lon. 4° 10' E.; lat. 39° 59' N.

**MINORITES.** See *Franciscans*.

**MINORITY**, in law; the age of minors. According to the Roman law, full age takes place, with both sexes, at the 25th year; in Prussia, at the 24th; in France, Saxony, England, and the United States of America, at the 21st. Monarchs, in almost all countries, come of age much sooner than other persons, very often in their 18th year. The golden bull declares the German electors of age at 18. See *Age*; and, for minority in the English law, see *Infant*.

**MINOS**:

1. A king of the island of Crete, who lived about 1406 B. C., and is not to be confounded with his grandson of the same name. He is celebrated as a wise lawgiver, and for his strict love of justice. To make the Cretans formidable and powerful, by union and military spirit, he obliged them often to eat in common, and constantly exercised them in military duties. Tradition has adorned the history of this king with various additions. According to it, he was a son of Europa and Jupiter, from whom, every nine years, he received his laws in a cavern on mount Ida. After his death, Minos was made with *Æacus* and *Rhadamanthus*, a judge in the infernal world. All three sat at the entrance to the kingdom of shades. Minos, as the chief justice, delivered the sentence.

2. A grandson of the preceding, who also ruled over Crete, and was the husband of *Pasiphae*, whose unnatural passion gave birth to the *Minotaur*. (q. v.)

**MINOT, GEORGE RICHARD**, an American historian, was born at Boston, in December, 1758, and completed his studies at Harvard college. He embraced the profession of the law, which he practised with much credit. In 1792, he was appointed judge of probate for the county of Suffolk, Massachusetts. Judge Minot cultivated, successfully, literature and science. He was one of the founders of the Massachusetts historical society. He published a very interesting narrative of the insurrection in Massachusetts in 1785, and various orations which he pronounced in public; but his chief production is a valuable Continuation (in 2 vols.) of *Hutchinson's*

History of Massachusetts. He died in January, 1802. A full account of his labours and character is contained in the eighth volume of the Collections of the Massachusetts Historical Society.

**MINOTAUR.** Fable makes this being the son of Pasiphaë and a bull, and ascribes to him the body of a man with the head of a bull. He ate human flesh, on which account Minos confined him in the labyrinth built by Dædalus, and at first exposed to him criminals, but afterwards the youths and maidens yearly sent from Athens as a tribute, until at length Theseus, who was comprehended among the youths, and was instructed and armed by Ariadne, the daughter of Minos, killed him, and freed the Athenians from this tribute.

**MINSTER** (Anglo-Saxon, *Mynster*, from *monasterium*) anciently signified the church of a monastery or convent, afterwards a cathedral. In German, the word is written *Münster*. Both in German and English, this title is given to several large cathedrals, as, *York minster*, the *minster of Strasburg*, &c. It is also found in the names of several places, which owe their origin or celebrity to a monastery, as, *Westminster*, *Leominster*, &c.

**MINSTREL** (French, *menestrier*, from *ministerium*); a name introduced into England by the Normans, and which comprehended singers and performers of instrumental music, together with jugglers, dancers, sleight-of-hand performers, and other similar persons, whose trade it was to amuse the great. The character of the minstrels differed much at different periods; and while we find them, at one time, the friends and favourites of princes, we see them again, in the reign of queen Elizabeth, classed with beggars and vagabonds, and forbidden to exercise their trade. The minstrels often sang the compositions of others, but they were often the authors of the poems which they recited. See Percy's and Ritson's works on minstrelsy; see, also, the articles *Minnesingers*, and *Troubadours*.

**MINT** (*mentha*); a genus of labiate plants, distinguished, however, by having the corolla divided into four nearly equal lobes. The stamens are four, two of them longer than the others. The species are herbaceous, nearly all perennial, having square stems, which bear opposite and simple leaves; the flowers are small, verticillate, collected into bunches in the axils of the leaves. Sixty species are known, all growing in temperate climates, and most of them European. They abound in resinous dots, which contain an essential oil. They have an agreeable odour, and have been celebrated, from remote antiquity, both in mythology and from their useful qualities. They partake, in the highest degree, of the tonic and stimulating properties which are found in all labiate plants. To the taste they are bitter, aromatic, and pungent. The *M. piperita*, or peppermint, is the most powerful, and, on this account, is most generally employed in medicine. The *M. viridis*, or spearmint, is milder, more agreeable, and is very commonly employed for culinary purposes.

**MINT**; a place where money is coined by public authority. In Great Britain there was formerly a mint, in almost every county; but the privilege of coining is now a royal prerogative here, and the only mint now in Great Britain is in the Tower of London. Coining, among the ancients, and, indeed, among the moderns till within the last 280 years, appears to have been very rudely and imperfectly performed, by placing the blank piece of money between two dies, or steel punches, containing the design of the coin, and striking upon the upper one with a hammer. This hammer-money is always imperfect, from the uncertainty of placing the two dies exactly over each other, and also from the

improbability of a man being able to strike a blow with such force as to make all parts of the moneys equally perfect. The coining-press was of French origin, and is generally said to have been first tried in the palace of Henry II. of France, a little or 1553. It continued in use till 1563 when Henry III. re-established the hammer-coining as a mark of its superior cheapness. The mint of France was introduced from France into England in 1562 in the reign of Elizabeth; but, after about ten years, was given up for the same reason as in France. France, it was re-established compulsorily in 1660, by Louis XIV. In 1623, it was established here in England, by Briot, a French artist. It was not there, alternately with the hammer for ten years. Under Charles II., in 1662, it obtained the complete ascendancy, and has remained in use ever since. See an account of the method of coining, in the *Encyclopædia Britannica*.

**MINTAREES**, or **MINETARRES** (called also *le Big-Bellies*); a tribe of Indians, in the northern part of the Missouri Territory. See *Indians America*.

**MINUCIUS FELIX**, *Minerius*; a slave of Agricola, who, about the close of the second and the commencement of the third centuries of the Christian era, attained to a considerable degree of reputation at Rome as a rhetorician. He was a Christian, and wrote a dialogue in defence of his religion, called *Octavius*, of which Jerome and Lactantius speak highly. This work, however, was long considered to be the composition of Ambrosius, till in 1581, he was restored to its real author. Another work, *De Fato*, has also been ascribed to him, but the difference of style which it exhibits, when compared with the other work, some doubts are cast upon its authenticity. There are two English editions of the *Octavius*.

**MINUET** (French, *menuet*); a French dance of slow time, which requires great grace and delicate carriage. It was, therefore, considered as the most elegant of dances, and is admirably adapted to cultivate ease and grace of motion. It was a favourite dance in the time of Louis XIV., and since been supplanted by cotillon, quadrille, &c. According to Brossard, the minuet was originally from Poitou, and is said to have had a quicker motion. According to Schenker, La Motte (1687) was the inventor of the minuet, and in 1694 it is said to have danced the first time at Versailles. The name is derived from *menu*, just on account of its short measured steps.

**MINUTE**; a division of time, and of every measure. The degree is divided into sixty minutes. The divisions of degrees are fractions, whose denominators increase in a sexagesimal ratio, that a minute is  $\frac{1}{60}$ , or second =  $\frac{1}{3600}$ , &c. of a degree. Minutes are expressed by acute accents thus: seconds by two; the thirds by three, &c. In the computation of time, a minute is the sixtieth part of an hour.

**MINYÆ**:

1. The Argonauts were so called, either from the bravest of their number were descendants of Minyas, or because they were natives of the town of the Minyæ, who had occupied the country of Orchomenus.

2. A people of Boeotia, near Orchomenus. Their state was, at an early period, powerful, and was founded by a Pelasgic tribe. They derive their name from Minyas, one of their kings. Their father, Orchomenus, built the city of that name. See Muller's *Orchomenus and the Minyæ*, (Göttingen 1820).

**MIQUELETS**; the inhabitants of the *Sierra Pyrenæa*, in Catalonia, and in the French

ments of the Upper and Eastern Pyrenees, on the heights of the chain of mountains which forms the boundary between France and Spain. They are mostly herdsmen, hunters, coal-burners, &c. They are warlike, and inclined to plunder. They also accompany travellers on the mountain-passes, and receive high pay for their protection. In war, they are dangerous partisans, who often descend into France in troops. In the war with Napoleon, they made themselves formidable to the French troops in Catalonia.

MIQUELON; an island in the Atlantic ocean, near the southern coast of Newfoundland, belonging to France; lat. 47° 4' N.; lon. 56° 20' W. To the south of it lies Little Miquelon (*Petite Miquelon*), which, since 1783, has been connected with it by a sand-bank. These islands are under the direction of the commandant of St Pierre (see *Pierre*, St), and are occupied only by a few families engaged in the fisheries.

MIRABEAU, HONORE GABRIEL RICQUETTI, count of, so famous for his influence in the French revolution, was born March 9, 1749, at Bignon, in Provence, and died at Paris, April 2, 1791. He sprang from a celebrated family. Nature gave him violent passions and a robust frame. Education might have made him a truly great man; but the propensities of his genius were checked, and the development of his energies perverted. When fourteen years of age, he entered a military boarding school, where he studied mathematics, made some progress in music and drawing, and became a proficient in bodily exercises. But as his moral education was entirely neglected, the most vehement passions grew with his growth. While yet a boy, he published a eulogy on the great Condé, and some pieces in verse. On leaving school, he entered the military service; and his intercourse with young and dissipated officers made him familiar with all their vices. His active mind, however, could not remain idle, and he read all the books which he could procure on the military art. He also fell in love; and his passion was marked by all the impetuosity of his character. His father, who systematically thwarted his inclinations, now procured his confinement in a fortress on the island of Ré. He was even on the point of having him sent to the Dutch colonies. But the friends of the family succeeded in preventing it. This abuse of the paternal power decided the son's hatred of despotism. After his liberation, he went, as a volunteer, to Corsica. He distinguished himself, and obtained a commission as captain of dragoons; but as his father refused to purchase him a regiment, he abandoned, though unwillingly, the military profession. During the war in Corsica, he wrote a memoir respecting it, with remarks on the abuses of the Genoese aristocracy, and gave it to his father, who destroyed it. In conformity with the request of his father, he now settled in Limousin, and employed himself in cultivating the earth and in conducting lawsuits. But he soon became weary of his situation. His domestic circumstances, moreover, were unhappy. In 1772, he had received, in Aix, the hand of Mademoiselle de Margiane, an unamiable young lady, with prospects of large fortune. But his extravagant propensities soon involved him in a debt of 160,000 livres. His contentious and inflexible father took advantage of the embarrassments of his son, and obtained from the Châtelet in Paris, an interdict, by which he confined him to his estate. Here he published his *Essay on Despotism*. He soon after left his place of confinement, to avenge in insult offered to his sister; and a new *lettre de cachet* imprisoned him, in 1774, in the castle of If, from whence he was transferred to Joux, near Pontarlier, in 1775. Here he first beheld his Sophia,

the wife of the president Monnier, a man of advanced age. She was well affected towards him. His passion for her soon became extremely violent. But St Maurice, the commander of the fortress, was his rival. In order to escape from the persecutions of this man and his father, he fled to Dijon, whither his mistress followed. He was seized, and his father obtained new letters of arrest. Meanwhile M. de Malesherbes, who was then minister, and felt much good will for the young Mirabeau, gave him a hint to escape from the country. He fled to Switzerland, and Sophia rejoined him there. He then took refuge in Holland with his mistress. The offended husband entered a complaint for seduction. Mirabeau was condemned to death, and was decapitated in effigy. In Holland, he went under the name of *St Matthew*, and lived unnoticed with Sophia, his books, and some friends. During the years 1776 and 1777, he supported himself and his mistress altogether by his literary labours. Among other things, Mirabeau translated, in conjunction with Durival, Watson's History of Philippe II. Learning that his father accused him of the blackest offences, he avenged himself by sending abroad libels against him. His father now effected a violation of international law, and a police officer was sent to Holland, with letters of arrest, signed by Amelot and Vergennes. Mirabeau and his mistress were arrested, in 1777, without the consent of the Dutch governor. Mirabeau was incarcerated at Vincennes; but Sophia, being far advanced in pregnancy, was resigned to the inspection of the police. After her delivery of a daughter, she was conveyed to the convent of St Clara, at Gien. During an imprisonment of three years and a half, at Vincennes, Mirabeau wrote the celebrated *Lettres à Sophie*; *Lettres originales de Mirabeau* (1792, 4 vols.) Of these, *Lettres écrites du Donjon de Vincennes* (1777.—1780, 3 vols.), a new edition appeared in 1820. Their accent is passionate, and the style is various, flowing, and forcible. Mirabeau's health was much affected by his confinement, and under many bodily sufferings, he wrote, with the assistance of Calmet's Dictionary of the Bible, his *Erotica Biblica*, a very free picture of the excesses of physical love, among different nations, particularly the Jews. At the same time, he projected a grammar and a treatise on mythology, translated *Johannes Secundus*, and exposed the abuses of despotic authority in his energetic work on *Lettres de Cachet*. As he was denied paper, he tore out the blank leaves in the beginning and end of the books allowed him. He concealed the leaves in the lining of his clothes, and left the prison with the manuscript of his *Lettres de Cachet* thus sewed in. His long incarceration had wearied his persecutors. The judges also saw that the conduct of Mirabeau's father, whose own character was far from moral, could only proceed from revenge and hatred. The son was therefore released, in 1780, and seems to have become reconciled with his father, for he lived with him, and left the paternal mansion only to obtain the revocation of the sentence of death pronounced against him in Portarlier, in which he succeeded in 1782. At the same time, Sophia recovered her dowry and freedom. Mirabeau now returned to Provence, and tried to effect a reconciliation with his wife. But nothing could overcome the opposition of his wife's relatives. He therefore had recourse to the law, and a process took place which was honourable to neither party, and which his wife gained. Mirabeau now went to London. His letters show that his opinions respecting England were not, in general, very favourable. He wrote there the *Considérations sur l'Ordre de Cincinnati*—an order of which he disapproved, as the beginning of a military aristocracy in the United States of America. He

likewise wrote against the plan of Joseph II. to make the Scheldt free, and, against Linguet's famous work,—his *Doutes sur la Liberté de l'Escaut*. He was also a condutor in the French journal, published in London, *Le Courrier de l'Europe*. In his subsequent writings on the *Caisse d'Escompte*, the *Banque de St Charles*, the *Actions des Eaux*, he discussed the grounds of public credit, and of speculations in the public stocks, according to Adam Smith's principles, with much eloquence. This and the satirical portraits of famous persons, brought his works into repute. He nevertheless solicited in vain, of the minister of finance, Calonne, the office of consul in Dantzic or Hamburg. He now lived some months of 1786 in Berlin, and then went to Brunswick, but returned to Berlin in the same year, probably with secret commissions from his court. In Berlin he collected information and projected the plan of the ingenious, but far from faultless work, *De la Monarchie Prussienne*, which was executed by his friend Mauvillon. His description of Frederic II. is especially admired. In 1787, Mirabeau returned to France. Calonne having convoked the notables, Mirabeau brought out his *Dénonciation de l'Agiotage, au Roi et aux Notables*. The king, on account of the offensive character of this pamphlet, ordered the author to be imprisoned; but he escaped, and wrote a continuation of his *Dénonciation de l'Agiotage*. He now wrote his *Avis aux Bataves*. At that time there also appeared (von Dohm asserts, V. 409, without the consent of Mirabeau) the letters on the Prussian court, written in confidence to Calonne, entitled *Histoire secrète de la Cour de Berlin, ou Correspond. d'un Voyageur Français, depuis le 5 Juill. jusqu' au 19 Janv., 1787* (1789, 2 volumes.) This work was an indiscreet disclosure of his political manoeuvres, and was written in the tone of a libel. It excited general reprehension of a man so unscrupulous as to make of the secrets of hospitality, and the confidence of his friends and the government, an offering to the public appetite for scandal. The work was condemned, by the parliament, to be burnt by the common hangman. When the estates were actually convoked, he went to Provence for the purpose of being elected; but the noblesse of the province refused him a place among them, on the ground that none were entitled to it but the possessors of fiefs. He was now chosen, by acclamation, a deputy of the third estate, where he soon obtained an immense influence. The 23d of June was one of the most remarkable days of his political career. It was decisive of the fate of the monarchy. The king, after making important concessions in this memorable sitting, had ordered the assembly to separate. The assembly, however, remained together in their seats. The marquis of Brezé, master of ceremonies, came to remind the assembly of the orders of the monarch. Mirabeau, in the name of his colleagues, made the celebrated answer, "The commons of France have resolved to deliberate. We have listened to the king's exposition of the views which have been suggested to him; and you, who have no claim to be his organ in this assembly,—you, who have here no place, nor vote, nor right of speaking,—you are not the person to remind us of his discourse. Go, tell your master that we are here by the order of the people, and that nothing shall drive us hence but the bayonet." Mirabeau had already made an unsuccessful attempt to establish an understanding with the ministers, with a view of relieving the distracted state of his pecuniary affairs. Negotiations were afterwards entered into between him and the court. He required a pension of 40,000 francs a week, and the promise of such a diplomatic or ministerial post as he should select, after the re-establishment of the royal authority. These demands

were conceded, and he received the pension in several weeks. It was agreed that a declaration of the assembly should be effected by a statement of the will of the nation, and that a vote should be convoked, composed of men of moderate opinions. While the negotiations were going, Mirabeau redoubled his activity in the assembly and at the Jacobin club. Suspicion was entertained of his defection from the moderate party, and clamours had already been raised against him, when a fever closed his stormy life. The news of his decease was received with a mark of popular mourning: his funeral was celebrated with the utmost pomp. His body was deposited in the Pantheon, from which, however, it remains were taken and dispersed by the persons who then stigmatised him as a royalist. Mirabeau was the creature of his passions; the early success which had been imposed upon him, served only to inflame them; and, with all the resources of genius, a decision and energy of will which yielded to no position, an audacity of purpose which courted no difficulties, he united an insatiable ambition. His orations are collected in the work entitled *Discours prononcés par lui-même* (1791, 4 volumes), and in the *Collection compl. des Travaux de Mirabeau à l'Assemblée nationale par Méjan* (1791, etc.: 10 vols.) *Esprit de Mirabeau* (1804), *Lettres inédites de Mirabeau, publ. par l'Émigré* (Paris, 1816, 2 vols.), and *Œuvres oratoires* (complete, at Paris, 1814, 2 vols.) and *Œuvres choisies de Mirabeau* (Paris, 1817). Concerning his connexion with the count de Mirabeau of Mad. Campan (Paris, 1823, 3 vols.) contain some remarkable disclosures. The life of Mirabeau of the *Mémoires des Contemporains* (Paris 1825) consists of four parts, containing *Mémoires sur Mirabeau et son Époque, sa Vie littéraire et privée, etc.*

MIRACLE (Latin, *miraculum*, a wonder) is a prodigy; in the original Greek, *teras*, *teras* is usually defined to be a deviation from the usual nature, or an event in a given system which can be accounted for by the operation of any general principle in that system. But this definition would omit one of the elements of a miracle, viz. that it is an event produced by the interposition of an intelligent Power for moral purposes; for, otherwise we must consider every strange phenomenon, what knowledge will not permit us to explain, as a miraculous event. To the atheist, who does not admit the existence of a Supreme Intelligence, a miracle is an impossibility, a contradiction in terms. A miraculous event cannot, indeed, prove the existence of God, for it presupposes it; but it may prove the moral government of the world by the Deity, or the divine character of a communication which claims to come from him. It is in this light that we must consider miracles as the proofs of a revelation, and, in fact, a revelation is itself a miracle. If one claims to be a teacher from God, he asserts a communication with God: this communication, however, cannot be visible, and visible miracles may therefore be necessary to give credibility to his pretensions. Those who deny the possibility of miracles, a revelation is impossible. The use, then, of a miraculous interposition in changing the usual course of nature to prove the moral government of God, and to attest the character of it. As to the nature of miraculous events, we may distinguish those which do not appear supernatural in themselves, but are rendered so by the manner in which they are produced, as cures of diseases by a touch or a word, and those which are supernatural in themselves, as in the burning of the sun, which was not consumed, the stopping of the course of the sun, &c. In proof of miracles, however, we must have recourse to the same kind of evidence

s that by which we determine the truth of historical accounts in general; for, though miracles, in consequence of their extraordinary nature, challenge a fuller and more accurate investigation, still they do not admit an investigation conducted on different principles, testimony being the only assignable medium of proof for past events of any kind. While some writers have entirely denied the possibility of miracles, others have, with the same result, denied the possibility of proving the occurrence of a miracle. Hume's argument on this point is, that it is contrary to experience that a miracle should be true, but it is not contrary to experience that testimony should be false: it is therefore more improbable that the miracle should be true than that the testimony should be false. Without dwelling on the ambiguity of the expression "contrary to experience," it may be replied that the improbability arising from a *want of experience* of such events is only equal to the probability of their repetition, this being the precise measure of the improbability of their performance. To assert that, because miracles have occurred, they ought to occur again, or frequently, is to render a miracle impossible; for an event which is frequently occurring would cease to be a miracle. The existence of a Supreme Intelligence being allowed, the infrequency of miracles, or their being against our experience, is no argument against their occurrence. Hume asserts that a miracle is a contest of improbabilities; and there is no need of denying this assertion, as is usually done: the improbability of a miracle is weakened by considering it an event in the moral system of the universe—not a causeless phenomenon, or a useless violation of nature; and the improbability that the testimony to it should be false is strengthened by the publicity of the event, the intelligence and honesty of the witnesses, the consideration of the results which followed it, &c. Further than this, the testimony, under these circumstances, is a fact which it is more easy to account for by allowing the event testified of to have actually taken place, than to have recourse to any other hypothesis. In examining the different objections which have been urged against miracles, it will be seen that they arise, in general, from a neglect of the existence of a moral system: when it is objected that they are against the *usual course of nature*, that is, against all we know of the government of God, it is forgotten that they are entirely in accordance with his moral government, and that experience as fully proves the existence and nature, as plainly teaches the character, of this government, as of the physical system of the world. Most of the miracles, of which history is full, may, indeed, be put aside from want of sufficient testimony, from their being useless, unnecessary, or even unworthy of a wise and good Being, from the circumstance that the workers of them did not lay any claim to divine agency, from their having been without results, &c. We may also reject those which are referrible to false perceptions; those which are merely tentative, that is, belonging to a series of attempts of which some were unsuccessful; those which are doubtful in their nature; those which are merely exaggerations of natural events, &c., especially if they are unconnected with others of a different character, or with moral effects; so miracles which are in support of an established creed, pretended to be wrought by men vested with a divine character in the presence of credulous devotees, if they do not belong to any of those above cited, are to be looked upon with suspicion. But, when miraculous powers are claimed to be exerted by the opponents of what is established in public opinion and supported by public authority, in the face of opposition and incredulity, by men without influence or friends, and

when they convince and confound their bitterest enemies, and produce a change in their lives and characters as a proof of their conversion,—when these witnesses, with no interested motives, but with the certain prospect of suffering and persecution, come forward and testify their belief, and when all these results are declared to have been produced to prove the divine origin of doctrines calculated to elevate humanity, and the divine mission of teachers, who spoke as no man had ever before spoken,—we are not surely to refer these to the illusions of credulity, or the jugglings of imposture. It is not possible, in a work of this nature, to go into a minute examination of particulars. The subject is fully and ably treated in Campbell's Dissertation on Miracles, in Reply to Hume; in Paley's Evidences of Christianity; in Butler's Analogy of Natural and Revealed Religion, and numerous other works.

MIRAGE; an optical phenomenon, produced by refraction. The unusual elevation or apparent approximation of coasts, mountains, ships, and other objects, has long been known under the name of *looming*; and, if the same phenomenon is accompanied by inverted images, it is called a *mirage*. The mirage is frequently observed on the surface of the sea by sailors, and on dry sandy plains, as in those of Egypt, where it was repeatedly seen by the French, during their campaign in that country. The appearance presented is that of a double image of the object in the air; one of the images being in the natural position, the other inverted, so as to resemble a natural object and its inverted image in the water. It may be produced whenever the rays of light meet in an oblique direction, the surface of a less refracting medium than that in which they were previously moving: they are thus turned back into the original medium in the same direction in which they would be impelled by reflection taking place at the common surface of the two mediums. The surface of the earth or sea, becoming heated, communicates a portion of its caloric to the superincumbent layer of air, which thus becomes less dense than the superior layers. The rays of light which proceed from an object in the heated layer will then be bent downward, and thus arrive at the end in such a direction as to cause the object to appear above its actual position. In the desert, where the surface is perfectly level, a plain thus assumes the appearance of a lake, reflecting the shadows of objects within and around it, and the thirsty traveller is often tantalized with this appearance, which recedes, as, by approaching it, he changes the angle of direction of the rays which enter his eye. The mirage is commonly vertical, that is, presenting the appearance above-described of one object over another, like a ship above its shadow in the water. Sometimes, however, the images are horizontal. On the surface of the sea, the phenomenon may also be produced by the difference of moisture in the layer of air in contact with the water and the superior layer. See *Optics*.

MIRANDA, DON FRANCISCO, the earliest martyr of freedom in Spanish America, was born at Caracas, of an ancient Spanish family. His grandfather was governor of the province of Caracas. At the age of twenty, he travelled through a great part of America on foot, and afterwards received the commission of colonel in the Spanish service. The governor of Guatemala employed him on several important occasions. In 1783, he visited the United States of North America, and then travelled on foot through Britain, France, Italy, and Spain, against which he cherished the bitterest hatred. In 1789, he was at Petersburg, and Catharine endeavoured to engage him in her service, but the events in France drew him to Paris. Here he was employed on a mission to Pitt, and,

through Péthion's influence, was appointed major-general. Under Dumouriez, he was second in command in Champagne and Belgium, and his skill as an engineer and tactician, united with his uncommon talents, obtained for him the esteem of the republicans in Paris, as well as the respect of the army. When Dumouriez entered Holland, Miranda was directed to besiege Maestricht, but, being unsupported by general Valence, was obliged to abandon the siege. In the battle of Neerwinden, he commanded the left wing: Dumouriez imputed to him the loss of the battle; but the charge was refuted by Miranda, in an able and ingenious defence. Dumouriez and Miranda had both declared against the Jacobins; but the former now became an object of suspicion to Miranda, who communicated his fears to his friend Péthion, then a member of the committee of public safety, and Miranda was ordered to arrest the commander. (See *Dumouriez*.) The Girondists, however, soon fell before the Mountain party, and Miranda was obliged to appear before the revolutionary tribunal. He was not convicted of the charges brought against him, and the fall of Robespierre delivered him from prison. Having, however, become suspected by the directory, he was again thrown into prison, and, in 1797, was condemned to transportation, but fled to England. In 1803, he returned to Paris, and was again banished, for taking part in an opposition to the first consul. General Miranda now devoted himself, with all the energy of his character, to the accomplishment of his long cherished scheme of overthrowing the Spanish dominion in America. Having procured some secret assistance, he sailed from New York in 1806, with one ship and a number of volunteers, and touched at St Domingo, where he chartered two schooners. On arriving off the coast, the two latter were captured by Spanish *guardacostas*, and he was obliged to escape with his ship. In August, he landed in Venezuela; but his attempts to rouse the inhabitants were altogether unsuccessful, and he found himself compelled to re-embark. In 1810, he renewed his attempt with more success (see *Colombia*), but was finally obliged to capitulate to the Spanish general Monteverde, who, in violation of the articles of his surrender, treated him as a prisoner. Miranda was sent to Spain, and confined in the dungeons of the inquisition at Cadiz, where he died, after four years' imprisonment. The monks caused his body to be thrown out without burial. Miranda was a man of great energy and sagacity, full of resources, bold, active, and intelligent.

MIRANDOLA, GIOVANNI PICO DELLA, count and prince of Concordia, surnamed the *Phoenix*, one of the brightest ornaments of literature at the time of the revival of letters, born in 1463, was the youngest son of Gianfrancesco della Mirandola and Julia, of the noble family of Boiardo. His youth was marked by an early display of talent, and, being destined for the church, he was placed at Bologna, to pursue the study of the canon law, at the age of fourteen years. Two years were spent in this course, when his growing repugnance to the study, and his inclination to philosophical and scientific subjects, led him to visit the different parts of Italy and France for the purpose of observation, and to attend the most celebrated schools and most distinguished professors. After seven years of the most assiduous application, he went to Rome, and, in 1486, proposed 900 theses on all subjects, which he declared himself ready to defend, according to the custom of the times, in public. He challenged all the learned from all countries to dispute with him, and offered to pay the expenses of the journey to those who came from a distance. No one ventured to appear against him,

and the envious endeavoured to suppress him as a charge of heresy. Mirandola repudiated the charge in his *Apologia*, a work full of profound erudition. To deprive his enemies of every ground for their accusations, he determined, although at variance to love and its pleasures, to lead the most quiet course of life, and to devote himself to letters. In consequence of this resolution, he threw into the fire five books of summary poems, the loss of which is much to be regretted. Two of his writings on this subject have been preserved, except a commentary on a comment of Cosimo Benivieni, in which he follows the notions of the New Platonists in respect to love. Having now applied himself to the study of biblical literature, he published the fruits in his *Hypotyposis*, a mystical cabalistic explanation of the history of the world, in which he derives Plato's doctrines from them. Two years after, he published a treatise on the doctors—*De Ente et Uno*—in which he aimed to set the opinions of Plato and Aristotle. Mirandola died at Florence, in 1494, where he had lived with us in terms of intimacy with some of the most learned and distinguished men of the age, particularly Lorenzo de' Medici and Politian. At the time of his death, he was employed in great literary exertions, to which his treatise against astrology may be considered as preparatory. He was considered to be contemporaries a miracle of learning and power. Paolo Giovio says that the immortal soul had been in him all rare gifts of mind and body. In justice of his works, it is necessary, however, to remember the state of letters at the time when he lived. His nephew Gianfrancesco Pico was a disciple of his, but not equal to his master.

MIRE, NOEL DE; a good engraver of books, among whose works are ornaments appearing accompanying the writings of Rousseau, Voltaire, Racine, and Lafontaine. His last work was part of the beautiful *Galerie de Florence* directed in 1811.

MIREVELT, MICHAEL JAMES, a famous portrait painter, born at Delft, in 1540, was the son of a goldsmith. He first intended to become an engraver under Wierinx, but, at a later period, turned to the art of painting under a painter named Blockland. He is said to have painted 10,000 portraits, and to have received a high price for them. Mirrevelt was a Memnonite, of a very amiable disposition. He died in his native city, in 1641. His eldest son, Peter Mirrevelt, is also esteemed as a painter.

MIRIAM, the sister of Moses, devoted to the brew women in their rejoicings after the passage of the Red sea. Having spoken against him on account of his marriage with an Egyptian woman, she was struck with leprosy, and died on the camp seven days. (*Num. xx.*) She died at Kadesh. (*Id. xx. i.*)

MIRKHOND, or MIRCHOND. See *Persian Literature*.

MIRROR. Mirrors are surfaces of polished metal or glass silvered on its posterior side, capable of reflecting the rays of light from objects presented before them, and exhibiting to us their size. There are three classes of mirrors, distinguished by the figure of their reflecting surface, they are plane, concave, and convex. The reflection of light by either of these mirrors observes the condition that the angle which the incident ray makes with the reflecting surface is equal to the angle of reflection. When a person views himself in a looking glass, if he measures the size of which he appears in the glass, the image will always be one half the magnitude: for, as the image appears behind the glass exactly at the distance of the object before, the mirror will be half way between the person and

is image; so that it will cut across the cone which comes from his image to his eye, half way between its base and its apex; the base of the cone is the image seen, the apex is at the pupil of the eye, where all the rays from the image are united in a point. Concave mirrors are those whose polished surfaces are spherically hollow. The properties of these mirrors may be easily understood, when we consider their surface as composed of an indefinite number of small planes, all of which make a determinate angle with each other, so as to throw all the rays to a point. This point is called the *focus* of the mirror, where an image of the object will be formed in an inverted position. The distance of this focal point from the surface of the mirror when the curvature is moderate, will be equal to half its radius. Concave mirrors are of great importance in the construction of reflecting telescopes, in which they are commonly called *specula*. (See *Telescopes*.) The employment of concave mirrors in collecting the heat of the sun's rays from the whole of its surface to a single point, thus accumulating a very great degree of heat, for the combustion and fusion of various natural substances that are infusible in the greatest heat capable of being produced from ordinary fire, may be exemplified, among those of modern date, by the burning mirror of M. de Vilette. The diameter of this aërial speculum was three feet eleven inches, and the distance of its focus from the surface was three feet two inches. The composition of this metal was of iron and copper, which reflects the light very powerfully, and is capable of a high degree of polish. When exposed to the rays of the sun, by doctors Larris and Desaguliers, a silver sixpence was melted in seven and a half seconds when placed in its focus. A copper half-penny was melted in sixteen seconds, and liquefied in thirty-four seconds; tin was melted in three seconds, and a diamond, weighing four grains, lost seven-eighths of its weight. The intensity of heat obtained by burning mirrors or lenses, will always be as the area of the reflecting surface exposed to the sun is to the area of the small circle of light collected in its focus; thus the diameter of the spot of light at the focus of Vilette's mirror, was  $\frac{1}{358}$  of an inch, and the diameter of the mirror, thirty-seven inches: hence the area of these circles was as  $0.358^2$  to  $47^2$ , that is, the intensity of the sun's rays was increased 17,257 times at the focal point. The loss of light occasioned in passing through the medium of which the lens is composed, together with that lost by reflection from the surface of mirrors, must, however, be deducted from this theoretical calculation. (For further information, see *Burning Mirrors*.) Concave mirrors afford many curious illustrations of their peculiar properties; for example, when a person stands in front of a concave mirror, a little further from its surface than its focus or half the radius of its concavity, he will observe his own image pendent in the air before him, and in an inverted position. This image will advance and recede with him; and, if he stretch out his hand, the image will do the like. Exhibitions have been brought before the public, in which a singular deception was obtained by a large concave mirror. A man being placed with his head downwards, an erect image of him was exhibited in its focus, while his real person was concealed, and the place of the mirror darkened: the spectators were then directed to take a plate of fruit from his hand, which, in an instant, was dexterously changed for a dagger, or some other dangerous weapon. Convex mirrors are chiefly employed as ornaments in apartments. The objects viewed in these are diminished, but seen in an erect position. The images appear to emanate from a point behind the mirror: this point, which is

its focus, will be half the radius of convexity behind their surface, and is called the *negative* or *imaginary* focus, because the rays are not actually collected as by a concave mirror, whose focus is called *real*.\*

In the earlier periods, with which history makes us acquainted, mirrors were made of metal: the Egyptians, Greeks, and Romans made use of metallic mirrors. Pliny, in his natural history, also mentions the use of obsidian for this purpose. Gold and silver, highly polished, were employed by the Romans for mirrors, which were richly ornamented with precious stones. The forms were various, but most commonly oval or round.

MISCHNA, or MISNA; the code or collection of the civil law of the Jews. The Jews pretend that, when God gave the written law to Moses, he gave him also another, not written, which was preserved by tradition among the doctors of the synagogue, till rabbi Juda, surnamed the *Holy*, seeing the danger they were in, through their dispersion, of departing from the tradition of their fathers, reduced it to writing. The Misna is divided into six parts: the first relates to the distinction of seeds in a field, to trees, fruits, tithes, &c.; the second regulates the manner of observing festivals; the third treats of women and matrimonial cases; the fourth, of losses in trade, &c.; the fifth is on oblations, sacrifices, &c.; and the sixth treats of the several sorts of purification. See *Talmud*.

MISDEMEANOUR, in law; a crime of a lower nature. *Crimes* and *misdeameanours*, properly speaking, are mere synonymous terms, though, in common usage, the word *crime* is made to denote such offences as are of a deeper and more atrocious dye; while smaller faults and omissions of less consequence, are comprised under the gentler name of *misdeameanours* only.

MISERERE (Latin, *have mercy*); the name of a celebrated church song, taken from the fifty-seventh psalm, beginning, in the Vulgate, *Miserere mei, Domine*. The *miserere* forms part of certain liturgies, and various great composers have taken it as a subject. The *miserere* of Allegri is particularly famous; and this alone, sung by the papal choir, in the *capella Sistina*, in the Passion week, would repay the trouble of a visit to the "eternal city."

*Miserere* is also the name given to pictures representing the dying Saviour.

A terrible disease, produced by an obstruction of the bowels, is also called by this name.

MISERICORDIA (mercy; in Greek,  $\mu\iota\sigma\epsilon\rho\iota\alpha$ ) was personified as a deity. She had a celebrated altar in the market-place of Athens, constituting an asylum.

*Misericordias Domini* is the name given to the second Sunday after Easter, because the mass for this day begins with *Misericordias Domini cantabo in æternum*.

*Misericorde* (French) was also the name of the dagger of the knights in the middle ages. Fauchet derives its names from its putting men out of pain when irrecoverably wounded, or from the sight of it causing the vanquished to cry out for mercy.

MISHNA. See *Mischna*.

MISITRA, or MISTRA; a city of Greece, in the Morea, capital of the department of Laconia. It lies nearly a league from the ruins of Sparta, which have supplied materials for its construction. Before the Egyptian expedition to the Morea, it contained 6000 inhabitants and several churches, literary institutions and manufactories; it is now a heap of ruins, inhabited by about 150 families.

\* The reflecting surface of a cylinder has been occasionally used in optical amusements for giving to *anamorphoses* (distorted or deformed pictures) regular shapes, when reflected from such surface.

n Pekin, except the mathematicians, physicians, and artists in the service of the court. Besides the seven provinces which belong to these three bishoprics, there are other provinces of the Chinese empire belonging to the mission of the *évêques vicaires apostoliques*. Of the state of the Catholic mission in the East Indies, the abbé Dubois, a French missionary, in his *Letters on the State of Christianity in India*, &c., gives a not very encouraging account. Christianity appears to have made more progress in East Tonquin, where there are 780 churches and eighty-even monasteries. China and Tonquin together contain 380,000 Christians. According to the missionary reports up to Sept. 24, 1824, there were in China alone 46,287 Christians, twenty-six Chinese and three European priests, and twenty-nine schools for boys, and forty-five for girls. In 1824, a seminary was also instituted, in which twelve scholars are taught Latin. The Russian ecclesiastical mission, established in China in 1727, is not intended for the conversion of the Chinese, but for the instruction of young Russian clergymen in the Chinese language. In 1822, a new Catholic mission was instituted in Tibet. A princess, whom an Italian had converted to Christianity, appointed him her first minister, and requested of the *Propaganda* eighty missionaries for her conversion of her subjects. Five Capuchins were accordingly sent. The splendour of the Catholic worship attracted and won over the gentle and ignorant children of nature in Brasil, Mexico, the countries lying on the Andes, and Paraguay, and several missions have, therefore, been introduced here. The new republics propose to restore them as schools. The Catholic church has also shown great zeal in endeavours to win back the favour of the people, and to restore the lost influence of the church in revolutionized France and Italy. The *heocratic faction*, as it was called, which included state and church in its plans of reform, co-operated in these attempts. Preparatory to the jubilee year 1825, there were missions in Rome, which were devoted to religious exercises, and which proclaimed absolutism. According to the *Almanac du Clergé de France pour l'An 1824*, a congregation of missions was established in France as early as 1816, which, unlike the old French seminary for foreign missions (in China, Cochinchina, Tonquin, Siam, and Pondicherry), was destined solely to restore the Roman Catholic religion in France to its former importance. Besides this, there was a *congrégation du St Esprit*, destined for the service of the hospitals and missions. For this domestic mission in France, a *maison principale*, with a seminary for novices, was instituted, which, in some dioceses, furnished priests to the destitute parishes. To accomplish, at the same time, a political and religious restoration, a crowd of Jesuits had entered France with the Bourbons; they were called *pères de la foi*; they educated a great number of pupils, not only in theology, but in other branches of knowledge, and, by this means, kindled a religious enthusiasm, which, in some instances, amounted to fanaticism. In the seminary of St Sulpice, at Issy, near Paris, such enthusiasts were educated as missionaries. They lived by the most rigid rules, and studied with great fervour. As the *fathers of the faith* could procure little aid from the bishops in general, they formed a sort of separate church, and depended upon the *aumonerie*, which was restored much upon the same footing on which it existed under Louis XVI. The friends of this religious connexion took advantage of that tendency to mysticism which prevailed in Europe, and which was principally observed among the women—a consequence of the revolution, which shook many weak minds. The missionaries sent by the congregation

were often merely fanatical preachers of repentance, and made the greatest impression on the female sex. Their religious exercises, in the churches at Paris and other places, repeatedly produced great disturbance of the public peace. In 1824, the number of missionaries in their 372 chapels amounted to 379. These *pères de la foi* were enemies of the charter (because it established religious toleration), of a representative government, and even of the Gallican church. The provincial of the Jesuits, at Paris, who had a college in the village of Mont Rouge, near Paris, exercised a sort of secret spiritual government, which extended over several provinces of the kingdom, principally the southern and western, and was connected with the Spanish apostolical junta.—Upon the state of the Catholic missions, see the *Choix des Lettres édifiantes écrites des Missions étrangères* (2d. edit. of the above-cited *Lettres édific.*, &c., Paris, 1824). They consist chiefly of geographical, historical, political, and literary information, relative to the missionary countries, China, India, the Levant, and America.

Among the Protestants who have distinguished themselves in the work of missions, are the British, the Danes, and the Germans. In 1699, the Society for promoting Christian Knowledge was founded in England; and, in 1701, the Society for the Propagation of Christianity in Foreign Parts. In 1704, the richly endowed Royal Danish Missionary Society was founded by Frederic IV., which still continues its exertions at Tranquebar, on the Coromandel coast, and in whose service Knapp, Ziegenbalg, Franke, and others, distinguished themselves. Franke, in Halle, took the first steps towards the education of missionaries; Ziegenbalg established the first society in 1707; and the first report appeared at Halle, in 1718. In 1794, the Society for the Conversion of Negro Slaves in the West Indies was established, among whose undertakings the sending of Christian preachers to Southern Africa and Australia is particularly worthy of note. The United Brethren began their missions in 1732, and soon sent missionaries into all parts of the world. Missionaries have not only been sent to the heathen, but also to ignorant and mistaken Christians; and the whole system has, undoubtedly, contributed much to the diffusion of the gospel, though it cannot be denied that, in the choice of persons and means of instruction, and in the objects proposed and the institutions founded, many mistakes have been committed, through partial views or misdirected zeal. As the British find Christianity the most effectual means of civilization, particularly in their colonies, the government has aided the missionary societies in their objects. Among the religious associations in Great Britain, which collect yearly about £400,000 by voluntary contributions, are the following: 1. The London Missionary Society, founded 1795, which has 253 branches in all parts of the world. 2. The Church Missionary Society, for Africa and the East, which supports eighty missionaries in forty-five places. 3. The Society for the Propagation of the Gospel in Foreign Parts, which has confined itself principally to North America, and employed, in 1823, above eighty missionaries. 4. The London Auxiliary Society in Aid of the Baptist Highland Mission. 5. The Home Missionary Society, founded in 1819, has twenty-five missionaries preaching in 206 villages; fifty Sunday schools, containing 2868 children; and labours to form village libraries. This society was very necessary, as there were found to be 314 villages with 110,344 souls, in England, destitute of religious instruction. 6. The London Association in aid of the Moravian Missions, which employs 161 missionaries. 7. The Wesleyan Methodist Mission-

ary Society, which has more than fifty regular missionaries, and above 25,100 proselytes, principally among the slaves in the colonies. Its schools contain above 8000 children. It also maintains missionaries at Paris, and in the south of France. 8. The Baptist Missionary Society (1792) has more than 10,000 children, in the East Indies, under its direction. 9. The Missionary and Tract Society of the New Jerusalem Church, founded in 1821. 10. Continental Society incorporated in 1818; they have eleven missions. 11. A London Society for promoting Christianity among the Jews, which sends missionaries to Poland and Holland; and a Ladies' Missionary Society instituted for similar purposes, which has twelve missionaries, among whom are five converted Jews. The former has in its service a German, Joseph Wolf, of Halle, descended from Jewish parents, who was converted to the Catholic church, instructed in Tübingen, and at Rome, in the *Seminarium Romanum*, where, having expressed doubts of the infallibility of the pope, he was thrown into prison: he then left the Roman Catholic church, and, without acknowledging himself a member of any established church, entered, under the character of a Biblical Christian, into the service of this society, which sent him to Asia: at Bassora, he had discussions with the Sabians, or Christians of St John, which are printed in the Jewish Expositor. 12. The Edinburgh Missionary Society, founded 1796, has missions in Tartary, and in the Susoo country, in the neighbourhood of Sierra Leone. From 1701 to 1817, 11 missionary societies (5 in England, 1 in Scotland; 1 in Denmark; 1 in Germany—that of the United Brethren; 3 in the United States) founded 10 missions, which, in 1819, occupied 439 missionaries, most of whom belonged to the United Brethren, and 303 of whom were supported by the British societies, 85 by the German, and 37 by the societies in the United States. They also supported a great number of physicians, farmers, labourers, and their families. More than 150 missionaries laboured in Asia, above 70 in Africa, and above 200 in America. In 1824, the whole number of missionaries exceeded 500, of whom 370 were supported by the British. In Paris, the Calvinistic and Lutheran churches united to form a missionary society. Their object, however, has been not so much the conversion of the heathen as the instruction of poor children, and they have already opened schools for several thousand children. In Germany, where the United Brethren educate most of the missionaries for their own and other missions, there are also societies for the education of missionaries in Berlin, Basle, and other places, which obtain their funds for instruction by voluntary contributions. The Berlin Missionary Union, established by the king of Prussia in November, 1823, numbered then above 300 contributors. The British societies also support an institution for the education of missionaries at Sierra Leone. Among the means by which missionary societies aim to accomplish their objects, one is the translation and distribution of the Bible. See *Bible Societies*.

Although the judgment of the missionaries, especially in the East Indies, has not always been equal to their zeal, yet the vital power of Christianity has displayed itself in an extraordinary manner in many countries. The inhabitants of the Society islands, particularly those of Otaheite, have embraced Christianity, and much progress has also been made in the Sandwich islands by the American and British missionaries, and books have been published in their language. Similar results have attended the labours of the Wesleyan Methodists in the East Indies, as, for instance, at Trincomalee and Colombo, on the

island of Ceylon. A school has been established to them, for the gratuitous instruction of poor native children. Among the most active promoters of Christian civilization, in the British East Indies, is the establishment of missions and schools, by the Middleton, bishop of Calcutta, who died in 1822. Different sects have supported missions in the same places, as, for instance, in Madras, Amoy, and Bombay, without any interruption from sectarian disputes, and have assisted one another with the utmost cordiality. For the better promotion of their common object, the Danish East India company has even given up to the British Society for the Promotion of Christian Knowledge, eleven missions of native Christians about Tranquebar, an establishment which the Danish missionary Schwartz had long been active. The British Bengal Missionary Society is also been very active in the East Indies. According to its fifth report (1823), it had erected four churches and schools. Attached to one of the stations there is a printing-office, at which 117,000 copies of a Holy Scriptures in English and the native languages have been printed at the expense of the society. The condition of the chief Danish missionary station at Serampore, in Bengal, on the Hooghly, once attended particularly to the instruction of Indian and Mussulman boys, is represented to be favourable. From their printing office, translations of the whole or parts of the Holy Scriptures have been issued in twenty-seven languages of Central India. Among the British missionaries at Serampore, Marsden, a celebrated author of the *Climate of India*, has particularly distinguished himself by his researches in Hindoo literature. The great number of languages, especially in Malabar, is a great impediment to the success of the missionaries, who, it is doubted, should be able to operate by precept as well as by example; and many local obstacles—the power of the Bramins, the division into castes, &c.—are the impediments in their way; but their zeal, and the simplicity of their lives, tend to improve the character of the natives. Of South Africa, where the chief missionary station (since 1802) is situated at Grahamstown, where the United Brethren now support missions in three places (see *Lalrede*), an agent of the Free Missionary Society—Campbell—has given account (London, 1815). Missionaries have constantly laboured with their main object an attention to the ethnography and geography of the country, which earned the highest commendation—such as Latham in North America, and the Danish missionary Malmgren, who was in Africa from 1806 to 1809, and published *Materials for a Description of the Country of Nama* (Copenhagen, 1822). The missionaries here have rendered great service to the study of languages, as for example, in the work of Blumenthal respecting the missionary school at Basle, *Comparative Observations upon the Connexion between the Indian Languages, which are almost all related to the Sanscrit* (Basle, 1819). In the conversion of the South Sea Islanders, the American and British missionaries have been very successful. The spiritan hunter Christian Australia, Maraden, is one of the most intelligent missionaries. He does not attempt to convert savages without preparation, but prepares for their instruction, and endeavours to guard against the new vices which attend the beginnings of civilization. See *New South Wales*, and *New Zealand*.

Among the latest missions of the United States (see *United Brethren*, and *Grinnell*), that established among the Calmeck tribes deserves to be mentioned. They sent two missionaries, East and Schill, from Sarepta, in 1823, to the Calmeck among whom, by the aid of the Russian Bible Society (which caused the Bible to be translated

Calmuck), they distributed the Holy Scriptures. Their report is given in the *Biblical Journal*, published at Petersburg (1824). The great opposition of the Calmuck priests, however, induced the khans to threaten an emigration, and the mission was given up from political views. On the other hand, the missionary Carruthers exerted himself, with great zeal, in the conversion of the Tartars in the Crimea, and a new station has been established on the Caucasus. The whole number of missions of the United Brethren cost, in 1823, between seven and eight thousand pounds, besides the support of fifty-five retired missionaries and fifty-three children. The society receives the largest contributions from Holland, Denmark, and Sweden.

Concerning the conversion of the Jews to Christianity, in London, Berlin, Petersburg, Dresden, Breslau, Minden, Königsberg, Posen, &c., the first public report of the Berlin Society, established in 1822, appeared in 1824. It has issued a stereotype edition of the New Testament, in the Hebrew language, and sent a missionary to the Polish Jews, who had succeeded in gaining attention in more than one synagogue.

There are, at present, in Germany, above thirty missionary and auxiliary missionary societies, which are connected with the missionary society of Basle. The Basle society issues a lithographed correspondence; other societies, at Hamburg, Leipsic, Berlin, &c., publish yearly reports; and others, as at Stuttgart and Königsberg in Prussia, publish missionary journals. In St Gall there is a ladies' missionary society. The great missionary school established at Basle (1816) not only educates the pupils (of whom, in 1824, there were thirty-three, in four classes, instructed in all departments of theology; in the explanation of scriptural passages from the Hebrew and Greek; in the Latin, English, and Arabic tongues; in the comparison of the Koran with the precepts of the Bible; in geography, arithmetic, geometry, and astronomy; in rhetoric, singing, and drawing) for the British and Dutch missions, but has, also, since 1822, maintained missionaries at its own expense, at the stations on the Caspian and Black seas. One of these missionaries, Aug. Dietrich, has undertaken, with Mr Macpherson, the superintendence of the Persian translation of the New Testament, and has also superintended the publication of several biblical extracts and precepts into the Persian language, and translated the work of Grotius on the truth of the Christian religion into Arabic. The missionary school established at Berlin, under the direction of the preacher Janicke (1800), has already sent more than twenty pupils to the East Indies, Sierra Leone, and the Cape. The Russian government has employed, in the German colonies planted about thirty years ago, from Odessa to Gandscha in Georgia, and Astracan, missionaries from Basle, as colonial preachers, who have the spiritual charge of the Germans, and endeavour likewise to operate on the adherents of the old Eastern sects, particularly the Armenians, and to gain access to the Mohammedans among the Persians. The translation of the New Testament into modern Persian, by the missionary Martin, has been distributed, and eagerly, but secretly read. To effect these objects, the Russian emperors have conferred privileges, not only on the Scottish missionary colonies at Kara, but also on the evangelical missionary colony established (1822) in the Caucasian village of Schuschi, principally inhabited by Armenians. The Moravian United Brethren now employ 171 preachers of the gospel, in thirty-three missions in the West Indies, North America, and South Africa. According to the seventy-second number of the *Transactions of the*

Evangelical Missionary Societies in the East Indies, there are now upon the main land of India forty-nine missions, twelve on Ceylon, and three on other islands. In Ceylon there are seventy-five missionary schools, with more than 4000 scholars.

The principal missionary societies in the United States are the following; American Board of Foreign Missions, founded in 1810; income, in 1829—30, 106,928 dollars: American Baptist Board of Foreign Missions, founded in 1814; income, 1830, 12,000 dollars: Board of Missions of the General Assembly, founded 1818; income, 1830, 12,632 dollars: Methodist Missionary Society (1819), income, 1830, 13,128 dollars: American Home Missionary Society (1826), income, 1830, 33,229 dollars. The whole income of the various Missionary, Tract, Education, and Bible societies, for 1830, was about 500,000 dollars. The American Board of Foreign Missions has six stations in India, one at Canton, four in the Mediterranean, six in the Sandwich islands, and thirty-five among the Indians of the United States, employing fifty-nine missionaries, and 175 assistant missionaries. The board has printing establishments at Bombay, Malta, and in the Sandwich islands, from which the Bible has been issued in eleven languages. The number of scholars in their schools is 47,550. The expenditure during the twenty years from its foundation was 915,750 dollars. The annual reports of the different societies contain all the necessary information relative to their means and success. Besides the works already referred to in the article, the reader may consult Lord's *History of Missions*, and Brown's *History of the Propagation of Christianity*.

MISSISSIPPI, the largest river of the United States of America, and one of the largest in the world, rises in about lat. 49°, and lon. 96° 47', and flows south-south-east till it falls into the gulf of Mexico, in lat. 29° 6', and lon. 89° 30'. The length is usually given at 3000 miles; some make it less. We speak without reference to the great branch of it called *Missouri*. The country in which the most northern branches of the Mississippi have their rise, is an elevated table land, abounding with marshes and lakes, that are filled with wild rice. From the same plateau flow the numerous branches of Red river and other streams, which fall into lake Winnipeck, and thence flow into Hudson's bay. It is not easy to decide which of the numerous small lakes of this table land should be honoured as the principal source of the Mississippi, for travellers are not agreed in determining which of the numerous streams flowing from these lakes is the main river. We follow Mr Schoolcraft's map in giving the latitude and longitude of La Bush lake to the extreme source of the Mississippi. After a winding course of nearly 700 miles, its waters are precipitated over St Anthony's falls, a cataract of sixteen or seventeen feet perpendicular. About twelve miles above these falls, it receives St Peter's river from the west, which is regarded by some as the principal river. The width of the Mississippi, for twelve miles above St Anthony's falls, is about half a mile. Below the falls, it is contracted, for some distance, to 200 yards. The large and navigable tributaries which it afterwards receives, are so numerous that we can only mention a few of the principal. About latitude 44°, the St Croix comes in from the east, said to be navigable by boats 200 miles. In 42°, the Wisconsin, also from the east, opens an easy communication with the waters which flow into lake Michigan. Near 40°, on the west side, is the Des Moines, 150 yards wide, and navigable by boats for a great distance. In 39° enters the Illinois from the east, 400 yards wide, navigable by boats for more than 300 miles. A little below 39°, the mighty Missouri comes in from the

west, which is both longer and broader than the Mississippi above their junction, and imparts its own character to the stream below. In  $38^{\circ}$ , the Kaskaskias enters from the east, which traverses a most delightful country, and is navigable more than 100 miles. Between  $37^{\circ}$  and  $36^{\circ}$ , the magnificent Ohio also comes in from the east. This is much the largest eastern branch. On the west side, between  $35^{\circ}$  and  $34^{\circ}$ , is the St Francis, which is 200 yards wide, and is supposed to be navigable 300 miles. White river enters on the same side, in about  $34^{\circ}$ , and is supposed to be 1200 miles long. Between  $34^{\circ}$  and  $33^{\circ}$ , the Arkansas comes also from the west. It is 500 yards wide, and supposed to be 2500 miles long. Between  $33^{\circ}$  and  $32^{\circ}$  is the Yazoo, on the eastern side, between 200 and 300 yards wide. A little above  $31^{\circ}$ , the Red river comes in from the west. It is nearly as long, and brings as much water as the Arkansas. Here the Mississippi carries its greatest volume of water. Even above the Red river, in high floods, water escapes from the Mississippi on the west side, in many places, which never returns; and below Red river, there are many and large outlets, but no considerable streams flowing into it. Only four or five miles below Red river, the Atchafalaya carries off, at some seasons, as much water as the Red river brings in. A little below the town of Baton Rouge, on the eastern side, flows out bayou Manshac, or Iberville river, and passes through lakes Maurepas, Ponchartrain, and Borgne, to the gulf of Mexico. Bayou Plaquemine and bayou La Fourche flow out from the western side before we come to New Orleans; but there is no outlet below the city till we arrive at the divisions which form the four mouths of the Mississippi. From the falls of St Anthony to a few miles below the river Des Moines, the Mississippi is about half a mile broad. Below the rapids which occur at this place, its average breadth before it receives the Missouri, is a full mile; and its transparent waters, its gentle current, the number and beauty of its islands, the variety and magnificence of the natural scenery upon its borders, render it admirable beyond description. Its current here is about two miles an hour, and its average depth is about four feet. Where the Mississippi receives the Missouri, it is a mile and a half wide. The mouth of the Missouri is about half a mile wide. When these are united, they constitute a stream that is about three quarters of a mile in breadth, very deep, with muddy waters, and a furious, boiling current. Its average width, during the remainder of its course, does not exceed a mile. The influx of the other mighty rivers only increases its depth and the boiling and whirling motion of its waters. Its medial current is about four miles an hour, but it is often much greater. We know not that it has been sounded in such a manner as to justify any estimate of its average depth. At Natches, about 400 miles from its mouth, we have frequently heard it stated that its depth is found to be from 100 to 150 feet. Between New Orleans and its mouths, we have seen a large anchor dropped three times by a vessel descending with the current, at places far distant from each other, and it did not reach the bottom in either case, with less than sixty fathoms of cable. In estimating the width of the river, we refer to the space between the banks of its regular channel. At every flood, it overspreads a vast country, principally on its western side, which is from ten to fifty miles in breadth through the last 500 miles of its course; and most of the water which overflows below Red river goes to the gulf of Mexico, without returning to the river. The country thus overflowed is generally without any habitable spots, but is covered with cypress, cotton-wood, or coarse grass; and its waters abound

with alligators. After the Mississippi unites the Missouri, its course is so serpentine, as to present very few "reaches," or places where it is straight, that an extent of three or four miles can be seen at one time. In many places, the low narrow necks at its borders is thirty or forty miles in breadth. The boundaries of this river-valley are called high-lands, and these are often very steep, and sometimes 200 or 300 feet in height. In several places, the river ranges, for a considerable distance over these high-lands, alternately on one side and the other; and, at a few places, it leaves the whole alluvial tract on one side. From the sources of the river to the mouth of the Missouri, the annual flood ordinarily commences in March, and does not subside till the last of May, and its medial height is fifteen feet. Between the Missouri and the mouth of the Ohio, the annual flood is twenty-five feet. For a great distance below the point, it is fifty feet; but it subsides above Vicksburg, and thence gradually to the mouth of the river. At Baton Rouge it is about thirty feet, and about twelve at New Orleans. Between the Missouri and Ohio, the most shallow parts of the channel have as but of water when it is lowest. Thence to the St Pierre, there are several shoal places, where, at low water, pilots are perplexed to find a sufficient depth. Below that point, there is no difficulty for vessels of any draught, except to find and preserve the right channel. There are no tides in the Mississippi. A variation of a few inches in the height of the water is generally observed during the night, and sometimes during the day; but even at the very mouth of the river, the water is at all times fresh, and no ebb and flow are seen corresponding with those of the sea. The muddy waters of the river are perceived by those who approach it, when the mariner is still out of sight of land. It will be seen from the description here given, that the Mississippi is not to be estimated by its apparent magnitude, but by the prodigious number and size of the rivers whose waters it receives. The immense valley of which it receives the waters, extends from the Alleghany to the rocky mountains, and from latitude  $49^{\circ}$  to the gulf of Mexico, is  $15^{\circ}$ . Its navigation is at all times attended with some danger, on account of the raging power of its current, and the numerous trees which it dislodges on its banks and bears away in its tide. Steam boats are admirably fitted to avoid these dangers; and the navigation above New Orleans is every year becoming more confined to them. Flat boats still bring down much produce, but no other vessels than steam-boats are often seen ascending.—For a more full description of this mighty river, and of the Mississippi valley, see Flint's Geography of that country. A considerable part of this description has been selected from the excellent work.

MISSISSIPPI; one of the United States of America, between  $30^{\circ}$  and  $35^{\circ}$  N. lat., and  $88^{\circ}$  and  $91^{\circ}$  W. lon. Its average length is about 300 miles, and its average breadth 160; square miles, 48,700. It is bounded on the north by Tennessee, east by Alabama, south by the gulf of Mexico and Louisiana, and west by Louisiana and the Mississippi river. Mississippi and Alabama constituted one state in 1817. Population of both in 1800, 86,320. in 1820, 40,352. Population of Mississippi alone in 1820, 45,929; in 1820, 75,448; white males, 23,200; white females, 18,390; slaves, 32,814; persons engaged in agriculture, 22,033; in manufactures, 20; in commerce, 291; militia, 5,292. In 1821, there were 38,497 white males; 32,121 white females; 32,687 male slaves; 32,687 female slaves; 237 free coloured males; 237 free coloured females; 13,594. There are several distinct ranges of hills, of moderate elevation, besides a singular succession of mountains

alled bluffs, which, in some cases, approach to the river, and at other places, are seen several miles from it. On the border of the river are those called *Walnut Hills*, *Grand Gulf*, *Natchez*, *White Cliffs*, and *Lofthus heights*. Two ranges of hills divide the state nearly in its whole extent, and separate it into sectional visions. In advancing from the bottoms of the Mississippi, there is everywhere, at a greater or less distance from the river, an appearance of bluffs, high, when mounted, spread out into a kind of table surface, waving agreeably; but, in many instances, the richest table lands have precipitous benches, which expose the land to be washed, and divided by deep ravines. In the northern part of the state, inhabited by the Cherokees and Choctaws, the land rises into pleasant and regular undulations. The soil is deep, black, and rich; and, in its natural state, both here and in the more southern parts of the state, much of it is covered with cane-brake. The country inhabited by the Chickasaws, in the north-west part of the state, is charmingly variegated with swells and alleys of great fertility, and abounds with fine springs. In the lower parts of Mississippi, bordering on the river, neither rocks, stones of any size, or even gravel, are often seen on the surface of the ground. Some places are exceptions to this remark, but, in other parts, a person may perform a day's journey without finding any stones which have not been brought from distant places. In general, the surface of this state is most agreeably diversified with ridges, hills, and valleys, and the soil is remarkably fertile. The Mississippi river washes the whole western border of the state. Following its very meandering course, this distance is about 700 miles. The curves of the river often bring it back with very little progress, after a course of seven or eight leagues. The greater part of this long line of river coast consists of inundated swamps, seldom seen except by people travelling on the river. These swamps are generally covered with dense forests. The Yazoo is the largest river that has its whole course in this state. The Pearl is next in importance, and traverses the centre of the state from north to south. Some legislative efforts have been made to improve its navigation. The Pascagoula rises in lat. 33°, and has a course of 250 miles before it enters the gulf of Mexico. It is capable of considerable navigation. At its mouth, it widens into an open bay, on which stands the town of Pascagoula, whither many people from New Orleans resort during the sickly months. The Big Black has a course of 200 miles, and is navigable for boats fifty miles. It enters the Mississippi just above Grand Gulf. The Homochitto is also a considerable river, and flows into the Mississippi above Fort Adams. The other rivers and creeks are comparatively small. The quantity of land embraced within the state is 31,074,234 acres. Of this, the Indians still claim 11,514,517 acres, and the United States claim 16,885,760 acres; leaving only 2,673,957 acres properly belonging to the citizens of the state. Mississippi has only about thirty miles of sea-coast, and has no harbour except Pascagoula. Along the coast are a few islands of little importance. Back from the coast, the country, for a considerable distance, is a sandy, level, pine forest; but this part of the state is healthy, and the timber is very valuable. The climate of this state is generally best suited to the growth of cotton. Its western border is so much exposed to inundation, that it cannot be expected to be very healthy until levees are raised to keep the great river within its proper banks. In the most fertile parts of the state, the forests present an immense growth of oak, hickory, lime, sassafras, cottonwood, magnolia, poplar, and other valuable trees; and the swamps abound with cypress. In moist land,

the trees are covered with long moss, hanging often five or six feet from the branches, and giving to the forests a very singular and rather gloomy appearance. The palmetto is seen in the southern section, and the family of laurels in various parts. The laurel magnolia (*magnolia grandiflora*) is frequently seen in great perfection; and the forests abound with beautiful flowers, which remind the northern traveller that he has entered upon a new climate. The sugar-cane grows only on the southern borders of the state. The orange and the live-oak are principally confined to the lower waters of the Pascagoula and Pearl rivers. In the middle regions, figs, tobacco, maize, sweet potatoes, rice, indigo, squashes, melons, plums, and peaches will grow well; but excepting maize, peaches, melons, potatoes, and squashes, they are but little cultivated. Grapes of various kinds grow wild, and the vines are seen, in great numbers, hanging from the branches of the highest trees, like the ropes of a ship. Many of them are two or three, and some are six or eight inches in diameter. Almost every species of the grape would probably come to maturity in this state. But the principal attention of the Mississippians is directed to the growth of cotton. This is the grand staple of the state. Although its price has diminished nearly two thirds within a few years, yet it is more profitable than any other production. Most of the good planters raise Indian corn enough for their own use, and also raise hogs enough to supply them with bacon. These are the principal and most wholesome articles of food for this climate, but the wealthy planters are supplied with an abundance of the necessities and luxuries of life. Apples and pears grow imperfectly in a few places. Probably they might flourish on some of the northern highlands. Natchez is much the largest town, and the principal seat of commercial transactions. Monticello is a pleasant, flourishing village on Pearl river, and was lately the seat of government. Jackson, near the head of Pearl river, has been selected as the permanent seat of government. It has a central, healthy, and pleasant situation, but has not yet many inhabitants. Vicksburg, below the Walnut Hills, on the Mississippi, has risen up within a few years, and has already become a place of great trade. Greenville, Woodville, and Winchester are flourishing villages. Gibson Post is a village of considerable importance; it is situated on Bayou Pierre, about thirty-five miles above Natchez. Shieldsborough, on the west side of the bay of St Louis, is often resorted to by the inhabitants of New Orleans during the sickly months. Warrenton is another thriving village on the Mississippi, from which large quantities of cotton are exported. There are ample public funds for the endowment of schools, but the blessings of education are not generally diffused. The legislature has done little towards requiring the establishment and support of suitable schools. This is also true of most of the Southern and Western States; and a large part of the children are consequently but imperfectly educated. An institution, called a college, has been incorporated at Shieldsborough. Jefferson college is at Washington, six miles from Natchez. Schools of good reputation have been supported at Natchez, Woodville, and Monticello. The principal religious denominations are Methodists, Baptists, Presbyterians, Catholics, and Episcopalians. The principal tribes of Indians are the Choctaws and Chickasaws. The former are estimated at 4000; the latter at more than 20,000. This state was included within the country which was discovered and possessed by the French, who formed a settlement at Natchez about the year 1716. In 1763, it was ceded to the British with the rest of the French possessions east of the river.

There were few white inhabitants before the end of the last century. In 1798, the country was erected into a territorial government, and into a state government in 1817. For the constitution, see *Constitutions of the United States*.

**MISSISSIPPI VALLEY.** This name is applied to the vast country which is watered by the Mississippi river and its numerous tributary streams, and which is included between the Alleghany and the Rocky mountains. Mr Flint considers that it properly includes the tracts watered by the comparatively small rivers, as the Mobile, Pearl, and other rivers of west Florida, on the east side, and the Sabine, Brassas, and Colorado of Texas on the west side, which enter the gulf of Mexico without uniting with the Mississippi. Including the valleys of these separate streams, the great Valley of the Mississippi is bounded south by the gulf of Mexico, and extends on the south-east to cape Florida. Running along that cape in a northern direction, the boundary on the east passes those table elevations which separate the waters of the Mobile and Tombigbee from those of the rivers of East Florida. Thence running through the country of what are called the Indian nations, and touching the north-western extremity of Georgia, the eastern boundary becomes plainly defined by the Alleghany mountains. There are no mountains or ridges on the north, to mark a general boundary between this Valley and the basins of the lakes, or between the waters of the Mississippi and those which flow northward into lake Winnipeg, Hudson's bay, and the Arctic ocean; but the Valley is to be considered as terminating on the north, where it begins to receive its waters. The western boundary is, for the most part, distinctly marked by the Rocky mountains. One of the southern ridges of these mountains divides the waters of Arkansas and Red rivers from those of the Rio del Norte, and traverses the Mexican states of Texas and Coahuila to the low marshes and prairies on the gulf of Mexico. Thus the Valley of the Mississippi extends twenty degrees in latitude, without including cape Florida, and about thirty degrees in longitude. From Oleanne point on the Alleghany, to the highest point of boat navigation on the Missouri, is 5000 miles. Between the extreme points of navigation on the Tennessee, and on the Arkansas and the Red river, the distance is at least 3000 miles. Unlike most other long and large rivers, the Mississippi rises in very cold regions, and flows towards the equator. It thus waters an immense valley, possessing almost every variety of climate, and furnishes the means of easy and most profitable intercourse between the various sections of so vast a region. If we except the Amazon, probably no other valley on the globe

will compare in size with that of the Mississippi, and is probably surpassed by others in the richness and variety of its soil, and in the extent of the support and comfort of its inhabitants. It is like a constant: in beauty and fertility: a most perfect garden of nature. For its features of the various sections of the valley, rivers, climates, and productions, see the various articles. The history has been given under the name territory, but some further details respecting earlier periods may be interesting. Tradition is supposed to have stated among the natives that but a few years after America was discovered by Columbus. The Spaniards entered the Valley discovered in lat. 30°, in the year 1492, by Ponce de Leon. Some say that he arrived on Easter day, and gave it the name of Florida, the Spanish name of that festival—*pasqua de flores*, the festival of flowers. Others say that in west Florida, the country of flowers, from the profusion of flowers with which the lower delta plants abounded. Between 1513 and 1521, and Vasquez, both Spaniards, made attempts. From mismanagement with the natives, the expedition failed in its purposes. In 1521, Ponce Narvaez obtained a grant of Florida. He entered the country as far as the Indian village of Anasco. The natives there defeated his party. He was succeeded by Ferdinand de Soto, governor of Cuba, who sailed from Havana with nine ships, about 2500 men, two or three hundred horses, and other stock. He was attacked by the Indians immediately after he landed; but he covered until he feared opposition, and marched far into the interior to the country of the Chickasaws. He was probably the first white man who entered the Mississippi. He crossed it near the entrance of the bay, but soon after sickened and died. The number of his followers had been much reduced, and those who remained were glad to abandon the project of conquering Florida. In 1564, the French, under M. de Charles, near the present site of St Augustine, a number of families were established there. It was not a permanent establishment. About twenty years afterwards, in 1608, a fleet arrived at St Lawrence, commanded by admiral Champlain, founded the important city of Quebec. The first permanent settlement of the French in America was in the inclement climate of Canada. The hardships made their first colonial experiments a sad and on Biloxi, at places which are remarkable for their sterility: the English made their first attempts at Jamestown and Plymouth, and other places then offered much encouragement to business and of peace.
